40,311. There would be very little for rent, I suppose, there?—A very small figure indeed. The figure for rent has been put at rather over a dollar; but that may, of course, mean merely the cost of the land.

40,312. (*Mr. Dalton.*) Does that include rates too?—The rent was a dollar and a half.

40,313. And the rates?—There is no mention of these in the specific returns. They include the sum for taxation probably in the rent; it is a small matter in a State like that.

40,314. I was going to say it appears to be very small; the labour is the main expense?—The labour is the main item. The labour in North Dakota alone consists of course of several items. The cost of sowing is given as 40 cents, the cost of harvesting as a dollar, the cost of threshing as a dollar and a half nearly, the cost of housing as about a third of a dollar more, and then the cost of marketing as about 75 cents.

40,315. What did you say it was about per acre in this country?—I have no official returns—nothing of any value—showing what the cost of wheat growing in this country is. I have seen figures quoted in the newspapers of somewhat over 5*l.* to 6*l.*, up to 7*l.* and 8*l.*, I think.

40,316. Is the straw of any value in those States?—In the far west of very little use at all. It is very largely burnt and used for running the threshing machine.

40,317. Then the value of the English crop is considerably larger than the value of the American, owing to the straw?—Where the straw is sold.

40,318. (*Mr. Giffen.*) What is the produce per acre?—The produce per acre in Dakota is rather better than in Iowa; probably it would be 16 to 17 bushels per acre; compared with about 28 or 29 bushels per acre in this country.

40,319. (*Mr. Clay.*) What is the gross expense per acre of cultivating a crop of wheat?—In Dakota they put down for manure 1 dollar 42 cents to 1 dollar 49 cents; for preparing the ground for working it, 1 dollar 55 cents to 1 dollar 69 cents, and the cost of sowing, 30 cents to 40 cents; harvesting, a dollar; threshing, a dollar to a dollar and a half; housing, from a quarter of a dollar to a third of a dollar; marketing, about three-fourths of a dollar.

40,320. How much altogether, gross?—Altogether about 9 dollars an acre; the amount sown per acre in that case is charged for separately. I ought to say that the 9 dollars includes the cost of seed, which is put down at about 80 or 90 cents per acre.

Major P. G. Craigie.
14 Feb. 1895.

Profits of wheat-growers in England and the United States compared.

40,321. (*Mr. Dalton.*) Do you consider that wheat is grown to a greater profit in the United States than it can be grown in England, or rather at a less loss in the United States than it can be grown here?—I am not able to say what the average profit or loss would be.

40,322. I mean taking these figures that you have before you?—I am not aware of an average figure for England. There is no English figure with which we can compare it. There has been no inquiry of this nature in England, and therefore we cannot say what the cost of wheat growing is. It is very difficult even in America if wheat forms part of a rotation to say what we should charge to the wheat crops and what to the other crops; it is very difficult to separate it from the other crops that are grown.

40,323. You could not say from the statistics you have that the man who sets to work to grow wheat in America is better off than the man who tries to grow it in England?—It would appear from these figures, if the figures may be believed, that you can grow in South Dakota for about 70*s.* what we grow here for 6*l.* or 7*l.*

40,324. On the other hand you get here the straw?—You get the straw, and then they have to transport the wheat for a considerable distance from South Dakota before they can get the value.

40,325. Do you think that wheat growing will continue to decrease in the United States?—I am quite unable to say what the future will be; it has decreased.

40,326. Do you think that the result of all the statistics that you have given us is to account pretty satisfactorily for the great fall in the price of wheat, or can you form any estimate whether it is due to any other cause as well, such as the appreciation of gold?—I am not prepared to make any general statement beyond that which I have given.

Statistics of acreage and live-stock in continental countries.

40,327. (*Viscount Cobham.*) There is one other paper that you wish to refer to, I believe, and which deals with the acreage and live stock of certain European countries in the period 1883–93; will you point out the inference that should be drawn from the tables in that paper (*see* Appendix A., XXII.)?—The tables only relate to certain European countries, and are given roughly in order to show what have been the changes, if any, in the corn crops as a whole, and of wheat by itself, in those European countries. The tables would show that, whereas there has been a falling off in the corn area of the United Kingdom, the corn area of Austria shows practically no change; that of Hungary shows a slight augmentation; that of France is almost stationary throughout the period; that of Germany has slightly increased; and that of Italy has very slightly increased. As regards wheat alone the United Kingdom has fallen off; Austria has maintained her acreage; Hungary has increased it slightly; France has managed to increase her acreage throughout the whole period from 1883 to 1893 from 17 million to 17½ million acres; Germany has increased her acreage of wheat, but only by 300,000 acres; and Italy has very much maintained the same acreage. The increases are very small in potatoes; in Austria the area is just the same; in Hungary there is a slight increase, but scarcely any at all if you exclude Croatia and Sclavonia; France has distinctly increased, and Germany has slightly increased. As regards grass of all sorts, France apparently has increased her acreage, but the other countries remain very much the same; the later figures for Hungary are complicated by including Croatia and Sclavonia. As regards cattle, we have slightly increased our stock; the Austrian figures are only taken at long intervals, and do not show much change; the French figures I have used from 1885, because I think, as regards the French figures for earlier years, there is probably a slight inaccuracy, a change having been made in the mode of reckoning at the end of 1883 and 1884, which years I have not given here.

40,328. I presume that your figures as to live stock in the United Kingdom would not take account of the drought of 1893?—They do not include the figures for 1894. I have taken 1893 as the latest year for the foreign countries. Our drop this year is below the figure given in Table V. The figure would be 10·8 for cattle for 1894, and for sheep the figures this year are about 1,400,000 less. The figures as regard sheep show a decrease in all European countries, and the figures as regards pigs show great fluctuation, but they have not been subjected to any very close analysis.

Agricultural experiment stations in the United States.

40,329. (*Mr. Little.*) I think you could give us some information in your private capacity, if not in your official

Major P. G. Craigie. 14 Feb. 1895.

capacity, with respect to the agricultural stations in the States; you have had an opportunity of inspecting some of these stations, have you not?—I had on the occasion of my last visit. I went to several of the American colleges and to the stations which were attached to them, and was rather impressed by the extensive arrangements which were made for conducting the various experiments and for publishing a great mass of matter bearing on the different points at issue. The figures are pretty well shown in the last report of the American Government, the report for 1893.

40,330. There are a considerable number of those stations, are there not?—They are marked on the map which I have put in with my report.

40,331. Almost every State has one?—Every State now, I think, has a station.

40,332. Are they founded by the State?—They are to some extent endowed by the State, but every one of those stations enjoys a special grant from Congress of 15,000 dollars under the Act of 1887. The colleges are endowed by an earlier Act.

40,333. Is that an annual grant?—It is an annual grant from the United States Government of 15,000 dollars—3,000*l.* each. They have local revenues as well from the different States, in some cases, but not in all. There are one or two States with two stations.

40,334. Are they supported at all by private contributions?—Only to a very small extent. The colleges, such as Cornell University in New York State, and some of the others, have been of course endowed very largely by private munificence, and the officers of the colleges are available for the use of the station, so that in that sense, private benevolence helps; but the experimental stations are chiefly helped by the State, or by the Agricultural Department.

40,335. Chiefly maintained by the State?—Less by the individual States than by Congress.

40,336. In addition to these experiments, they instruct, do they not?—They have a regular system of instruction at all those colleges.

40,337. Are the experimental farms held in connexion with the colleges?—As a rule, but there are one or two exceptions. There is an old experimental station in New York State—the Geneva station, which I visited, which is not in connexion with the college, and which existed some time before the Act of 1887. There are a few cases of that kind, but as a rule they are really stations subordinate to, and in connexion with, the agricultural colleges, and using the same scientific staff.

40,338. What is the extent of one of these experimental farms?—They vary in acreage. Some of them in New England have a very small amount of land attached, only four or five acres, but there the work is chiefly chemical and is done in the laboratory.

40,339. Consisting, I suppose, of experiments on certain manure?—Special analyses.

40,340. Not consisting of experiments in the growth of crops?—Not so much.

40,341. Nothing like Sir John Lawes' experiments?—No, not of that length. In the other cases, further West, the newer stations have considerable areas, some of them having from 120 to 200 acres.

40,342. Do they include live stock?—They do. I think I pointed out, in answer to a Commissioner just now, that in Wisconsin, and several of those States, experiments were being made in the crossing of sheep, particularly by different breeds of this country, such as Cotswolds and Shropshire.

40,343. Did you find a general opinion that these experimental stations were productive of good to agriculture?—I heard a great many remarks to that effect, certainly.

40,344. Are they carried out at any great expense?—The expenses are shown in detail in the last report—the Report for 1893 of the United States Agricultural Department. They vary very much.

Major P. G. Craigie. 14 Feb. 1895.

40,345. I have not got that report; I do not know whether you can give us some idea of what one of those stations costs?—Some of them cost just about the amount of the grant, the 3,000*l.* Others have added money to the grant. The revenues both of the colleges and of the experimental stations are given in the report to which I refer. The Kansas Station, for example, has a revenue of 15,000 dollars from the United States, and exactly spends that sum and no more. Take the New York College of Geneva; it receives no Government subvention; it is a purely State business; it receives about 69,000 dollars a year, and spends that sum. Taking an ordinary case, such as Wisconsin, which is one of those I visited, the Government paid 15,000 dollars; the State of Wisconsin found nearly 10,000 dollars, and the sales of products brought in a certain revenue; the total expenditure was about 30,000 dollars.

Work of agricultural experiment stations.

40,346. I suppose that they devote their attention to the crops and the products which are specially suitable for the States in which they are carried on?—And largely—as is the case in those New England States mentioned in the latter part of the memorandum, where they are changing their character of cultivation—to the smaller crops, to fruit growing, to vegetable growing, to the growth of plants under electricity, and to the growth of different varieties of fruits, to a very large extent, to dairying, to the analyses of dairy produce, and to the different modes of feeding cattle. Their attention is directed much more in that direction than in regard to corn or grain.

40,347. They look out for the newer forms of agriculture, which might be profitably introduced?—Yes; in certain cases the breeding of sheep generally, and the getting forward of early lambs to the market, is a subject of discussion; and the feeding of swine for pork in some other cases.

40,348. Are those experiments carried on with a view to profit, that is to say, do they take account of the cost incurred, or are they like Sir John Lawes' experiments, which are conducted, as you know, independent of the desire for profit?—Both practices are carried on. To some extent there are experiments made where the money cost of the food used is shown in order to be an instruction to other breeders, and the whole thing is balanced; but in other cases where it is a matter of pure research, where it is a case like the use of electricity to grow certain vegetables or plants, no question of cost enters into the matter at all in the earlier inquiries.

40,349. Do they experiment with certain crops to ascertain not only whether they can be grown, or how much can be grown, but whether they can be grown at a profit?—Here and there that has been the practice apparently. Of course I can only speak for a few of the stations, not having personally visited very many.

40,350. I suppose the students in connexion with the college have an opportunity of observing these experiments?—They have, and at many of the stations the students are employed to do part of the labour, not because it is an advantage, because I was told that it was rather a disadvantage, to the station itself, but because it is an advantage to the students to be trained.

40,351. Technical instruction, in fact?—They were thus taught pruning in the horticultural department; and they were taught the feeding of stock in the animal experiments.

40,352. I suppose they pay fees?—At the colleges the fees are very small, and usually for certain incidental things. Instruction and published information are supplied free to the inhabitants of the State.

40,353. Are there bursaries or scholarships, do you know?—There are a good many instances of what practically comes to this sort of arrangement.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Seventy-fifth Day.

Friday, 15th February 1895.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., *Assistant Secretary.*

Mr. J. M. Dodds.

Mr. JAMES MILLER DODDS called and examined.

Mr. J. M. Dodds.

5 Feb. 1895.

15 Feb. 1895.

40,354. (*Mr. Dalton.*) You are here to-day to give evidence on behalf of the Secretary for Scotland's office on the system of valuation and rating in Scotland?—Yes.

ystem of aluation nd rating Scotland.

40,355. With special reference to the practice in regard to the valuation and rating of railways, canals, and other properties?—Quite so.

40,356. How is Scotland divided for local government purposes?—The whole area of Scotland is divided twice over; first into parishes, the ancient division, and secondly into counties, burghs, and police burghs.

40,357. Do the counties and parishes overlap?—The parishes overlap counties and burghs in some cases. There are a large number of parishes which are wholly landward, that is wholly in a county, and a few, about eight or ten all over Scotland, which are wholly within a burgh.

ublic ealth and or law eas.

40,358. What are the areas for public health purposes?—The area for public health purposes is the burgh so far as the burgh is concerned, and, in what we call the landward part of the country, the county district.

40,359. And for poor law purposes it is the parish only?—For poor law purposes it is the parish only.

40,360. The parish is very large in some cases?—As a rule, the parish is very much larger than the English parish.

40,361. (*Mr. Little.*) Are there no combinations of parishes for poor law purposes?—There are a few combinations, but so few that they are hardly worth considering.

ating" uthorities

40,362. (*Mr. Dalton.*) What are the rating authorities?—For the more important rates—the rating authority in the parish is the parochial board, which is the poor law authority, and which will shortly give place to the parish council; in the counties the county council. Perhaps I ought to say that some of the county rates are levied over the whole area of the county, and others over the districts into which the counties are divided. There are about 100 districts in the whole of Scotland. In burghs the rating authority is the town council, which sometimes rates in its capacity of town council, and sometimes in its capacity of Burgh Commissioners under the Scotch Burgh Police Act; and in police burghs, which are areas constituted into burghal areas within recent times, as distinct from the old Royal or Parliamentary burghs, the Burgh Commissioners acting under the same Act are the rating authority.

aluation olls.

40,363. What is the basis of assessment in Scotland?—The basis of assessment in every case is the valuation roll; that is to say, no rate can be levied upon a higher amount than is quoted in the valuation roll as the annual value of the subject mentioned.

40,364. The annual value is the gross value, is it not?—It is the gross value. I have a valuation roll here if the Commissioners would care to look at it. This is a valuation roll for the present year for the county of Peebles (*handing in valuation roll*).

40,365. How often is it made up?—It is made up every year for the whole of Scotland.

40,366. At the beginning of the year?—It runs from Whitsunday to Whitsunday.

40,367. Is it made up once for all, or do you have supplementary valuation rolls?—I believe it is made up once for all.

40,368. (*Mr. Clay.*) It is made up each year?—It is made up each year for the year.

40,369. (*Mr. Dalton.*) Then no property comes into rating during the year that is not in the valuation roll at the commencement of the year?—I am not quite certain about that, but I believe not.

40,370. How is it made up?—It is made up for the county by an official called the county assessor, and for the burgh by a similar official, the burgh assessor; but the valuation of railways, canals, and certain other large undertaking is made separately by one official for the whole of Scotland, named the assessor of railways and canals, and inserted in the local roll on his certificate. You will find on the last page of the roll there the valuation of railways, canals, and other such subjects.

40,371. Is he appointed by the Government?—The railway assessor is appointed by the Crown on the recommendation of the Secretary for Scotland.

Railway assessor.

40,372. Does he require a large staff?—His staff is not large. The total cost of the system for the current year was as close as possible to 2,000*l.*, and the total value of the subjects valued by the railway assessor was approximately 2,000,000*l.* The cost of his valuation averages about a fifth of a penny on the total valuation of the subjects valued.

40,373. Does that include costs of appeal?—I think not. That is only the cost of salaries, office expenses, travelling expenses and the like.

40,374. What appeal is there against his decision?—Do you mean the railway assessor's decision?

Appeals against assessor's valuations.

40,375. Yes?—There is an appeal against the railway assessor's valuation to one judge of the Court of Session when the subjects valued are in more than one county, and to the sheriff when they are all in one county, the decision being final in either case.

40,376. In the case of the local assessors what appeal is there?—In the case of the local assessor there is an appeal to the valuation committee of the county council in a county, and to the magistrates and council in a burgh, with a further appeal on a case stated to the Land Valuation Appeal Court, consisting of two judges of the Court of Session.

40,377. And the parochial board have nothing whatever to do with making up the valuation roll?—Nothing whatever, but they can appeal against an entry.

Mr. J. M. Dodds.
15 Feb. 1895.

40,378. Who pays the costs of the appeal against the local assessors?—The people primarily concerned pay the costs.

40,379. But in the case of the railway assessor?—In the case of the railway assessor the whole costs of the appeal are paid by the appellants.

40,380. Then the companies pay his salary to start with, and if they appeal against his decision, they pay the whole costs of both sides of the appeal?—I believe that is a correct statement, but it is fair to say that the assessor is not allowed to employ counsel, although the companies do employ counsel.

40,381. (*Mr. Little.*) In the appeal of individuals against an assessment are they empowered to employ counsel?—Yes.

40,382. (*Mr. Gilmour.*) They do that, but they have to pay their own expenses?—They have to pay their own expenses. I am afraid I do not know what happens if the appeal goes in their favour; I could not say for certain whether the costs are thrown upon the appellants.

40,383. If they choose to employ counsel they pay him?—Is that so?

40,384. (*Mr. Clay.*) Each man chooses his own counsel but if there is no counsel each one advocates his own appeal and the sheriff naturally is paid by the country?—Quite so.

40,385. (*Mr. Gilmour.*) It is about the committee that we are speaking now, not about an appeal from the railway assessors to the Court of Session?—No; the appeal from the local assessor to the committee, I think, was what the question referred to.

40,386. As a rule, those objecting to a valuation generally appear for themselves?—I imagine as a rule they do.

40,387. Unless there was a very important principle involved?—Yes.

40,388. (*Mr. Dalton.*) And the valuation is conclusive for local and Imperial purposes?—It is in some cases. It is conclusive for both local and Imperial purposes when the assessor is the Inland Revenue assessor. Perhaps I should explain that when the assessor is the Inland Revenue assessor the whole cost of making up the valuation roll is charged to the Crown; when the assessor is appointed separately by the county or burgh, the cost of the making up of the valuation roll is defrayed by the county or burgh, and the roll in that case is not final as against the Crown for Crown taxes.

Official and local assessors.

40,389. In what proportion of cases is the Inland Revenue assessor the local assessor?—The present figures are 26 Inland Revenue assessors in 33 counties, and 43 out of 86 burghs.

40,390. (*Mr. Gilmour.*) When you mention here the whole cost of the valuation roll, of course most rolls are printed, and the county has to pay for the entire cost of printing the rolls?—There has been a good deal of discussion about that recently, and I am not quite sure of the final result.

40,391. That is the fact, I think I may say. Of course, where a roll is not printed then the county has no expense if it is the Inland Revenue assessor that does the work; but wherever a county prints, as almost all counties in Scotland do now, that, as in the county of Fife, costs perhaps 250*l.* a year to print, so that the whole cost is not in that case borne by the Crown?—I understand.

40,392. (*Mr. Dalton.*) Then at the present time more than half the counties employ the Inland Revenue assessor, and exactly half the burghs?—Yes; much more than half the counties—26 out of 33.

40,393. Do the most important counties employ him? Yes; I think so. I remember the county of Ayr and the county of Argyll employ local assessors; they are certainly important counties.

40,394. (*Viscount Cobham.*) Is it an optional matter with the counties?—Entirely optional.

40,395. Why do they not always employ the Government assessor; it would save them a considerable expense?—That I cannot say. In some cases I should imagine they have followed the old practice, and gone on appointing the local men. It is just possible they think that in some cases the result of appointing the Inland Revenue assessor might be to raise the valuations; but as to that, I am not in a position to speak.

Mr. J. M. Dodds.
15 Feb. 1895.

40,396. (*Mr. Dalton.*) Do they find that is the case in these counties, where they have their own assessor and also the Inland Revenue assessor, that the Inland Revenue assessor's valuation is the highest?—I could not say generally whether it is so, but I have heard of particular cases in which the Inland Revenue assesor has considered it necessary to raise the local assessor's valuation.

Procedure in assessment.

40,397. On what principle do the assessors have to ascertain the value of the different properties on the valuation roll?—It is the duty of the assessors "annually to ascertain and assess the yearly rent or value "of the several lands and heritages within the county "or burgh respectively," and to make up the valuation rolls in the manner prescribed by statute. Lands and heritages are to "extend to and include all lands, "houses, shootings and deer forests, fishings, woods, "copse and underwood from which revenue is actually "derived, ferries, piers, harbours, quays, wharves, docks, "canals, railways, mines, minerals, quarries, coalworks, "waterworks, limeworks, brickworks, ironworks, gas-"works, factories, and all buildings and pertinents "thereof, and all machinery fixed or attached to any "lands or heritages." It is provided, however, that "no mine or quarry shall be assessed unless it has "been worked during some part of the year to which "such assessment applies."

40,398. How is that worked; if you make up the valuation roll at the beginning of the year, do you enter a mine or a quarry in it, if it has been worked during the preceding year?—I think so, but as to that I cannot say very definitely.

40,399. Is every class of rateable property entered in the valuation roll?—I think it is fair to say every class of rateable property; in fact, some property is entered which is not rated.

40,400. What property is that?—Such property as a church, I believe, is in some cases entered.

40,401. Entered at a value?—Entered at a value, but not rated.

40,402. What is the object of entering it?—Because it has been held to be the duty of the assessors to include, under the terms of the Valuation Acts, every property in the county which might bring in a rate. The Valuation Act does not decide what property is to be rated; the valuation roll is solely for the purpose of enabling property to be valued.

40,403. (*Mr. Clay.*) Is it not the case that the Established Church ministers have never paid parochial rates, and that they are favoured in that way, and perhaps it is the same with glebes; do you know that?—I do not know for certain, but I may perhaps point out that the valuation roll is not at all final in deciding whether the subject entered in it is to be rated or not. That must depend upon the provisions of particular statutes.

40,404. But the Established Church minister is freed from paying rates levied for the purpose of raising money for the parochial board?—That may be, but I could not speak with absolute certainty about it.

40,405. (*Mr. Gilmour.*) Because he was supposed to pay more out of his pocket to the poor directly?—Yes.

40,406. (*Mr. Dalton.*) I think you said feu duties were not entered in the roll for the purpose of assessment?—Not for the purposes of assessment.

Feu duties.

40,407. What are feu duties; are they the same as ground rents?—Not precisely, I believe. A feu duty is an annual sum payable by the purchaser of land who has taken it from the owner on the condition of paying so much per year, the owner parting with the property.

40,408. It is like a perpetual ground rent?—Yes, with possibly an increase at intervals, called, I believe, a casualty.

Determination of annual value of lands and heritages.

40,409. Are the rules for fixing the yearly value much the same as in England?—The rule for fixing the yearly value is laid down in the principal Valuation Act as follows:—"In estimating the yearly value "of lands and heritages under this Act, the same "shall be taken to be the rent at which, one year with "another, such lands and heritages might in their "actual state be reasonably expected to let from "year to year; and where such lands and heritages "consist of woods, copse, or underwood, the yearly "value of the same shall be taken to be the rent at "which such lands and heritages might in their

"natural state be reasonably expected to let from year "to year as pasture or grazing lands; and where such "lands and heritages are *bonâ fide* let for a yearly "rent conditioned as the fair annual value thereof, "without grassum or consideration other than the "rent, such rent shall be deemed and taken to be the "yearly rent or value of such lands and heritages in "terms of this Act: Provided always, that if such "lands and heritages be let upon a lease, the stipulated "duration of which is more than 21 years from the "date of entry under the same, or in the case of "minerals more than 31 years from such date of entry, "the rent payable under such lease shall not neces-"sarily be assessed as the yearly rent or value of such "lands and heritages, but such yearly rent or value "shall be ascertained in terms of this Act, irrespective "of the amount of rent payable under such lease."

40,410. I suppose "grassum" is the same as premium?—Grassum is a sum paid to the landlord at the entry to the lease in anticipation of and over and above the rent.

40,411. How do you interpret that provision about the underwood; do you take the value of underwood as being the value at which the lands would, in their natural state, be let as pasture or grazing land?—Yes, I suppose that the idea of that is, that it would be unfair to take the actual value of woods in any particular year, because they take a very long time to mature.

40,412. You do not value them in the same way as you would pasture land, do you; you do not put them at as high a value as pasture land?—As pasture or grazing lands.

40,413. At the same value?—Yes, I believe so; the assessor assumes for the moment that they are pasture and grazing lands, and values them accordingly, even although there is no return for the year from the woods.

40,414. Does not that give them rather a high value?—It may give them a high value in some years; in other years, on the other hand, in the year in which the timber is cut, I suppose it gives them a low value.

40,415. You do not assess the saleable underwood separately at all?—No.

40,416. I think you say that the value entered in the valuation roll is a gross value?—Yes, I think that is a special feature about the Scotch roll, namely, that the value which enters the roll in the case of the ordinary subjects is a gross value, and not as in England and Ireland a net value.

40,417. But some rates are levied on the gross value and some on the net value?—That is so.

Valuations of railways and canals.

40,418. How do you arrive at the value of a railway?—In the case of railways and canals certain rules are laid down by statute for the guidance of the railway assessor. He is first required "to inquire into and fix "*in cumulo* the yearly rent or value in terms of the "principal Valuation Act, of all lands and heritages in "Scotland belonging to or leased by each railway and "canal company and forming part of its undertaking"; and to "inquire into and fix the amount which one year "with another would be required in order to the acqui-"sition, formation, and erection of the several stations, "wharves, docks, depôts, counting-houses, and other "houses and places of business respectively in Scotland, "of or connected with each such undertaking (includ-"ing the solum on which such stations and others are "erected)," and also to "inquire into and fix all other "matters necessary to enable him to make up a valuation "roll of railways and canals." The general rule that yearly value is to be taken as the rent at which, one year with another, the subjects might in their actual state be reasonably expected to let from year to year applies to railways as well as to other lands and heritages. In practice the cumulo valuation is taken to be the net revenue left after making certain deductions from the gross revenue of the undertaking during the year preceding the valuation. First the gross receipts are ascertained. From this are deducted, in the first place, the working expenses, namely, one half of the expenses incurred in maintaining or repairing the permanent way, general cost of management, locomotive power, traffic charges, Government duty, and law charges——

40,419. Why is only one-half of those expenses deducted?—The other half is deducted in fixing the net assessment for parochial rating, and I imagine that has a good deal to do with the present state of the law.

40,420. (*Viscount Cobham.*) Are these figures taken from the company's books, or are they all estimates?—They are taken from the company's books; the assessor has access to all the companies' books.

Mr. J. M. Dodds. 15 Feb. 1895.

40,421. (*Mr. Dalton.*) What are the other deductions?—The second series of deductions are tenants' allowances, namely, 25 per cent. upon the estimated present value of the working stock and plant (representing tenants' profits, deterioration, interest, and incidents); 25 per cent. upon the value of workshop tools, office and station furniture and plant, horse and carting plant, telegraph instruments, and sacks.

40,422. Why is 25 per cent. taken in those two cases? Is that laid down by statute, or is that the practice?—I think that has been laid down by the judges according to the practice; at any rate it is the actual figure.

40,423. In all cases?—Yes. The other deductions are 10 per cent. for interest and deterioration on the value of general and locomotive stores on hand; 5 per cent. interest on an estimated floating capital, and 18 per cent. on the value of plant employed in working other lines. A further abatement is allowed is respect of earnings from traffic carried in plant belonging to traders. What remains is the *cumulo* valuation.

40,424. And that is taken as the gross income of the company for Imperial and local purposes?—For local purposes, certainly. I do not feel sure about the Imperial purposes; I suppose the principal Imperial tax upon the railways is the income tax, and how that is levied I could not state.

40,425. How do you allocate the valuation between the different districts?—The valuation is allocated as follows: From the *cumulo* valuation of the railway is deducted a sum of 5 per cent. of the yearly estimate of the cost of the stations, &c., and the balance is divided among the various parishes, counties, and burghs through which the line runs in proportion to the mileage of the line situated in each. To the result in each case is added a sum equal to 5 per cent. on the cost of stations, &c., within the parish, county, or burgh. A single line gets the same rate per mile as a double line.

40,426. Is it considered fair to apportion it according to the mileage everywhere, whether you have a single line or a double line?—The point has been mentioned before Committees of the House of Commons, but I do not recollect that any recommendation has ever been made about it.

40,427. It has always been so?—It has always been so since the system came into force in 1854.

40,428. The railway assessor values other properties besides railways, does he not?—I find that for this year he valued 24 railways, 2 canals, 12 tramways, 10 waterworks, 2 gasworks, and 1 electric lighting works—51 undertakings in all.

40,429. How does he arrive at their annual value?—As regards canals, similar rules apply as in the case of railways with suitable modifications. On the request of any water company, or gas company, or other company having continuous lands and heritages liable to be assessed in more than one parish, county or burgh, the railway assessor is empowered to value such lands and heritages. The general rule of lettable annual value applies in such cases as in that of railways, but in practice it is somewhat differently worked. In the case of corporation waterworks, all necessary outlays for management, maintenance and repairs properly chargeable against revenue, not merely a proportion of them, are deducted from gross revenue.

40,430. Why do they deduct the whole in the one case and only a proportion in the case of the railways?—I believe it depends upon judges' decisions.

40,431. You do not know what the reason given for it was?—I could not say.

40,432. You deduct a comparatively small proportion in the case of railways?—It is an extremely complicated question which was investigated by a Committee of the House of Commons in 1888.

40,433. Is the present system found to work well?—It gives great dissatisfaction to the burgh authorities I believe.

Valuation of waterworks

40,434. Are they dissatisfied with the deductions made from the railways, or do they think too great a deduction is made from the other companies?—For the moment, I was speaking of the waterworks alone.

Mr. J. M. Dodds.

15 Feb. 1895.

40,435. Of the waterworks belonging to local authorities?—Of the waterworks belonging to local corporations, which is the case with most waterworks in Scotland.

40,436. Do you allocate the value of these undertakings in a different way from that which you adopt in the case of railways?—The yearly rent or value is allocated on the principle of allowing to each rating area the proportion of the total annual value which the structural cost of the works in that area bear to the total structural cost. That system only dates from 1884. Prior to 1884 I believe the system was similar to the one prevailing in England; namely, the waterworks were valued on the basis of allowing for the profits supposed to be earned in each rating area.

40,437. And that was abandoned?—That was abandoned in consequence of a decision of the Court of Session.

Rating on gross and net valuation.

40,438. In what cases do you rate on the gross valuation, and in what cases on the net rateable value?—Roughly speaking, the county and burgh rates are imposed upon the gross valuation, and parochial rates are imposed upon a net valuation.

40,439. What is the reason for that distinction?—The primary reason is simply that the Acts of Parliament vary; what the ultimate reason may be I do not presume to say; but the variation has attracted the attention of various Select Committees of the House of Commons.

40,440. Are the rates on the gross valuation under more recent Acts or under older Acts; which is the more ancient system?—The more ancient system on the whole I should say was the valuation on the gross; but of rating statutes in the present century the most important has no doubt been the Poor Law Act of 1845, and that has since been the rule for the levying of all parochial rates, namely, that they are levied upon a net valuation and not upon the gross.

Division of rates between owners and occupiers.

40,441. In what cases are the rates divided between owners and occupiers?—In taking the three main areas again, in the case of counties up to 1889 most of the county rates were levied upon owners. In 1889, when the Local Government (Scotland) Act, establishing county councils, was passed, the rule was laid down for the future that county rates except the public health rate should be levied upon the gross valuation as entered in the valuation roll without any deduction, half upon owners and half upon occupiers; but as prior to 1889 the greater part of the county rates fell upon owners alone, the Act contains a provision under which an average owner's rate for the 10 years before 1889 was struck for each county. Up to that average owners alone are rated; above the average the rates are equally divided between owners and occupiers, and any new rates since 1889 have been so divided. I should perhaps explain that the average only applies to rates which prior to 1889 were levied upon owners alone. Certain rates, such as the contagious diseases (animals) rate and the roads rate for maintenance, were levied half and half upon owners and occupiers, and the average rate of course did not apply to them.

County rates.

40,442. For what purposes were the old county rates raised that fell entirely upon the owners prior to 1889?—I think a return was circulated with my brief which contains a list of the county rates——

40,443. The old county rates?—Of all the county rates. On page 3 of that return, No. 100, 1894 (House of Commons), will be found an explanation of the system. It is in the last column, headed "Incidence." "Prior to the commencement of the Local Government Act these assessments, namely, County General "Assessment, Police Assessment, Sheriff Court House "Assessment, Registration of Voters Assessment, "Militia Assessment, and Lunatic Asylums Assessment, were payable wholly by owners."

40,444. Did they constitute the greater part of the county rate in amount?—No, I think, on the whole, that probably the heaviest county rate was the road rate, which was payable only as regards capital expenditure by owners alone. As regards maintenance, it was payable half and half by owners and occupiers. Looking at the first county mentioned in that return, I see the total of rates levied by Commissioners of Supply, in the year 1889–90 was, in the county of Aberdeen, almost 3*d.*: the road rate levied by the county road trustees was 5*d.*

Mr. J. M. Dodds.

15 Feb. 1895.

Road rates.

40,445. The roads rate was borne half and half?—One could not say in any case definitely, whether it was borne exactly half and half, because one would have to know whether there was a debt.

40,446. (*Mr. Clay.*) You were speaking just now about the New Roads Act?—Yes, the Act of 1878.

40,447. Under the old Roads Act the trust roads were supported by tolls?—Quite so; that was prior to 1878.

40,448. And the statute labour roads, what we call in England the parish roads, were supported by landlords and tenants?—Yes. I have figures which show that in 1848 the tolls taken on roads over the whole of Scotland amounted to 6*d.* in the pound of valuation.

40,449. (*Mr. Dalton.*) When the tolls were abolished on whom did the cost of the old turnpike roads fall?—They now fall, half upon the owners and half upon the occupiers, so for as maintenance is concerned; and the road debt incurred since 1889 is likewise divided equally between the owners and occupiers; but the owners have still to bear the burden of the old road debt prior to 1889.

40,450. Is there any Treasury subvention for those disturnpiked roads?—There is.

40,451. What does that amount to?—There is a subvention of 35,000*l.* a year.

40,452. What proportion of the maintenance would that be?—I am afraid I cannot give you the figures at the moment; I could furnish them.

Division of rates between owners and occupiers.

40,453. What is the rule in burghs as to sharing the rates between owners and occupiers?—The general rule in burghs is, that rates are levied upon the gross value, and that they fall upon the occupiers. I believe, roughly speaking, that about one-sixth of the burgh rates fall directly upon the owners.

40,454. For what purposes do they fall upon the owners?—The cost of constructing the sewers is charged upon owners, and the old contagious diseases (animals) rate is imposed equally upon owners and occupiers; but, as a rule, the practice is to levy burgh rates upon occupiers.

Assessment of agricultural land in Scotland.

40,455. What deductions are made in burghs in respect of agricultural lands and other property?—They are assessed upon one-fourth of the value entered in the valuation roll. The exceptions made in the case of the principal burgh assessment to the rule of levying on gross value are that, within a burgh—"(1.) "All lands and premises used exclusively as a canal or "basin of a canal, or towing-path for the same, or as a "railway or tramway, constructed under the powers of "any Act of Parliament for public conveyance, ex"cepting the stations, depôts, and buildings—and all "bridges, frontages, and ferries not being private pro"perty; (2.) All the underground gas and water pipes, "or underground works of any gas or water company "or corporation; (3.) Salmon fishings, and all wood"land, arable, meadow, or pasture ground, or other "ground used for nurseries, market gardens, or for "agricultural purposes,"—are assessed upon one-fourth of the value entered in the valuation roll."

40,456. That is for all rates levied in the burgh by the burgh authorities?—No, that does not apply absolutely to all rates; it applies to what is known as the burgh police rate, which is by far the most important rate levied in burghs.

40,457. (*Mr. Little.*) Not to the poor rate?—No, it does not apply to the poor rate.

40,458. (*Mr. Dalton.*) Nor to the school board rate?—No.

40,459. What about the public health rate?—There is a similar rule in levying the public health rate in burghs under the Public Health Acts.

40,460. Then land in burghs in Scotland pays less to the urban rates than it does in England, because in England the borough rate is levied on lands at their full value?—Yes, I suppose so.

Assessment to land tax in Scotland.

40,461. On what valuation is the land tax levied?—The land tax in burghs is, as a rule, not apportioned among the owners and occupiers according to valuation as entered in the roll, but is assessed or "stented," to use an old Scotch word, upon them, following the ancient custom, according to an estimate of their income from heritage and trade made by a committee chosen by the burgh magistrates formerly known as "stent masters." Although the amount of the tax is trifling—only about 7,000*l.* among all the ancient

Mr. J. M. Dodds.
15 Feb. 1895.

burghs of Scotland—the mode in which it is assessed is considered a grievance, and so recently as 1894 a memorial was presented by the convention of royal burghs repeating a request which has been put forward at intervals since 1834 to the effect that real property, proportionately to its rental as fixed under the Valuation (Scotland) Acts, should within burghs be the sole basis of assessing the land tax.

40,462. But outside those ancient burghs does it go according to the valuation roll?—The land tax was fixed in the 17th century, and all burghs except the burghs which then existed are disregarded in the levy of the land tax.

40,463. But do you have a certain amount put upon each parish?—It was fixed, I believe, for what we call landward and burghal areas.

40,464. (*Viscount Cobham.*) You have just said that the land tax was fixed in the 17th century. Do you not mean the 18th?—I thought it was the 17th. The proportion of it for Scotland was fixed at the Union at the beginning of the 18th century.

40,465. (*Mr. Dalton.*) Was it fixed for each parish?—It was fixed for each burgh and for each county, and the amount of the county tax is apportioned according to an ancient valuation which was made in the 17th century.

Assessment to poor rate in Scotland.

40,466. What is the rule as to the poor rate?—The general rule in the case of poor rates, which include, as well as the poor rate proper, the school rate, the registration rate, and the burial ground rate, is that they are assessed half upon owners and half upon occupiers, and are levied not upon the gross valuation entered in the valuation roll, but upon a net value, based in every case upon the gross valuation, but allowing deductions, which may be varied for different kinds of lands and heritages according to the absolute discretion of the parochial boards.

40,467. Are there any exceptions to that rule?—The only exceptions are unimportant local usages, which now exist in 13 parishes only. In 46 parishes there are no compulsory poor rates.

40,468. What do you do in those 46 parishes? How do you meet the expense for the relief of the poor?—It is met by voluntary contributions on the part of the inhabitants.

40,469. (*Mr. Gilmour.*) Can you give me a rough idea what those parishes are where that is done?—In 1894 there were 46 such parishes in Scotland, of which 10 are in Forfar, 9 in Fife, 5 in Perth, 4 in Aberdeen, 4 in Argyll, 4 in Peebles, 3 in Lanark, 3 in Orkney, 1 in Ayr, 1 in Berwick, 1 in Caithness, and 1 in Stirling.

40,470. (*Mr. Dalton.*) Do they vary from year to year? If enough is not raised from voluntary subscriptions, is there the power to levy a poor rate?—By the Poor Law Act of 1845 they are empowered to adopt the system of compulsory assessment, but so far they have got on without it.

40,471. The present poor law is based upon an Act which was passed about the same time as the Act of Elizabeth in England, is it not?—Yes, an Act of 1579.

40,472. What was the system of compulsory poor rates under that Act?—That Act on which the present poor law is still based, authorised the imposition of an assessment upon "the whole inhabitants within the "parish according to the estimation of their substance "without exceptions of persons," and ordered that at the end "of the year the taxation and stent roll be always "made of new, for the alteration that may be through "death or by increase or diminution of men's goods "and substance."

40,473. Then the poor rate was not levied under that merely upon lands but according to the ability of the people?—That was the rule laid down, but until the middle of the 18th century, I believe there was no case in which a compulsory assessment was made for the poor.

40,474. Then it was a dead letter?—It was practically a dead letter.

40,475. And all the expenses were paid out of voluntary contributions?—Out of voluntary contributions or by means of a licensed begging system.

40,476. Since you have had compulsory poor rates, what alteration has there been?—Compulsory assessments for the support of the poor do not seem to have been adopted at all before the middle of the 18th century, and in the early part of the present century there was great variety of practice in the imposition of the rates. But the division between owner and occupier seems to have met with general commendation.

Mr. J. M. Dodds.
15 Feb. 1895.

40,477. Has the poor rate always been divided between the owner and the occupier since you have had compulsory poor rates?—That has been the general rule. The Commission on Scottish Municipal Corporation in 1835 recommended that the basis of assessments in burghs should be "the real rent of all heritable "subjects within the boundaries of the burghal jurisdiction (excepting such portion of land as may be "occupied for purposes entirely agricultural) one half "of the tax to be paid by the proprietor and the other "by the tenant." In 1844, the Scottish Poor Law Commission reported that as regards raising a poor rate "almost every burgh has some peculiar established "usage as to the mode of carrying the general law "into effect," and added that they were "not prepared "to recommend any alteration with regard to the mode "of imposing assesments."

40,478. Were most of the poor rates levied according to means and substance before 1845?—There was great variation, and I think possibly the most authoritative statement is that contained in the first report of the Board of Supervision:—"According to the "law of Scotland previous to August, 1845, the principle of rating on means and substance was recognised "in all assessments for the relief of the poor."

Rating on means and substance.

40,479. The rating of means and substance was practically an attempt to have a local income tax on all classes of property and incomes, was it not?—Certainly. "In the purely burghal parishes having no landward "district attached to them, which were few in number, "the law appears to have been that the assessment "should be laid on the whole inhabitants according "to the estimation of their means and substance in "terms of the statute, 1579, chapter 74, unless that rule "should have been superseded by a local Act or usage "in particular burghs. With the exception of the eight "or nine purely burghal parishes, the only mode of "assessment for the poor recognised by the law of "Scotland prior to August 1845 was that one half of "the burden was laid on the owners of lands and "heritages within the parish and the other half on "the whole inhabitants according to their means and "substance."

40,480. What difficulties were found in the levying of rates on the means and substance of the inhabitants; the system has been entirely discontinued now, I think?—It has been entirely discontinued. The last case in which it was applied, so far as I have been able to ascertain, was in the case of Greenock, where the system survived as recently as 1880. It was abandoned by the Greenock parochial board, because of the strong local feeling against it on account of the difficulty of obtaining correct information as to the real incomes of the ratepayers.

40,481. What was the practice if a man had property in several parishes and was also possessed of a considerable amount of personalty; to which parish would he contribute?—He could choose which parish he should be assessed in.

40,482. But he could not be assessed in more than one?—No.

40,483. Then if he were a man of great wealth he could choose a parish where there was a very small amount of rate, I suppose, and the only contribution he would make for his personalty would be for the rates of that parish?—I would imagine he could do so.

40,484. (*Viscount Cobham.*) He would select the parish in which he had most land probably?—Yes.

40,485. (*Mr. Dalton.*) The rating on means and substance was abolished about 1860 by Act of Parliament?—In 1861.

40,486. By general consent?—By general consent. In 1845 the Poor Law Act gave three alternatives for rating.

40,487. (*Mr. Lambert.*) By whom were those alternatives to be chosen?—They were to be chosen by the parochial board subject to the approval of the central authorising body, the Board of Supervision: "And be it "enacted, that when the parochial board of any parish "or combination shall have resolved to raise by assess"ment the funds requisite, such board shall, either at "the same meeting, or at an adjournment thereof, or

Mr. J. M. Dodds. 15 Feb. 1895.

"at a meeting to be called for the purpose, resolve as "to the manner in which the assessment is to be "imposed; and it shall be lawful for any such board "to resolve that one half of such assessment shall be "imposed upon the owners, and the other half upon "the tenants or occupants of all lands and heritages "within the parish or combination, rateably according "to the annual value of such lands and heritages."—then the rest of the section is now repealed.

40,488. There were three methods authorised?—Yes; the others are now all repealed, but I suppose I had better read them: "Or to resolve that one half of such "assessment shall be imposed upon the owners of all "lands and heritages within the parish or combination "according to the annual value of such lands and "heritages, and the other half upon the whole inhabi-"tants, according to their means and substance, other "than lands and heritages situated in Great Britain or "Ireland; or to resolve that such assessment shall be "imposed as an equal per-centage upon the annual "value of all lands and heritages within the parish or "combination, and upon the estimated annual income "of the whole inhabitants from means and substance "other than lands and heritages situated in Great "Britain or Ireland; and when the parochial board "shall have resolved on the manner in which the assess-"ment is to be imposed, such resolution shall be forthwith "reported to the board for approval; and if the manner "of assessment so resolved upon shall be approved by "the board of supervision the same shall be adopted "and acted upon in such parish or combination, and "shall not be altered or departed from without the "sanction of the board of supervision."

40,489. (*Mr. Dalton.*) Was not the result of that Act that the rating on means and substance very rapidly began to disappear?—It was. From 1845 to 1861 any Scottish parochial board had the choice of these three methods, so that whatever result followed was purely voluntary. In 1847 out of 558 assessed parishes, 431 levied poor rate on rental, and 71 on estimated means and substance. In 1860 of ont of 752 assessed parishes, 698 levied it on rental, and only 25 on means and substance. In 1861 an Actwas passed (without discussion in the House of Commons)——

40,490. It was fully discussed in the House of Lords, I think?—It was, and there were some very curious and interesting statements made. That Act abolished the power to rate according to estimated means andsubstance when the system had been introduced since 1845.

40,491. Then the result was that when it was left to the parochial boards to decide what system they would have, they practically, almost unanimously, abandon the old system of rating on means and substance, was not that so; they came down to 25, I understand, in 1860?—They abandoned the system.

40,492. They voluntarily abandoned the system of rating on means and substance?—Yes, because of the extreme difficulty of working it by the means at their disposal.

40,493. I think in the discussion in the House of Lords the Duke of Argyll said that every Scotch member was in favour of abolishing it?—I think that was so.

40,494. The Act by which it was abolished was brought in by a Scotch member, was it not?—Yes, Mr. Baxter, and it now stands as 24 & 25 Victoria, chapter 37.

Assessment to poor rate in Scotland.

40,495. Now you have substituted a different system of rating for the poor rate in lieu of means and substance?—Yes. A single method is now all but universally in use in the levy of poor rates. These rates are levied not upon the gross rental but upon a net rental, after certain deductions are made from the gross. The rule is that "in esti-"mating the annual value of lands and heritages" (for poor rate) "the same shall be taken to be the rent at "which, one year with another, such land and heri-"tages might in their actual state be reasonably "expected to let from year to year, under deduction "of the probable annual average cost of the repairs, "insurance, and other expenses, if any, necessary to "maintain such land and heritages in their actual "state, and all rates, taxes, and public charges payable "in respect of the same."

40,496. These deductions are made by the parochial board, are they not?—Yes, each parochial board has complete discretion as to the amount of the deductions.

Mr. J. M. Dodds. 15 Feb. 1895.

40,497. What are the usual deductions?—I find from the most complete returns available (which cover nearly the whole of Scotland) that the average deduction on dwelling-houses is about 16 per cent., on farms 11 per cent., on other assessable property 20 per cent. For Aberdeenshire the average figures are respectively 14, 10, and 14 per cent.; for Lanark, 19, 9, and 21; for Perth, 6, 7, and 13; for Renfrew, 25, 13, and 30; for Stirling, 13, 15, and 20; for Wigtown, 8, 10, and 17.

40,498. What are the deductions in the case of railways?—They vary from 25 to 35 per cent., as a general rule; there is no uniformity whatever.

40,499. There is no maximum or minimum fixed by Statute in any way?—There is not. So long ago as 1865 a Select Committee recommended that the figures for all parishes in each county and burgh should be fixed by the county and burghal authorities respectively; and they suggested 8 per cent. for land without houses, 10 per cent. for mines and quarries, 15 per cent. for land with houses, 20 per cent. for houses and buildings other than works and manufactories, and 30 per cent. for mills and works; but the recommendation has never been carried into effect.

40,500. In addition to those deductions you charge for the poor rate in certain parishes different classes of property in a different way, do you not?—Yes.

40,501. Could you give us some account of that?—The Poor Law Act of 1845, section 36, provides that "It "shall be lawful for the parochial board, with the "concurrence of the board of supervision" (now the "Local Government Board) "to determine and direct "that the lands and heritages may be divided into "two or more separate classes according to the pur-"poses for which such lands are used and occupied, "and to fix such rate of assessment upon the tenants "or occupiers of each class respectively as to such "boards may seem just and equitable." The board of supervision (now the Local Government Board) has no initiative in requiring classification, although its approval must be obtained to any particular classification introduced; and any parish may desert it without the concurrence of the board.

40,502. Then it is entirely left to the parochial board to settle whether they will have this system of classification or not?—Any particular system requires the approval of the central authority, but the central authority has no power to require any individual parochial board to adopt the system at all, and any parochial board may give up the system without the consent of the Central board being required.

40,503. Then in the cases where this system is in force, it is in force because the parochial board think it equitable?—Undoubtedly. I find that in 11 out of 17 Scotch burghs whose population is above 20,000 inhabitants, there are parishes the lands and heritages in which are classified. In a large burgh probably in most cases there is more than one parish, and each parish goes partly into the burgh, and partly into the county. As I have said in 11 out of 17 burghs with over 20,000 inhabitants, there is a classification of lands and heritages for poor rating in one or more of the parishes partly contained in the burgh, and in 10 out of 14 burghs with a population of between 10,000 and 20,000 there is also a classification.

40,504. Would those be the cases where the majority of the inhabitants were householders and not occupiers of land?—I think that would be the general rule in such cases. The return which was circulated I believe among the members of the Commission gives particulars of individual cases, and also contains an explanation of the principle.

40,505. What proportion of parishes in Scotland now have this system?—Out of nearly 900 parishes there are only 168 classified, of which 100 are partly burghal and partly landward.

40,506. I suppose if you have got a purely rural parish it does not make much difference whether you have this system or not?—No, I suppose that would also apply to a purely burghal parish.

40,507. (*Viscount Cobham.*) In all parishes that are partly urban and partly rural, should you say the system was in force?—No; not in all; I am afraid I could not say for certain how many such parishes there are in all.

40,508. (*Mr. Dalton.*) At any rate it would be in force in a very large number of parishes where it would be

Mr. J. M. Dodds. 15 Feb. 1895.

to the interest of the majority of inhabitants not to have it in force?—Certainly.

40,509. They have done it because they thought it was a fair and reasonable arrangement?—Yes.

40,510. And in all these classifications agricultural land is assessed at a lower value than other properties, I think?—That is the general system, usually at a quarter of the rate levied upon houses.

40,511. But the classification only applies to the rate payable by the occupier, not to the half of the rate payable by the owner?—It applies only to the occupiers' rates.

40,512. Therefore in those cases where you have it in force and the land is rated at a fourth only, practically something less than two-thirds of the rate fall upon the land, as compared with the whole of the rate which falls upon houses; and supposing you had a 3*s.* rate, the owner would pay 1*s.* 6*d.* and the farmer would pay 4½*d.*—that is to say, they would between them pay 1*s.* 10½*d.* out of that 3*s.* rate?—Yes.

40,513. There is a circular in this return which you have given us of the 10th December 1868, from the board of supervision; can you say whether that represents the present views of the board of supervision upon the subject?—The board of supervision, as you are no doubt aware, has been reconstituted under an Act of last Session, and they have been so busy in arranging for the election of parish councils that I imagine they have not had much time to consider this question; but, so far as we know here, there has been no change in the views of the board.

40,514. This circular has never been superseded by any later circular, has it?—No.

40,515. It expresses a very strong view as to the desirability of rating lands and farms on a reduced estimate?—It does.

40,516. Could you give the general effect of the circular?—Yes. The circular is contained in the Parliamentary Return to the House of Commons, No. 154, 1886. On page 25 of that return the following paragraph occurs:—"Assessment for the relief of the "poor was originally established on the equitable "principle, that everyone should contribute in propor- "tion to his income, and that principle has never been "abandoned. But as trade and commerce have "extended, and social relations have become more "complicated, it has been found difficult to ascertain "the amount of each man's income, and the inquisition "required to effect that object was unpopular. "Attempts were therefore made to devise the means of "maintaining the principle without the necessity of "having recourse to an inquisition into each man's "affairs. It was assumed that, as a general rule, men "occupied dwelling-houses at rents proportioned to "their income, and that an assessment on the annual "value of houses would therefore be approximately an "assessment proportionate to their means. A man "whose dwelling-house was of the annual value of 100*l.*, "would thus be required to contribute ten times as "much as the man who lived in a house worth only "10*l.* a year. It was found however, that this rough "and ready measure of men's means was very imperfect, "and that where lands and heritages were occupied for "different purposes, the income of the occupant varied "with reference to the purposes for which the lands "and heritages were occupied. A farmer who paid "100*l.* a year for his farm could not be supposed to have "an income equal to that of a man who paid a rent of "100*l.* a year for his dwelling-house; and if the "principle that every one should be required to con- "tribute in proportion to his income was not to be "lost sight of, it was obviously necessary that facilities "should be afforded for imposing different rates with "reference to the different amounts of means repre- "sented by the different kinds of occupancies." Accordingly, in the Act of 1845 it was provided (section 36), that it should be lawful to distinguish lands and heritages into two or more separate classes, according to the purposes for which such lands are used and occupied, and to fix such rate of assessment upon the tenants and occupants of each class respectively, as may seem just and equitable. It was thus made lawful to vary the rate with reference to the presumed income of the different classes of occupants. The Act of 1861, which abolished direct assessment on means and substance, has given increased importance to the equitable exercise of this power of classification. Occasions for the exercise of the power arise chiefly in the case of parishes partly urban and partly rural, and of rural parishes containing villages inhabited by a manufacturing population. Let it be supposed that in such a case the rate is to be assessed upon tenants and occupants of dwelling-houses, of tenements occupied as shops or for manufacturing purposes, and of lands occupied as purely agricultural subjects; then the Board have frequently approved of a classification assessing the occupants of dwelling-house at a full rate, or, say, 1*s.* in the £ of their rental, the occupants of agricultural subjects at one-fourth of the full rate, or 3*d.* per £, and the occupants of shops or manufacturing premises at a half of the full rate, or at some immediate rate. This has occasionally been complained of as unjust to the occupants of dwelling-houses, particularly where they happen to be working men whose income consists of the wages of their labour, and who, by the supposed classification, are apparently more heavily burdened than the tenants of agricultural subjects. It is easy to see, however, that the reverse is the case. "Thus "a farmer paying 100*l.* a year of rent in Scotland "is held by the Legislature, under the Income Tax "Acts, to have a taxable income of only 33*l.* 6*s.* 8*d.* "equal to one-third of his rent, yet at 3*d.* in the pound "he has to pay 25*s.* of poor rates; while the working "man, with an income of 39*l.*, living in a house the rent "of which is probably not more than 5*l.* per annum, "and assessed at 1*s.* in the pound, pays only 5*s.* per "annum of poor rates. The farmer, even if we suppose "his income to be equal to that of the working man, "would be paying five times as large an amount of poor "rates. Or take the case of a farmer paying a rent of "300*l.* a year whose income is held to be equal to one- "third of his rent, or 100*l.* a year, that is a fraction less "than three times the income of the working man "earning 13*s.* a week, and living in a house at a rent "of 5*l.* per annum; the farmer assessed at 3*d.* in the "pound, would pay 3*l.* 15*s.* of poor rates, while the "working man assessed at 1*s.* in the pound would pay "only 5*s.* The farmer with three times the amount of "income would pay 15 times the amount of poor "rates.".

40,517. Did those poor rates include rates for other purposes besides the relief of the poor?—The poor rates include the education rate and the other rates levied with them.

40,518. Those rates were subject to this classification?—Yes. They include the education rate, registration rate, and burial ground rate, as well as the poor rate proper.

40,519. This is an attempt to rate according to the ability of the different people in the parish without the inconveniences that arose under the old law, of assessing on means and substance?—I think that was the intention of the system.

40,520. Is it on the whole a popular system?—Where it has been adopted it appears to be popular.

40,521. You have no complaints of it?—No; I do not recollect any complainst of the system having reached our office. On the other hand, of course you can understand that it gives rise to difficulties, as between the ratepayers in the urban part of the parish and those in the country part. In some cases it has come to be at question of a majority of the parochial board representing one party or the other, and the system of classification has been adopted or rejected accordingly.

40,522. The property that you rate at a reduced estimate is not merely agricultural land, but the farm house connected with it?—Yes.

40,523. Among the agricultural subjects you would reckon farmhouses?—Yes, if the land and the farmhouses are in the same occupation.

40,524. Has it been proposed in Scotland, instead of leaving it to each parish voluntarily to do this, to have a proportion fixed by the statute?—There have often been such proposals made.

40,525. Would that not be better?—Select Committees have pronounced that it would be better. The Poor Law (Scotland) Select Committee of 1871 recommended that if lands and heritages were to continue alone to be taxed to the poor rate, the provisions with respect to the classification should be improved and extended by giving greater power to the board of supervision to require proper classification; and the Valuation (Scotland) Select Committee of 1890 recommended that the evil [arising from the great variety

Mr J. M. Dodds.
15 Feb. 1895.

of the existing classifications should be remedied, either by giving an initiative in altering classification to the board of supervision upon the representation of any ratepayer in a parish, or by providing for a statutory classification.

Parliamentary grants to Scotland.

40,526. Could you give us any information upon the Parliamentary Grants to Scotland?—For the year 1893–4 the amount of grants out of the Local Taxation (Scotland) Account was, from the probate and license duties, 593,517*l.*; and from the customs and excise duties, 149,430*l.*

40,527. Have you any other Parliamentary Grants?—Those are all.

40,528. You have the Education Grant?—Yes; in the Estimates there is the Education Vote; but a great part of the Local Taxation Grant goes to education.

40,529. (*Mr. Gilmour.*) It is part of that grant which goes to relieve school fees, is it not?—It is.

Valuation of urban and rural properties in Scotland.

40,530. (*Mr. Dalton.*) Can you say at all what the valuation of the urban and rural properties is in the whole of Scotland at the present time, and how it contrasts with that in the past?—In 1848 the urban valuation of Scotland was 3,000,000*l.* and the rural valuation was 7,236,000*l.*, the total valuation being 10,236,000*l.* In 1893 the urban valuation was 13,078,000*l.* and the rural valuation 11,102,000*l.*, the total valuation being 24,180,000*l.* Of course, the rural area has decreased, while the urban area has increased during the interval; there has been a constant formation of new burghs.

40,531. But the rural property appears to have increased very much in value in Scotland since 1848?—It has nearly doubled.

40,532. Has it fallen much of late years?—I think the highest year was 1885, and since then the rural valuation has fallen, I think, by about 1,000,000*l.*

Mr. J. M. Dodds.
15 Feb. 1895.

40,533. (*Mr. Little.*) You are speaking now of the gross valuation of the rural part?—Yes, the gross; I am speaking of the gross valuation of land.

40,534. (*Mr. Dalton.*) But there is a very considerable increase in the value of the land as compared with 1848?—It includes buildings in the rural parts of the country; by rural, I mean not contained within a burgh or a police burgh.

40,535. You have not got separate valuations of lands then; can you say whether agricultural land has gone up or down in value, and to what extent?—I can give you the per-centages. In the year 1848 the proportionate valuation of land alone was 54·1 per cent. of the whole, of buildings 33·5, and other property 12·4; in 1892 the lands were responsible for 26 per cent., buildings for 56·4 per cent., and other property for 17·6. So between 1848 and 1892 the proportionate valuation of land has gone down from 54 per cent. to 26 per cent. over all Scotland.

40,536. That is the proportion of the total valuation?—Yes.

40,537. (*Chairman.*) Can you give us the actual amount in pounds?—I am afraid I have not got the figures.

40,538. (*Mr. Lambert.*) Would the "buildings" include dwelling-houses and such like?—Yes.

40,539. (*Chairman.*) Perhaps you could add the total in pounds because it would be extremely important to know what is the actual valuation of land now as compared with the past?—Yes, I will try to get that. *The witness subsequently furnished the following statement:—*

STATEMENT, prepared by the Local Government Board for Scotland, showing the Valuation of Lands, Buildings, and other Property in Scotland in certain years from 1814–15 onwards, and the Per-centage borne by each class to the Total Valuation.

Year.	Lands.	Buildings.	Other Property.*	Total Valuation.	Per-centage of Various Classes.		
					Lands.	Buildings.	Other Property.
	£	£	£	£			
1814–15	5,079,540	1,368,662	203,443	6,651,645	76·4	20·6	3·0
1848–49	5,634,351	3,492,587	1,292,378	10,419,316	54·1	33·5	12·4
1856–57	5,932,156	4,358,398	1,704,319	11,994,873	49·5	36·3	14·2
1867–68	7,186,295	6,546,093	3,042,660	16,775,048	42·9	39·0	18·1
1875–76	7,505,178	9,396,788	3,340,095	20,242,061	37·1	46·4	16·5
1881–82†	7,648,589	11,992,164	3,048,253	22,689,006	33·7	52·9	13·4
1887–88	6,824,100	12,715,904	3,579,689	23,119,693	29·5	55·0	15·5
1892–93	6,291,119	13,642,508	4,246,856	24,180,483	26·0	56·4	17·6

* Includes Railways, Mines, Quarries, Ironworks, Gas Works, Water Works, Canals, Fishings, Shootings, &c., &c.

† *Note.*—The Annual Value of Lands reached the Maximum in 1879–80, when the Total Value assessed to the Income Tax amounted to 7,769,303*l.*

The figures relative to Lands and Buildings have been furnished by the Comptroller of Stamps and Taxes for Scotland, and show the Gross Valuation assessed for Income Tax purposes. The Total Valuation from 1849 onwards is taken from the Reports of the Board of Supervision, the difference between the Totals and the Amounts for Lands and Houses being placed under other Property.

40,540. Could you distinguish railways from other property?—The total valuation of all the subjects valued by the assessor of railways and canals is rather more than 2 millions, and the total valuation of the whole of Scotland is 24 millions, so that, roughly speaking, the valuation of railways and canals and other subjects valued by the assessor of railways is in the proportion of 2 millions to 22 millions, or one-eleventh.

40,541. (*Mr. Little.*) That 2 millions includes waterworks, does it not?—Yes. I find the total valuation of railways alone is about 1,800,000*l.*

40,542. (*Chairman.*) Has that increased very much during the last 20 years?—It is a very variable item, because it depends ultimately upon the amount of profits earned by the railway in the year preceding the valuation.

40,543. It varies in each year then?—It varies in each year. If the year preceding is a bad year it goes down, but if it has been a good year it goes up.

40,544. (*Viscount Cobham.*) Under which head do railways and canals come?—Under the head of "other property;" they do not fall under either "lands" or "buildings" in the proportionate figures I have just given.

Fluctuations in urban and rural rates in Scotland.

40,545. (*Mr. Dalton.*) Could you give us any information as to the rise or fall in urban or rural rates of late years in Scotland?—The average urban rates in 1848

Mr. J. M. Dodds. 15 Feb. 1895.

were 1s. 2d.; in 1867, 2s.; in 1881, 2s. 3d.; and in 1893, 2s. 7d.

40,546. Those would be purely urban rates, would they not?—Those are purely urban. That does not represent the whole of the burden upon the urban ratepayers, because it excludes parochial rates. The average county rates in the same years were, in 1848, 5d.; in 1867, 6d.; in 1881, 7d.; and in 1893, 11d.; and the parish rates were, in 1848, 1s.; in 1867, 1s. 1d.; in 1881, 1s. 2d.; and in 1893, 1s. 2d.

40,547. The only class of rates that have not gone up much are the parish rates?—Yes.

40,548. (*Mr. Gilmour.*) You have not taken into account the maintenance of roads in that, or do you put that among the county rates?—Yes, that comes in the 11d. The increased pressure of these rates is mainly due to the road-rate being now thrown upon the owners and occupiers, whereas in 1848, when the total county rate stood at 5d., roads were maintained by tolls.

40,549. (*Mr. Little.*) Those are the full amounts of rates, I suppose; they are not rates of that amount on both the owner and the occupier?—No, this is the full amount which has to be divided according to the statutes.

Area of parishes in Scotland.

40,550. (*Mr. Lambert.*) What are the sizes of the parishes in Scotland; are they fairly equal or are they not equal in population and area?—They vary very much. Looking over the local taxation returns, I notice one parish in Peebles-shire has a population of 187, and another parish in Lanarkshire, the Barony Parish, has about 310,000.

40,551. So there is no uniformity between them?—No.

40,552. (*Mr. Gilmour.*) The Barony Parish is really Glasgow, is it not?—That is, half of Glasgow.

40,553. (*Mr. Lambert.*) But I want to know something about the rural parishes, are they in acreage something alike?—No.

40,554. There is no uniformity?—There has been no uniformity, there has been no grouping according to population or acreage.

40,555. Has the parish with this small population of 187, its own board of guardians for poor law purposes?—There is no grouping of the parishes for the poor law in Scotland; it is an absolutely independent area for poor law administration.

40,556. (*Mr. Giffen.*) Are there not workhouses in Scotland which are used for several parishes at the same time?—Yes. Parishes may combine for the purposes of poor houses alone.

40,557. That is a kind of union?—So far.

40,558. (*Mr. Lambert.*) What is the general average size for the parishes in Scotland?—The total population of Scotland is as nearly as possible four millions, and there are about 880 parishes.

Assessment to poor rate in Scotland.

40,559. You said there was a great divergence of opinion in the different parishes as to whether there shall be this classification or not?—Yes. Of course there is a divergence of interest as between the country part of the parish and the burgh part, because according as a benefit is given to the country ratepayers the burgh ratepayers are proportionately higher rated.

40,560. There is frequently a collision between these different sections of the parish as to whether classification should be adopted or not?—I should not like to say frequently, but I have known of such cases.

40,561. There is collision?—There has been collision. I think that is the principal ground on which it has been advocated, that further powers should be given to the central authority of requiring parishes to classify lands and heritages for poor rate.

Poor law areas.

40,562. (*Mr. Long.*) There is one question which does not arise properly out of your evidence, but which arises out of a question put to you by Mr. Lambert, and which I should like to ask you if you are in a position to answer it. With regard to this poor law system in Scotland, has not each parish a separate poor law area for the maintenance of its own poor, the cost of which falls exclusively upon the parish?—Upon the parish.

40,563. But where they combine for the use of the workhouse, the cost of building and maintaining the workhouse falls, of course, upon the combined parishes?—Quite so.

Mr. J. M. Dodds. 15 Feb. 1895.

40,564. Can you tell us whether the cost of the paupers maintained in the workhouse is spread over the whole area composed of the combined parishes, or whether each parish pays a fixed sum for each pauper it sends to the workhouse?—My impression is that each parish is responsible for its own paupers alone, which, of course, comes to the same thing as paying a fixed sum for each pauper.

40,565. Only the establishment charges are spread over the whole area?—Yes, I believe so.

Assessors.

40,566. With regard to these assessors, to whom you referred earlier in your evidence, can you tell the Commission what sort of men they are, and from what classes they are selected, are they professional men?—The bulk of them are civil servants, because in most cases the assessor appointed is the Inland Revenue assessor.

40,567. I ought to have said that I meant in the cases where the assessor is not the government official. You mentioned two large counties, the county of Argyle was one, where the county authorities selected their own assessor?—Yes.

40,568. In that case what sort of men do they select, can you tell us?—I cannot tell on what grounds he is selected, I know in Argyle he is a man who is universally respected in the county, and whose opinion carries great weight.

40,569. I mean is he a professional man living in the county, or is he a man selected from anywhere and appointed *ad hoc*?—There is no statutory requirement that he should belong to any particular profession, so the appointing bodies are completely free in their selection, and I should imagine that they generally select some person with experience in valuing.

40,570. Is he called upon to devote his whole time to the work?—That I do not know. I think it varies between one county and another.

40,571. You do not know whether it would be possible for them to appoint a man acting as a valuer for private individuals in the county?—I believe it would be quite possible, but he cannot so act while he holds the office of assessor.

Procedure of local and official assessors.

40,572. Is there much variation in the practice adopted by the assessors who are selected by the county and that adopted by those who are civil servants; as I understand it, these assessors have the right of fixing the valuation for the whole county?—Yes.

40,573. And on that assessment depends the incidence both of local and of Imperial taxation?—Of Imperial taxation only if the assessor is an Imperial officer.

40,574. In the cases where the county official acts it only affects local rates?—Unless the Inland Revenue chooses to accept the valuation made by the local assessor.

40,575. It only by necessity affects the local rates?—Yes.

40,576. Is there any great variation in the procedure adopted by the two different kinds of assessors?—I do not know about the procedure. I believe the local assessor has statutory powers of getting at values which the Inland Revenue officer has not, and of course the local man has generally a large amount of local knowledge which is very useful to him. I could not say without seeing the actual figures whether the total value of lands and heritages in a county where a local assessor is employed varies very greatly between the levy of local rates and the levy of income tax.

40,577. Then in all probability if no facts of that kind have been brought to your notice it would be fair to presume that the system has produced uniformity of assessment throughout Scotland?—I think that is a perfectly fair conclusion. At the same time I remember it was given in the evidence before a Select Committee in 1888, that in one or two counties it had been found that the local valuation required to be raised considerably in several individual instances before the Imperial taxes were levied upon it.

40,578. But there is no power, where the assessor is a local assessor, to raise it for local purposes?—There is no power whatever, subject of course to the appeal.

40,579. There is no power held by the Government authority to raise it for any other purpose than Imperial taxation?—No.

40,580. Have you any information as to how these assessors proceed in cases where there have been very

Mr. J. M. Dodds.
15 Feb. 1895.

heavy falls in the value of agricultural land; have they in Scotland invariably followed the rental as the best indication of value?—The statutory provision is that: "Where such lands and heritages are *bonâ fide* let for a "yearly rent conditioned at the fair annual value there- "of . . . such rent shall be deemed and taken "to be the yearly rent or value of such lands and heri- "tages in terms of this Act." I am afraid I cannot speak with knowledge of the actual practice of the assessors, but I should imagine if property was let at so much per year for a term of years, the assessor would be bound to take that without consideration of any return of rent unless some formal agreement for a return were made.

40,581. Yes, but that would not quite apply to the cases I have in my mind in which the rents would only be annual rents liable to annual alteration?—If they were annual rents liable to annual alterations he would certainly be bound to take the actual rent.

Assessments to poor rate in Scotland.

40,582. I notice that in this Return—an extremely interesting Return which has been sent to the Commission and which was published in May 1886—the Poor Rates Assessment (Scotland) Return—that in all the counties, the classifications vary considerably in their number?—There is absolutely no guarantee of uniformity.

40,583. Take, for instance, the parish of Kirkintilloch on page 7, you will see the classes there are five, namely, banking houses, writers' offices, warehouses and dwelling-house, works, and lands; the rates are, "In Class II. to "be three-eighths less than the rate in Class I., the rate in "Class III. to be one-fifth less than the rate in Class II., "rate in Class IV. to be one-fourth less than rate in "Class III., and rate in Class V. to be eleven-eighteenths "less than rate in Class IV." That is the first I had noticed, but there are others still more remarkable. Then just above, take the parish of Dumbarton; there there are only three classes and the rate in Class I. is one-fourth of that in Class II., and two-thirds of the rate in Class III. Do you think that any considerable, either inconvenience in the collection of rates, or injustice to different classes of ratepayers has resulted from this great variation in classification and in incidence?—I am hardly prepared to give an opinion, but I think perhaps it may be well to remember that in each case the classification has been that which has commended itself to the parochial board of the parish and presumably——

40,584. It would be a fair inference that it was regarded as just?—That it was regarded as just, locally.

40,585. From that letter at the end of the return from the secretary of the board of supervision, it would appear that the practice, which has been adopted in Scotland for the purposes of rating, has been to differentiate between, not merely the different classes of property, but also between the positions of the property owners or occupiers, because I notice that in the last paragraph on page 25 it is pointed out that they have not taken merely the value of the house or land, but that they have estimated that value having regard to the probable income of the occupier?—I think the main object of classification is to proportion the amount of rates payable by any individual to what is at the bottom of the Scotch theory of rating generally, namely, his real ability to pay; and so far as that ability differs between one class of the community and another, the classification is supposed to be founded on the difference.

40,586. Is it regarded on the whole as satisfactory in Scotland, or are you aware of any desire to alter the system?—Of course it must be remembered that the system only applies to about 168 parishes out of nearly 900. In those parishes I think it would be considered a great hardship as a rule to depart from the classification. But the main criticism which has been made on the system, both in and out of Parliament, is that sufficient initiative is not given to the central authority to require a system of classification, and that too much initiative is left to the local boards.

40,587. To the local authorities?—Yes, to the parochial authorities.

40,588. Is there a suggestion that a Government official should be appointed and given greater powers of supervision and alteration?—It has not been put in that way quite. The suggestion made by Select Committees, both in 1871 and 1890, was that the central authority should have power both to initiate a classification and to refuse its consent to a classification being departed from.

Mr. J. M. Dodds.
15 Feb. 1895.

Assessment of railways in Scotland.

40,589. One question more. I want to ask you about the railway assessment. As I understand it, all the railways in Scotland are assessed by a railway assessor specially appointed?—Yes.

40,590. Do you know at all how the assessment in Scotland compares with the assessment of railways in England as regards the difference between the value placed upon railways and the value placed upon other classes of property?—That would be a question of proportion. I do not know the English figures.

40,591. You are not familiar with the English figures?—No. In Scotland, I think, I gave the figures.

40,592. Do the railway people themselves appear satified with their assessment in Scotland, or are there many appeals?—I do not think they are satisfied; I mean they would like to pay a great deal less.

40,593. That is the general disposition, I think, on the part of ratepayers?—Yes; but on the other hand the other ratepayers want them to pay a great deal more, as a rule.

40,594. Is there still an impression that the railways are not rated up to their full value?—I would not like to say that, but certainly it has been a mooted question for years whether the system would not be the better for a few alterations in detail. As regards the principle I think everybody is agreed that it is far better than the old system which allowed the railways to be valued locally.

40,595. (*Mr. Dalton.*) Was that the old system in Scotland?—It was the system prior to 1854 when the assessor of railways was first appointed. Before that they were valued locally.

40,596. (*Mr. Little.*) I suppose the classification is adopted chiefly in parishes where the property is of a mixed character?—That is undoubtedly the case.

Assessment to poor rate in Scotland.

40,597. And where it is agricultural, or almost entirely agricultural, classification is not required?—Yes. I think I gave the figures. Out of nearly 900 parishes only 168 are classified, of which 100 are partly urban and partly rural, the remaining 68 being either wholly urban or wholly rural.

40,598. When you say rural, you do not mean rural in the sense of the Census classification, do you?—No; I take it in the sense that neither a burgh nor what is known in Scotland as a police burgh is included in the area.

40,599. And this system of classification does attempt to keep up the old liability in some form on means and substance?—Undoubtedly.

40,600. Which the Scotch people did not abandon as the English people have done?—They did not abandon it in theory, I think.

40,601. I mean to say that in England the operation of the law was, until recently, suspended every year, but in Scotland it remained the law until very recently?—It remained one of the alternatives until 1861, and in theory it still remains.

40,602. When that method of rating on means and substance was practically abolished, an opportunity was given to those parishes where the property was of a mixed character, to differentiate between different kinds of property?—That is generally the case, but I should say that the power to classify has existed ever since 1845.

40,603. Then I will say that it was not finally abolished until a system had been instituted by which something like the same effect could be obtained?—Yes, for 15 years the two systems had been concurrent.

40,604. Do I understand that now the board of supervision has the power to alter or vary a proposal?—Not of its own initiative.

40,605. It had in the case of certain parishes?—In 1861, when the Act abolishing the means and substance rating was passed, some 25 parishes were required to classify their lands and heritages subject to the approval of the board of supervision, and those 25 parishes, and those alone, are unable to desert the classification system.

40,606. I suppose, if the assessor is an Inland Revenue assessor, he has access to Schedule A, and he can get at the rental from that?—Yes.

Mr. J. M. Dodds. 15 Feb. 1895.

40,607. But I think you said that the local assessor if not an Inland Revenue assessor, has some statutory power?—He has power to require returns.

Powers of local assessor.

40,608. From the owner?—From all the people concerned—fullest powers.

40,609. (*Mr. Giffen.*) Is it not the case that he is very strict in getting returns from every occupier?—I think so; he has full statutory power, subject to a penalty on refusal.

40,610. (*Mr. Little.*) I should like to ask you whether he has the power of getting it from the owner, because in England the responsibility of making the return is thrown on the occupier?—He has power to get it from both.

Schedule A.

40,611. I suppose that Schedule A. in Scotland is based almost entirely upon actual returns?—I cannot speak as to the practice, I fear.

40,612. I may say that in England, Schedule A. is based greatly upon the parish valuation, and I was wondering how a parish valuation could be based upon the Income Tax return, if the Income Tax return was based upon the valuation?—Where the Inland Revenue assessor is also the local assessor of course he has powers in both capacities.

Assessment of lands of occupying owner.

40,613. I do not think Mr. Dalton asked you how the cases where the owner is the occupier of the land were dealt with?—In such a case he pays the whole of the rates.

40,614. Yes, but for the valuation, how do you arrive at the rent?—In that case an estimate has to be made.

40,615. An actual valuation of the land?—Yes, an actual valuation.

40,616. (*Mr. Giffen.*) The owner has to make an estimate, has he not?—The owner will make it in the first instance.

40,617. He is obliged to make an estimate, is he not?—Yes; and of course the assessor will check it.

40,618. Do you know whether appeals frequently are made by owners, do you happen to know, where owners occupy their lands?—I do not happen to know.

40,619. (*Mr. Gilmour.*) They are very common, are they not?—They do not come within the cognisance of our Office; they are dealt with locally by the local valuation committees.

Water and drainage district areas.

40,620. There was one point which I do not think you have touched on, which I think is an important part of the Scotch rating, and I do not know whether you have it in England; that is, the power to form special water and drainage district areas for which there is special rating?—Full particulars about that are given in the local taxation returns for 1892–93 just issued. These returns give the rates payable in every parish in the whole of Scotland to the parochial board, to the county council, and to the town council or burgh commissioners, and in the last column of Part VII. of these returns all the special districts are mentioned with the rates payable in each.

Mr. J. M. Dodds. 15 Feb. 1895.

40,621. Is there any similar thing in England?—I believe so, but I cannot speak with certainty.

Effect of Parish Councils Act.

40,622. Has any idea reached the office in which you are as to the likelihood under the new Parish Councils Act of economy being brought to work in joining small parishes in Scotland?—There have been a large number of applications for alteration of parish boundaries, and the Secretary for Scotland has, I think, made 24 Orders for such alteration. I could not for the moment say how many of those are for a union of parishes, but there have been several especially in the case of Edinburgh, Aberdeen, Paisley, and Hawick, and in those cases the whole of a burgh has been placed within a single parish—subject to protest—the Orders having not become final yet.

40,623. (*Mr. Clay.*) Will this local government board take the place of the board of supervision?—Yes.

Constitution of board of supervision.

40,624. There is no other change?—The constitution of the board of course has altered, but the board has no new powers except the few which were given to it in the Act of last session.

40,625. The same powers are retained in the board, the same machinery, and are the same individuals retained on the board?—The present vice-president of the board, Mr. Skelton—to whom I am indebted for many of the figures which I have given you to-day—is one of the old officials, but the other members of the board are new.

40,626. (*Mr. Little.*) Do you remember some evidence which Sir George Cornwall Lewis gave, I think, before a Committee of the Lords on this subject of classification?—Yes.

40,627. He expressed a very decided opinion on the subject, did he not?—Yes, he was very much in favour of the system, if I remember rightly.

40,628. I have here a quotation from the report of the Lords' Committee: "Sir George Cornwall Lewis "said, in adopting this wording, you approach as "nearly as you can to the principle of an income tax "without going into the income of each individual." That was given in evidence in support of the system of classification then in force, was it not?—Yes, that was about 1850.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Seventy-sixth Day.

Thursday, 21st February 1895.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.	JOHN CLAY, Esq.
ROBERT GIFFEN, Esq., C.B.	CORNELIUS NEALE DALTON, Esq., C.B.
Captain OWEN THOMAS.	ROBERT LACEY EVERETT, Esq., M.P.
FRANCIS ALLSTON CHANNING, Esq., M.P.	JOHN GILMOUR, Esq.
	WILLIAM CUTLACK LITTLE, Esq.

HERBERT LYON, Esq., *Secretary.*

R. F. CRAWFORD, Esq., *Assistant Secretary.*

Mr J. Howson 21 Feb. 1895.

Mr. JOHN HOWSON called and examined.

Mr. J. Howson. 21 Feb. 1895.

40,629. (*Sir Nigel Kingscote.*) You are a land agent at Blackburn in Lancashire, I believe?—Yes.

40,630. And have been so for some time?—About 25 years.

40,631. Were you, and are you, agent for the trustees of the late Daniel Thwaites of Blackburn?—Yes, I am.

Particulars of estates under witness's management.

40,632. What acreage do those estates comprise?—About 8,227; from about 2,747 in Lancashire, 3,086 in Scotland, 2,394 in Leicestershire.

40,633. What are the sizes of the holdings on the Lancashire estate generally?—From 160 acres down to about 20 acres.

Mr. J. Howson.
21 Feb. 1895.

40,634. Are they chiefly dairy or arable farms?—They are all dairy farms without exception.

40,635. The estate in Scotland comprises, how many acres did you say?—3,086.

40,636. Is that divided into large or small holdings?—They are rather large farms.

40,637. Of about 400 acres?—400 acres and less—downwards.

40,638. Then as to the estate in Leicestershire in what neighbourhood is that?—It is near Melton Mowbray.

40,639. What number of acres does that consist of?—2,391.

40,640. What is the size of the holdings there?—From 650 acres down to a few acres taking the small ones in.

40,641. Down to about 20 acres?—Yes, taking the very small holdings in; but they are principally large holdings there.

40,642. Are they arable or grazing farms?—They are about one-third arable.

40,643. However, you are chiefly cognisant of the district which is covered by the Blackburn, and District Farmers' Association, are you not?—Yes, I am.

40,644. I had better ask you this at once; I believe you have asked to be examined here, having seen the evidence of Mr. J. Kay?—Yes.

Farms in the Blackburn district.

40,645. Who gave evidence about a district, in a part of which you are an agent?—Yes.

40,646. As I understand it, you know the district very well?—Yes, very well indeed.

40,647. Are the farms in that district let on leases or not as a rule?—On yearly tenancies invariably.

40,648. What are the tenants of these farms chiefly, are they working tenants?—They are small working tenants; they work, both themselves, and their families.

40,649. I think you said they were chiefly engaged in milk and butter production?—They are all milk and butter farms.

40,650. Do they make cheese?—No, nothing but milk and butter, and they barter the productions themselves in the large adjoining towns; they retail it, as you will understand.

Relations between landlords and tenants.

40,651. What is your experience of the relationship which subsists between the tenants and the landlords and the agents in that district?—It has always been of the very best.

40,652. Have there been many changes of tenancy in that district?—No, not to my knowledge.

Tenants' capital.

40,653. Do you know of any case in which the rent has been raised upon a sitting tenant?—Not in a single case on our estate, not one; neither has it been raised for improvements.

40,654. Do the tenants there lay out their own money upon the land?—Nothing whatever; they have not the money to lay out; it is as much as they can do to find stock for their own farms.

40,655. (*Mr. Channing.*) Is that because they have not capital to start with?—No, not to start with.

40,656. (*Captain Owen Thomas.*) Are there not men with capital ready to take the farms?—No. You see they are in the hands of small farmers, and they sell their own milk and butter. There are no large farms. The largest farm of 160 acres, is, at the present time, split into two; it has been taken as one farm, and it has usually been farmed as one farm, but it is now split into two.

40,657. (*Sir Nigel Kingscote*) What capital is required for 160 acres?—About 2,000*l.* the way they work; but I do not think that they will have that amount of capital.

Landlords' improvements.

40,658. You distinctly state that the tenants there do not make improvements of their own?—None whatever.

40,659. And do not drain?—No, never.

40,660. Do the landlords drain or lay out money on improvements?—Yes, very considerably. I should very much like to give you a statement of what we have laid out on our estate.

40,661. If you can do so shortly, we shall be glad to hear you; but we do not wish to go into too great *minutiæ*; I presume you are going to speak of this estate in Lancashire of 2,747 acres?—Yes. The purely agricultural portion cost 282,052*l.* originally. There has been spent upon it in permanent improvements within the last 20 years the sum of 44,227*l.*, making the total cost up to 326,279*l.* The expenditure in capital money was made spontaneously and continuously by the landowners, and in the case of sitting tenants invariably without increase of rent, and not as stated by Mr. Kay in answer to Question 14,009 "recently and in place of reducing rents." I desire also to put before you the facts relative to the income from this estate, and its expenditure, over a series of years both in the time of the late owner and since it came under the management of the trustees, and to show the rate of interest which the owners are compelled to take on the capital spent in purchasing and improving the land. This I do not put forward as an isolated case, but as the case of most landlords in the district of the Blackburn Farmers' Association, but, of course, in varying degrees. The present yearly rental is 6,212*l.*, showing an average return of 1*l.* 18*s.* 1*d.* per cent. on 326,280*l.* without allowing anything for management. The average letting value of this land is 2*l.* 5*s.* 3*d.* an acre. There is upon this estate accommodation for housing 1,588 milking cows, 50 young cattle, and 229 horses, which is equal to one head for every 1a. 1r. 35p. of land; and in addition there is accommodation for 363 pigs at the least; there is more, there is a fourth more than that, but I give that as the least. The last time I counted the stock upon the estate in 1890, I found 1,516 cows and 187 horses, equal to one head for every 1a. 2r. 18p. in addition to numerous sheep and pigs and young cattle. The stock then on the land was less by 164 than the housing accommodation.

Mr. J. Howson.
21 Feb. 1895.

40,662. That is an estate upon which you know the expenditure of every farthing?—Of every farthing expended by myself.

40,663. Should you say that the neighbouring estates were worked very much in the same way?—Pretty much in the same way, from my observation of them.

40,664. That the landlords make the improvements and have laid out a considerable sum of money upon them?—They have, and they are always willing to accommodate any sitting tenant, and that without increase of rent. The furthest we ever got out of them was a little carting, or hauling of a few tiles or a little bit of lime, or a little bit of materials for improvements.

Reply to Mr. Kay's evidence, Question 14,004. Second Report of Evidence.

40,665. You have Mr. Kay's evidence there; will you turn to Question 14,004; was the farm that he mentions in that question under your jurisdiction?—No, it was not under me, but I know the farm very well indeed. He says, in reply to a previous question, that he has absolutely found it necessary to supersede the Government draining; that was a portion of the same estate which he is there complaining about as being undrained.

40,666. Was that an estate in the hands of mortgagees or in the hands of landlords?—It was in the hands of mortgagees, but it is a very exceptional affair altogether. It was a case of this sort: the gentleman was a manufacturer, and purchased this estate, and at the time he purchased it he mortgaged it. After that time agricultural land depreciated very much, and his business fell off. Therefore, he was really insolvent almost from the time of buying the estate; still, he did borrow a lot of money from Government for draining, and, as I say, the piece of land that Mr. Kay said he superseded the draining of by the Government, was a piece drained by this same landlord.

40,667. Did you, as a matter of fact, upon the farm held by Mr. Kay, as agent for the landlord give him notice to quit?—Yes.

40,668. Under what circumstances?—Owing to the slovenly condition in which he was farming. If you will allow me, I will give you the evidence of his own writing, and everything else.

40,669. I see, on reading that question and answer again, that Mr. Kay does not make any mention of anybody's name; as far as you are aware, did it refer to yourself or not?—It certainly does refer to our farm.

40,670. (*Mr. Channing.*) And to Mr. Kay?—Decidedly. I have his agreement here, and I have his letters here, and you can see them all. In his agreement the Agricultural Holdings Act of 1875 is referred to as not applying to the tenancy, but that is of course repealed by the Act of 1883, and this agreement was in use long before that time; it was in use ever since Mr. Thwaites bought this estate in 1877.

40,671. (*Sir Nigel Kingscote.*) The same agreement was then in existence?—Certainly it was. It was then printed; they are all printed agreements.

40,672. (*Mr. Channing.*) When was it signed?—It would be signed on March 6th, 1889.

Mr. J. Howson.
21 Feb. 1895.

40,673. (*Sir Nigel Kingscote.*) When was it you gave him notice?—In 1891, I think.

40,674. (*Mr. Channing.*) I understand Mr. Kay held several farms?—No.

40,675. We understood more than two?—No, two.

40,676. I thought three or four?—Two only.

40,677. (*Sir Nigel Kingscote.*) Does this agreement you have handed to us refer to both those farms or only to one of them?—I have the other agreement here.

40,678. Is that of a different date, with different covenants?—It is the year preceding, 1888. They have exactly the same covenants, with this exception: in the first lease he is under a six months' notice to quit, in the second lease he is under 12 months' notice to quit; therefore, under orders, I gave him 12 months' notice for both, as the same thing applied to both farms, namely, the slovenly nature in which he was keeping the places. It is a thing unknown to disturb a tenant without just cause, and it would be against the best interest of the landlord to do so. The tenants frequently go on for years, and are succeeded by their descendants or relatives. I have cases where more than five relations have succeeded each other on our farms, and without any alteration of the rents as well. I quote from a letter before me, written by a tenant farmer then upon the estate, on the 13th February 1891, in which he says, "It redounded greatly to Mr. Thwaites' "credit that he never in his life found it necessary to "notice a tenant." I have the letter here. No landlord does such a thing as to capriciously disturb his tenants, and I may say it is quite unknown in my experience. I am well acquainted with the circumstances relating to the case mentioned by the witness in reply to Question 14,064. It occurred upon this estate. The tenant held two farms; he entered upon one farm, which was the Home Farm in the Park, within 200 yards of Woodfold House, where the tenant for life is now residing, under an agreement dated 3rd April 1888, as from the 2nd February previously. It contained 160 acres, and had accommodation for housing about 60 head of cattle. It is a dairy farm, and the rent was 315*l.* a year. The landlord had had it in hand improving it for three or four years, and it was, at the time of letting, in a good state of cultivation, the landlord having spent upon it, in the four years immediately preceding, 976*l.* 19*s.*; and he agreed with the tenant to erect additional shippons, as the farm would then carry more cattle than could be housed, raising the housing accommodation to 90 head of cattle, or equal to one head for every 1a. 3r. 4p. of land, (which was still under the average of the provision for the whole estate, and 18 per cent. below the average kept upon the whole estate, and the rent was 20 per cent. below the average); and to allow from the rent 20*l.* a year towards manure for the farm. During the four years that tenant remained upon the farm the landlord spent upon improving the place a further 516*l.* 15*s.* 10*d.*, and in manure for it 148*l.* 5*s.* 6*d.*, leaving the rent receivable 594*l.* 18*s.*, or an average of less than 150*l.* a year for the owner to live upon. In March 1889 the same tenant also took an adjoining farm containing about 42 acres, statute measure, at a yearly rent of 78*l.*

40,679. Is that the same man?—It is the same man, but it is an adjoining farm. The landlord agreed to allow the tenant for six years the sums of 18*l.*, 15*l.*, 12*l.*, and 10*l.* a year for the three last years for manure to spread upon the pastures. His rent was 40 per cent. less than the average.

40,680. (*Mr. Channing.*) Is that the average on the estate or in the neighbourhood?—It is the average on the estate. In the three years the tenant was upon the farm the landlord spent 135*l.* 17*s.* in addition to putting his fences into repair leaving the net average rent received less than 33*l.* a year. He had not been long upon the farms before I had occasion to complain of the way in which he was managing them, and I had on many subsequent occasions to complain, and on one occasion he wrote me: "I must have a more presentable lot of men "about me and have the place kept more respectable." I have his letter here with that in.

40,681. What meaning do you attach to those words?—His complaint is, according to this evidence before me, that we gave him notice through a rabbit trouble.

40,682. What do those words mean: "I must have a "more presentable lot of men about me"?—I had previously had to complain very often about the slovenly dirty state in which he kept his farms.

40,683. In what way did you complain, in letters to him?—Personally to him, then he wrote me this letter saying that he has changed his men, and that he must have a more respectable set of men about him and keep the place in better order. The farm was deteriorating in his hands, and his method of farming set a bad example to the other tenantry; and we had no alternative but to give him notice. With respect to the smaller farm he was entitled under the terms of his agreement to 12 months' notice, under the terms of the agreement for the larger farm he was entitled to only six months' notice, the landlord therefore gave a 12 months' notice for both shortly before the usual notice day, 2nd February 1891. On the 18th February 1891 I went over the farms with the agent for some of the largest estates in the district, and he reported upon the state of the buildings in writing, which report I have before me. He says:—"The shippons were "dirty, and young stock were turned loose in some of "them, standing in manure a foot or more in depth. "Many window panes were broken. All the ventilators "nailed up, and the manure tanks were full and the "liquid was backing up into the shippons. The fences do "not seem to have been trimmed during his tenancy. "No painting has been done to the buildings. Perhaps "100 or more sheep were grazing upon the pastures con-"trary to the conditions of the lease, and one dead sheep "lay in the pasture next the farm buildings."

Mr. J. Howson.
21 Feb. 1895.

40,684. I want to ask you whether it is not the case that in the lease signed by Mr. Kay the printed clause prohibiting him from keeping sheep was struck out with your approval?—No, it is not struck out at all.

40,685. I have a copy of it here (*handing a document to the witness*)?—No, it is not struck out at all. That is not my agreement. That was a disused lease altogether, and it was not in operation at all. To tell you the truth, we really do not prohibit them keeping sheep further than to this extent: we say, if you keep sheep you must keep your adjoining fences good, so that you shall not trespass on your neighbour. That is the only prohibition we have, and in fact they nearly all keep sheep.

40,686. (*Captain Owen Thomas.*) You prohibit them from keeping fowls?—No we do not; that is just under the same conditions.

40,687. You have got it down?—That is true enough, but they are merely saving clauses. The farmers are now keeping up to 200 head of poultry. It is merely a saving clause in this way; that if they are doing damage we say then, you promised not to do it.

40,688. (*Sir Nigel Kingscote.*) Will you go on with your story, please?—Yes. "The manure yard is partly filled "with manure, not cast up in a heap but all over the "place, and the pump in the house is not in working "order." With respect to the smaller farm the same gentleman reported: "This farm does not appear to be "stocked with anything but a few sheep. There are only "about six loads of manure in the pit, and that is old."

40,689. That is the reason you gave him notice?—Yes. "The shippons do not appear to have been used for a long "time. The stable is converted into a poultry house, and "the farmhouse is sublet to a cottager, and the meadows "have been pastured." That was the state of affairs that the agent for the trustees had frequently complained of, and which led to the notice being given; and in a letter to the tenant dated 3rd February 1891, I said to him——

40,690. Then you gave him notice, did you?—Yes.

40,691. I do not think you need read this letter to him; it seems rather a long one?—It is not a long one, I said to him, "I am rather surprised to find that you have to "search for a cause for the notices received, as I have so "often had occasion to complain both to you and your "servants of the slovenly way in which your holdings are "kept; and as there has been no improvement I was "obliged in self-defence to name the matter to Mr. "Yerburgh, as I found others of our tenantry gradually "sinking to your level. We, therefore, came to the con-"clusion that rather than submit to that we had better "relieve you of the farms, even if we took them in hand "again. I can assure you that it is no pleasure to me to "be obliged to act as I have had to do, and had you not "asked for an explanation I would much rather have left "the matter as it originally stood, namely, a notice with-"out comment."

40,692. You also found at the same time that the land in your opinion was very much understocked?—It was very much understocked.

40,693. (*Mr. Channing.*) Is it the fact that there was a larger head of stock kept upon it after Mr. Kay took the farm?—No. We always had a large head; and when he had an extra quantity of cattle on they were merely

Mr. J. Howson,

21 Feb. 1895.

Reply to Mr. Kay's evidence. Question 14,057-8, Second Report of Evidence.

brought off the smaller farm on to the larger farm; the smaller farm was shockingly neglected.

40,694. (*Sir Nigel Kingscote.*) I am now going to ask you in reference to Mr. Kay's answers to Questions 14,057 and 14,058, in which the Ground Game Act is alluded to and in which certain clauses are quoted; were those clauses issued by you or by anybody connected with you?—We have nothing like those in ours. I will read you the two clauses we have They are very short clauses indeed. No. 3 is one "also is reserved for the landlord "all game, rabbits, fish, and wild fowl, and full power at "his discretion to preserve the same, and also is reserved "for him, and all authorised by him, free liberty of "shooting, hunting, fishing, and sporting upon the "demised premises at all times."

40,695. Then that long clause in the answer to Question 14,058 was not issued by you or anybody connected with you, or with the estate which you look after?—No, and I have never heard of such a thing before on any estate.

40,696. (*Mr. Channing.*) But your own clause reserves to the landlord contrary to law the whole property in the rabbits on the estate?—No, not contrary to law—merely a joint user of them.

40,697. You say nothing about the Ground Game Act?—No, but still it is in that condition.

40,698. (*Captain Owen Thomas.*) Are the tenants allowed to kill the rabbits?—Yes.

40,699. (*Sir Nigel Kingscote.*) What eventually happened; did Mr. Kay leave his farm?—Yes, he did.

40,700. Had you any difficulty in letting it?—No, no more than any other.

40,701. As a matter of fact in the neighbourhood are there farms to let, or are they taken up when vacancies occur?—I have no trouble in letting farms and I do not hear of any one else who has.

40,702. Not in that district?—No, and not in the district of the Farmers' Association; I do not hear anything of it.

40,703. Referring to Question 14,063 in the answer to which it is stated that a memorial was presented by the landlord, did you receive that memorial?—I did not, Mr. Yerburgh did.

40,704. Did you see the memorial?—I saw the memorial later on.

40,705. (*Mr. Channing.*) At what date did you see it?—I think he forwarded it to me on the 31st of the month that it was sent in.

40,706. You had not seen it before then?—Not at all.

40,707. Had you any information as to who had drawn it up?—Not the slightest; I was in Leicestershire at the time when it was forwarded to me.

40,708. (*Sir Nigel Kingscote.*) Did you reply to that memorial on behalf of Mr. Yerburgh, or did Mr. Yerburgh reply to it himself?—Mr. Yerburgh replied himself; I have his letters here.

40,709. (*Mr. Channing.*) Was Mr. Yerburgh resident at Woodfold at the time?—Not at Woodfold, but at an adjoining place, Billinge Scarr.

40,710. He was in the neighbourhood?—Yes, close to it.

40,711. (*Sir Nigel Kingscote.*) As I understand he does not live upon the place?—Yes, he does, within 200 yards of it; in fact, the mansion is on the very farm that Mr. Kay spoke of. The memorial is correctly set out in Question 14,063, with the exception that Mr. Kay says it was signed by 45 out of 55 tenants; it is 45 out of 94 tenants. It was received by the landlord on the 30th January 1891. On the same day the landlord replied, saying, "I have on "various occasions expressed my intention of keeping "rabbits down upon land not in my own hands; orders "have been given by me to that effect. The tenants may "rely upon their being carried out." On the 31st—I have all these letters before me if you like to see them—he wrote again in reply to a further letter: "With regard to "my position upon the rabbit question I was under the "impression it was thoroughly understood by the tenantry. "In the summer my agent told me the farmers were com-"plaining. I at once gave orders that they should be "killed down. Since then I have stated upon various "occasions that it was my intention to kill down rabbits "upon any ground that is not in my own hands. I have "given orders to this effect and shall take care that they "are carried out."

40,712. Did you receive any communications from the tenants at that time about the rabbits yourself. I only want you to speak about yourself?—Not the slightest. This is Mr. Yerburgh's letter. "Since the summer I have "repeatedly been at Blackburn, and no complaints as to "rabbits has reached me there. The memorial which you "in common with the other tenants signed and forwarded "was, therefore, altogether a surprise. I am glad, how-"ever, that it was set on foot, as it has given me the "opportunity of expressing my views on the rabbit ques-"tion beyond possibility of mistake. Each farmer whose "name appears upon it had only to apply to my agent, "and the rabbits would at once have been destroyed." On the 2nd February the tenant who forwarded the memorial wrote in reply: "No doubt you are surprised "that having been at Blackburn only a week ago"——

Mr. J. Howson.

21 Feb. 1895.

40,713. I do not think we want to go into all this; what was the upshot; was the memorial again presented or were any letters from the tenants received by you or Mr. Yerburgh?—Yes, these are all letters from the one tenant.

40,714. We do not want them all?—I thought, perhaps, it would show you how Mr. Yerburgh had answered.

40,715. He answered that he had given orders for the rabbits to be killed. Very well. What happened a little bit afterwards; let us get to February or whatever month it was when they wrote again; did you receive any notices from any of the tenants on this estate?—Yes.

40,716. When was that?—The very next thing I was going to was a resolution which they sent in.

40,717. Very well, let us get to the memorial?—He says, "I have placed your reply to the memorial of the "tenantry before a meeting convened for the purpose "yesterday, and I am sorry to inform you it was con-"sidered unsatisfactory, and the following resolution was "passed."

40,718. Was this written or spoken?—It was written; and all the letters are here.

40,719. All right, go on?—"That two tenants having "received notice to quit, and as such notices are sup-"posed to have been sent in consequence of a memorial "signed by 45 tenants asking for the application of the "Ground Game Act, and such memorial having been "refused: It is hereby resolved by this meeting consist-"ing of 17 representative tenants whose aggregate rental "is 2,036*l.* per annum, that the whole of those present "forthwith send in their notices which shall continue in "force until and unless the whole are withdrawn together "with the two in question, and that the memorial referred "to with the reply of R. A. Yerburgh, Esq., M.P., be "published."

40,720. Who wrote that—Mr. Kay?—Yes, Mr. Kay. The 17 tenants sent in their notices before the usual notice day. I, as agent, then wrote to each to ask them whether they intended to hold to their notices, and if so to send me legal notices. I received no replies and not a single notice was given, and not a single tenant left.

40,721. Was that all you heard of it; was that the end of it?—Yes, that is the end of it. It is clearly a case of one tenant trying to work the others to go with him.

40,722. Notices were never sent in?—Notices were never sent in, and not a single tenant left.

40,723. (*Mr. Channing.*) As a matter of fact, were any steps taken to get the rabbits down at this time, or shortly after?—No, just the same as usual. The fact is, there is no trouble with the rabbits. We have only five farms that possibly could be troubled with rabbits. There are half of our farms that you could not find a single rabbit on, give them what you would. There might be five or six farms near the woods in the park, these are all in the park ground surrounded by a wall, and they really cannot help having a few there.

40,724. (*Mr. Little.*) Do you say the tenants sent in notices then, and then afterwards —— ?—Rescinded them; allowed them to slide.

40,725. They were informal notices then?—Mr. Kay got 17 of them to sign a sort of round robin to Mr. Yerburgh, and to give their notices in.

40,726. (*Mr. Channing.*) Did they actually sign any notices?—Yes, I have it here; everyone signed at the foot.

40,727. I thought you said that not a single notice was sent in?—Yes.

40,728. (*Sir Nigel Kingscote.*) Did you at any time receive any notices from the tenants?—This memorial was signed at the foot by 17.

Mr. J. Howson.
21 Feb. 1895.

40,729. (*Mr. Channing.*) That is not a notice?—That is what I told you; I had not a formal notice from them.

40,730. (*Sir Nigel Kingscote.*) When you received that memorial you wrote to them and said you required formal notices?—Yes.

40,731. And you never received a single notice?—Not a single one. It is clearly a case of one man trying to work the others, because he was obliged to move from his farm.

The letting of farms.

40,732. (*Captain Owen Thomas.*) How do you let your farms, by tender or otherwise?—Never by tender; we would not accept a tender.

40,733. How do you let them?—We do not even publish a farm in the newspaper. The surrounding country knows a certain farmer has given a notice and they apply. I have never had occasion to publish one farm as being to let.

Clauses in agreements.

40,734. Do you fully approve of the clauses of this agreement?—We find them to act very well indeed, and I have never had a single complaint about them, with the exception of Mr. Kay's which is before you.

40,735. Have you read and studied other agreements?—Yes; I have seen the agreements of General Fielding, who is the next large landowner; of Petres; of Sir Charles, now Sir James De Haughton; in fact, I know all the agreements round about and they are pretty similar. We may have a few clauses in there that seem stringent, but they are really not stringent clauses. We never act on them. We say, for instance, they shall pay all rates and taxes, but we do not insist on that. We pay the land tax and we pay tithes, although I put myself in the position that I may claim my tithes from the tenants. Mr. Yerburgh said, "No, it is the law that we pay the tithes, and let us pay the tithes." I have done so. Then in mole-catching we pay everything. In regard to mole-catching we never charge them a halfpenny for it.

40,736. Then why do you put all these things down?—They are things of this sort you understand; they are things that help us to rule the estate better. An unruly tenant says, "I will not;" "I set you at defiance." The reply is, "You know what you signed for"; that is all they are for, they are never used.

40,737. If you were going to take a farm on your own estate, or on any other estate, would you not look on this agreement as a very extraordinary one?—No, it is the custom of the country, and in Leicestershire it is pretty much the same. I have the Leicestershire agreements here. It is pretty much the same also in Scotland, allowing for the different user of the farms; it is pretty much the same all over.

Tenants of long standing.

40,738. I think you said you have many tenants whose families have been on the estate for generations?—Yes.

40,739. For five, or six, or seven generations?—At the present time, I have two applications, and they are both granted, from two sons following their father; one a son of the very man who is stated in this evidence to have got notice through the Ground Game Act. That was merely because he would not cut his fence at the time. As soon as ever he agreed to cut his fence I withdrew the notice, and now his son is following him on the same farm. I have another case where the father is retiring from business and the son is following him.

40,740. Are these men whose families have been on the estate for generations, and who are farming now, good farmers, and practical men?—Yes, I consider the farms are well let.

40,741. And well farmed?—Yes; I have no complaints whatever of any of the farms with the exception of the one farm of Mr. Kay, which was slovenly worked.

40,742. I think you also said that your tenants have no money with which to make improvements?—They have not.

40,743. Then, again, you say they have been farming for generations on the estate?—Yes.

Results of farming.

40,744. Yet they have not been able to save anything?—No.

40,745. How is that?—It is the same with everything else; every other business round about, I am afraid you will find has not much money, turn to what business you will.

40,746. I know some farmers who farm 200, or 300, or 400 acres. I know a good many in my part of the country who really were able to save thousands of pounds, 20 or 30 years ago?—I have not come across them; I have not indeed.

40,747. You say all these men are practical farmers, good men all round?—Yes; and understand they are small farmers everyone of them.

Mr. J. Howson.
21 Feb. 1895.

40,748. (*Sir Nigel Kingscote.*) You have called them hard-working practical farmers?—Yes.

40,749. (*Captain Owen Thomas.*) Yet they are unable to make the business pay?—They bring up their families well and start them in business, and they cannot both save money and start each of their children in business; they do the latter constantly.

40,750. Do you think a man of capital would ever take a farm with such a lease as yours?—They do.

40,751. I think you told us that you cannot get men with capital to take these farms?—No, I did not; I say I cannot find men with capital; I did not say I cannot get them.

40,752. Do you not think this agreement has something to do with it?—No, not the slightest.

Sporting rights.

40,753. Do you think a man of capital would take a farm from you and be expected to look after the game and fish when he is not allowed any opportunity or anything else on the farm; do you think that would be an inducement for a man to take a farm?—The days of sporting farmers are over; I could not find a sporting farmer, go where I would.

40,754. (*Mr. Channing.*) Just to pursue that point for a moment I see that in the 16th section of the lease with Mr. Kay, there are these words:—"the tenant shall not hunt or sport," or anything of that kind "without the landlord's written consent." Another passage referring to it is the one I have asked you about before. I asked you whether you consider it legal to reserve to the landlord the whole of the property in the rabbits on the farm, and you expressed your opinion that it was legal?—No, he really has not the whole of it.

40,755. But these are the words of your lease?—It may appear so, but really we have not the whole of the game. The tenant has a right along with us to take his rabbits, but if we did not put a clause in to that effect it would simply be this, that we should let the game along with the farm to the tenant to the exclusion of the landowner. The landowner could not take the game at all, unless I had a saving clause in about it.

40,756. Why do you not revise your agreements so as to be consistent with the Ground Game Act; this clause distinctly excludes the Ground Game Act; why do you not revise your leases so as to be consistent with the law of the land?—Perhaps it would have been better if I had done so, only it is an old lease, and it has just gone on in the same way it had always gone along before the Ground Game Act came into force.

Form of agreement with Mr. Kay.

40,757. About these farms, Mr. Kay had two farms I understand (I was under the impression that it was three), the Park Farm which I think immediately adjoins Mr. Yerburg's residence?—Yes.

40,758. That is the larger farm?—Yes.

40,759. The rent of that is?—315*l.*

40,760. You admit this agreement which I have to be the correct agreement?—No, I do not know anything about that agreement. This which I have is the agreement.

40,761. This is dated 1888?—Yes. There was some flaw in that agreement, but it is a printed form exactly like this.

40,762. (*Mr. Clay.*) Had you any alteration in your new agreement?—We have never had a new agreement.

40,763. I thought you said that was a new agreement?—There is something wrongly written in that; I do not remember at the moment, but I know he took the agreement at the time with him when he signed it.

40,764. Will you explain this statement; of course we are not in a court of law here, and I ask you informally, this agreement which you put in is a later agreement, I understand?—They were signed within a day of each other.

40,765. Within a day of each other?—Yes.

40,766. Now this is very curious, this agreement which you put in has these words "shall not keep any sheep thereon" still standing?—Yes, it has.

40,767. The other agreement, which, I may say, has been handed to me by Mr. Kay himself, has the words struck off?—We did not strike them off, that is all I can say.

40,768. It is signed by Mr. Thwaites, and Mr. Kay; now I should like to ask you to explain the discrepancy

Mr. J. Howson.

21 Feb. 1895.

between the two?—That I cannot tell. *This* is the agreement in force; *that* was a cancelled agreement.

40,769. Look at that by all means; can you give some explanation of it, I believe you are the agent of the estate.

(*Sir Nigel Kingscote.*) Who puts in the agreement you are referring to?

(*Mr. Channing.*) This has been sent to me by Mr. Kay, and Mr. Howson admits its existence and says it has been signed within a day or two of the other.

(*Sir Nigel Kingscote.*) Do you produce that?

(*The Witness.*) No, I produce our own agreement, signed and stamped, and sealed.

(*Mr. Clay.*) Do you say that it is the same as that one?

(*The Witness.*) Pretty much the same, but there was some flaw in it which made me ask him to sign a fresh one.

40,770. What was the flaw?—I do not know.

(*Mr. Channing.*) Will you kindly examine that agreement and examine the signatures, and say whether it is a legal agreement or not, and then explain why it is there in this other agreement.

(*Mr. Gilmour.*) Is that a stamped document which has come from Mr. Kay?

(*The Witness.*) No, it is not stamped at all.

(*Mr. Gilmour.*) That has been in Mr. Kay's hands, I understand.

(*The Witness.*) Yes, it was.

(*Mr. Channing.*) I will hand it to the Chairman; it is a most extraordinary affair, and it ought to be cleared up in some way.

(*The Witness.*) It is not the agreement he was working with; that is all I can tell you.

40,771. (*Sir Nigel Kingscote.*) This is an unstamped agreement as far as I can see dated the 28th November one thousand eight hundred and —— the year is not filled in?—No, it was not in use at all.

40,772. But what you put in is a stamped agreement of the 3rd day of April 1888. Have you ever seen the agreement dated the 28th November, and did you fill that up yourself?—I have seen it before.

40,773. But it was never completed?—No, he never completed it, he took it with him. One dated April 3rd is the one that was stamped.

40,774. (*Mr. Channing.*) The point, irrespective of that, is, why this alteration in regard to the sheep occurred?—It was not done by me. All of our agreements are alike. I could produce you the 94 agreements everyone stamped and sealed, and everyone with the same clauses in it without any erasures of any description.

40,775. Did Mr. Kay make it a condition of taking the farm that he should have the right of keeping sheep?—No, not in the slightest.

40,776-7. You deny that entirely?—Yes; but mind you, I am going to tell you this that we always did keep a few sheep on the farm, we never prohibit it. Although in the document we say he shall not keep sheep, we do not prohibit a single tenant if he keeps his fences in such a way that his sheep do not run on to the adjoining land.

(*Sir Nigel Kingscote.*) The document dated November 28th is evidently a non-completed document because there are all sorts of crosses on it, and it is not stamped or dated?—That is so.

40,778. (*Mr. Channing.*) Can you give any reason why in one of these documents—in the incompleted document—the prohibition of keeping sheep was struck out, and in the other it was not?—All I can say is that it was not struck out by me, and I prepared the document. I prepared that and I prepared the real document in force, and it was not struck out by me.

40,779. (*Sir Nigel Kingscote.*) I think this ought to be pointed out—that the erasure has not been initialled in any way; it may have been struck out at any time?—It was not by me.

40,780. I think we have it quite clear; *that* is not recognised by you in any way, but *this*, which is a properly stamped and dated document, you say is what was drawn up?—Yes. We do not raise any objection to their keeping sheep if they will keep them off their neighbour's land.

40,781. It was in the agreement that no sheep shall be kept?—It was.

Reply to Mr. Kay's

40,782. (*Mr. Channing.*) To pursue the main point raised by Mr. Kay as to this notice to quit in connection with the memorial, you said, I think, that you frequently complained to him personally of his farming badly?—I have, both to him and his servants.

Mr. J. Howson.

21 Feb. 1895.

40,783. But not in writing?—No; every time, not every time, but many a time, when I have crossed this farm and been with him on this farm.

Evidence, Question 14,057-8, Second Report of Evidence.

40,784. What is your explanation of the fact that this notice which I have here to quit, both these farms was dated two or three days,—two days, I think, after the signing of this memorial by the tenants?—That I cannot tell you; but I knew nothing about the memorial when I sent my notice in. I think I can tell you a little further than that. I can show you that that memorial had nothing at all to do with the notice, because I have letters here from one of the tenants asking me to withdraw his notice, in which he says: "I signed the memorial after the 27th;" now that must really have been at the very least on the 28th, and Mr. Kay received his notice on the 28th.

40,785. It is dated the 28th?—He received it the same day.

40,786. I thought you were in another part of the country?—No. When the memorial came I was in Leicestershire, but that was several days after the 28th.

40,787. (*Mr. Little.*) What was the time for quitting?—The 2nd of February, and if it was a 12 months' notice it must be given on or before the 2nd of February.

40,788. (*Mr. Channing.*) Twelve months' notice is required in the case of the Ravens Wing Farm, is it not?—Yes.

40,789. And six months with regard to the Park Farm?—Yes.

40,790. Therefore you might have given your notice on the 2nd of August?—No. He might have said: You knew you were going to part with me on the 2nd of August; why did not you give me 12 months' notice, and give me a chance of finding a fresh farm. He would have had a cause for complaint against me, had I given him 12 months' notice for one and allowed the time to run another six months for the other. I gave the 12 months' notice, knowing that the same thing affected both farms. That is the only reason we gave him 12 months' notice for both.

40,791. Had he had any previous intimation—any informal intimation that supposing the farm was not in your opinion worked better you would serve this notice upon him?—I complained many a time.

40,792. Had you given notice that he would have to leave the farm in case the farming was not carried out according to your wishes?—I do not think in absolutely those words that I should say so, but certainly he knew very well that he was not suiting me in the farming.

40,793. (*Mr. Dalton.*) I have not got the dates clear; what was the date of the memorial?—I never saw it until after the 30th; it was forwarded to me on the 30th from Mr. Yerburgh. He answered it and forwarded it up to Leicestershire.

40,794. Is it not dated?—I do not think it was.

40,795. (*Mr. Channing.*) May I draw your attention to the answer to Question 14,064: "The tenant who drew up "this memorial drew it up on the Monday; the "memorial was sent round on Tuesday, and was signed "then by,"—a number of tenants—"and on the Wednes- "day the notice which I have in my hand was sent to him "without comment to quit both his holdings"?—I know nothing about that, because I knew nothing about the memorial until such time as it was sent to me.

40,796. You do not deny the fact that the memorial was going about for signature on the estate before the notice to quit was sent?—I knew nothing about the memorial until I received it in Leicestershire on the 31st.

40,797. You may not personally, but can you deny that the memorial was circulated the two days preceding this sudden notice to quit?—I do not know anything at all about it, and I could not tell you about it. I received no intimation of the memorial until the 31st.

40,798. You are not in a position to deny the fact that it was circulating?—I cannot deny anything that I do not know anything about.

Rents and allowances.

40,799. About the system of rents on these estates; I understand that the rents are rather high, and are mitigated by a system of gifts; is that not so?—No.

40,800. Is there a large allowance for manure, and is it not the case that a tenant may be in this position where this system is adopted, that this allowance may be withdrawn in future, and therefore he is rather more at the mercy

Mr. J. Howson.
21 Feb. 1895.

of the landlord?—No; they are actually allowances by agreement in every case, by stamped agreement.

40,801. Year by year?—Year by year; unless it is supplemented with a gift we will say of perhaps a few tons of lime or something of that sort for the year; I say nothing about that.

40,802. In the case of a renewal of an agreement, if the tenant wished to renew his agreement, you would be in a position, of course, to say that you might withhold that allowance?—It is a case of this sort; we have never raised a sitting tenant in the whole 25 years that I have been on the estate; therefore there is no case of renewals in any way; they sit there from year to year; if they wish to go, I cannot help it, but we never attempt to raise them or to push them off, because it is quite as much to the benefit of the landlord, in fact it is more to the benefit of the landlord, to have a really good tenant on the spot.

The letting of farms.

40,803. How do you account for the fact which you have stated, that there is not sufficient competition for these farms?—Not sufficient competition?

40,804. Our general information is that in Lancashire there is more competition than in almost any other part of England for farms?—In Scotland it is just the same. I can let the farms easily in Scotland, and I can let them easily in Leicestershire.

40,805. But you cannot let them in Lancashire?—Certainly; I never have a farm in hand unless I take it in hand to bring it up in cultivation.

40,806. (*Mr. Gilmour.*) You have said that you have never had to advertise?—No, never, and I do not do it in Leicestershire nor in Scotland. It is just known that a tenant is leaving, either that he is going to a larger farm or that he is going somewhere else, and another applies for it.

Notice to Mr. Kay to quit.

40,807. (*Mr. Channing.*) As a matter of fact, when Mr. Kay took the Park Farm, is it not the case that it only carried about 40 or 50 head of cattle?—No.

40,808. And that two years after it carried 65?—I farmed it for the late Mr. Thwaites for four years, and I spent 900*l.* and odd on the farm in improvements. I always had more than 90 head of cattle and seven or eight horses; but mind you, I never could winter them because I had not sufficient buildings for wintering them. Then when Mr. Kay took this farm we agreed we would build him up to 90 head of shipponing, and carried it out. Before he took the farm we agreed to that, and he certainly never filled this shipponing with cattle.

40,809. Are you aware that Mr. Yerburgh gave it as his reason when Mr. Kay wrote to ask him why he was being turned off these farms that he was coming to reside there?—Yes.

40,810. Is it true that the farm was afterwards immediately relet to two tenants?—It was. I want to explain that matter. I was then appointed agent for both Leicestershire and Scotland just about the time, and I said to Mr. Yerburgh, "Seeing you are not coming to this "mansion for another year or two years"—I have since renovated the mansion and spent a considerable amount of money on it—"will you let me let the farm until such "time as you come to the mansion?" and he did so.

40,811. As a matter of fact these farms——?—As a matter of fact he is coming to the farms and going to take them in hand.

40,812. As a matter of fact these farms were relet after Mr. Yerburgh had told Mr. Kay that he wanted them, because he was coming to reside there?—He did not tell him he wanted them because he was tenant of the house; he said he should take the farm on his hands.

Sporting rights.

40,813. (*Mr. Dalton.*) Do any of the tenants take advantage of the Ground Game Act?—Yes, they take their own rabbits.

40,814. Did Mr. Kay do so before this memorial?—No, I do not think he did.

40,815. It is rather assumed in the memorial that they do not: "We are unanimously of opinion that the Ground "Game Act being put in operation is the only real way to "give effect to our wishes and to remove our griev-"ance?"—Yes; but really and truly they have no grievance.

40,816. They seem to think, whether they have got a grievance or not, that the Ground Game Act should be put into operation, and they seem rather to assume that it is not put into operation?—As you know, they have the right to put it into operation, and they do it.

40,817. Did they venture to exercise it?—They do.

40,818. Did they before that memorial?—I cannot say about that; but they are not being prohibited in any way, no further than when they take their agreements we say they are expected not to go up and down shooting and sporting, that is the only thing. The same in Leicestershire. Nearly all the rabbits that are taken are given to the tenantry; they are not marketed in any way.

40,819. (*Mr. Gilmour*). On page 7 of your *précis*, you very clearly state "Game is, subject to the provisions of "the Ground Game Act, reserved to the landlord;" and you state that in your evidence here?—It is so, it is subject to the Ground Game Act.

40,820. And the tenants are well aware of this fact, that they can put that Ground Game Act into operation if they feel themselves aggrieved?—Yes.

Notice to Mr. Kay to quit.

40,821. (*Mr. Clay*). I suppose when Mr. Kay had notice to quit one of the reasons was that his landlord was going to take possession?—He wrote asking Mr. Yerburgh, and of course as a gentleman he said—he did not want to make any trouble—"I am going to the hall and I shall take the "land in my own hands"—but I had previously told him.

40,822. That was the reason he gave to Mr. Kay?—Yes.

40,823. Did he take the land into his own hand?—No, but he will do.

40,824. I am asking the question, did he at the time?—I thought I gave the reason a short time ago. At my request he postponed the time for taking it, as he had already given me extra work to do. He put the Leicestershire estate on my hands, and then the agent for Scotland suddenly died—dropped down dead—and I was sent up there to attend to that as well. Therefore I asked him to allow it to slide for a couples of years or so, until such time as he came to reside in the house. It is his intention still to take it, and he will take it; it is the home farm.

Results of farming.

40,825. You say your tenants have not made any money on their land?—I say this, they have not got money. They have made money, because they have brought up their own families—perhaps four or five children each, but they have not money to lay out in permanent improvements, and it is not a thing expected by us that permanent improvements should be done by a tenant.

Tenants' capital.

40,826. If I do not mistake your evidence, you say they have no money even when they enter on the farm?—No, I do not say that; I say they have no money beyond stocking their farms; they have not indeed beyond what they require for stocking, and buying and selling.

40,827. They have no money to run the farm and keep the farm in good condition?—That is as much as they have.

40,828. Have they that?—Yes.

40,829. And to improve the farm?—I do not know about improving it.

40,830. That is what I am asking you?—They can put no permanent improvements in.

40,831. How is it that you take men with so little capital?—Because we cannot get anything else in the neighbourhood; they are all alike.

Rents.

40,832. If they have no money, and they make none, have you not been charging too much rent?—I do not think so; especially when you come to consider that we do not get even one per cent. on the capital, leaving out the improvements that we have made.

40,833. Some people get no per-centage just now?—I am afraid we are going to be in the same box in a short time.

40,834. If you had charged a lower rent would they have had more money left?—I think we have charged a low rent. Of course, if we give the farm for nothing they might have something left.

40,835. If you charged half the rent you have charged them would they not have sufficient money to improve the farm?—I cannot see that, because if a farm is only let at 50*l.* a year and we gave it for nothing, they could only save 50*l.* a year; and how far would 50*l.* a year go in permanent draining?—You see it takes 8*l.* an acre to make a good job of draining, so he would have to be a few years on the farm for nothing before he could do a little draining.

40,836. If the farm had been let at 25*l.*, would he?—How many years would he have it at 25*l.* to be able to do any permanent improvements?

40,837. I am simply asking if he had to pay 25*l.* instead of 50*l.*, would he not have been more capable of keeping the farm in a good condition?—I will give you an instance.

Mr. J. Howson.

21 Feb. 1895.

40,838. I want an answer to that question?—I want to show you how even then it would have been. In Leicestershire, when the late Mr. Thwaites bought this estate, the the rental was four thousand and some odd hundreds of pounds, it is now two thousand and some odd hundreds of pounds, and off that 25 per cent. is given. The rents there have dropped down to the one-half you are speaking about. I have not a farmer there who can afford to put any permanent improvements down, still they have been there all the time and they had all these reductions. The rental has dropped down from the 4,200*l.* to 2,700*l.*

40,839. How many acres will a man have who pays 50*l.* rental with you?—In Lancashire?

40,840. Yes?—A little over 2*l.* an acre is the average.

40,841. (*Capt. Owen Thomas.*) Has it been more than that?—No. In 1892 and 1893 we returned seventeen hundred odd pounds, I think it was, back to the tenants as we thought they had been two bad years. Mr. Kay, again, in his own evidence, says that the land has depreciated so much through the farmers not being able to do what they ought to do that it has gone 25 per cent. back.

40,842. Because you have been charging them more rent than the produce would pay?—I will take you to an estate where we have reduced the rents by even one half, and have given them 25 per cent. discount on the top of that; and I have not a farmer there who can do that. I tell you even if we gave them the farms for nothing, some of them could not do it. I can tell you what we spend on that estate, and what we have reduced the rental to. It is a long way above one half reduced.

40,843. And still your farmers cannot make money?—They cannot. But that is on arable and pasture land, you will understand.

40,844. There is hardly an estate in England with an average rental of 2*l.* an acre?—Yes. I should think so.

40,845. That is about the highest average, I should think, in England?—Again, you do not consider that this 2*l.* an acre does not come out of the land; it comes out of the buildings. It is the same as letting a cottage or a house; there is only a small quantity of land and a great quantity of buildings. In Leicestershire it is quite a different thing. In Leicestershire a large farmer with three or four hundred acres has not as many buildings as one of these men with 50 or 60 acres of land.

Mr. J. Howson.

21 Feb. 1895.

40,846. (*Mr. Clay.*) Who put the buildings there in Lancashire?—Ourselves; they have all been built or re-built in my time.

Landlords' improvements.

40,847. Have you not made the mistake yourself of over-building?—No. Mr. Kay says in his evidence that the tenants are certainly cramped for room; now, if a tenant is cramped for room with that quantity of accommodation, I do not know what he wants; he wants it all building and no land; he wants what we term "paving stone" farming, that is to come into the town and to carry all his cattle under cover, and to bring the fodder to them.

40,848. (*Mr. Dalton.*) Has any part of the estate grown into building land?—No.

Value of the land.

40,849. Or been let for factories?—No, nothing at all.

40,850. Has the capital value diminished since it was bought or not?—That I could not say without a re-valuation; land is in such a state now.

40,851. (*Sir Nigel Kingscote.*) I conclude that the whole district is very favourably situated near large centres of population?—Yes.

40,852. And on very good soil?—Yes.

40,853. It grows potatoes and many things of that sort, does it not?—Yes, it has every accommodation; but of course it is the buildings with us which add up this price in the rental.

40,854. How long have you been agent for this estate?—Near on 25 years, I should think, but not that length of time for Mr. Thwaites.

40,855. Was there any change between the time of Mr. Thwaites and Mr. Yerburgh?—No.

40,856. Just the same?—Just the same, and the management was just the same. And we are spending as much money per year as we did during Mr. Thwaites' time.

The witness withdrew.

Sir J. B. Lawes.

Sir JOHN BENNET LAWES called and examined.

Sir J. B. Lawes.

History of experiments.

40,857. (*Chairman.*) I need hardly ask you whether for a great number of years you have given your attention to agricultural questions, and have written very largely in the agricultural journals upon the subject?—Yes, for a great number of years.

40,858. And you have conducted very valuable experiments which have been made public?—Yes.

40,859. When did you begin to farm yourself?—In 1833-34.

40,860. How much did you then take in hand?—230 acres.

40,861. Of those 230 acres 140 were arable and 90 grass?—Yes.

40,862. You added to it another 130 acres all arable?—Yes.

40,863. Later on 50 more, making altogether 410 acres?—Quite so.

40,864. Shortly afterwards you began to carry out your experiments upon crops and manure?—In 1843 and 1844.

40,865. Will you just state briefly what the nature of those was?—First of all growing permanent crops of wheat, barley, oats, beans, roots, and grass. Oats we gave up afterwards, as we found that we could not keep so many crops free from weeds.

40,866. In 1843 you selected another field to grow continuous root crops?—Yes.

40,867. Other fields followed, making altogether about 50 acres for the experiment?—Yes.

40,868. In 1872, in consequence of the disturbance which had arisen in the minds of agricultural labourers, you thought it well to lay down a larger portion of your farm in grass?—Quite so.

40,869. And between 1872 and 1880 you laid down about 100 acres?—Yes.

40,870. Will you state briefly what was the result of that change?—It stopped any strikes or anything of that sort, which I was afraid might interfere with my experiments, as I required a very large quantity of labour to attend to them properly.

40,871. It was from a fear——?—That they should strike.

40,872. That these labour difficulties might interfere with the experiments?—Quite so.

40,873. And not so much from a fear with regard to your general farm?—No.

40,874. But it is specially with a view to continue your experiments which require a very large amount of labour?—Yes.

40,875. Then three or four years ago thinking that the farm might no longer be available in the event of your death, and wishing that the experiments might be carried on by a trust committee, you decided to let all but the experimental portions?—Quite so.

40,876. And from that time you have only carried on the experimental part of your farm?—Yes, hiring labour as I wanted it, and hiring horses and hiring everything.

40,877. You have published from time to time papers in connection with agriculture, describing specially the results of these experiments?—Quite so, some having a bearing upon what you may call commercial things, and some on scientific questions entirely.

40,878. These papers deal with a very large number of subjects?—A great number.

40,879. Among them I find the "Exhaustion of the soil in relation to landlords' covenants and the valuation of unexhausted improvements?"—Yes.

40,880. "Unexhausted tillages and manures, with reference to the Landlord and Tenant (Ireland) Act, 1870." "On the valuation of unexhausted manures;" "Freedom in the growth and sale of the crops of the farm, considered in relation to the interests of the landowner and the tenant farmer;" and, "Is higher farming a remedy for lower prices?"—Yes.

40,881. On that latter question I should be glad if you would state briefly your conclusions?—It is generally supposed, and has often been said that the lower the prices of

High farming as a remedy for low prices.

Sir J. B. Lawes. 21 Feb. 1895.

our agricultural crops, particularly of wheat and barley, we ought to grow more and more. Unfortunately the result of all our experiments, which are very extensive, is that the reverse is the law. As you increase your crops so each bushel after a certain amount costs you more and more. Therefore, if we had a famine in the land, and we could get a guinea a bushel for our wheat, we should try to grow the very utmost that is possible, but the lower it goes so we must contract our farming down to what I should call the average of the seasons. We have in this country very bad seasons, and very good seasons, and the mean of those is something like what we can grow, not more.

40,882. Then in your opinion a remedy is not to be found in higher cultivation in the sense of putting more manure to the land?—No, it is quite contrary to that. The last bushel always costs you more than all the others.

40,883. As you force the produce of the land, so you have to put more and more manure in at a greater cost?—These manures only do their work in very good seasons. For instance, in 1863, which was the greatest season I ever knew (our crop was grown always every year with the same manure), we grew 55 bushels of wheat, the same manures in 1849 grew about 26 bushels.

40,884. Then you must take the average of good and bad together?—You must take the average; but the more that you can get for your corn the more it is worth your while to grow bigger crops.

40,885. And conversely the lower the price of corn?—The lower you must farm. It is a law which it is impossible to overcome, I am afraid, we are so dependent upon the atmosphere, and our rainfall and temperature. 93 or 94 per cent. of our crops is derived from the atmosphere, over which we have no control.

40,886. Then, I suppose, you would deduce from this that in the corn districts the higher the farmer has farmed his land in the sense of adding manure the worse has been the financial result?—Yes, quite so.

40,887. Do you think that those farmers who have farmed on a very high system have probably lost more money than those who have farmed on a lower scale?—I am afraid so.

40,888. You are afraid that that is the case?—The general tendency of the country is to lower farming I am sure.

40,889. Another subject of your papers has been "On "the home produce, imports, consumption, and price "of wheat, over 28 (or 27) harvest years"?—Yes; we have really gone up to 40 years I think in another paper published last year.

40,890. I suppose, no doubt, that return shows a continual fall in the average price?—Quite so. I have a copy of the paper here if you like to put it on the table.

40,891. There are so many valuable papers in your list that one is rather in a difficulty to know what special subjects to examine you upon, but perhaps you would yourself indicate the particular points?—Would you like something more in a general way on distress in agriculture?

Present condition of agriculture.

Effect on future cultivation.

40,892. Yes; with reference to the present position of agriculture, and what you would recommend—what you think can be done?—I daresay you understand that the last two years, or about the last two years, have been much more disastrous than any we have had before, that is to say, the prices of corn have gone down so rapidly, and to a point that nobody, I think, thought it possible they could go down to. In my opinion, the end must be that the greater part of our arable land must go on into grass. It is impossible to go on farming at the prices we have now, as far as I can see, even if the land is given up for nothing, unless it is very fine land indeed.

40,893. That is to say especially wheat, I suppose?—Especially good wheat land, or really good barley land; but really, strictly speaking, I think the land must go out of cultivation, or rather go into pasture land, where they can lay it down. In Norfolk and Suffolk, on light lands, you cannot produce good pasture; they must go to waste again as they were before—a sort of sheep feed.

40,894. I presume that a certain amount of arable cultivation would be continued with the pasture farms?—Yes, a certain amount, certainly; I do not mean to say it would be absolutely so, but bit by bit the land must go out of cultivation. I think the light land in Norfolk must. I happen to have a friendly management, as I call it, of a good large estate in Norfolk for several years, for a relation of my wife's, and I have had a great deal to do with farming there lately. It has all come to this, that you must farm for the game, and not what you may call for the profit. They become valuable as game farms—you had some very good evidence from Mr. Sewell Read about it; I could confirm all he said on the matter. If you allow your land to waste, then the tenants will not take the game; the game will have food upon the ground somewhere.

Sir J. B. Lawes. 21 Feb. 1895.

40,895. In your own district in Hertfordshire what has happened?—I do not think that has suffered so much. It is very near London; it has got a lot of railways through it, and I think many of the tenants have other occupations. It is not what I call a purely agricultural county.

Agriculture in Hertfordshire.

40,896. What is the nature of the cultivation there; has the land been laid down in grass?—No.

40,897. Do they continue to cultivate it?—They cultivate it in a very loose manner, I am afraid; still very little land is thrown out of cultivation. The landlords will have to leave and let their places—great numbers of them.

Rents.

40,898. Has the rent been largely reduced?—Rents have gone down very largely indeed. I can much more easily let land that is laid down to grass at 30*s.* an acre than I can let my arable land for 15*s.* It used to let for 28*s.* or 30*s.*; now it has got to 15*s.*

40,899. Have you been able to let land that you allow to be laid down to grass at 30*s.* an acre?—Yes, I have had no difficulty whatever.

40,900. No difficulty?—No; then it is near a village, and near a great railway station; the Midland Railway goes through our parish.

40,901. Does the tenant sell the milk?—Yes, milk principally.

Laying land down to grass.

40,902. Has much land in your neighbourhood been laid down in grass in the same way?—No.

40,903. How do you account for the fact that more has not been laid down?—I think it is only, really, the last year or two that the pressure has become so very serious. They have been hoping for better times, and worse have come, and, of course, it is rather expensive work to lay down land to grass; that is to say, it is some time before you get what you call a good pasture land.

40,904. What do you reckon that it costs to lay down land such as you have in Hertfordshire to grass, taking into account the length of time that it takes?—I think, generally speaking, a great deal of money is spent in laying down land to grass that ought not to be spent—a great deal of expense in taking out the weeds, and cleaning the land, and getting fancy seeds, and all that sort of thing, which disappear. The pasture is ultimately what the land will grow naturally. You may put all the fine seeds in the world in the ground, but they are all driven out by what I should call the native vegetation.

40,905. What should you say it costs an acre to lay it down, having regard to the length of time it takes; can you form any opinion?—I never tried to estimate that at all; according to the management of the land it takes more or less years; I have been able to get very good pastures down in about seven or eight years.

40,906. The land that you could only now let at 15*s.* an acre as arable you can get 30*s.* an acre for in grass?—Yes; I did not spend much in laying it down; I did not go to the expense of clearing all the weeds out, and fallowing the ground, and all that sort of thing. I consider if you manure the land well, all the best grasses will drive out all the weeds and bad grasses.

40,907. What should you say, in your own case, it has cost you to convert the arable into pasture?—Perhaps 10*l.* an acre.

40,908. Do you expect that in your neighbourhood a good deal of land will be treated in the same way?—I expect so now. If these prices are to continue, I am sure they cannot grow wheat and barley.

Essex clay land.

40,909. With reference to the heavier clay lands of Essex, have you any of that heavy land in your district?—Not so heavy as that; we are heavyish loam on the chalk. We are all on the chalk where I am. It is clay, but there is a loamy soil above it.

40,910. I am speaking of the very heavy lands on clay, of which I have no doubt you have read an account?—I know them well; they must go to grass.

40,911. Will those go to grass too?—Those must go to grass too, or else be abandoned altogether to grow what they can.

40,912. Do you think they can be laid down in grass?—Yes, certainly.

Sir J. B. Lawes. 21 Feb. 1895.

40,913. They can?—Yes, everything but a light sandy soil; that will not carry grass. If there is anything like clay below you can grow grass.

40,914. I suppose the difficulty in the case of the Essex lands has been enhanced by the land getting into such a very foul state?—Yes, that is it; they cannot afford to clean it.

40,915. If it had not been allowed to get into that foul state it might have been laid down in grass earlier and better?—Yes; by degrees it will come into grass—manure is the great thing.

Price at which wheat can be cultivated.

40,916. Have you formed any opinion at what price the land can be cultivated for wheat?—No, I should not like to give an opinion; I think a practical farmer probably would give a better opinion than I should.

40,917. You cannot form any opinion?—I would rather not give an opinion.

40,918. Much of the land in Essex is said to have fallen out of cultivation when wheat was at 40*s.* and 45*s.* a quarter?—Yes, a good deal of it.

40,919. I suppose in some other parts of the country it could be cultivated at a lower price?—Yes.

Relations between landlords and tenants.

40,920. Are there any recommendations you could make with a view to any alteration of the law with regard to the landlord and tenant, or other matters, which you think might alleviate the position, and tend to facilitate the making the best of the land?—No, I cannot say that there are. Of course, I could see points on which I could form an opinion on any case put to me, but I cannot make general suggestions which are applicable, I mean, to all purposes.

The Agricultural Holdings Act.

40,921. Have you considered, yourself, the question of the Agricultural Holdings Act?—Yes, I have considered that.

40,922. Do you consider that any amendment of that is needed in order to give greater inducements to the better cultivation of the land, not, of course, in the sense of the very high farming that you are speaking of, but for the ordinary operations of farming?—No; I think it is impossible to have what I call a very simple measure which will be applicable to all purposes. You can only lay down what I call general rules which are applicable, but you cannot give details in an Act which would suit all purposes and all soils.

40,923. You must leave a great deal to contract between the landlord and tenant?—I think so, certainly; and the local circumstances.

40,924. Local circumstances?—Yes, you cannot tie them down.

Judicial rents.

40,925. Is there any feeling in your neighbourhood in favour of judicial rents?—No, none at all; they are all annual tenants as a rule.

40,926. Are the landlords ready to give leases if the tenants wish?—They would not wish; they do not ask for them.

40,927. The tenants do not ask for them?—No, they would rather not have them.

40,928. Has the question of judicial rents been discussed among the tenant farmers in your neighbourhood at all?—Not at all.

Changes of tenancy.

40,929. Has there been a great change of tenancy in the district?—No.

40,930. The same men go on?—The same men go on somehow.

40,931. How do you account for their going on?—They do not spend much on the farms or on themselves, and the ordinary farming with us is really taking what the soil gives. There is very little of what you would call high farming at all—very little indeed.

40,932. What do the rents average—what you stated, 15*s.* an acre for the arable land?—15*s.* an acre for the arable land and 1*l.* or 25*s.* perhaps for the grass.

Consumption of wheat.

40,933. (*Mr. Giffen.*) I should like to ask you one or two questions about the home production and consumption of wheat. I should suppose from these elaborate tables that you have printed, that there has been a very small increase of the consumption of wheat per head in the United Kingdom?—Very small.

40,934. Have you considered at all what the nature of the increased consumption has been; is it the case that some classes of people, or the people in certain districts, who did not consume wheat 40 or 50 years ago have become wheat consuming—it is not the case that the classes who consumed wheat before are consuming more of it?—I suppose they are certainly.

Sir J. B. Lawes. 21 Feb. 1895.

40,935. But there has been no great increase of the consumption per head generally?—No.

40,936. (*Chairman.*) I think there has been a slight increase per head?—Slight.

40,937. (*Mr. Giffen.*) I am suggesting that this increase may be due not to the people who were consuming wheat before,—to those classes of people taking more of it, but to certain classes of people, such as the people in Scotland, who did not consume wheat very largely 40 or 50 years ago, having become consumers of wheat, and possibly something of the same kind in Ireland; I merely wish to know if you can give us an opinion on that point?—No, I cannot.

Production of meat and land laid down to grass.

40,938. The other question I wish to put is with regard to laying down land to pasture. Suppose the consumption of meat in this country had remained almost stationary per head, as the consumption of wheat has remained stationary, would it have paid so well to lay down land to pasture; would that have been much more profitable than wheat has been?—I am assuming that a great deal of land is laid down to pasture, and therefore produces a great deal more meat.

40,939. There is more meat produced and there is more meat imported; and I believe the consumption of meat has very largely increased?—Very largely indeed, no doubt.

40,940. So that what has been beneficial for pasture land, apparently, has been the large increase in the consumption of meat?—And milk and butter and other grass products.

40,941. And this great increase of consumption has helped to maintain the price of dairy produce and of meat?—Yes.

40,942. Have you any reason to believe, putting all things together, that the prices of meat and dairy produce are likely to be maintained, say, in the next 20 years as they have been in the last 20?—It is a very difficult question to answer, because we are now beginning to feel the imports from New Zealand and from those colonies over there; now they are beginning to bring large quantities.

40,943. Would that not affect the practical question of looking for much relief from laying down land to pasture?—The down-laying of land for pasture is simply to relieve the farmer from paying wages—labour. It is the labour question which compels him to go to grass.

40,944. It is not so much a question, then, of the price which he gets?—No, it is the cost of the labour.

40,945. Does pasture land produce more meat than arable land?—If you have got a fine pasture, such as a Leicester pasture, there is no question of pasture producing the most meat, but with ordinary pasture and arable land I am not prepared to give an opinion.

40,946. You have not given any consideration to the question of what the causes likely to affect the price of meat and dairy produce are at the present time?—You are assuming another million or two of acres is laid down to pasture in England? No, I have not looked at it in that sense. The labourer has not suffered yet; what he will do I do not know.

Process of laying land down to grass.

40,947. (*Mr. Clay.*) I think you gave very extended evidence before the Duke of Richmond's Commission in 1881?—Yes.

40,948. You then advocated very strongly the laying down of land to grass?—Yes.

40,949. No doubt looking forward, as you always have done, to the price of grain rapidly going down?—Quite so.

40,950. You considered that the low price and the expensive labour would be sure to bring the arable farmer to perhaps the position he has got in to-day?—Yes.

40,951. I think you advocated, in answer to a question that was put to you, the laying down of land to grass. It was Mr. Stratton, I think, who put the question to you, "What do you consider to be the most economical way of "laying the land down to grass?" Your answer was "I have always laid down my own grass land with a barley "crop, and after that I have depended entirely upon feed-"ing with cotton cake; and that is the way in which I "think I can get my land into pasturage better and "cheaper than by any other process." Is that your opinion still?—Yes, quite so.

40,952. Further on you were asked another question, "But in making an estimate as to the value of the "manure from cotton cake, the nitrogen which is con- "tained in it forms by far the largest and most valuable "constituent, does it not?" Your answer is, "Much the most valuable"?—Quite so.

40,953. I suppose you are still of opinion that to lay down grass to be beneficial as pasture, it must not only be done in a systematic manner with seeds that are accustomed to grow on that kind of land, but that it is after that the whole benefit accrues, and the benefit from making good pasture land comes by liberal feeding?—Liberal feeding.

40,954. With cotton cakes and other cakes—especially cotton cake, which is the most valuable?—Yes, quite so; spend all your money upon manures, and very little upon cultivation or seed.

40,955. Does cotton cake given to sheep or cattle make the best pasture land, which would you make old grass best upon?—Sheep certainly, because they spread their manure better all over the ground.

40,956. There is another question Mr. Stratton put to you, which I will draw your attention to because I think this is very valuable evidence, and I am glad to see you still bear out your opinion; it is "Can you tell us roughly "what proportion of the manurial value in it is due to "nitrogen?" Your answer is, "I think nearly 6*l.* out of "the 6*l.* 12*s.*, or whatever the amount is." What is your opinion after other 10 years' experience of the remaining unexhausted value of good cotton cake left in the soil, the manurial value of it?—The manurial value, of course, has really gone down in price because the cotton cake itself has gone down in price.

40,957. It has gone down about a third, but what do you say is the manurial value of cotton cake that can be bought at 4*l.* 10*s.* or 5*l.*?—Probably about one half.

40,958. That would be about 2*l.* 10*s.* per ton?—About 2*l.* 10*s.*

40,959. Is that consumed on grass?—On grass.

40,960. So you do not despair of making a good deal of land in England yet, that will not pay for cultivation through the low price of corn and the expense of labour, if it were laid down in grass, still useful to the farmer and the proprietor?—It must come to that I am afraid, if we are to have the present prices of wheat and barley.

40,961. You have said that you were inclined to think that grass land may be still worth 30*s.* an acre when arable land and wheat soil is not worth 15*s.*?—Yes, but I must qualify that by saying that my grass land is favourably situated, and is a good quality of grass land. I cannot fat cattle for stock upon it, but it is near to a railway station. I do not think the whole of England will produce a rent of 30*s.* an acre.

Stock-keeping on grass and arable land.

40,962. At the same time you were asked the question whether grass land or arable land will keep more stock; do you not think from your experience that a mixed quantity of land—arable land and pasture land—will keep more stock in proportion than any single class of land?—I do not think that you can keep much stock upon grass land unless you use artificial food with it.

40,963. But still, would not a proportion of arable land along with good grass land turn off more stock for the nation?—I think the grass would do the most really.

40,964. You think grass would do the most?—Provided you use artificial food, which is really, of course, bringing food from a distance on to the ground.

40,965. They might do it in summer, but what would you do with your grass land in winter for keeping the stock; would you not have to apply partly to the green cropping in the arable department for the winter keep?—That is rather an awkward question.

40,966. You require straw, and you require mangolds, or roots, as you call them in England; would the two kinds of farming not work best together?—Certainly.

40,967. As I understand you, the native grasses generally in time abolish the finer grasses that are put in?—They do invariably.

Process of laying land down to grass.

40,968. But still your idea of liberal feeding, which is the only way, I think you said, of making old grass, retains the finer grasses and the more nutritive grasses longer?—Quite so.

40,969. And after the grass has once got a firm footing in the land, it is not easily displaced?—No; but you may displace anything by what I call manuring. I have had a field with a mass of couch grass, a thick bed of it, and I have destroyed it all by simply putting a quantity of manure upon it. The grasses have come of themselves and driven it out. Of course it is a longer process, but it does it.

40,970. The starvation process will neither make cattle nor sheep fat, nor will it make good old grass?—No. You can produce any amount of quantity of grass, but you cannot produce quality.

40,971. It is the extra feeding of old grass, which forms the old grass which really makes beef and mutton?—Yes.

Compensation for unexhausted fertility.

40,972. If an out-going tenant has laid down grass liberally, does that not go to prove that he leaves a good deal of unexhausted fertility in the land?—Yes.

40,973. What you call "cumulative" fertility; do you agree with that word?—Yes.

40,974. Do you not think he is entitled to compensation?—Yes.

40,975. In that way an Agricultural Holdings Act framed so as to give compensation for cumulative fertility on lands left in old grass made by the outgoing tenant would be very beneficial, and would be the means of bringing capital to the land, when otherwise it would not be brought?—Quite so, and if necessary, if times come better you may break it up again, and get all your manure back out of the land again. Grass is an accumulation of large quantities of food. You cannot have a pasture without quantities of food accumulating in it.

40,976. Still you would not despair of British agriculture if both the landlord and the tenant were to join together and put a considerable amount of capital into it?—No.

Improvement of pasture.

40,977. One of the Commissioners, who is away, has asked me to put this question to you: Can ordinary English pasture land be properly improved at a reasonable cost in view of the present prices of meat and dairy produce?—Yes, certainly; commercially, it can be improved to pay.

Freedom of cultivation and sale.

40,978. (*Mr. Gilmour.*) I notice that in No. 5 on the list of papers mentioned in your brief, you put forward a matter which is of considerable interest just now, both to landlord and tenant, namely, the question of freedom of growth and freedom of sale; on the general question as to maintaining the fertility and usefulness of the soil of this country, do you think that freedom of growth and freedom of sale could be fairly given?—I think so, certainly; qualified, of course, by a man not selling off everything and bringing back nothing.

40,979. Then freedom does not in your view mean exactly freedom?—Yes, it does mean freedom. You confine him now to a certain rotation of crops, but I would give him anything in the way of freedom, so that he does not injure the landlord.

40,980. Where do you draw the line, because then you cease to give a man a free hand to deal with the land as he likes during his lease—take a Scottish lease?—If he had a lease, then, I should begin to restrict him towards the end of his lease. I would not allow him to sell everything off the land—straw, corn, roots, and everything, all that time, and then walk off. That would not be fair for the landlord, surely.

40,981. I suppose you know the Scottish leases very well?—Yes, they are 19 years' leases generally.

40,982. They were. What restrictions would you put upon an average arable farm, either in the Lothians or Fifeshire, where you could fairly consider that by so doing you maintained the proper fertility of the soil and yet left the man as free as you possibly could?—I should begin to restrict him towards the end of his lease. In other words, he should not sell off his roots and his hay, and his straw, and those sort of things during the last five years of his lease.

40,983. Do I understand that during the remainder of the lease—that is during 14 years of a 19 years' lease—that man could sell off what he liked without bringing back anything?—If he was such a man as I should select myself, if I were selecting a tenant, that is a man with capital intending to farm properly—and I would not take anybody who came—if he was a man who was suitable to take that farm—I think he ought to have unlimited freedom to do what he likes; but then, as I say, it ought to be protected so that he did not injure the landlord.

40,984. Have you formed any idea of the amount of capital a man would require to have before you would accept him upon those conditions?—He would require much less than he used to require, because everything is so cheap. I have not really worked it out as if I was going

Sir J. B. Lawes. 21 Feb. 1895.

to advise a person who was going to do the thing; 7*l.* or 8*l.* an acre, we will say—10*l.* I should have said years ago.

40,985. Do you know the principle that obtains in these farms close to markets in Scotland, where you may say freedom of sale obtains, because there they can sell off what they grow on condition that they bring back so many tons of manure?—Yes.

40,986. Would you consider that it is a necessity to lay down a rule like that?—It is not a necessity if you have got a man with capital, because he would do it for his own profit. If you choose to accept a man whom you ought not to accept—a man without any means—you do it at your own risk; but a man who has got his own money to lose will take good care that he does not destroy the land or injure it; it will not pay him to do it.

40,987. Of course, you are aware that in these times a man with capital who is willing to go into a farm at all is a *rara avis*?—Yes, very rare.

40,988. May I ask again—because this is a question of very great interest both to the tenant and to the landlord—while you think more freedom could be given both as to sale and as to growth of crops; still, on the general principle it is necessary, is it not, that certain safeguards should be laid down?—Very necessary indeed, I should think—exceedingly necessary.

Manufactured foods for stock.

40,989. I notice that you are willing to give the Commission some observation on the recently introduced manufactured foods for agricultural stock; I think it would be of interest for us to hear them?—I did read a paper on that, as there is a very strange thing in connexion with these manufactured foods. You must recollect, in the first place, that the manufactured foods that we generally buy—that is to say, cotton cake and linseed cake—are refuse, and if we did not buy them the manufacturers would throw them away. They do not make cake for us; they make oil. Oil is their manufacture and the cake is their refuse. The farmer puts just what price he likes on it, because they must get rid of it. Now, when you come to manufacture cakes you have got to get the very things I or anybody else can buy in the market. You have to grind them up, and you have to press them very hard for the men to break them up again. You do not add anything to the food value, but you spend 2*l.*, 3*l.*, or 4*l.*, or whatever it is, and call it a cake. The farmer immediately says: There is a nice cake, and he pays 3*l.* or 4*l.* extra for the very thing he can buy without all that labour being put upon it, and absolutely has to break it up afterwards. A manufactured cake is simply a produce of whatever you like—beans or oats, or linseed, or anything else you like, and you have to pay the cost of the manufacture, which adds nothing to its feeding properties fertility.

40,990. (*Mr. Clay.*) They go under the name of compound cakes?—Yes, or whatever you may call it; but is there scientific knowledge equal to producing a much better feeding substance from those things by combining them? I deny that there is any knowledge at present which will enable us to do that. I could not, nor could anybody else who has studied feeding, put together these ground beans, ground wheat, and ground barley and get a particular compound which would beat, pound for pound, linseed cake or cotton cake.

40,991. (*Mr. Gilmour.*) Do I understand that you think a farmer would do better to buy his locust beans and his other things separately?—Yes, and not pay for all this labour and trouble.

40,992. Then, really, the pressing of this cake, which has to be knocked to bits with a hammer again, only makes it handier for handling?—Yes, and for travelling, perhaps.

Agricultural education.

40,993. I daresay you have looked into the question of the technical education being given in most of the counties just now. Is there a field, do you think, whereby agriculture may be helped very considerably by an extension of that?—Very slowly. The fact is that our agriculture is, according to these times, in many respects too good for the times. I feel almost myself, and so does my colleague, Sir Henry Gilbert, that we are doing more benefit to other nations than to ourselves, because they have not got up to the standard of ourselves.

Utilization of sewage.

40,994. I notice in your proof that you mention a good deal about sewage; are you a very strong advocate for its utilisation?—No. I have been on several committees about it at different times, and I have been examined over and over again on it, and I carried out experiments a great many years ago at Rugby. But sewage is too diluted; it is hopeless to think of doing anything with it.

40,995. (*Mr. Little.*) I believe you have carried out a series of experiments for a great many years with a view of testing the capacity of the soil and noting the effects of the seasons?—Quite so.

Sir J. B. Lawes. 21 Feb. 1895.

Recent seasons.

40,996. Is it your opinion, taking a broad view, that the seasons of late years have been less favourable, and that there have been greater calamities from bad seasons than in former years?—What do you call former years?

40,997. Your experience goes back to 1834, but your records do not go back quite so far as that, I believe?—No. What I call our measurement of season records do not go back further than 1844.

40,998. Would you say that the last five or six years have been more unfavourable than any of the others in that time?—No, I should not.

40,999. Then you would not attribute the great depression at the present time largely to the seasons?—No, certainly not. I happen to have a paper here, as I thought I might be asked a question on this point, which was not drawn up for the Commission, which was, in fact, made some time ago. Our measurement of seasons very much depends upon the continuous growth of wheat upon one particular piece of ground without any manure, upon a second piece which is always manured with farmyard dung, and a third piece which is always manured with artificial manures. We think the variations of those very much depend on the seasons. I happen to have here the figures from 1852 to 1891 divided into four different periods of 10 years each. Of course you would think that the unmanured ground would gradually decline; but this is the produce of the first years—14 bushels, the next 13·6—a little decline, the third 9½, the fourth 12½. Therefore, the last seasons have been better than those particular ones in the third series. Those figures are confirmed in the same way by the farm yard manure results, and by the artificial manure results. The third series of 10 years is in all cases the worst.

41,000. (*Chairman.*) The third period includes the very bad years of 1875, 1876, 1877, and 1879, does it not?—Yes. If you look at the table you will see that there is only one fairly good year all the way through.

41,001. That period included the very bad year of 1879, when produce was very much below the average?—Yes, it was a most shocking year.

41,002. (*Mr. Little.*) That would be mainly a test as regards corn?—That is all.

41,003. That would apply very much to the eastern counties which depend for their prosperity to a very great extent upon the corn ear?—Quite so.

41,004. Measuring one period with another you would not say that the last period of seven years or ten years, has produced exceptionally unfavourable seasons?—Certainly not.

41,005. You would not attribute the depression to that? No, not taking the agriculture of the country of all sorts.

41,006. (*Chairman.*) Would you mind adding to that a description of the year 1892 and 1893; they were in the last period of ten years, and they were bad years, were they not?—Yes.

41,007. That of 1892 was a wet season?—Yes.

41,008. And 1893 was an extraordinary drought, which, almost for the first time in our experience, resulted in a bad crop?—Bad crops of every sort—grass, wheat, barley, and oats.

41,009. As a general rule a dry season is favourable in England?—Yes.

41,010. But the drought of 1893 was extraordinarily bad?—For everything.

41,011. Therefore the last three years——?—Have certainly been bad.

Cost of production.

41,012. (*Mr. Little.*) Then as another cause of depression, would you say that the increased cost of production enters into the calculation?—Decidedly.

Labour.

41,013. Would you say that the cost of production has generally increased?—It has generally increased, and I am afraid I must say there is a deficiency of good labour.

41,014. The particular item of increase is that of labour, I presume?—Yes.

Low prices.

41,015. But, after all, I suppose the main cause you would allege would be the price?—Of course.

41,016. The prices of agricultural produce generally, and particularly the price of corn?—Yes.

41,017. More especially the price of wheat?—Yes.

Sir J. B. Lawes.
21 Feb. 1895.

41,018 The aggregate production of the country, I suppose you would say has decreased?—You mean taking everything?

Deteriorated cultivation.

41,019. Yes, taking everything together?—It has decreased, certainly, there is bad farming—worse farming.

41,020. And the land has deteriorated?—Certainly, there is no mistake about it.

41,021. In your evidence before the Duke of Richmond's Commission, you said that the land must under any circumstances be deteriorating and must be diminishing in value?—Of course I am speaking now agriculturally, that is to say, weeds do not injure the soil you must recollect—they injure the farmer, but not the soil.

41,022. In your evidence before the Duke of Richmond's Commission you said there must be a waste going on from continued cultivation, but that is a mere theoretical waste?—It is a natural waste; we are intended to what you call exhaust the soil; we are bound to do it.

41,023. Very slowly, just as the earth is cooling down very slowly?—Yes. If you bring your cake or corn from somewhere else you are exhausting somebody else's soil. It is meant to be used and is bound to be used.

41,024. Your opinion now would be that, since the time of the Duke of Richmond's Commission, the land has deteriorated?—Yes.

41,025. Either by want of cultivation?—Yes.

41,026. Or want of labour?—On account of the expense—they cannot afford to pay the money.

41,027. You have already expressed the opinion that high farming would not be a remedy for the depression?—Decidedly.

41,028. You are familiar probably with a statement which is attributed to Lord Derby, that the produce of this country could be doubled?—Yes. It is easily said.

41,029. Do you think that the produce of this country could be largely increased with profit to the farmer?—Certainly not.

41,030. It is not the incapacity of the farmer to produce, but there is not a sufficient reward in view to induce him to spend his money?—Quite so.

Compensation for unexhausted improvements.

41,031. You have, as we know, given a good deal of study to the subject of compensation for unexhausted improvements?—Yes, it has been part of my programme at different times.

41,032. Twenty-four years ago I think you read a paper before the Farmers' Club on this subject entitled "The Valuation of Unexhausted Improvements"?—It was a good many years ago; what is the date?

41,033. 1870. In that paper you laid down this principle that there are two items to be taken into consideration, viz., "fertility" and "condition"?—Quite so.

41,034. "Fertility" being the natural properties of the soil and the property of the landlord?—Yes.

41,035. "Condition" being the added fertility the property of the tenant?—Yes.

41,036. Have you seen any reason to doubt the justice of that division?—Not a shadow.

41,037. The "fertility" would be something equivalent or very nearly equivalent, I suppose, to what is described in the Agricultural Holdings Act as the inherent capabilities of the soil?—Yes, that which is given us to take away.

41,038. That you say is the property of the landlord, and that must be taken into consideration in valuing the "condition," or what the tenant has added?—Quite so.

41,039. It must by any scientific valuer, or by anyone who wishes to take a fair view, be taken into consideration?—Quite so.

41,040. Then you would not think that the putting of those words into the Agricultural Holdings Act nullifies the Act; it is there stated that regard shall be had to the inherent capabilities of the soil; you would not say that those words deprive the tenant of any right?—No none at all.

41,041. If those words are complained of, and if those words are taken out of the Act, the principle would still have to be considered by every valuer in valuing?—It ought to be certainly.

41,042. By any fair valuer?—By any fair valuer.

41,043. Then "condition" is an element that is transitory?—Yes.

41,044. It can be put in in the course of a few years, and it can be taken out very rapidly?—Yes, very rapidly.

41,045. And it can be consumed by the tenant who comes in?—Yes, slowly; soil has a wonderful power of laying hold of manure.

Sir J. B. Lawes.
21 Feb. 1895.

41,046. But still it is a moveable thing?—Yes, it is a moveable thing.

41,047. And "fertility" is a much less moveable thing?—Yes, it is very slowly moveable; luckily for the human race.

41,048. Would you say that you cannot either permanently injure or permanently improve land?—Certainly, you cannot permanently injure it; that is to say permanently in the way I speak of; it is impossible. Whether you can permanently improve it is a rather more doubtful thing. But unless you continue to put on things, there is no permanency.

41,049. The improvement must be kept up?—The improvement must be kept up; "condition" is what the farmer adds.

Scale of compensation.

41,050. You were examined before the Duke of Richmond's Commission on the subject of laying down a scale of compensation for improvements, you will probably remember?—Yes.

41,051. And you have published tables of the unconsumed theoretical values of different descriptions of produce?—Yes, I published some tables some years ago.

41,052. Would you recommend—you did not in 1880—but would you now recommend any scale which can be universally applied for compensation?—I could only remodel my own scale to the present prices.

41,053. Your scale was only applicable thus far: it is the application, I understand, of certain products under the most favourable circumstances, all taken care of, properly used, and properly applied?—Yes, quite so; as standards in fact.

41,054. As a maximum standard?—Yes.

41,055. But in applying that standard you would have to take into consideration the purposes for which the manure was used?—Quite so. You would have to look at the state of the buildings, for instance; there are hundreds of things that a valuer ought to take into consideration, only, as I tell you, give him a basis.

41,056. But you would not say that it would be practicable under any scheme of legislation to lay down a scale, as was expressed by a witness before us, which a third standard schoolboy could tot up to see what was due to a tenant?—No, it wants immense judgment even to apply my scale really and honestly to a landlord and tenant. All we do is this: to give you a sort of idea as to the value of these things; it is not a cut-and-dried scale for compensation.

41,057. Would you say that the schemes which valuers have contrived for meeting this difficulty, by taking a certain part of the cost over a certain period, and allowing that to the outgoing tenant is only a rough and ready way?—Very rough and very ready.

The Lincolnshire system.

41,058. In the Lincolnshire system——?—Yes, I know Lincolnshire well.

41,059. Which is considered such a good system——?—They only confine their idea to cake, if you recollect.

41,060. They have adopted corn of late?—A little; but they had not in my days, when I wrote.

41,061. You would consider that a rough and ready way of inducing the tenant to farm well up to the end of his tenancy?—That is the object of it, I conclude.

41,062. It being impossible to lay down, or to arrive at the exact value to the incoming tenant in practice, this method of compensation has been adopted?—It is impossible to do it. The more you try to do it in that way the worse you would make your Act.

Freedom of cultivation and sale.

41,063. Then with regard to freedom of cultivation, you have expressed yourself at various times in favour of doing away with antiquated restrictions?—Yes.

41,064. But would you be in favour of giving by law to a tenant an absolute freedom of cultivation and sale of produce?—No; certainly not.

41,065. Could any conditions be devised which would secure the landlord, if once that freedom were given by law?—No.

41,066. The mere laying down the principle that the landlord would be entitled to compensation, would not secure him compensation?—Not unless you give him something to come upon.

41,067. We have had evidence before us is in favour of giving by law to the tenant an absolute freedom of cultivation and sale of produce, subject to compensation to the landlord for deterioration?—That seems a very pleasant idea.

41,068. You would want some security?—I would give all possible freedom to the tenant; I would give him every possible freedom; but I must consider that the landlord is entitled to have something more back than a waste bit of ground.

41,069. You would not be in favour of giving by law this absolute freedom?—Certainly not.

Compensation for unexhausted improvements.

41,070. Now, I think there is one thing in your paper of 1870, and also in your evidence before the Richmond Commission which I have omitted to mention. Your idea then was that a fairer system of compensation for both parties was a very liberal compensation for the crops grown upon the land by the quitting tenant?—Yes; quite so.

41,071. Your argument was that if a tenant entered upon a farm which was only capable of growing a ton of straw to the acre, and he left it capable of growing two tons of straw, that additional one ton represented "condition"?—Quite so.

41,072. And that he ought to be paid liberally for that one ton?—Or allowed to sell it.

41,073. I think you advocated that for the increase of produce the man should be allowed market value?—Yes.

41,074. And in the same way with roots; if a man gradually increased the capacity of the land for growing roots, that would be an evidence of "condition"?—Quite so.

41,075. For which you would give liberal compensation?—Yes; certainly.

41,076. You thought then, and I wish to know if you think now, that the safest mode of compensation to an out-going tenant is paying for visible tangible products, rather than for things which are hidden and as to which you cannot obtain evidence whether they were properly used or properly saved?—I suppose that is common sense, is it not?

41,077. (*Mr. Clay.*) If the way-going year happened to be a very bad year for growing roots and straw, then the tenant might suffer by the badness of the year?—He might, certainly.

41,078. So even then it would not be a very sound criterion to go upon?—That is the nearest you could get to. I suppose a person is not called in at the last moment in those valuations; but he is allowed to look over the ground to see what is the general condition of the crops.

41,079. If the out-going tenant had left in the year 1879, and he treated the improvements on the basis of the bad crops that the year grew, owing to the season, he would be nowhere?—He would suffer; but there ought to be somebody who knows something about what the general farming of the man is, so as not to come upon him for a very bad year.

41,080. So you would qualify that?—Certainly.

41,081. With respect to what Mr. Little put to you in regard to "fertility," if the tenant is laying grass land down, there would be a considerable amount both of "condition" and of "fertility" left in the grass land?—Yes; you could not have grass land without accumulation.

41,082. So "fertility" is not merely the inherent capabilities of the soil; it is mixed up with the "condition"?—Yes, accumulatively. We have done a great deal with the analyses of soils, and we know a good deal more what goes on in the ground now.

Freedom of cultivation.

41,083. (*Mr. Channing.*) About the freedom of cultivation, a suggestion which has been made by some witnesses is, that freedom of cultivation would do no harm to the landlord or to the land, if an equivalent of manure was replaced on the land at the proper time for what was sold off in the way of hay or straw; would you object to freedom of cultivation in that sense?—Could you define a little what equivalent was? For instance, you may put on nitrate of soda, which would grow a great quantity of straw; but it would hardly be an equivalent, if you paid a man money for what he took away.

41,084. Do you not think that such an equivalent might scientifically and practically be defined in an agreement between the landlord and the tenant?—I think it might. There would be no difficulty about it; only you must not use the word "equivalent" without explaining it in some way, because there are such things as equivalents which are not in the least equivalents.

Scheduling the condition of farms.

41,085. About the "condition" of land, do you approve of the suggestion which has been made by a good many witnesses before this Commission, that there should be a schedule generally of the "condition" of cleanliness and "fertility," and of the state of the buildings on a holding at the entry of the tenancy; do you think that that would help very much?—If it is not too minute; the general condition of the buildings would certainly.

41,086. Do you think that the conditions as to the "fertility" and the productivity of the land could be entered in such a schedule?—I should think so certainly, by a person who knows what land is, and is accustomed to it. I should have no difficulty myself if I went over a farm of saying whether it was in a good condition, or in a bad condition, or in what condition it was, not the least in the world.

41,087. Do you not think that would help to settle the matter as between landlord and tenant, as to what was added or lost during a tenancy?—Are you raising a new question? Is that not really done at the present moment? Before a tenant goes on to a farm, does he not walk over the farm himself, and talk about the condition of it, "It is very foul," or "It is very much out of condition."

41,088. I am rather suggesting that that sort of talk should be crystallized into an actual document for reference subsequently?—One would like to see the document a little first, before pronouncing an opinion upon it.

Compensation for unexhausted improvements

41,089. I understood you to say in answer to Mr. Little, that you thought the question of added fertility was a question for experts, and not one to be settled by a rule of thumb of so many years, and so many bills as to manures and so on?—That is so.

41,090. It is a question to be determined by an expert going over the land, and determining the quality of the land?—Yes. A person with experience knows at once; if you are almost half-blind you can tell whether land is well-farmed and in good condition.

Farmyard manure.

41,091. There are only one or two questions I should like to ask you as to your experiments, although one might ask a great many. With regard to the results from manure, I suppose the comparatively high results obtained from farmyard manure alone are due to the use of cake?—No, that is merely straw and horse dung. You are speaking now of what I am putting on my land, are you not?

41,092. Yes, in your experiments, and I am referring to the figures resulting from the use of farmyard manure alone?—It is not rich manure.

41,093. It is not enriched by the use of cake or anything of that kind?—Certainly not.

41,094. How would you describe it—how would it be defined?—Is it what you would take out of a yard where animals walk about without any cake; they walk it well down; then you let it stand up in a heap. We have to rot it well, or else it would not go into the ground properly.

41,095. It is corn and hay that the animals have eaten, and things of that kind?—Quite so; it is the ordinary farmyard manure.

41,096. You have not purchased cakes—that is what you mean?—That is so.

41,097. On that I should like to ask you whether the comparatively high results obtained from farmyard manure do not give you rather a more hopeful view of the future of agriculture?—No, I do not think that that has anything to do with the future of agriculture. I have been putting on 14 tons of dung every year for the last 15 years.

41,098. That would be relatively cheaper?—That would be there, but it would take a man 100 years to get it out again, if he tried ever so much.

41,099. Would it not be relatively cheaper than others of the applications you have mentioned?—Yes, I think it would.

High farming.

41,100. You state that it would be ruinous to farm too high, and that the last bushel cost a far greater proportion than it was worth?—Yes, the dearer the corn the higher you may farm.

41,101. I suppose it would be equally bad economy to farm too low, would it not?—Yes, certainly. What you call the natural produce of the soil would not pay a man to cultivate now.

Deteriorated cultivation.

41,102. About the wholly unmanured land, did I understand you to be of opinion that the land was steadily deteriorating in value?—Very slowly—exceptionally slowly.

41,103. But steadily deteriorating?—We are taking off every year, as far as we can judge, about 10 lbs. weight of corn.

41,104. You do not think there is an irreducible minimum in it?—It would take another century, I think; but it still grows more than the average of the crop of the world.

Change in system of cultivation.

41,105. As between those two limits of too high farming and too low farming, do your experiments suggest to you any medium course, either of special applications or of rotations of crops, which would be the most economical way of working farming now?—No; in Norfolk you could not get away from the four-course system much.

41,106. You do not think there could be any modification of the courses?—No, except keeping the clovers two years instead of one, and that sort of thing, perhaps.

41,107. That would save a little in labour?—It would save labour.

41,108. But you do not yourself suggest any medium course between high farming and letting the land alone, which would be the cheapest way under present circumstances?—No. Farming is such an old act that it is very difficult to tamper with it; it is rather dangerous work.

41,109. Then really you think the only solution is permanent pasture for the most parts of England?—It comes to that if the price of corn is to stand where it is now.

Future of foreign competition.

41,110. (*Chairman.*) That, of course, is a matter of uncertainty?—It is quite a matter of uncertainty, but permanent pasture has been going on, although very slowly, and it will go on a little faster, that is all. I do not myself think that we can have many years at the low prices we have now.

41,111. You do not think so?—No, I expect there will be a re-action before long.

41,112. What do you ground that on?—It will hardly pay them to send it here. Nations cannot alter—in fact, nobody cannot alter suddenly—but I do not think it will pay them for many years to send it here at 3*s.* or 2*s.* 6*d.* a bushel.

41,113. Do you think the price is abnormally low?—I think so. You must recollect that they only grow about 10 bushels an acre.

Uncultivated land.

41,114. (*Mr. Channing.*) About this tumble-down land, which is very extensive in Essex and a good many other counties, what do you think would be the ultimate fate of that land, supposing it is broken up; do you think it would accumulate fertility to a certain extent?—To be sure it will, slowly.

41,115. But to any considerable extent?—It is very slow. But nature abhors a vacuum, and she will fill it up with something and put a growth upon it.

41,116. (*Chairman.*) Even fill it up with twitches?—That is a great factor; you will be surprised how land increases in fertility by leaving it alone.

41,117. Leaving it to the twitches?—Yes.

41,118. (*Mr. Channing.*) Is there any cheap way of introducing leguminous plants, so as thereby to increase the nitrogen in the soil?—No; the grass, the twitch, and that sort of thing will push them out.

Wages.

41,119. (*Chairman.*) Do you recollect the wages in your district in the year 1834, when you began farming?—They were about 8*s.* or 9*s.* a week.

41,120. When did the rise take place, about 1870?—The best it got up to was about 1872; everything was doing very well in those days.

41,121. Was it in 1872 that the wages of the labourers rose?—No, they had been rising all the way; but 1872 was the time when there was a sort of agitation, and they thought they would get a guinea a week.

41,122. There has been no subsequent fall of wages up to the present time?—No.

41,123. They have been maintained?—Yes.

41,124. What are the wages now?—12*s.* and 13*s.*

41,125. Then the labourers, at all events, in your district have not only not suffered, but have gained?—They have gained.

41,126. And they have gained the great benefit of the low prices besides?—Quite so.

41,127. Therefore, in addition to a rise of 30 per cent. in their wages, they have had the advantage of a fall in the prices of the commodities they consume of 30 or 40 per cent. more?—They are very well off indeed now.

41,128. Do you see any tendency to a fall in your district?—No.

41,129. (*Mr. Giffen.*) I suppose that 12*s.* does not include their harvest money and extras of that kind?—No. That is what it is at this time of the year, you may say.

41,130. (*Chairman.*) It does not represent the average over the whole year?—No.

41,131. What should you put the average for the whole year at?—I should think about 15*s.* or 16*s.*

Rules for farming.

41,132. (*Mr. Everett.*) As the result of your very interesting and wonderful experiments, could you summarise briefly what are the practical lessons to the pounds, shillings and pence farmer, to be derived from your experiments; could you point to a few leading lessons?—No. I could if you were the farmer and showed me your land, but I cannot lay down general rules for all farmers; it is impossible; I should only make a mistake if I tried to do it. I can go on anybody's farm, and I can see at once that there are certain things which they ought to do which they do not do, but I could not lay down that rule for the county, or even for the district.

41,133. In the present condition of prices in agriculture, is it your opinion that the arable land loses least if you let it baste itself?—No, I should prefer laying it down to grass certainly, to leaving it to what I call growing nothing.

High farming.

41,134. I think I rather gathered that you expressed the view that low farming now pays better than high farming, or loses less than high farming; I am speaking of the ordinary arable farm?—On the Norfolk land you could not farm without a certain amount of high farming. With a light land you must use cake or something; but you would not bring that on to a heavy land farm, where there is a fair amount of what I call natural produce.

41,135. Your conclusion on the whole would be, I expect, that the future of British agriculture is with animal products, rather than with corn or vegetables?—Yes, assuming the present prices prevail.

Agricultural depression in 1883–4.

41,136. You have the advantage of a very long retrospect of British agriculture, and you remember, I daresay, that there was considerable agricultural depression about the time that you began farming—in 1833 and 1834?—Owing to the immense English crops.

41,137. There was a Committee which sat to inquire about it in 1833, I think?—Yes, there was.

41,138. Have you paid any attention to those examinations into the depression of the 20 years before and after 1833?—I have looked at them decidedly. The difficulty of course is to see how far it was due to seasons, and those sort of things. There were great changes just then; there was the return to gold payments in 1820 and 1821 which had an immense effect upon agriculture at the time.

41,139. That caused a great fall in prices, did it not?—An immense fall in prices.

41,140. Which fall was generally believed to be due to that monetary change?—No doubt; in fact there was, for years, a fight amongst economists as to how much was due to good crops, how much to bad crops, and how much to currency. I studied those questions to see the influence of climate upon crops; that was my study; but I am always coming across these theories about currency.

Low prices of wheat and foreign production.

41,141. Is it not possible that the present extraordinary fall in prices is also due to monetary changes—have you paid any attention to that possibility?—I have: but I am afraid it is due to an increased production all over the world. You see we have India, we have America, and we have the Argentine, all growing immense crops.

41,142. Do you think the production of wheat has increased faster than the mouths that consume it?—I should say so, certainly.

41,143. Is there any evidence of that, do you think?—It is all poured into this country, and in those countries they do not starve. In India, for instance, they do not grow the wheat to eat; they grow it merely to supply us with it; in the Argentine it is the same.

Wheat production in India.

41,144. (*Mr. Giffen.*) Have you studied that point about India?—I am satisfied, as far as I know, that the natives do not eat wheat to any extent.

41,145 How much of the Indian production comes to this country, do you think?—I think it is three million or four million quarters.

41,146. Is it 20 per cent. of the whole, or 10 per cent.?—I do not know; I should think a great deal more than that. As far as I know, the Indians eat very little wheat.

41,147. Would you be surprised if I told you that the amount of wheat exported from India has never exceeded 15 per cent. of the total production?—I could easily understand it. Does that mean that they consume the bulk?

41,148. There is a certain number of wheat-consuming people in India, although the population of India generally does not consume wheat?—I thought they take gram, and some of those other cheaper things principally.

41,149. (*Mr. Everett.*) I think the evidence is, that something like 32 million acres of wheat are grown in India, and that that is about the same quantity which has been grown as long as man's memory goes back; the United States sent a Commission to inquire into it, and they reported to that effect?—I know they grow about 10 bushels an acre; that is their average crop.

The currency and fall in prices.

41,150. You have not given special attention to the possible currency cause of the present remarkable fall in prices?—Going on, you mean to say, since 1872, 1873, and 1874.

41,151. Yes?—No. It is very remarkable, but I would be very sorry to give an opinion about it. I have paid a great deal of attention to it, and taken a great interest in it, but I am not an expert, able to give opinions upon it.

41,152. Are you aware that the great depression which followed after 1819 was very widely attributed to the contraction or to the change in the standard made at that time; and therefore that there would look to be a certain kind of force in the reasoning that as great changes in the standard were made about 1873, the present great fall may likewise bear a close relation to those changes?—There is no question about the other one being due to money, and the return to gold payments—there is no doubt about that whatever—between 1816 and up to 1822.

41,153. Thank you. As an individual farmer, I should like to express my very high sense of the most wonderful experiments you have made, and for giving the public yearly the full advantage of accounts of them; I should think there is hardly anything in the whole history of the agriculture of the world like the long continuous experiments you have carried on, and given the public the full benefit of?—I am so sorry that it has not done more good.

41,154. (*Mr. Little.*) With regard to the state of a farm when a tenant quits, would you say that a tenant who leaves good crops and clean land, with a fair proportion of the area in a state to be sown with corn and other crops, has fully discharged his obligation to cultivate in a good and husband-like manner?—Quite so.

Effect of depression on arable cultivation.

41,155. (*Sir Nigel Kingscote.*) I understand you to say there is a very large area of land under arable cultivation at this present moment, which must go back to pasture to enable it to pay?—Assuming that the present prices are to prevail.

41,156. I suppose that would apply not only to sheep land, but to hundreds, if not thousands of acres of land, that was sheep walk and down, but which has been broken up and turned into corn land; it would be more valuable at this present moment if it was still down?—Yes.

Over-cultivation.

41,157. I also understand you to express a very strong opinion that, at all events for profit, you can overdo the cultivation of land?—Very easily.

41,158. You can lay out too much money upon it?—Yes.

Spade cultivation.

41,159. Do you think that spade cultivation can be made to pay better than with the plough?—No; that is, of course, assuming that it is the ordinary spade cultivation. A man came to me a little while ago about a spade that would dig for nothing. Of course, that is another thing; but you would not call it a spade.

41,160. We have had evidence in this room from a gentleman who says that by spade cultivation, deep cultivation, under his superintendence, and by unlimited manuring—by putting on, I think, he said, something like 30 tons—he had been able to grow 130 bushels of wheat to the acre, and 50 to 25 tons of straw?—Was there not a practical farmer in the room at the time who asked him how he supported that wheat?

41,161. He went on to give further evidence, and to state that he had had to put up pea-sticks to support it. Do you, for one moment, think that that would be practical, even on a small acreage?—I once went into the question myself of what we might do if we were blockaded —whether we could exist then, whether we could grow enough corn to keep us alive. There, I think, the pea-sticks would have to come in. Under those circumstances, when wheat would be worth two or three guineas a bushel, we might try pea-sticks.

41,162. He went on to say——?—I do not believe he ever did it on a large scale—he might grow a square foot or two.

41,163. You do not think it is possible?—I do not think it is practicable.

Small holdings and allotments.

41,164. Do you think that the produce of the soil can be very much increased, or at all increased, by small holdings and allotments?—Not materially. I think they can be increased to the benefit of the labourers, but not nationally, so as to supersede farming. I do not see my way to small holdings with small farmers, such as you have in Belgium and in France. I have looked very carefully into the question.

41,165. You do not think it is practicable?—No, it is not suited to our country. I have had a great many allotments of my own; but I never could find a labourer who would take more than an eighth of an acre.

41,166. And that is about the quantity that he really can employ himself over?—Yes; when you come to the little men who are a little better than labourers they will take acres.

41,167. But they want another occupation or employment?—Yes; I have got a list here, in case you should ask for it, showing the employment of all my acre people.

41,168. What are they, shoemakers and blacksmiths?—I have a list here; they are men with a little capital.

41,169. Blacksmiths and carpenters?—Yes; jobbers, carters, men with a horse and cart.

41,170. The agricultural labourer does not want the employment of digging after he comes home from his day's work, beyond the digging necessary to get his vegetables?—Nothing more than his garden; and then you cannot find him capital.

Utilisation of sewage.

41,171. Do you think town sewage can be utilised more than it is, for the benefit of farmers?—No; I have gone through that very carefully, and I have no idea of it. You probably remember Sir Edwin Chadwick saying that for twopence per ton he would distribute the sewage of London all over the place?

41,172. Yes; you do not think that is suitable?—He would not find a purchaser.

Light railways.

41,173. Of course a great many districts suffer from want of communication with populous parts?—Yes, quite so.

41,174. Have you given any thought to the question of light railways?—I have looked at it, but I do not think it is a national question; I think would be very useful in spots.

41,175. You would not like to see them made compulsory and put upon the rates?—No.

Labour.

41,176. (*Captain Owen Thomas.*) Is the quality of labour as good now as it used to be formerly?—No, certainly not.

41,177. Can you account for that?—The labourers are more independent and they are better off. They do not do a bit more than they can help; they have no interest in their work; they are not proud of it; they are not interested whether they drill straight or level.

41,178. During the whole of your experience, do you recollect anything like the present depression?—Never. When I began to farm, we had the wheat down to 5*s.* a bushel; but that was a temporary depression, and it was a depression owing to good crops.

41,179. How many acres of land do you think would be sufficient to keep a man and his family in ordinary times—not, of course, during this depression, but with ordinary prices?—He and his family are to live upon it?

Small holdings.

41,180. Yes; we have often asked the question, and some witnesses say 10 acres, others say 20?—I was going to say 10 acres as a guess, but I think I have never worked it out exactly—I believe I did once though. You see it would be useless to put him away from roads and that sort of thing. If he is near to a place where he can go and

Sir J. B. Lawes. 21 Feb. 1895.

buy his manure or sell his product, if he is near to a railway, he might get on—that is, if you find him the money. With 10 acres he could do it in my parish very well.

Position of farmers.

41,181. Would you say that farmers are losing money now?—Certainly, undoubtedly.

41,182. They are spending capital?—Yes, and their capital is diminishing. Look at the value of a man's capital; his wheat and his barley are worth hardly anything; his capital is gone, and that is why he hangs on, because if he goes out it is lost.

Sir J. B. Lawes. 21 Feb. 1895.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Seventy-seventh Day.

Friday, 22nd February 1895.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., *Assistant Secretary.*

Mr. JOHN LOOKER called and examined.

Mr. J. Looker. 22 Feb. 1895.

41,183. (*Sir Nigel Kingscote.*) You are, I believe, a land agent living at Wyton Manor, near Huntingdon?—Yes.

41,184. And you manage estates of about how many acres?—About 8,000 acres.

41,185. Do you farm any number of acres?—I personally farm 350 acres. I farm for other people about 2,300 acres.

41,186. At the present moment you are also a tenant farmer of 350 acres?—I am personally a tenant farmer of 350 acres.

41,187. Has that been a long time in your family?—That has been in my family since 1846.

41,188. About 50 years?—Nearly 50 years, we are going on to the 49th year now.

Effect of depression (1) upon landowners.

41,189. What is the effect of the depression upon the landowners, talking of recent years, as far as you know in your neighbourhood?—It is a reduction of their income from 40 to 60 per cent.; it produces an inability to lay out money on improvements of property and to employ tradesmen or labourers.

41,190. Has it driven many landowners to let their places and live elsewhere?—Yes, it has had that effect a good deal; a good many of our resident or would-be resident landowners are obliged to do so.

41,191. They have been obliged to reduce their expenditure, I suppose?—In consequence of the loss of income.

(2) upon the Pelly estate.

41,192. Can you give us an example of any estate between the years 1881 and 1894?—Yes.

41,193. Just shortly tell us what would the acreage be?—The acreage of this estate which is the Pelly estate is 2,768. In 1881 there was a gross rental of 3,179*l.*, and taking into account reduction of rents and repairs and agency expenses, there was a net amount paid to the landlord of 2,230*l.* 13*s.* 10*d.*

41,194. And in 1894, what was it?—On the same estate, with the same acreage, there was a gross rental of 2,243*l.*, and after the reductions in rents (which was 649*l.* 9*s.* 6*d.*) and repairs and agency expenses, the net amount paid to the landlord was 1,222*l.* 2*s.* 3*d.*

41,195. Very nearly half the former figure?—Very nearly half.

(3) upon a large estate.

41,196. Can you also give us an example of a smaller estate?—Yes, but if you will allow me I will first refer to one other large estate in the county, which is well known; I will not give the figures, because I have not got them, but I have got a letter from the owner of that estate, which corroborates the figures I have given.

Mr. J. Looker. 22 Feb. 1895.

41,197. Is it from a district known to you personally?—A district known to me personally in Huntingdonshire. He says "I can assert with confidence that the gross rental in 1873 more than doubled that in 1893." He is an owner of a very large estate, and an estate which Mr. Little is very familiar with, in the county of Huntingdon.

(4) upon a small estate.

41,198. Now will you give us an example of a small estate?—The acreage is 316 acres; the gross rent in 1881 was 441*l.*; the repairs and agency expenses came to 41*l.*; and the net amount paid to the landlord was 400*l.* On the same estate in 1894 the gross rent was 150*l.*; and after the reduction in rent and repairs and so on, the net amount paid to the landlord was 129*l.* 14*s.*

41,199. That is a still greater reduction than in the larger estate?—It is. These examples could be multiplied *ad infinitum* if necessary.

(5) upon large farmers.

41,200. What is the effect of the depression upon the large farmers; are they losing their capital at all?—Undoubtedly the large farmers are losing their capital.

41,201. Are they reducing their domestic expenditure?—Yes.

41,202. Do they employ less labour?—Yes.

41,203. Are there any instances of arable land going down to grass?—A good deal of arable land in our county and the adjoining district, or bordering on the county—that is parts of Cambridgeshire.

41,204. Is that land what I might call tumble-down or being properly laid down, or some of both?—Some of both; I should think perhaps it is half-and-half; a great deal is being laid down properly, and a great deal is tumbling down.

41,205. But with the view of saving expenditure and labour?—Inability to cultivate it at a profit is the reason it has got into that state.

(6) upon small farmers.

41,206. As regards the small farmers, are they any better off than the large farmers?—They are no better off than the large farmers, unless they have some other source of income, either as tradesmen or something of that description; or else have ceased to occupy arable land. The small grass farmers, who depend on milk

Mr. J. Looker. 22 Feb. 1895.

and not on corn growing, have been able to hold their own considerably better than those who have had anything to do with trying to grow corn.

41,207. You do not think the small farmer who occupies arable land, unless he has had other occupations, has been able to weather the storm better than the large one?—He is as bad off as anybody else.

(7) upon labourers.

41,208. What has been the effect on the agricultural labourer?—The general effect on the agricultural labourer must be taken in its effect on two classes. On all farms there is always a certain amount of the better class of labourers who have been in constant employment——

41,209. Such as shepherds and stockmen?—Shepherds, stockmen, the foreman and the horsekeeper. They have not suffered at all in villages; they are always in constant employ and are being constantly sought after; but the general labourer, not being one of the above, finds himself for many weeks in the year out of employ, and drifts away into towns and other various occupations.

41,210. The younger men, you mean?—The younger men do, and the casual labourer does. That leaves the residuum, which are at times very often pinched for even almost the bare necessaries of life.

41,211. Those who have got constant employment, I suppose, live better than they used to do?—They do, because they get more wages. When you say, "used to do," of course you refer back for some years; and the purchasing power of those wages is considerably better.

41,212. Then they get their school fees for nothing?—They also get school fees.

Wages.

41,213. What are your general wages at this present moment?—The general rate of wages, I think, I might say is 10*s.*, but my own wages have never been below 11*s.* on my own farm.

41,214. Never less than 11*s.*?—I have personally paid 11*s.* on my farm, which I cultivate for myself, but I am paying on another large estate, where I have 1,200 acres in hand at this present moment, 10*s.* I think you might say that the general run of wages at this moment for the ordinary labourer is 10*s.* That is not the average rate of wages for the year; I am speaking of the present rate of wages for the ordinary agricultural labourer.

41,215. Is that higher or lower than it was, say, 10 years ago?—I should say that is lower than it was 10 years ago. I could tell you absolutely if required.

41,216. If you have got it there we should like to have it. What should you think was the highest—13*s.* 10 years ago?—I took out the schedule of wages for my own farm, which is a fairly representative one, and it ranges from 14*s.* down to 11*s.* I was paying once, just about 10 or 12 years ago, 14*s.*, which gradually reduced itself to 13*s.*, to 12*s.*, and now to 11*s.*

41,217. Although they only earn 11*s.* now, do you consider the labourer is better off than he was when wages were higher, because he can buy everything much cheaper?—Certainly; the 14*s.* was in 1887, the 13*s.* in 1879, the 12*s.* in 1880, and from then it has been 11*s.*

Land out of cultivation.

41,218. You told us just now that a considerable quantity of land had been laid down to pasture, and some had tumbled down; is there any land actually gone out of cultivation?—I do not know of any land which does not bring in some returns, but it is not a return from cultivation. For instance, there is rough herbage upon it. There are hundreds and thousands of acres which have ceased to be cultivated, if you take the term "cultivation" to mean what it is supposed to mean. But the land makes some return to the landlord, because it lets for a small sum for grazing purposes.

41,219. (*Mr. Channing.*) Occasionally or by the year?—Generally it is let by auction for a year. I am speaking of the larger farms. I let by auction myself every year from 1,000 to 2,000 acres of land, which has gone out of cultivation, because it was not able to be let in the ordinary way.

41,220. (*Mr. Little.*) But it has not been designedly laid down; it has simply tumbled down?—It has simply tumbled down.

41,221. And it makes something; it is not derelict?—It is not derelict, because it brings a return.

41,222. (*Sir Nigel Kingscote.*) What is the return that it brings in?—In two instances I make more than I should be able to let it for to a tenant at the present moment for cultivation.

Mr. J. Looker. 22 Feb. 1895.

41,223. How is that?—Because, taken in comparison with the rents in the neighbourhood, the expenses of the auction and of the shepherd, and of the rates, do not come up to anything like the amount of the reductions and the repairs which a tenant would require.

41,224. Do you put it up to auction?—Yes, every year, and have done for 10 or 12 years.

41,225. What price per acre do you obtain for it?—In one instance I get an average of 1*l.* an acre. The price varies from 60*s.* to 2*s.* 6*d.* on the same farm.

41,226. (*Mr. Little.*) Then that would include some grass land, would it not?—Yes, the old grass, which was old pasture previously—the good old pasture—runs up occasionally to 60*s.*; and the strong clay which has laid itself down and tumbled down, is absolutely or simply a sheep run, goes as low as 2*s.* 6*d.*

Deterioration in cultivation.

41,227. (*Sir Nigel Kingscote.*) As regards what does remain arable, is there any deterioration in the quality of the cultivation?—Yes, undoubtedly. I estimate that the deterioration—and, of course, it is only an estimate—in the quality of the cultivation in our country and in our neighbourhood is at least 25 per cent.

41,228. You think it has decreased that much?—I think it has.

41,229. I suppose that has been brought about in two ways, namely, because the tenants are not able to spend so much in cakes and feeding stuffs, and because they are also not able to spend so much in manures?—Quite so; and generally because they have not the money to carry on a better class of cultivation.

Changes of tenancy.

41,230. Are the farms changing more frequently than they used to do?—Up to the last year I may say there were very frequent changes; but, apparently, there is a slight stoppage in it now.

Changes in system of farming.

41,231. Has there been much change in the system of farming as regards wheat; is that the main crop now?—Wheat was the main crop until this last year; this last year the system has changed considerably, and a great many farmers have very much reduced their wheat area.

41,232. What do they put in its place?—They are waiting to put in barley or oats.

41,233. (*Mr. Little.*) You mean for this seeding; you do not mean the harvest of 1894?—I mean that last autumn, instead of sowing their normal breadth of wheat, a great many of them, and I myself am an example, for I only sowed a third, and that purely for the sake of the straw, have sown very much less.

41,234. (*Sir Nigel Kingscote.*) Do you wish to substitute for wheat other grain crops?—I wish to substitute, indeed I must, other grain crops in place of wheat.

41,235. Is your system of farming altering, so as to enable you to keep more or less stock on the land?—There is considerably less stock now than there used to be.

41,236. Less stock, do you say?—Yes, because there is not the capital to do it, to start with.

41,237. (*Mr. Channing.*) Would things then be made considerably worse if more land is being laid down permanently or temporarily?—It would be worse for the nation if you put it so.

41,238. And worse for the men too?—Yes.

41,239. (*Sir Nigel Kingscote.*) Taking it altogether the system of farming has deteriorated instead of being kept up to what it used to be?—Undoubtedly.

Management of estates.

41,240. As regards the management of estates, is there much alteration?—There is a great deal of alteration in the class of men who used to be estate agents and who are estate agents now.

41,241. What sort of difference?—Twenty-five years ago all our land agents were solicitors, who simply said to a man, "There is the farm, and that is the rent; if "you do not like to have it, somebody else will." They have nearly all gone out. Times have beaten that class of men.

41,242. Who have taken their places—more practical men?—Their places are taken by practical men, who are able to farm the land for the landlord when he gets it in hand.

Mr. J. Looker. 22 Feb. 1895.

41,243. The fact is that on many large estates formerly the agent was very often a solicitor?—Almost invariably the agent for an estate was a solicitor.

41,244. That sort of man is not much in vogue now, and he must have a practical man who can actually farm the land?—I may say that I should not have been anything but a tenant farmer if it had not been for this very same cause.

41,245. I suppose that an agent now must be capable, as regards repairs, improvements, and drainage, and everything else connected with farming?—Quite so.

41,246. He must know how to carry it all on?—He must. He must be a practical surveyor and a practical farmer at the same time.

41,247. So that he may save what he can for his landlord, and do the best towards the tenant?—Yes, and not spend any more money than he can possibly help.

Rural depopulation.

41,248. Has there been any depopulation in the agricultural villages in your part of the world?—Yes, in the purely agricultural parishes. If you take out, which I have taken the trouble to do, the 40 parishes which are purely agricultural you will find there has been a reduction in population from 14,196 in 1871 to 10,542 in 1894, and that has since decreased proportionately in the last two or three years.

41,249. More have gone?—More have gone.

41,250. These agricultural labourers having gone, and also less money being spent by the tenant farmers and by the landlords, are the inhabitants of the villages, small tradesmen, publicans, and others feeling the depreciation very much?—They are very sensibly; not only the village tradesmen, but the people in the towns dependent on the supply of money coming from agriculture are also in a much worse state than they were 15 or 20 years ago.

Fall in prices.

41,251. May I ask you what you put the cause of the depression down to chiefly?—The fall in prices undoubtedly is the cause. If we could make more money of the stuff which we grow we should be better able to pay our way, and could pay everybody more than we do now.

41,252. I suppose that you would say that the fall in the price of corn was the strongest ingredient which produces the fall in the value of land now?—The fall in the price of corn is the great factor in the depreciation which is at present existing.

41,253. Could you give us any example?—On the farm of which I am tenant, taking the three years 1877, 1878, and 1879, the average price of wheat was 2*l.* 7*s.* 7*s.*, and of barley 2*l.* 3*s.* 3*s.*; the average value of the corn crop realised for these three years was 1,428*l.* 6*s.* 5*d.*, and my average labour bill was 626*l.* Compare those three years with the three years 1892, 1893, and 1894, when the average price of wheat was *l.* 5*s.* 1*d.* and of barley 1*l.* 9*s.* 1*d.*, the average value of the corn crop realised being 866*l.*, and the labour bill being 496*l.*

Bad seasons.

41,254. (*Mr. Little.*) When you say the years 1877, 1878, and 1879, do you mean the harvests of 1877, 1878, and 1879?—Yes, I do.

41,255. Then that period included a very bad year?—That included one very bad year.

41,256. And one not very good year, 1878?—Personally, perhaps, on my farm, I think, that 1878 was not a bad year.

41,257. (*Sir Nigel Kingscote.*) I suppose 1879 was a very bad year?—1879 was a very bad year.

41,258. (*Mr. Dalton.*) The other three years, 1892, 1893, and 1894, were they good years or bad years?—As far as the quantity produced was concerned 1892, 1893, and 1894 would be fairly an average, equal to 1877, 1878, and 1879.

41,259. Would they not be any better?—They would not be any better.

41,260. (*Mr. Little.*) The difference would be in the price?—The difference of these two returns is in the price entirely.

41,261. (*Mr. Channing.*) 1893 would be a very bad year, would it not?—1893 was bad, and 1879 was bad.

41,262. Is this farm you are speaking of the farm that you rent?—Yes.

41,263. As I understand, you do not state the rent and the other outgoings besides?—They were all stated in a return I gave to Mr. Pringle. I can tell you the rent from memory.

Mr. J. Looker. 22 Feb. 1895.

41,264. (*Mr. Little.*) But, of course, Mr. Pringle does not in his report give any names?—I did not know that the Commission would not have my previous report (which contained these figures) laid before them; so that the evidence might be taken together. Unfortunately the rent is so fixed on my memory that I cannot forget it; it is 573*l.* 10*s.* a year for 351 acres.

Reduced labour.

41,265. (*Mr. Dalton.*) Is the average labour bill which you have given us for these two periods of three years the labour bill for the corn only?—No, the labour bill extends to the whole farm. I drew out the average of the labour to show not only that I suffered myself, but that the labourer suffered also from the bad price of the corn, or rather that the money which was spent in the village and the neighbourhood was lessened owing to the bad price of the corn.

41,266. (*Sir Nigel Kingscote.*) You spent considerably less in the last three years than what you did in the former three years?—I did; these are the absolute figures taken from my books.

41,267. (*Mr. Channing.*) Is there any more grass on the farm now than there was then?—No, it is exactly what it was then.

Foreign competition.

41,268. (*Sir Nigel Kingscote.*) Then, of course, these prices are really the result of the importation of foreign food?—That is my idea, and that is my theory.

Labour.

41,269. As regards the supply of labour, does that fall short with you?—We are not short of labour, because we do not want so much as we did. If my farm had been cultivated in the same way it was 25 years ago I should be extremely short of labour.

41,270. Is the quality of labour as good as it used to be?—The quality has deteriorated considerably. Beyond the best men, who are, perhaps, one-third of your labour supply, the remainder are either incompetent or unable to work.

41,271. In fact, whether it is the increased education, or whatever it is, whether it is the facilities for travelling, for instance, the younger and better class of men go off into the towns, and do not stay to learn the agricultural work as they used to do?—Yes, that is so. Increased education enables the better class of young men to obtain work in towns as carmen, porters, policemen, and so on; and they leave behind them the inferior young and the worn-out old.

Rates.

41,272. As regards rates and taxes, have they increased lately, or are they very much the same?—The increase in rates and taxes proportionately to the income is very great; the absolute volume of rates and taxes, as it was 10 or 15 years ago, does not vary very much.

41,273. (*Mr. Dalton.*) What is your union?—I live in St. Ives Union, and this farm that I am speaking of is in the Union of St. Ives.

41,274. Have you got the figures as to the rates in your union?—I am afraid I have not brought them with me. I have left the particulars behind; but, practically, it is what I have said, namely, that the amount is the same for the last 10 or 12 years.

Land tax.

41,275. What is it in the £?—The amount in the £ is, speaking from memory, 2*s.* 7*d.*

41,276. (*Sir Nigel Kingscote.*) Have you anything to say about the land tax?—Yes.

41,277. Do you look upon that as being oppressive upon the land, or not?—I think the land tax, as compared with the burden of taxation upon other property, is very unjust.

41,278. As I understand from your brief, you mean that when taxes on trade were abolished some years ago, the land tax remained?—The land tax remained. In 1842 the land tax was, I take it, permanently re-established on its present basis.

41,279. (*Mr. Little.*) In 1842? That was in 1798?—But it was re-adjusted in 1842; it was permanently established then at 4*s.* an acre.

41,280. No, excuse me, the quotas were fixed in 1700, and the quotas have been the same since 1798 for each parish?—I was taking 1842 and the land tax as it was at that time; whether it had been in existence absolutely on the same basis in 1798, did not enter into my mind. The land tax was permanently re-imposed, I think you will find, that is my information, and I am only speaking from history, in 1842. In 1842 there

Mr. J. Looker.
22 Feb. 1895.

were co-existent in taxation several manufactured articles. These were gradually abolished and in 1861 they ceased to exist, and the compensating duty on corn ceased entirely in 1869. My point was this: that though taxes on trade were abolished, and the compensation through the corn duties taken away, the land tax still remained.

41,281. What you wish to urge is that other interests have been relieved of taxes?—And the land tax still remains.

41,282. (*Sir Nigel Kingscote.*) And we are told in your brief has become an hereditary burden?—That is the complaint we hear about it. I think I ought to say this, that all those taxes which were then in existence on trade, were also for the encouragement of agriculture. Take, for instance, candles, soap, starch, glass, bricks and tiles; a tax upon all of those operated as a protective duty on those articles, which, more or less, came from the land. There was also a tax upon imported butter.

Loss of capital.

41,283. Now we will go to another head. Do you suppose there has been a large loss of capital in farming operations by tenants and landlords of late years?—Undoubtedly there has been a considerable loss.

41,284. Do you think that is one of the contributory effects of the depression?—It is, certainly.

Deterioration in cultivation.

41,285. I suppose the deterioration in cultivation is also one of the effects of the depression?—That is one of the effects.

41,286. Not the cause of it?—No; there was not bad cultivation until the necessity arose for economy of money, because I suspect they then had not the money to spend.

Tenure.

41,287. Do you think the existing tenure has any share in the depression?—I do not think that it has the slightest effect upon the depression.

41,288. You do not hear of it as a cause of complaint amongst the farmers?—I hear no complaint as to whether the land is freehold, copyhold, or whatever tenure it is; in fact, as far as I can see, I am not aware that it makes any difference.

Agricultural Holdings Act.

41,289. As regards the Agricultural Holdings Act, does that come into operation in your part of the world?—Yes; it is not very general, but it is in operation, and it is repeatedly called into operation.

Compensation for artificial manures.

41,290. What is thought regarding it?—The general complaint made is that there is a notice required before they obtain any compensation for cake or artificial manures. The tenant farmers think that that ought to go without a notice, that there ought not to be a notice of that, and that the practice ought to be more or less analogous to the Lincolnshire customs, for instance. It is undoubtedly a source of many claims, not particularly large ones, but of small claims, being thrown on one side, rather than face the counter-claim, which the landlord occasionally brings, when a claim is made under the Act.

Notice of claim.

41,291. Have you any suggestion yourself to make as regards the Act, whether it would be better to have less notice or more notice, or simultaneous notices, or what?—I think it would be an excellent thing if cake, artificial manures, feeding stuffs, and claying, were subjects which you should not be required to give notice for. I only mention claying, because other matters which might be equal to that are not in vogue in our neighbourhood.

41,292. Do you think the landlord and the tenant ought to give in their claims on the same day?—No, I do not. I think if the Act were managed as I suggest, there would not be one claim in 50; all the other matters are mere bagatelles compared with these four subjects which I have suggested.

41,293. Then, as I understand, you think as regards notice that the agent might take the place of the landlord?—I think that the Act saying that notice shall be given to the landlord is very often the cause of considerable trouble. It is rather a moot point, I believe, whether "the landlord" there means the landlord personally or whether it means "the landlord or his agent." If it were clearly defined that they might give the notice to the agent, I think it would save considerable trouble; but it would come to the same thing in the end.

Official referees.

41,294. Would you like to see a referee or umpire, chosen by any particular parties, or by any particular tribunal, or what would you like to see in that respect?—I think all references under the Acts should be decided by men of a certain calibre and status; and to guarantee that, I think they ought to be selected from a district list approved of or holding certificates from the Board of Agriculture. I make this remark because I saw that one gentleman in giving evidence before this Commission recommended the appointment of one man approved of by the Board of Agriculture for each county. I must say that that would not work at all in our district. We are a very small county, and if you had one man only, you would give him the monopoly of all this work; also many occasions would arise when everybody has not the same confidence in one man which they would have if they had a list to select from. It would restrict itself to one man in a county; and as we have a small area, we more frequently than not have to go outside the county for a referee; not only for that reason, but also for another, namely, that he is farther away from the locality, and is more likely to be free from bias or prejudice.

Mr. J. Looker.
22 Feb. 1895.

41,295. Then you would have a certain number?—I would have a certain number for all valuations which are carried out under the Act; I am not referring to other matters.

Law of distress.

41,296. Would you like to see any change in the law of distress?—As there is some question and some doubt as to whether in some cases a year and a half's rent can be claimed, I think it would be considerably better if one year only in all cases were all that the landlord could be able to claim, whether his rent was collected in advance or otherwise.

Restrictions.

41,297. As regards the restrictive clauses in agreements, would you like to see a more liberal interpretation of custom, would you like to see a general extinction of restrictions, or is the interpretation given to those clauses now too liberal in your estimation?—I think the landlord ought to be and must be protected in many instances by restrictive clauses.

41,298. Do you mean that the landlord might otherwise be at the mercy of an unscrupulous tenant?—If a landlord gave what I call an absolutely free hand, he would be giving the opportunity to some man to ruin him.

41,299. Therefore you think it would be only fair that there should be general restrictions?—I think it is an absolute necessity.

41,300. (*Mr. Little.*) You would not be in favour of giving by law to a tenant absolute freedom, subject to compensation to the landlord if he were injured?—Freedom of cultivation?

41,301. Yes?—Certainly not; I would not, under any circumstances.

41,302. Because the security for the compensation might not be forthcoming when the mischief was done?—The man would not be there. I mean it would be giving an opportunity for an unscrupulous tenant to sell off and ruin the whole of your farm, he himself at the same time being ruined, because, as a rule, when a man does that, he generally brings himself to the ground as well. You can get no compensation out of anybody then, for you have got nobody to fly to.

Railway rates.

41,303. (*Sir Nigel Kingscote.*) As regards railway rates; are they complained of by the growers of vegetables, roots, and other farming produce in your district?—No. Some people complain of the railway rates, but I have never heard of any serious complaint on that head. The plea generally is that they do not carry the stuff cheap enough for them; they want it carried cheaper than it is now.

41,304. You do not think that that is the cause of the depression in your part of the world?—It is not in any sense a cause of the depression.

Rates.

41,305. As regards remedies, have you any remedies to propose; I see from your brief that you make some suggestions as regards the incidence of taxation?—I think there are certain local burdens which would be much more fairly put upon the Imperial Exchequer. As showing the incidence of taxation, I have already handed in to the Secretary a statement of the absolute incidence of rates in one particular parish in my neighbourhood. (*See* Appendix A., XXIII.)

41,306. Do you think that a sensible reduction might be made by throwing the cost of many things, such as education, the non-resident poor, main roads, police, lunatics, registration of voters, sanitary matters, and the carrying out of the Local Government Act, 1894, directly upon the Imperial Exchequer?—I do.

Mr. J. Looker. 22 Feb. 1895.

41,307. There has been a considerable help in that direction already, has there not?—There have been subsidies towards some of these objects, but, unfortunately, only a very small portion of the subsidy gets into the farmers' pockets. We are told, I believe, that out of every 5,000,000*l.* only 1,000,000*l.* goes to release the rates.

41,308. (*Mr. Dalton.*) No?—I took that to be Sir William Harcourt's express statement in the House of Commons.

41,309. I think the statement was that out of every 5,000,000*l.* in aid of the rates 1,000,000*l.* came in aid of agricultural lands?—That is what I say, 1,000,000*l.* out of 5,000,000*l.* gets into the farmers' pockets—the occupying owners' pockets.

41,310. The householders in towns, of course, take their share of it?—Exactly, leaving one-fifth only for the landed interest.

Technical instruction.

41,311. (*Sir Nigel Kingscote.*) Has much money been spent by the County Council on agricultural technical education in your county—on dairy farming, for instance?—Yes, in the county they have had their usual contributions from the excise duties, and they have devoted something like 2,300*l.*, I believe, to this subject.

41,312. In your estimation has it done good?—Not commensurate with the expense. I should not like to say it had done no good, but I should not like to say it has done as much good as the same amount spent in some other ways might have done.

Dairy farming.

41,313. Is dairy farming carried on much with you?—No, dairy farming is not very much of an industry in Huntingdonshire. There is one small district where there is a large open common attached to the township, which sends a good deal of milk away, but beyond that Huntingdon is not suitable for dairying.

Fruit culture.

41,314. I suppose there is very little fruit culture in Huntingdonshire?—Fruit culture is extending, but there is not much of it at present, comparatively speaking, in the county.

41,315. (*Mr. Little.*) That is not very successful, is it?—I do not think that one can say that because it has not been in operation long enough to test what profit there will be eventually upon it.

41,316. Not down at Colne and about there?—But that is not a recent fruit industry.

41,317. It has been growing there, has it not?—Yes, it is fully developed there; but I am speaking of the more recent attempts at cultivation.

Duty on barley and hops.

41,318. (*Sir Nigel Kingscote.*) Have you anything to say about the duty on barley and beer and hops?—My opinion is that the depression in agriculture might be, I do not say absolutely taken away, but relieved, if encouragement were given to the growth of British barley and hops, and if prices were raised by putting a duty upon all substances used in brewing beer, except British barley and hops.

41,319. Is that a pretty general opinion about you?—That is an opinion very strongly held by a great many people in the neighbourhood.

Reduced rental on the Pelly estate.

41,320. (*Mr. Little.*) In reference to the first estate that you spoke of, is there any land in hand, or is it all let?—That is all let at this present moment.

41,321. The figures that you have given us show a decrease of about 30 per cent. in the gross rental?—Yes.

41,322. And about 45 per cent. in the realised rental?—I think that is so. I have not worked them out, but I take that to be correct.

41,323. The realised rental is now considerably less than 10*s.* an acre, is it not?—Yes.

41,324. That is an estate, if I am right, where it was a great object to get on to some 30 years ago; it was then a very coveted occupation?—A relation of mine was offered 1,000*l.* for the goodwill of the offer of a farm, if it could have been transferred to another party 28 years ago.

41,325. It was such a coveted spot?—It was such a coveted spot that one gentleman said, "If you will let "me step into your place I will give you 1,000*l.*

Land out of cultivation.

41,326. I understood you that in some instances, where the land had fallen out of cultivation, or rather had ceased to be cultivated, it paid the landlord better to take what he could get from a casual tenant than to keep it tenanted and cultivated?—That is so to my knowledge in the case of two farms of 500 acres.

Mr. J. Looker. 22 Feb. 1895.

41,327. If they had been let as farms, the average rental would not have been as good, and the expenses would have been greater?—The return to the landlord would not have been as much, if let for cultivation, as it is at the present time let for herbage only.

41,328. Under such circumstances there must be many cases where the landlord has no very great inducement to keep the land let?—There is an inducement to keep the land let if he could get a rent.

41,329. Yes, but the rent which he can get is not sufficient to give him a strong inducement to let it, if he can make as much by abandoning the worst portions of it?—That is so up to this present time, but I think it ought to be borne in mind that if the area is extended, the demand for herbage would be satisfied quicker, and then the price of the whole would go down.

41,330. But if the necessary result of the present prices were to be that a larger amount of land were to be thrown out of cultivation, then this depopulation that you have been speaking of must increase?—Clearly that is so.

41,331. The people could not continue to live, neither the labourers, nor the tradespeople, nor anyone else?—That would be so.

41,332. Is it your opinion that there is in the district of Huntingdonshire and the surrounding counties, a very considerable area of land which could not possibly be cultivated at the present price of corn?—I should say at least three-quarters of the county of Huntingdon is farmed at this present moment at an absolute loss.

Tithe.

41,333. I have not heard you mention tithe at all as entering into the question of rent; I think in Huntingdonshire there is very little tithe?—No, except on portions of the fen; there is tithe there. I have not made any mention of the tithe.

41,334. In the inland parishes, tithe was redeemed at the enclosure by setting out glebe farms, was it not?—It was; there was land in lieu of tithes.

Wages.

41,335. You gave us the wages of labourers, but you did not give us an estimate of the earnings, taking the whole year round; what would you say they earn, taking one week with another all the year through?—The first class 15*s.* and the second class 13*s.*

41,336. Among the first class would you put the horsekeepers?—Yes, I put the horsekeepers, foremen, and shepherds in the first class.

41,337. You are including now what they earn as extra wages in harvest, and spreading it over the whole year?—Exactly.

41,338. Would they get anything in addition, house rent, for instance?—I have taken the house rent into consideration.

Arbitration.

41,339. You recommend in your brief that matters of valuation and all disputes as to the construction or non-fulfilment of agreements, should come within the provisions of the Arbitration Act of 1889; will you explain how that procedure would differ from that under the Agricultural Holdings Act?—The Arbitration Act of 1889 says that "submission" shall mean where any two persons agree in writing to submit their differences to arbitration. Where there is no agreement in writing necessarily there is no submission. It often happens in practice that, where there is no agreement between the parties, the valuer for one party may be contumacious, and it may answer his purpose to delay the proceedings, and in that case there is nothing to force him except an action at law. If the provisions of the Arbitration Act were applied to all valuations, and it should be implied that in all cases, whether there was an agreement in writing or not, there should be submission, the machinery of the Arbitration Act would be brought into force to facilitate and expedite all valuations under the Act.

41,340. When you say "agreement in writing" do you mean an agreement in writing as to the terms of the holding, or an agreement in writing to go to arbitration?—I mean an agreement in writing of any sort or description. You cannot bring in the Arbitration Act unless there is submission; there is only submission where the parties agree in writing to submit; therefore, any other tenancy which is not held under an agreement in writing cannot be brought com-

Mr. J. Looker.

22 Feb. 1895.

pulsorily under the provisions of the Arbitration Act. I would amend it in that respect.

41,341. But it can be brought under the Agricultural Holdings Act?—But all schemes are not under the Act. I am thinking of all valuations, whether under the Act or not. When the scheme is under the Act, practically there is not so much difference between the provisions and the course of procedure in the Arbitration Act.

41,342. Then do you mean in a case where there is no agreement in writing, any one of the parties should be able to set in force the Arbitration Act without the consent of the other party?—Certainly, as far as matters referring to agricultural valuations are concerned.

41,343. Where custom gives a man compensation for the ordinary incidents passing from one tenant to another, as crops, could you compel a valuation there, except by going to law?—I do not know any other means of doing it.

41,344. If the incoming tenant, or rather the landlord, refused to recognise the claim, the outgoing tenant might appoint his valuer who would be powerless?—Yes; there is no machinery to compel the incoming tenant to pay or the outgoing tenant to be paid, unless by action at law.

41,345. Or the landlord?—Or the landlord, as the case may be.

41,346. Not under the custom?—Not under the custom.

Compensation for artificial manures, claying, &c.

41,347. Under an agreement, of course, the thing would be provided for. Do you know whether it is the practice in your neighbourhood, you would know if it were, to substitute compensation for the Act?—Compensation is substituted a very great deal on the large estates, for the Act; and I have got an example of it.

41,348. Can you give us the definite form which it takes?—Shortly what the effect of it is?

41,349. Yes?—The effect of it is that most tenants get paid for a proportion of the cake in the last year; a proportion of the artificial manure on the roots used the last year; and for the claying.

41,350. Then the compensation is based upon the proper expenditure, and during a recent period, a defined period?—A period which has been defined by practice.

41,351. I mean in the substituted agreement it says, so much consumed in the last year, and so much consumed in the year before?—I beg your pardon; I thought you were referring to the substituted compensation when you said "definite period." The substituted compensation is carried out in practice by a certain number of years' compensation.

41,352. In the substituted agreement does it not define the period?—In the substituted agreement it defines the period, as a rule.

41,353. Where there is no substituted agreement the valuers by consent spread the cost over a certain number of years?—Quite so, and, generally speaking, that is uniform, but not in all cases. I mean the compensation is not always spread over the same number of years under the Act. The Act says you shall have compensation.

41,354. In arbitrations under the Act?—In arbitrations under the Act; I mean to say in the practice in carrying out the Act.

41,355. It does not limit the time?—No, it does not.

Notice of claim.

41,356. I understood you were of opinion that claying land, and the application of artificial manure, and the consumption of cake, in your opinion, should not require notice of claim?—That is so. I strongly think that a tenant ought to be entitled to that without any notice, that he should not set the Act in motion for that purpose.

41,357. The case of claying is particularly one where there could hardly be any dispute as to the fact of its having been done, or the manner in which it had been done?—No, that is not open to fraud in any shape or form.

41,358. Whatever necessity there may be for giving notice in the case concerning the use of artificial manure or cake, there can be none with regard to claying?—Certainly, there is no question about claying.

41,359. Would you say it was a great hardship where claying has been done, and no notice of claim has been made, that compensation has been refused?—Certainly it would be a great injustice.

Mr. J. Looker.

22 Feb. 1895.

41,360. *Primâ facie*, supposing there were nothing to explain the circumstances?—Of course I mean in a *bonâ fide* case. If a man simply forgot to give notice of his claim, or somebody on his behalf forgot to give notice, I should say, although he might be deprived of his compensation on that account, it would be a very great hardship and a great injustice.

Official referees.

41,361. You say that any referee or umpire under the Act should be selected from a list holding certificates; would you confine individuals in the choice of the referee in the first instance to those?—Under the Act I would.

41,362. You think it is desirable?—I do, because it is the very first start, which rightly or wrongly makes the thing go satisfactorily.

Restrictions.

41,363. Then with regard to the restrictive clauses in leases, you said very distinctly that you were not in favour of the law giving a right to a tenant to crop and cultivate as he pleased; but would you justify the restrictions of antiquated leases with regard to cultivation and the sale of produce?—You must give me some more definite points. I could not answer that as an open question.

41,364. Would you say that under the altered circumstances of agriculture, it is necessary to give the tenant a freer hand than in former days?—A freer hand certainly.

41,365. A freer hand?—Undoubtedly.

41,366. Would you say that a tenant who cultivates his land and leaves it with good crops and with clean land, and with a fair proportion of the land in a fit state to grow the ordinary crops of the district has fulfilled his obligation?—He has fulfilled the obligations imposed upon him by his agreement.

41,367. He may have broken the letter; he may have taken an extra number of crops; he may not have grown the crops in the rotation prescribed; but do you think the existence of good crops, and the cleanliness of the land, should absolve him from a departure from the letter of the lease?—No, I do not.

41,368. You do not?—No; it would no doubt be an element in the umpire's mind, and a factor in the umpire's mind when he came to adjudge compensation, but I do not think I should like to say that I would over-ride all bargains that had been made.

41,369. I am not speaking of the operation of the law, but in practice?—I would not even limit it to practice.

41,370. (*Mr. Gilmour.*) Are leases common in your county?—Not very. The tenants are more anxious to get a smaller time to get out in than to keep in long.

41,371. Therefore that would point to the necessity, probably, of laying out a well-defined method of cultivation upon those farms for the sake of fertility?—Clearly, because they come into operation so much more often.

41,372. They are on yearly notice I suppose, most of them?—Nearly all on yearly notice; but there are a few leases, I have, unfortunately, one of them myself.

41,373. Is it the habit where farms are so situate as to be convenient to markets, railway stations, and so forth, that a tenant can sell off what he grows if he bring in an equivalent in regard to manures?—Those provisions are inserted in some agreements and in some leases, but it is not absolutely general.

41,374. As a practical man, do you think that tables such as those which have been prepared by Sir John Lawes and other well-known men, pointing out the proportion of the price of the stuff consumed on the farm to its manurial value, would be sufficient to entitle you to enter into an arrangement with a man to sell off as long as he has brought an equivalent back?—No, I am sorry to say I do not. Although I appreciate Sir John Lawes' tables as much as anybody I always have this in my mind, that the manurial value of any article which may be defined must only be defined by the resulting produce which it will bring if applied to the land. The manurial value of a ton of cake when wheat was at 50*s.* must have been considerably more than it is at the present time, when wheat is at 20*s.* Therefore it is a very hard thing to say what manurial value is when the result of the manurial value is fluctuating every day.

Mr. J. Looker.
22 Feb. 1895.

Compensation for consumption of home-grown corn.

41,375. In your brief I see you notice a complaint about corn grown on the holding not being compensated for; have you thought out the most practical way of enabling such a scheme to be carried out, and for things to be properly vouched for, on the generality of farms?—I have given considerable thought to it, and I cannot find any scheme which is not more objectionable in my mind than the present system which is laid down in the Act, under which the tenant purchases all his corn. I think there would be more inconvenience and more trouble and more expense to a tenant in verifying and vouching (if he possibly could do it) for all the corn which he uses of his own growth, than it would to send that corn to the mill and buy some of somebody else. I am speaking of my own district, where mills and railways and so on are not very far off.

41,376. But practically speaking, could it not be done where you have an agent resident on the property who looks after such matters, if the tenant informed him that he had threshed so many quarters, and he intended to consume so many quarters of that? Would that not be held sufficient?—No; it would not be sufficient to me, because as a matter of proof, I should want to be there to see that heap, and to see that all that heap was used for the stock as he said it was. Otherwise there would be an inducement for it to be frittered away for other purposes. It would be no evidence to me for a man to say "I have 50 quarters of wheat here "which I intend to use for my cattle." I should know he had it originally and intended so to use it, but I could not know that he did use it.

41,377. If he kept properly authenticated barn books, would that not be sufficient?—I should want to know the number of cattle he started with, and the number that he kept week by week, the man who fed them, and how much he gave them, and to total it up and see how much it came to. Then with the evidence on oath of the man who fed the cattle, and of the farmer, and all the rest of it, I perhaps might be satisfied. But I have had considerable difficulty in getting satisfied in a great many instances as to the consumption of home-grown corn.

41,378. The fact is that your idea is that practical difficulties are against the carrying out of such a scheme?—I cannot see any way in which it could be carried out without considerable difficulty. I am not speaking against the principle that a man should be compensated for it, if it can be carried out without injury to the man who has to pay the money.

Labourers.

41,379. What is the length of your engagement with your workpeople?—My labourers are all weekly servants.

41,380. A week's notice on either side?—As a matter of fact, there is hardly a written agreement in the county of Huntingdon, or, at any rate, very few, not 1 in 50, between a labourer and his master.

Labourers' cottages.

41,381. Are cottages supplied on the farms?—Not the whole number of them, but a fair number. There are a good many villages where there is a cluster of cottages in the village which do not belong to a particular farm; but many of the farms have a fair number of cottages.

41,382. On these farms where the horsemen, or ploughmen, or whatever you call them, sit on a weekly engagement, do the men also have a house on a weekly notice?—Yes; they have a house on a weekly notice, and they are weekly servants.

Estates vacant.

41,383. Now, are there many estates in the county which have come into the market of late years, since the bad times came on?—Not a great many; there would be more, if there were any possible chance of selling them.

Letting of farms.

41,384. Speaking about the changing of tenants, how do you proceed to endeavour to get another tenant when a farm is out of lease?—I do the best I can to obtain a local man if I possibly can, and I meet him in the rent, and frequently in the conditions in the covenants. To secure a good man, I would make considerable sacrifices in regard to a principle in the covenants which I had not hitherto done, and I would also meet him considerably in the rent. If I cannot get a tenant on those terms, I farm the land for the landlord.

41,385. Do you advertise these farms as being to let?—Yes, all over the country; in the "North British Advertiser," "The Midland Counties Herald," and in our local papers.

41,386. Is that the usual practice?—That is the usual practice with me, and, in fact, it is with all land agents.

Mr. J. Looker.
22 Feb. 1895.

Small holdings.

41,387. I see you say in your brief that the small farmers live a hand-to-mouth existence?—Yes, that is so.

41,388. Is there any demand for small holdings in your county?—There is where there is a good proportion of grass upon the holding. If you define a small holding as something from 50 to 80 acres there is a demand of a description of small holdings. There is a much better demand for small holdings than for large holdings; in fact, there is not a demand at all for the larger farms.

41,389. Is that quantity of land sufficient to enable a man to work on to advantage and bring up a family upon?—It all depends on the man. One man will make a living and do well on a small farm, where another one with great deal better advantages would be in the workhouse in two years.

Light railways.

41,390. Is there any cry in your part of the country for light railways?—No. The subject was not thought of until quite recently except in certain districts in the fen, where there was an attempt made to make a tramway as a feeder for the Great Eastern Railway, but it fell through from some cause or another; I never heard absolutely the reason. That was the only case in the county where I heard of any suggestion for a railway which is not a permanent railway in the same way that the ordinary tracks are.

41,391. Is the country round there pretty well served then?—I think our county is fairly served by railways.

Rates.

41,392. (*Mr. Dalton.*) I think you have not got the figures of the rates for the farm you have been speaking of as being in your occupation?—I am afraid I have not.

41,393. Could you furnish them to the Commission for a series of years?—Yes. (*The witness subsequently supplied the following figures.*)

WYTON MANOR FARM.

Particulars of Rates paid.

Year ending.	Amount per £.		Amount paid.
	Houghton.	Wyton.	
	s. d.	*s. d.*	£ *s. d.*
Michaelmas, 1887	2 0	2 2	54 8 7
„ 1888	2 0	2 10	67 16 0
„ 1889	3 0	3 4	84 5 3
„ 1890	2 6	2 0	60 7 11
„ 1891	2 6	2 6	66 12 2
„ 1892	2 6	2 9	71 19 4
„ 1893	2 4	2 6	60 16 11
„ 1894	2 7	2 6	55 7 11
			£521 14 1
	Average Annual Amount		£65 4 3

41,394. Are you sure the rate in the 1*l.* has not gone down in your parish?—Yes.

41,395. So far as one can judge from the returns the rates appear to be lower now in your neighbourhood than they have been?—They would have gone down considerably, and they have gone down in all cases where the Education Act has not come into operation to raise them; where that has come in they have then slightly gone up.

41,396. Then you have got a school board in your parish?—Yes.

41,397. What is the school board rate?—The school board rate in our parish varies from 5*d.* to 6*d.*

41,398. That is what has sent the rates up, and if it had not been for that they would have gone down, I suppose?—If it had not been for that they would have gone down.

41,399. You have put in a statement with respect to the Imperial and local taxation paid by farmers and four gentlemen in a parish in your county; are the figures, to your knowledge, correct, or have they been furnished to you. (*See* Appendix A., XXIII.)?—I saw the tax papers, and I saw the rate-book, and I saw it signed by the auditor where it had been audited; so far the figures are absolutely within my knowledge.

Mr. J. Looker.
22 Feb. 1895.

41,400. On the side of the farmers, I see, you have entered the land tax?—Excuse me, it should have stated that they were assumed to be occupying owners.

Land tax.

41,401. Are they occupying owners?—No, they are assumed occupying owners. At this present time they are, none of them, absolutely occupying owners; they are all tenants.

41,402. If they are actually tenants, they are not paying the land tax; it is the owner who is paying it?—It is the owner who is paying the land tax.

41,403. To that extent you have varied the real facts—I am only saying that the owner is paying the land tax?—The owner pays the land tax.

41,404. Therefore the amounts which the occupiers are actually paying do not include the land tax?—No.

41,405. Which forms one of the heaviest items here; in the first case, 19*l.* 13*s.* 5*d.* out of a rateable value of 145*l.* 11*s.* 6*d.*?—Yes, that is so.

Income tax.

41,406. Then you also enter against the farmers income tax A and B; as a matter of fact, I suppose a man who who is occupying a farm at 145*l.* pays no income tax?—He does not.

Rates.

41,407. Then these particular occupiers really pay no Imperial taxation at all?—The farmer *per se*?

41,408. *Per se* in that parish?—He neither pays A nor B, nor the land tax, unless he has some other source of income raising his income over 500*l.* a year.

41,409. In these cases have they any other source of income?—I am not prepared to say. The gentleman whose name I have got down here is a horse dealer; I cannot say what his gains are.

41,410. At any rate, the amounts that are put down here as being paid to the Imperial revenue are not actually paid by them, but would be paid by them if they were the owners?—Exactly; they are assumed occupying owners.

41,411. On the other side you begin with a retired colonist?—Yes.

41,412. And you take his income, you say, at 500*l.* a year?—I have taken his income assumably at 500*l.* a year. He is a gentleman who has made his fortune in the colonies, and he has retired and come to live in that place. I do not know whether that is a correct description of him.

41,413. Do you know what his property consists of, on which he gets this 500*l.* a year?—Of my own knowledge I do not.

41,414. You have assumed in this statement that he pays no rates on that property; but supposing, we will take for example, that his property was railway property, I find that the average rates paid on the net income of railways amounts to between 7 and 8 per cent.; and therefore, assuming for the moment that this 500*l.* was derived from railways, he would be paying between 30*l.* and 40*l.* a year in rates there. On the other hand, if he was the owner of land, I presume you would admit that a certain proportion of the rates fall upon the owner?—The rates fall upon the owner, yes; but, as a matter of fact, I believe this gentleman derived his income from diamond mines.

41,415. But you are not clear as to that; you are not clear that he does not pay rates on some portion of his property?—No, I would not like to say what I do not know of my own knowledge.

41,416. Then the banker you put as paying rates on 140*l.* a year; is that on his residence or on his bank as well?—No, that is on his residence.

41,417. But he would pay rates on his bank as well?—He pays rates on his bank in another parish.

41,418. It is hardly fair to assume he is not paying more rates than appear in this statement?—That he does not pay more rates than that.

41,419. Yes?—No, I should not like to say that he did not.

41,420. You propose that the cost of education, main roads, police, lunatics, and sanitary matters, should be paid directly out of the Imperial Exchequer, I think?—Yes, I do.

41,421. You are aware that the cost of education to a very considerable extent is now borne by the Imperial Exchequer?—I am, but I am also aware that, speaking as a ratepayer, in one particular parish my contribution is considerably more than it was before the Education Act came into force, or before board schools.

41,422. Do you know what proportion of the education in your parish is paid out of the Imperial taxes now; can you say if half is? In a good many parishes more than half would be paid?—Our fee grants, if you take them.

Mr. J. Looker.
22 Feb. 1895.

41,423. You have a fee grant?—We have a fee grant.

41,424. You have also the ordinary education grant?—Yes.

41,425. And do those two together come to one half the expenditure on education in your parish?—I do not think they do, but they leave 6*d.* in the £ for me to pay, or for the ratepayers to pay.

41,426. You propose to put the whole of it on the Imperial Exchequer?—I should put the whole of that on the Imperial Exchequer; that is my idea of justice.

41,427. Would you have the local administration in your parish?—I would leave the administration to the authorities. I think they are quite capable.

41,428. Would they have the same incentive to economy that they have at present?—No, I do not suggest that they would.

41,429. Then as regards main roads, have you not already in your locality a sufficient amount of Imperial revenue paid over to the County Council to defray the greater part at any rate of the cost of those main roads?—No, there is a margin of a considerable mileage in the county which the main roads have to come upon the rates for.

41,430. (*Mr. Gilmour.*) Might I ask what your county rate is?—The highway rate in this particular parish where our discussion was about was 1*s.*

41,431. (*Chairman.*) In the £?—Yes, and the county rate was 4*d.*, and out of that 4*d.* there was some portion of it used up for main roads.

41,432. (*Mr. Dalton.*) Do you feel sure of that?—Certainly. I can give you the county statement which, I think, will prove it at once.

41,433. I am only asking you?—The subventions for main roads are not equal to the cost of the main roads.

41,434. And for the police and the lunatics, you are aware, you get a considerable amount from the Imperial Exchequer?—Yes.

41,435. How do you think that the rural district would gain if you made sanitary expenses a charge on the Imperial Exchequer? Sanitary expenses are comparatively small in rural districts, are they not, and very heavy in urban districts?—Yes, and they are only a ½*d.* in the £.

41,436. And in many urban districts they are 3*s.* or 4*s.* in the £?—Yes.

41,437. If you made them an Imperial charge, both in urban and in rural districts, I should think the rural districts would lose by it, because you would have to subscribe to Imperial taxation in some form or other to meet it and the urban rates every year?—Quite so. If the charges for special matters are levied what I should consider justly it would not be a question of the effect, it would be a question of the principle. If I have to pay more because the people of this country would be made healthy I am willing to pay more, but I think I am paying more than my share.

41,438. It is a ½*d.* in the £ in your parish, I think?—It is a ½*d.* in the £. It is infinitesimal, but the principle is the same on a ½*d.* if the principle is right, as it would be on a 1*s.*

41,439. What I was trying to get at is, seeing that it is a ½*d.* in your rural parish and 3*s.* or 4*s.* in an urban parish, if you say that it ought to be paid out of the Imperial revenue, whether the rural parish will not lose by it?—I have not worked that out; in fact I am not in a position to work it out, I could not, because I do not know what contributes to each one.

41,440. (*Mr. Little.*) Mr. Dalton put the case of the Education rate, and of the contribution from the Imperial Exchequer to the cost of education, but you contribute to that in addition to the 6*d.* rate that you pay; whatever the State pays towards the cost of education in your parish, you contribute to?—I contribute to that, in addition to the 6*d.* I pay as a ratepayer.

41,441. (*Mr. Dalton.*) Clearly; but your proposal being to throw all these expenses on the Imperial Exchequer, if that proposal was accepted, additional

Mr. J. Looker. 22 Feb. 1895.

Imperial taxes would be raised, and you would have to pay your share of them?—Quite so. I pay my share now, and the local share as well; that is my contention.

41,442. In your brief you say that a sensible reduction might be made by throwing these expenses on the Imperial Exchequer; but that would depend upon how much you have paid hitherto to the Imperial Exchequer for these purposes?—Yes; but in the four instances I have brought forward I am not taking my own case personally, nor my own parish.

41,443. (*Sir Nigel Kingscote.*) It comes to this, that you think they are higher taxed than their neighbours?—Yes.

41,444. (*Mr. Dalton.*) Than their neighbours would be if they were owners, because these gentlemen, I understand, are not occupying owners, and therefore do not pay the greater part of the taxation which is set down against them?—They do, if you take it that they are assumed occupying owners. That land which is cultivated through tenants does pay exactly the proportion I say. "The charges on *land* as compared with other investments," I believe are the words used in my brief.

41,445. (*Captain Owen Thomas.*) Is there any difficulty in letting farms when they become vacant?—Yes, great difficulty.

Reductions of rent.

41,446. Are they let for a reduced rent?—A reduced rent from when?

41,447. Are they let to the incoming tenant at a reduced rent?—That would depend on when the last reduction had taken place. For instance, I am occupying a farm to-day, and it is 18 years since the lease expired there; if my farm were to be let to-morrow, or if farms of a similar nature under similar circumstances were to be let, they would have to be let at 40 per cent. less than their rent to-day.

41,448. (*Mr. Gilmour.*) How much per cent.?—40 at least.

41,449. (*Captain Owen Thomas.*) Why do these tenants leave? Do they take farms anywhere else?—Sometimes they leave because the landlord will not reduce the rent to the point to which they think he ought to reduce it, and sometimes they leave because their money is reduced to a point when they cannot go on any further; and then they leave for other and natural causes, death, and so on.

41,450. I suppose you would agree with me that the majority of these tenants leave because they cannot get a reduction of rent?—No, I would not say that. I am taking the agricultural sales as my guide. The majority of sales are the result of the want of success of the tenant, and not of his leaving, because he could not get a reduction of rent. He left because he was done up, and he could not get any farther. That is the reason he left.

Mr. J. Looker. 22 Feb. 1895.

41,451. In all those cases, would you say that the landlord has done his part fairly?—I do not think there is very much to complain of in the part the landlords have taken in the county of Huntingdon. I think the case which I gave at the beginning is a typical one. The figures I gave show that the landlord does not get half what he got before; and even that does not represent his income, because out of that he pays a rentcharge of 200*l.* a year, which I did not mention, for improvements on the property of which the tenants gets the whole benefit.

41,452. On the estates you manage, are the tenants fairly satisfied with the rents they are paying now?—No, they are not; but they are satisfied with the landlord. They are not satisfied that the land is worth any rent at all.

41,453. Yet they are paying it?—They are paying it hoping things will be better.

41,454. Are they able to make it out of the land?—They continue to fulfil their obligations up to the present. Occasionally one drops out and somebody else comes in at a less rent, and money is spent by the landlord to put him there.

41,455. (*Sir Nigel Kingscote.*) Have the landlords in your neighbourhood, as far as your knowledge goes, endeavoured to meet the tenants by a reduction of rent?—Certainly; I think that must be acknowledged by everybody who knows the circumstances of the county.

41,456. But it has now got to that pitch that neither the landlord nor the tenant can live on it?—They cannot. The tenant says, "I cannot come to you and say "I will not pay any rent; I know you must have some "rent; but I do not know where it is to come from." So he pays something.

41,457. Unfortunately you have not been able to point out any remedy for this state of things?—I am afraid I cannot.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Seventy-eighth Day.

Thursday, 28th February 1895.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*

R. F. CRAWFORD, Esq., ALAN MACKINNON, Esq., *Assistant Secretaries.*

Mr. J. C. Reynolds. 28 Feb. 1895.

Mr. JOSEPH CRESCENS REYNOLDS called and examined.

Mr. J. C. Reynolds. 28 Feb. 1895.

41,458. (*Chairman.*) I believe you are an owner of land and a tenant farmer at Paxford Camden in Gloucestershire?—I am.

Particulars of witness's farms.

41,459. Is your district on the borders of Gloucestershire and Worcestershire at the northern end of the Cotswold Hills?—Yes.

41,460. Is the prevailing industry there sheep farming?—On the Cotswold? Yes.

41,461. Is the land not suitable for dairying or market gardening?—A good deal of the land on the Cotswolds is not suitable for dairying or market gardening. Dairying may do in some favoured districts in the valleys.

41,462. How much land do you own?—I own 164 acres.

41,463. How much do you rent?—I rent 47 acres only.

41,464. You farm the whole of your land, I suppose?—Yes, I farm my own land.

41,465. Is your own farm a sheep farm?—No, it is not a sheep farm; I go in for dairying and corn.

41,466. Is there much less corn grown there than formerly?—Yes, considerably less, and I should say that that remark applies very largely on the Cotswold Hills. My own farm is not on the Cotswold Hills; it is just on the border of the Cotswolds.

Mr. J. C. Reynolds.

28 Feb. 1895.

41,467. On the lower ground, I suppose?—Yes, on the lower land.

41,468. Is it good land?—Yes, with a clay subsoil; it is a little bit too strong, but it is very useful land.

Reduction of rents.

41,469. Has the rent been reduced of late years?—In my own case my rent has been reduced very fairly, and I have nothing to complain of at all. I rent under the Ecclesiastical Commissioners.

41,470. What per-centage has been the reduction?—It has been reduced considerably beyond the average reduction in the district as I shall show by-and-bye.

41,471. What has been the average reduction in rents in the neighbourhood?—Inquiries were made by the Worcestershire Chamber of Agriculture, and they came to the conclusion that the average reduction was 17½ per cent. Similar inquiries were set on foot by the North Cotswold Farmers' Association, a copy of whose report I have here. They came to the conclusion that the reduction in rents was considerably larger than that. They give instances in which there is a reduction of 50 or 60 per cent., but they say that good clays and loams on the slopes of the Cotswolds are reduced 33 per cent. My impression is that that includes temporary reductions. I say about 20 per cent. in my brief, but I should add that that does not include temporary reductions returned on rent day in consideration of bad seasons.

41,472. Are you now speaking of the land on the Cotswolds or of the land at the foot of the Cotswolds and towards Worcestershire, round about Evesham and Pershore?—You have to draw a distinction between the gardening districts and the strictly farming districts. When you get into the gardening districts I should say decidedly that the reduction of rent has not been so great, and in many of those districts there has not been any reduction at all.

41,473. When you speak of the gardening districts, I suppose you mean round Pershore and Evesham?—Yes.

41,474. What should you say the average reduction has been there?—In regard to the market gardeners, I am not prepared to say that there has been any reduction: the reduction has been small, if any, I should say.

41,475. Leaving that we come to the strictly farming and—still at the foot of the Cotswolds—in the better land, I suppose?—Yes.

41,476. What has been the average reduction there?—I should say 20 per cent.

41,477. But with further abatements in bad seasons?—Yes.

41,478. Then coming to the Cotswold Hills and the poorer land there, what has been the reduction in those cases?—I should say there, that the North Cotswolds Farmers' Association will be a very fair guide; they say there has been a reduction of from 30 per cent. to 50 per cent.

41,479. Has what you call the garden land been gradually extending?—Yes, it has decidedly.

Acreage of land under market gardens.

41,480. Can you give us any idea of the acreage of land under cultivation in that district?—I have not looked up the acreage; but I can give you an instance of one particular village, that is the village of Badsey, near to Evesham, which some years ago began to develop that industry, and now the whole of the land in the village is in the hands of the market gardeners.

41,481. Do you say the whole of the land in the parish?—Yes. Within my remembrance there was no gardening done there at all, or very little.

41,482. (*Mr. Chaplin.*) What is the acreage of the parish of Badsey?—I have not the exact acreage with me; I should think it would very likely be 800 or 900 acres, perhaps 1,000.

41,483. (*Mr. Everett.*) Is it land essentially different from the bulk of the land; does this gardening go on only in the favoured spots of the land?—I do not know that it is the land so much as the situation, the warmer and the more sheltered aspect, so that they can get the stuff a little bit earlier than we can.

41,484. (*Chairman.*) Is there a very considerable extent of land around Pershore and Evesham which is cultivated in this way?—Yes, decidedly there is; it is a large industry.

41,485. I want to get an idea whether it is 50,000 acres or 20,000 or 10,000; which is cultivated in this way; within limits can you tell us what is the extent?—There are a great many farmers who do a bit of it on their farms, who grow green peas and a few vegetables, and so on. That is rather a different business from that of those men who do gardening and nothing else—men who, perhaps, have 10 or 20 acres and who deal with it all on the intense system.

Mr. J. C. Reynolds.

28 Feb. 1895.

41,486. There are a considerable number of small people who devote themselves wholly to this garden cultivation, as I understand it, with holdings of from 10 to 20 acres, or more I suppose?—Yes, there are.

41,487. A considerable number?—A great many.

41,488. And there are others—farmers—who devote a portion of their land to this intense cultivation, farming the remainder in the ordinary way?—That is so.

41,489. Has there been a considerable increase of what I may call intense cultivation on the part of farmers?—There has been an increase, decidedly, in recent years.

Profitableness of market gardens.

41,490. Has that business been on the whole a paying one?—I should say that it has paid better than the ordinary farming business where the locality is favourable.

41,491. Would you consider that the increase of land devoted to that purpose is an indication that on the whole it pays?—I should.

41,492. Is there a demand for these market gardens?—Yes; they are always let in favourable localities. It is a matter very much of climate, and, to some extent, of soil; but of course chiefly of climate and situation.

41,493. Do the men often cultivate their own land?—Not in many cases.

41,494. Are they generally tenants?—They are generally tenants.

Tenant right of market gardens.

41,495. Do they hold from year to year, or do they have leases?—They have a system which has become almost universal in the Evesham district. It is a system of tenant right, I should say, but it is not legalised.

41,496. It is a customary form of tenant right then?—As you are aware, no doubt, it is a customary form of tenant right, and efforts are being made to legalise the existing system.

41,497. What is the system?—It is something like allowing a man to sell his interest in his holding and to introduce a new tenant.

41,498. Do you know what is meant by the custom of Ulster?—Roughly speaking, I do.

41,499. Is it at all analogous to that: is it based only upon the additional value which has been given to the land by the tenant, or is it something more; does it recognise a kind of right of occupancy?—I should say that the custom does recognise a right of occupancy, and also, of course, the additional value given by the tenant to the land.

41,500. Can you give illustrations of what has been given by an incoming tenant to an outgoing tenant under it?—I do not know whether I can give an illustration with names, but I believe that as much as 200*l.* or 300*l.* an acre has been given.

41,501. (*Mr. Chaplin.*) 200*l.* or 300*l.*?—I have heard so, I do not give that as authoritative, but I know that very large sums have been given for tenant right there.

41,502. That is building land price?—That would be for the very best of the land in the best districts of Evesham.

41,503. (*Mr. Everett.*) And would include all the bushes and trees and such things, I suppose?—Of course it would include everything.

41,504. (*Chairman.*) With what kind of rent?—The rent is high, but I must frankly say that this question is a question of market gardening, and I was rather prepared to deal with the farming and agricultural question, or I should have gone more into details.

Rent of market gardens.

41,505. Still, as you appear to know something about it, one is rather glad to take the opportunity of hearing something about it from you. What should you say is the average rent of a good market garden?—I should think they vary from 3*l.* or 4*l.* an acre up to 14*l.* or 15*l.*

41,506. Up to 14*l.* or 15*l.*?—Perhaps more; some are very high, I know; 10*l.* is commonly given.

41,507. Ten pounds is common?—Yes, on the best land.

Tenant right of market gardens.

41,508. And would you say that in a case of that kind as much as 150*l.* or 200*l.* has been given for the tenant right?—I have heard of such sums, but I do not know that authoritatively, because I have not looked it up.

Mr. J. C. Reynolds. 28 Feb. 1895.

41,509. What should you say is an ordinary average sum to be given?—I should very much prefer to supply you with those facts in writing later on; if you would allow me to do that I could do it very easily. I think it would be more satisfactory than for me to make a shot at it now.

41,510. (*Mr Everett.*) I suppose the great bulk of that money is for value received; it is not for the good-will so much as for the stock of good living plants that are on the land?—Yes, and for the high condition of culture into which the land has been got. There may be some land especially fit for this; a man may have special lines; for instance, asparagus beds are the great thing.

41,511. Already planted?—Yes, in full swing.

41,512. (*Mr. Channing.*) Is this sum of 200*l.* or 300*l.* given for the good-will of the farm or for the actual value of the improvements?—For what you may call the tenant-right I suppose. I will look the actual figure up and let you have it and I will get one or two cases.

41,513. (*Chairman.*) Without committing yourself to any particular details have considerable sums been paid by incoming tenants for this garden land to outgoing tenants within quite recent years?—Yes, certainly.

41,514. What is the garden cultivation in the main; is it fruit?—Fruit is a great matter; but asparagus is a very leading thing with them; all kinds of vegetables are grown, strawberries also.

41,515. And plums and fruit trees of that kind?—Yes. I should say the village of Badsey, to which I referred just now, has been made by asparagus.

Condition of farmers in Cotswold district.

41,516. Now, passing from that favoured district you then come to the more strictly farming districts in the neighbourhood; what has been the condition of the farmers there?—Very bad I should say. A good many of them have lost a great deal of their capital; and a good many have been compelled to give up during the last few years.

Rent of farms.

41,517. What should you say is the average rent of this land now?—There is a very great difference between the rent paid by new tenants and the rent paid by old tenants on a good many of the estates.

41,518. You are speaking of land at the foot of the Cotswolds, or on the slopes of the Cotswolds?—Yes, on the northern end of the Cotswolds.

41,519. (*Sir Nigel Kingscote.*) Near what place?—Evesham is about 10 miles from where I live; I am not very near any large town—Stow-on-the-Wold, Moreton-in-Marsh, Chipping Camden, and Stratford-on-Avon, are 10 miles away.

41,520. (*Chairman.*) What should you say the new tenants, the incomers, have to pay for that land on the average?—I have a few cases that I have put down: there is the case of one man in my own parish who paid 230*l.* a year for a good many years; the farm had been in his family 40 or 50 years.

41,521. For how many acres?—He paid 230*l.* a year for 235 acres, 2 roods, and nine perches, and he would liked to have remained very well at 200*l.*, but he could not get that reduction. The farm was subsequently let (that is in 1893) to a new man at 120*l.* a year.

41,522. How long had it remained in the owner's hands?—No time.

41,523. No time?—No; the old tenant left at Michaelmas 1893, and the new tenant took on at the same time; but I should say that the rent I believe increases 10*l.* a year until it gets to something like 200*l.* I have several cases of that kind.

41,524. You say the rent was 230*l.*; had that been reduced from a larger amount within recent years?—It had been reduced within recent years I have no doubt. I am not prepared to say exactly what the rent was 20 years ago, but I have no doubt it was more than 230*l.*

41,525. Then there was another case you were going to mention, I think?—Yes, I have another case of 424 acres, 2 roods, 5 perches—that is at Michaelmas 1893 too; the old tenant went out; the old tenant paid 240*l.* a year, and the actual rent paid by the new tenant is 148*l.* 15*s.*

41,526. Was there any interval between the outgoing tenant and the incoming tenant?—No, there was no interval in that case either. There is another case I have—that is on the same estate, 117 acres, 3 roods, 30 perches. The actual rent of that is 160*l.* 5*s.*, which is paid by the old tenant, a man, I suppose, who has been there 20 or 25 years; he pays 160*l.* 5*s.* for 117 acres, and in the first case to which I referred the tenant pays 120*l.* a year for 235 acres, he being a new tenant.

41,527. Is the land of the same quality?—I should not say there is very much difference in the quality; I should say that the first man has quite as good a farm as the other.

Mr. J. C. Reynolds. 28 Feb. 1895.

41,528. What are these farms; are they dairy farms or arable farms?—They are mixed, dairy and arable. The first farm is a fairly good sheep farm.

41,529. Are these farms on the Cotswolds, or down below?—The first farm I alluded to, I should say about half of it is on the Cotswolds, on the hill.

41,530. Half of it?—Yes, about half of it, and it is used for sheep land.

41,531. Are these on the same estate?—Yes, they are on the same estate.

41,532–3. Is it a large property?—Yes, a considerable property; it forms the greater part of the parish.

41,534. What is the Poor Law Union you are speaking of now?—Shipston-on-Stour.

41,535. Is it in Gloucestershire?—It is in three counties, Warwickshire, Worcestershire, and Gloucestershire.

41,536. Then the garden lands that you speak of, I suppose are in the unions of Pershore, and Evesham?—Yes, that is so.

Reductions of rent.

41,537. Now going to the worst lands on the Cotswolds themselves where you say the reduction has been greater, can you give illustrations there of the reductions?—The second farm that I referred to is, I should say, a case in point. I do not know that it is the worst land on the Cotswolds, but there would be a reduction from 240*l.* to 148*l.* 15*s.*

41,538. Is that about the average reduction?—Yes, I should think something like that. The reductions are very variable on different farms.

41,539. Are many farms out of occupation?—No.

Land out of cultivation.

41,540. When farms fall vacant can they be let with a reduction in the rent?—Yes, they can be let with reductions of rent, and many of the old tenants would be very glad to keep them on with similar reductions to those that are granted to the new tenants. There is a certain amount of land out of cultivation in my district, especially, I know, glebe and at Stratford-on-Avon amounting to something like 100 acres; I believe that land was let at nearly 2*l.* an acre some years ago, and now I do not suppose it bears any value at all, that any man who would pay the rates and the merest trifle of rent would be able to have it. It has all gone into dilapidation, the fences are overgrown, and the land has all gone to nothing.

41,541. Is that because it has been neglected, and been thrown on the owner's hands, and the owner has been unable to cultivate it?—It is because the owner did not grant a reduction at the proper time. If he had granted a reduction at the proper time it might have been kept in cultivation and been bearing very good produce now.

41,542. (*Mr. Everett.*) Is that heavy strong clay land?—Strong land; a good deal of it wanted laying down, but it has tumbled down, and you know what that is. I should think it would take 8*l.* or 10*l.* an acre to put it into condition again, and then it might be let at 20*s.* or 25*s.* an acre very well in allotments and small holdings.

41,543. (*Mr. Channing.*) In your opinion it might have been kept in condition if reductions had been made soon enough?—Yes, it would have been kept in condition; adjoining land is let, I think, at 25*s.* an acre to the poor, and this village where this land is, is in a most deplorable condition.

41,544. (*Chairman.*) Is there much adjoining land let to tenant farmers at 25*s.* an acre?—I do not expect they pay quite so much as that.

Allotments.

41,545. But when it is let in allotments it is let at about that rate?—Yes, it is let by the Countess of Camperdown; 25*s.* and 22*s.* 6*d.*, I believe, the people pay, and they seem to do very well on it, and there is no reason why this 100 acres should not be doing the same thing.

41,546. What size plots do they take it in?—An acre or two; some less, some half an acre; I do not think there is any limit.

41,547. They are let purely as allotments?—Yes.

41,548. Cultivated by labourers who are employed as labourers on other land?—Yes, that is so.

Unoccupied farms.

41,549. I think you said there are very few, if any, farms which are unlet?—Very few.

41,550. Is there much land in the occupation of the owners?—Not in my immediate district.

Mr. J. C. Reynolds.

28 Feb. 1895.

Deterioration in cultivation.

41,551. Is the land not so well cultivated as it was?—It is not cultivated so carefully, and a good deal of the land, especially on the Cotswolds, I should say that applies, has been about half let down to grass. It has been let go down to grass, but not done well enough, and the consequence is a very poor turn out. The cost of laying down is not fancied very much, I think, by a good many farmers; the expense of laying down rather checks men from laying it down in the best possible way.

Laying land down to grass.

41,552. What do you reckon to be the expense of laying it down to grass in a fairly good way?—You must not estimate simply the cost of the seed and the cost of the working; you have to consider that for a year or two, or two or three years, your land will not produce very much at the beginning. If it is a mere question of seed and working, of course that is very easy to estimate.

41,553. Quite so; but estimating also the loss which the occupier sustains in not getting a return for two or three years what should you put it all at?—It would vary very much on different soils. I do not think for me to make a shot at it would be very valuable to the Commission.

41,554. Take the land on the Cotswold Hills, would it cost 5*l.* or 6*l.* an acre or what?—I should think ultimately it would cost quite that.

41,555. Will the land you speak of, if it is left to nature, grow grass after a time?—It will grow something, but it will not come to a good turf, of course.

41,556. (*Mr. Chaplin.*) On the hills?—No, not on the hills.

41,557. You would not lay it down there I suppose?—No, I should go in for a system of two or three years ley and then plough it up again.

41,558. (*Chairman.*) Temporary grasses?—Yes.

41,559. Has much land been dealt with in that way?—Yes, I should say the good farmers who are carrying on business satisfactorily do treat land in that way decidedly.

Results of farming.

41,560. I think you said your own farm is a dairy farm?—It is chiefly dairying.

41,561. Has that paid fairly well?—I think it has paid better than anything else. I grow a good deal of fruit, which also is helpful rather.

41,562. On the whole have you made your own farm pay?—I have just managed to live.

41,563. (*Mr. Everett.*) Off the farm or have you outside resources in addition?—I have lived off my farm.

Condition of labourers.

41,564. (*Chairman.*) Now with regard to the labourers, what is their position?—There are a good many out of work at this particular time, and their wages are low. Their average wage I should say now is about 10*s.* a week. This winter has been an exceptionally bad winter with them. There is one village I know of in Gloucestershire, not very far from me, in which there are 133 men and lads over 17 years of age, and only something like 40 of them get work in their own village.

41,565. (*Mr. Chaplin.*) How long has that been the case?—It has been the case during this winter.

41,566. (*Chairman.*) Is that due to the hard weather, or was it before the hard weather began?—There has been great complaint in that quarter for a good many years; but I took the trouble to make special inquiries as to the number of men out of work there for an illustration to bring here, and that was the result I arrived at.

41,567. Was that during the hard weather, or was it before?—There are more out of work during the hard weather, because a good many of these men would get temporary work on the farms if the weather were to break, but they would not be regularly employed on the farms—they would get piece-work.

41,568. But they could get work?—You have to draw a distinction between a man who has a place, and a man who gets work.

41,569. (*Mr. Chaplin.*) What you mean is he gets occasional work?—He gets occasional work in good weather, and he may perhaps earn more than the man who has a place.

41,570. (*Chairman.*) The important thing is whether he gets work; would he generally in good weather work?—Yes: all these men could not get work in their own parish.

41,571. (*Mr. Lambert.*) Do some men prefer to have piece-work?—Yes, there are some who decidedly do.

41,572. Would that be general, that only 40 men out of 133 are at work in Gloucestershire?—In every parish?

41,573. Yes?—No, I do not think it would; I think that is an extreme case.

Mr. J. C. Reynolds.

28 Feb. 1895.

41,574. Where would the men get the work outside their village?—I think recently these men have not had anything to do. Some of them do walk to a distance and get an occasional job.

41,575. What at?—They may get a job sometimes with tradesmen; sometimes they may get a job at threshing, or something of that kind, but nothing to rely on. Then some of these men have a bit of land.

41,576. (*Chairman.*) I want to gather from you whether these 90 men you speak of were out of work through the hard weather; whether it was on account mainly of the hard weather that they were out of work?—The hard weather would aggravate the position, no doubt, it would make it worse, but their living would be rather precarious even in moderately good weather.

41,577. (*Mr. Channing.*) Owing to the position of the farmers, you mean?—Yes.

41,578. The farmers are not able to continuously give employment?—No; it is consequent a good deal upon the introduction of machinery, no doubt.

41,579. (*Chairman.*) It is not all due to depression?—It is not all due to depression.

41,580. Do many of these men get work in the garden lands down in that neighbourhood?—In this particular village they are very badly off for land; they are going to try to get it through the parish council.

41,581. I mean would they get temporary work on the gardens at no great distance down in the Evesham district?—Some of them do in good weather; they go on the Monday morning and stop till Saturday night, but not a great number of them.

Labourers wages.

41,582. Have the wages gone down to what they were some 20 years ago?—Yes, I think that the wages now are very much what they were before Mr. Arch's agitation in 1871 and 1872; I think they have got down to about their level, but of course you can buy more with the money than you could then.

41,583. The purchasing power of their wages is much better than it was?—Yes.

41,584. Then you do not think the farmer can look for any relief to lower wages?—No, I think it would be a very calamitous thing if he did.

41,585. Are the labourers badly housed?—In some cases they are very badly housed.

41,586. You have been speaking mainly of the labourers on the Cotswolds; when you come to the better districts in Pershore and Evesham what is the rate of wages there?—The gardening men would get, I daresay, 2*s.* 6*d.* a day, or 3*s.*, but that is more or less skilled work; in some cases they would get more, in some less. There is a good deal of piece-work done in the gardens too; there are a good many women employed tying up bunches of stuff, and so on.

41,587. You say it is rather skilled work?—Some of it is skilled work.

41,588. What would the skilled labourer get at piece work in the gardens there?—I should think some of them would earn 1*l.* a week.

41,589. Then there is employment for women and children during the fruiting, I suppose?—Yes.

41,590. Picking the fruit and tying?—Tying up bunches of radishes; you see there is a lot of tying up to be done, which women and children do very well.

41,591. And picking the strawberries and picking the fruit generally?—Yes.

41,592. Then in that district the labourers must be very well off, I suppose?—Yes; in ordinary seasons; there has been a good deal of distress this winter.

41,593. What has that been due to, the bad weather?—Yes, the very long frost; you see they could do nothing.

41,594. Yes, but apart from that, which is after all an exceptional case, the labourers are not badly off in that district?—No, comparatively I should say they are well off.

41,595. Is there a large number of labourers employed in that district in this garden cultivation?—There are a great many more to the acre than are employed on the farm undoubtedly.

Bad seasons.

41,596. What have been the seasons of late in your district?—1893 was a very ruinous season there is no doubt about it. I think a great many cattle died of starvation in the winter after 1893.

Mr. J. C. Reynolds.
28 Feb. 1895.

41,597. On account of the drought?—Yes, and the price of store cattle went down practically to nothing at all. I think that a great many farmers lost a great deal of money then. I should not think any farmer in my district, a purely agricultural man, made anything at all towards the rent in 1893—I do not know whether they paid it I am sure, but they did not make it.

41,598. That was mainly on account of the drought and the consequent bad season?—Yes. With the exception of 1893 I do not consider that seasons in my district have been particularly bad; I do not think the last season was a bad season as far as produce goes.

41,599. Then last year, has that been a fairly good season?—Yes, I think so. In regard to 1893 I have here the report of the North Cotswold Farmers' Association which extends over a good deal of ground; I think there are about 200 farmers in it. They speak of the increased difficulties caused by the lower values of farm produce and the drought of 1893, and of the very heavy arrears and increasing arrears of rent that have come about within the last few years, culminating in 1893,—"the arrears of "rent are heavy and increasing." I think that is rather significant. Mr. Freeman-Mitford, who is known to you, no doubt, is the President of the Association, and landlords and farmers are united in the Association.

41,600. (*Mr. Channing.*) To what class of farmers does that refer, the general farming or market gardening, or what?—General farming.

41,601. (*Chairman.*) I suppose the sheep have done fairly well this year?—Yes, I should think sheep have done better than anything else.

Condition of sheep farmers.

41,602. Have sheep farmers made any profits?—I should think as far as the sheep go they would not have much to complain of.

Local rates.

41,603. Have the rates increased in your district?—In regard to rates, since the abolition of the turnpikes there has been a great complaint among the farmers that the whole of the roads have been thrown upon the land, but looking over the rate books of my own district, and making an average, I find that so far as the poor rate is concerned in the four years from 1887 to 1890 the average expenditure on the poor rate was 1*s.* 4⅛*d.* in the £; the average from 1891 to 1894 on the poor rate is 1*s.* 3¾*d.* in the £. That seems to show an actual reduction as far as the poor rate is concerned, but that is only apparent, because the Assessment Committee in March 1892 changed the system of valuation, and took it on Schedule A. of the Income Tax instead of on the gross estimated value. Thus the rateable value of the parish in 1887–91 was 12,367*l.* 11*s.*, but in the four years 1892–4 it was 13,240*l.* 3*s.* 4*d.* That would make it almost exactly the same; that in those two periods of four years the expenditure on the poor rate was practically the same; that there was neither an increase nor a diminution. The highway rate likewise does not show much variation in that period. Of course, we have to consider the Parish Council rate coming on us, and also the sanitary rates, which always tend to increase.

41,604. Those are matters rather in the future, in prospect; your figures show that in the past there has been no increase of rate?—There is the Education rate, of course, in certain parishes; that does not apply to my parish, but it does apply to some parishes.

41,605. We are wishing to get your evidence as to facts which now exist in your parish?—The facts which now exist in my parish only show an increased sanitary rate.

41,606. What has been the increase in the sanitary rates?—There have been considerable sanitary works in progress and money has been borrowed, and I can hardly tell you what the rate would be.

41,607. Is yours an urban district, or is it a rural parish?—It is a rural parish.

41,608. I think you said your own rent had been reduced; have you had the assessments reduced in proportion?—Yes, I have had the assessment reduced.

Corn rents.

41,609. In proportion to the reduction of rent?—Yes.

41,610. Has that generally been the case in the district?—No, I do not think it has been. A good many farmers are dissatisfied because the Assessment Committee does not consider a reduction of rent, and does not consider variation by what are called corn rents. There is a system of corn rents prevailing on some of the estates, and the Assessment Committee does not consider that in estimating a man's rateable.

41,611. What do you mean by that; I do not quite understand?—Do you mean the corn rent?

41,612. Yes?—On some estates there prevails a custom of raising and lowering the rent in proportion to the price of wheat. I believe it exists more or less on the Northwick estate to which I referred just now. I have endeavoured to get the exact scale on which they proceed.

Mr. J. C. Reynolds.
28 Feb. 1895.

41,613. (*Mr. Channing.*) The rent of the whole farm or of the part of the farm which is used for the cereal produce?—The whole farm, making the price of wheat the basis.

41,614. (*Chairman.*) Those farmers must have gained very greatly by the reductions, on account of the great fall in the price of wheat?—Yes, I have heard the farmers speak very favourably of it.

41,615. (*Viscount Cobham.*) It is a wheat rent really, not a corn rent?—Yes, a wheat rent.

41,616. (*Chairman.*) Wherever the wheat has fallen very greatly these farmers must have derived a great advantage?—These rents did not begin till the wheat got down very low; I mean the system was not inaugurated till then.

41,617. May we take it the Assessment Committees think that that is hardly a fair way of testing the value of land?—In 1892 the Assessment Committee practically took Schedule A of the Income-tax as a basis: I do not say they adhere to that; but they stick pretty close to it.

Reductions of rent and reduction and assessments to income tax compared.

41,618. If there had been any reduction of rent the Income tax would show it?—Yes.

41,619. Therefore we may assume, I think, that the farmers have had the benefit of any reductions of rent in the reductions on their assessments?—The assessments have been reduced undoubtedly.

41,620. (*Mr. Everett.*) I think I understand you that the assessment had enormously increased on the whole—the gross assessment had increased nearly a third, did you not say?—The gross assessment has increased from 12,367*l.* to 13,240*l.*

41,621. (*Mr. Dalton.*) That includes not only agricultural lands but houses as well?—Yes.

41,622. Have the houses increased?—I cannot tell you without the particulars before me.

41,623. It would not follow from these figures that the assessments of the lands had increased?—No, it would not follow necessarily.

41,624. (*Chairman.*) It includes also railways?—You see it is less than 1,000*l.* in 13,000*l.*

41,625. Therefore it is no guide as to what the effect has been on land?—I should not say it would be any guide of any special value.

41,626. But generally speaking, especially as they appear to have taken the income tax as a basis, we may assume that the assessments have been reduced in proportion to their reductions of rent?—Yes.

41,627. With the reservation that in the case of those farmers who have had their corn rents or wheat rents, the assessment committees have not taken that into full account?—No, that is just what the farmers complain of.

41,628. I suppose they thought as compared with other occupiers of land in the neighbourhood, the wheat rent would give them too great a reduction in their assessments; I suppose that has been the principle?—Yes. In regard to my own case I should perhaps correct myself a little, I said my own had been reduced in proportion to my reductions of rent, but my last reduction is very recent, and I have not yet made an appeal on this last reduction to the assessment committee. You understand what I mean.

41,629. Quite so; up to quite lately?—So far, till the last reduction I have nothing to complain of.

41,630. You will present yourself before the committee?—I shall present myself before the committee by-and-bye.

41,631. Now that you have got a further reduction in of rent you will appeal for a further reduction in your assessment?—Yes.

Corn rents.

41,632. (*Mr. Dalton.*) Can the corn rents be ascertained before the end of the year?—Before the end of the year?

41,633. How do they vary; do they go according to the last year?—They go by the Imperial averages, the published statement.

41,634. For the last year?—Yes.

41,635. They are settled at the beginning of the year then?—Yes, I am not on a corn rent myself, and it is a little difficult to get at particulars on some of these estates.

41,636. I was wondering how the income tax assessment could take them into account if you did not know

Mr. J. C. Reynolds.
28 Feb. 1895.

what was to be the rent till the end of the year according to the price of the corn?—They could take them into account at the end of the year.

41,637. For the following year?—Yes.

Railway rates.

41,638. (*Chairman.*) Now what are your suggestions for remedies for the present state of things?—The railway rates, I think, are objectionable.

41,639. (*Mr. Lambert.*) Have you any specific instances to put before us in regard to railway rates?—Yes, I have.

41,640. You say in your brief the foreign producer has a great advantage over the English producer?—I have a specific instance in my own parish. A neighbour of mine occasionally has a polled Angus bull from Scotland; it costs him 6*l.* 15*s.* to bring that animal from Kirriemuir, wherever that is, in Scotland, to Blockley station in Worcestershire; he can get one from Canada for about 4*l.* 4*s.* I may also say that I have it from Mr. Bruce, of Norton Hall, who is a Gloucestershire magistrate, that he sometimes sends his sporting dogs to this very place, Kirriemuir, where the polled Angus bull comes from, and though my neighbour has to pay 6*l.* 15*s.* for bringing a bull from Kirriemuir to Blockley, Mr. Bruce can send the sporting dogs there in the same way; that is they have a horse-box for the dogs and a horse-box for the bull.

41,641. (*Chairman.*) Where is this place you speak of, is it in the extreme north of Scotland?—In Forfarshire.

41,642. How would the cattle come from Canada; would they come to Bristol?—They come to Liverpool; of course I do not suppose they come in a horse-box across the Atlantic.

41,643. I mean when you speak of the comparison of 4*l.* 4*s.* with 6*l.* 15*s.*, do they come to Liverpool and then from Liverpool to your place?—Yes.

41,644. You say that that would be 4*l.* 4*s.*?—The whole thing would be about 4*l.* 4*s.*

41,645. (*Viscount Cobham.*) Do you think it ought to be cheaper from Scotland, or more expensive?—I think decidedly it ought to be cheaper from Scotland than from New York.

41,646. Do you think the difference all goes into the pockets of the railway company?—I do not know where it goes, I know where it comes from.

41,647. (*Mr. Everett.*) You did not finish about the dogs?—I think it should be noted that a horsebox for sporting dogs can be hired for 5*l.*, whereas if you have a bull, an agricultural animal, you have to pay 6*l.* 15*s.* to the same companies over the same route.

41,648. (*Chairman.*) You think then that relief could be given to farmers by reductions in the railway rates?—Yes; I think the railway rates ought to be dealt with in a very different way from what they have been yet.

41,649. (*Mr. Lambert.*) Do you think that if railway rates were placed upon a fair level—upon the same level as the foreign producers' rates, that it would open up our country districts and afford the British competitor a very much better chance in the market?—I do.

41,650. And you regard the matter as of great importance?—I do. I think the milk trade is very much crippled by the conditions imposed by railway companies in regard to the transit of milk.

Foreign competition in milk.

41,651. (*Chairman.*) That, of course, is another matter; you do not come into competition with foreigners there?—No, but we are threatened very much with foreign competition in milk.

41,652. But you have not got it at present?—We have at present, excuse me; a great deal of Danish milk and Norwegian milk has been landed in London; I do not know whether it has this season, but we have had foreign milk to compete with.

Railway rates.

41,653. Where do you send your own milk to?—To London—Notting Hill. The companies will only take at the reduced rate, of course they have their common rate and their reduced rate, but they will only take at the reduced rate which is the only possible one; if a man does not send at the reduced rate he cannot send at all; provided we sign a declaration that we release the company from all liability for loss, damage, misdelivery, delay, or detention from whatever cause arising either with respect to the milk or the milk cans when full or empty. I had myself a can of milk tilted over at the station the other day by the railway company down in the six-foot way, and I had no remedy whatever for the loss; they accepted it to deliver, and poured it down on the six-foot way, and I had no redress.

41,654. Now what other matters do you wish specially to bring under the notice of the Commission?—I think greater reductions of rent are necessary in a great many districts, and that those reductions ought to bear something like an exact proportion to the fall in prices. Wheat is a staple and has been the staple product of large districts in my neighbourhood, and it has fallen in a much larger proportion than the permanent reductions in rent. I do not think that the old tenants will be able to obtain those reductions without some authority at the back of them in the nature of a land court. I am in favour of a land court. I think that the railway rates question should be dealt with.

Mr. J. C. Reynolds.
28 Feb. 1895.
Reductions of rent.

Land courts.

41,655. One moment about the land court. What is your idea, that the land court should be appealed to in every case that the tenant desires, and that the court should determine for a term of years, or for what?—For a term of years.

41,656. What term of years?—I do not think it would be necessary to make the term of years very long.

41,657. What term?—Five years.

41,658. But at the end of that, do you think the tenant should have a right again to appeal to the court for a further term?—Yes, and I think the landlord should have a right to if he wished.

41,659. Am I to understand by your proposal that the tenant should have a perpetual right from time to time of appealing to the court?—If a question of dispute arose which the landlord and tenant were not able to settle between themselves, I think it would be more satisfactory if an authority existed to settle it for them.

41,660. I only wanted to know exactly what your idea is; is it that a tenant who is in possession from year to year should be entitled to appeal to the court for a rent to be fixed for five years?—Yes.

41,661. And at the end of that five years should the tenant again have the right of appealing, even though the landlord may wish to remove him, and to get another tenant?—I think that if the landlord wished to remove him under those conditions the court should have power to award to the tenant such compensation as might be deemed necessary for disturbance on his holding.

41,662. What is your idea upon that; the tenant is to have a right to appeal to the court for a five years' term; at the end of that time the landlord is to have the right of removing him on paying the compensation for disturbance; on what principle is that compensation to be based?—In the first place I do not think a tenant can give up a farm which he knows well and which he has occupied for years and take another farm without very considerable loss; he must necessarily lose. Of course that fact gives a landlord a very great power in dealing with a tenant who is a man of very small capital. If the tenant knows that he must lose from 10 to 20 per cent. of his capital by removing from one farm to another, he would naturally wish to stay, even though the rent be more than he thinks he ought to pay.

Compensation for disturbance.

41,663. I only want to arrive at what your view is and on what basis this compensation for disturbance is to be fixed?—On what basis?

41,664. Yes, on what kind of basis is the compensation for disturbance to be fixed?—On the basis of the loss which would probably accrue to the tenant in consequence of that disturbance.

41,665. Over and above the value of his tenants' improvements?—I think there is something in the disturbance altogether beyond the question of improvements. A man has acquired a special knowledge in regard to that farm which is worth something to him, and when he goes to another farm he has got to acquire a special knowledge with regard to that.

41,666. How is that to be estimated, is that to be on a scale to be fixed by law, or is it to be dealt with in each individual case, and if so, upon what kind of basis?—I imagine the law would have to fix certain limits, but that competent assessors or valuers would be necessary to deal with the question.

41,667. I want to arrive at what your plan is; what limits do you think should be fixed for the compensation for disturbance?—At per acre, do you mean?

41,668. Yes, at per acre?—It would depend so very much upon the quality and situation of the land; of course there is some poor land on the Cotswolds.

41,669. When you said that the scale must be fixed I thought you meant by the law; that there must be a

Mr. J. C. Reynolds.

28 Feb. 1895.

maximum rate which would be laid down, within which the arbitrator or the Court would determine what should be given in the individual case; I want to know what your view is as to what scale should be laid down: is it to be three pounds an acre, or five pounds, or what?—The maximum rate could only be fixed as a result of very careful investigation extending over a very large number of holdings and counties. It would want to be thoroughly discussed before such a rate was fixed.

41,670. (*Mr. Channing.*) Is not what you want an allowance to the tenant in the first place for his loss by removal, and in the second place some compensation to him for his trade loss in giving up his holding; is that not what you are contemplating?—His loss by removal and his loss from giving up his holding; that would practically come to the same thing, would it not.

41,671. The actual cost of removing from one farm to another is different from his trade loss?—It is not a question of removing from one farm to another; I do not think the tenant has any claim at all to the expenses of removal.

41,672. (*Chairman.*) All that the Commission wish, I am sure, is to know what your views are upon the matter. You have suggested a mode of dealing with this case; that is that a maximum scale is to be fixed for compensation for disturbance on the tenant being removed by his landlord, and we desire to know, as far as possible, what kind of scale you think should be laid down?—How much per acre?

41,673. Yes?—I think that would require very careful investigation before you could lay it down.

41,674. Have you any idea what it should be in your own district? I do not want to cross-examine you, I only want to elicit what your scheme is?—I should say that a man who has a couple of thousand pounds invested in a farm in ordinary culture would probably necessarily lose two hundred pounds or three hundred pounds in giving up that farm and going into another.

41,675. (*Mr. Chaplin.*) What size farm?—If he has a couple of thousand pounds invested in a farm it might be a farm of three hundred acres or three hundred and fifty acres.

41,676. (*Chairman.*) That then would be a fair illustration of your scheme?—Yes.

41,677. A man with a farm of three hundred acres, which involves an outlay of capital of two thousand pounds, on notice being given him by his landlord to quit, should be entitled to about two hundred pounds as compensation for disturbance; is that the kind of illustration that you would give?—I should say that probably a man would lose that amount in shifting from one farm to another.

41,678. That therefore you think would be a fair measure of what should be given to him for going out?—On the question of disturbance.

Leaseholders and compensation for disturbance.

41,679. Apart from any improvement value which he may have put into the land?—Yes.

41,680. Supposing a tenant has taken a farm for 14 years on a definite lease, would you at the end of that lease consider that he is entitled to compensation for disturbance?—Do you mean a lease existing at the present time?

41,681. I will assume that the tenant has taken a lease from a landowner of a farm for 14 years; is this compensation for disturbance payable at the end of that lease?—A lease current now before this question is raised?

41,682. Yes?—I do not know why a leaseholder who is now holding a lease should be exempt from the benefit of the proposal.

41,683. Let us assume that your project is carried would you in such a case think that a man who has previously entered into a lease for 14 years is entitled to this compensation for disturbance at the end of it?—There are an immense number who hold on a two years' notice to quit, and I should not exempt them.

41,684. I want an answer to that particular case that I put; as I say it is necessary to put a few questions of this kind in order to ascertain what is your scheme?—I would not exempt that man from benefit under the proposal.

41,685. You would give him the benefit?—I would give him the benefit if he required to stay and was ejected from his holding.

41,686. Now let us put the other case of a man after the law has passed, taking a lease of 14 years, would you think that at the end of that lease he should be entitled to compensation for disturbance?—I think the matter might be referred to in the lease probably.

41,687. Suppose it is not?—If it is not referred to in the lease, I should say he would be entitled to the compensation.

Mr. J. C. Reynolds.

28 Feb. 1895.

41,688. Would you allow the landlord to make a covenant in the lease which would exempt him from payment of this compensation; of course these are questions which necessarily arise upon the consideration of a scheme of this kind?—Yes, assuredly they do.

41,689. And I only want to know what opinion you have formed upon them?—I have not given very much consideration to the question of leases, they are not very common in my district now.

41,690. They might of course become very common under schemes of this kind?—If the landlord were allowed to contract out, the tenants would probably lose a good deal of the benefit of the business.

41,691. Then am I to understand from that that you would not allow the landlord to contract out of a position of that kind, even if he was prepared to give a lease of 14 years?—No, I do not think it would be possible to allow contracting out; I think you would neutralize the whole thing if you did that.

Farmers' losses on quitting their farms.

41,692. (*Mr. Chaplin.*) Do I understand you to maintain that there must necessarily be loss always upon changing a farm?—Not necessarily, but in the vast majority of cases.

41,693. Now take the case of quitting a large farm at a very favourable time for leaving, that is to say, when the price of stock, and implements, and everything is high, and going into a very small one; would there be any loss; would there not be probably a positive gain upon making a change of that kind?—I do not think there would be very often a gain I confess.

41,694. Are you prepared to say that, under those circumstances, there would necessarily be a loss?—I am prepared to say that all farmers I ever knew——

41,695. In answer to that question, under those circumstances which I have put to you, are you prepared to say there would necessarily be a loss?—That is in giving up a large farm, and taking to a small farm?

41,696. At a very favourable time for giving up when the prices of stock and everything else were high?—Yes, I think there would be a loss; I do not think the question of leaving a large farm and taking a small one has anything to do with it.

41,697. Do you not?—Because you only require so much capital.

41,698. But you require so much less if you have got to lay out a small sum in stock instead of a very large sum; and if you are selling a great quantity of stock at a favourable time, you make a gain. Of course you understand that there are favourable times for entering, and favourable times for leaving a farm?—Giving up a large farm and taking a small one is giving up the farming business to a certain extent. To fairly deal with my point you must assume that a man is giving up a farm of the same size he is taking, or of practically the same size.

41,699. That is the only answer you have to my question?—That is the answer that I give.

41,700. (*Chairman.*) Supposing a tenant dies, would his representatives be entitled to this compensation for disturbance?—If they desired to keep the farm on.

Judicial rents.

41,701. (*Mr. Dalton.*) When a judicial rent is fixed, is the tenant to be forced to remain in for five years?—It is not very easy to force him to remain, I suppose.

41,702. Is it to be taken that he has contracted to remain in for five years, or may he throw his farm up; may he decline to be bound by the judicial rent if he chooses to go out?—If he takes it?

41,703. He goes to the court for a judicial rent which is to be fixed for five years; is he bound to accept that, or may he throw up the farm?—I do not think it would make much difference whether he does it or not; the thing would be in the market.

41,704. (*Chairman.*) Your proposition is that the tenant should have the right of appealing to a court, and the court might possibly say that the rent fixed by the landlord is insufficient. The tenant might find on his appeal to the court, that the court was against him, and fixed a higher rent; is the tenant then to be bound to remain on for the five years paying a higher rent than he was prepared originally to give?—No, I do not see how you can keep him on.

41,705. Not?—No.

Mr. J. C. Reynolds.
28 Feb. 1895.

41,706. Then the tenant would be in the position that if the decision of the court was in his favour and gave him a rent less than the landlord asked, the tenant is to take advantage of it; but if on the other hand the decision of the court is the other way, and the rent is fixed at a higher point than the tenant was prepared to give, the tenant is to be allowed to go?—But if the decision of the court is a correct decision the landlord will not lose anything, because someone else will be quite willing to take the land at the money—supposing the court has fixed a fair rent.

41,707. That may or may not be; the question is as between that particular landlord and that particular tenant; is the tenant to be entitled to take advantage of a decision of the court if it is in favour of him and to throw it up if the decision is against him. (*Mr. Lambert.*) If the tenant threw up a farm, surely there would be a great loss to him, would there not, in changing?—Yes; he would not throw a farm up if he could help it, I am sure. If the court fixed a fair rent I do not see what the landlord would have to complain of, because the farm would be let directly. Of course if the court fixed the rent at more than the farm was worth that would be another question, but we are assuming that if we have a court to fix a fair rent, it will fix a fair rent.

Rating of land.

41,708. (*Chairman.*) Now to pass on to some other matters; what other matters do you wish to bring under the notice of the Commission?—I think that the rating question might be dealt with. The Worcestershire Chamber of Agriculture is very strongly urging that agricultural land should be rated at one fourth for poor law and other purposes, as it is rated for sanitary purposes.

41,709. For all purposes in fact?—Yes, that it should be rated for all purposes at one-fourth. The chamber argues that the land is the raw material of the farmer, who manufactures his produce out of it, and that it ought not to be taxed. The same thing would apply, although the Worcestershire Chamber of Agriculture does not meddle with that, to the question of tithe. I for one think it is very unjust that the whole burden of the church or practically the whole burden should be thrown on the land. Rates might be reduced in that way.

Dairy factories.

41,710. Do you think there is much to be done in adopting the factory system as regards dairy produce?—Yes, I do.

41,711. Are there any cases in your district of it?—Yes, there is one case of a factory at Fladbury in Worcestershire; it is not a very large one, it is worked by water power, and I think it is rather successful. That is a butter factory, and I think that a factory to be perfect should be able to manufacture cheese as well as butter. The great difficulty in regard to establishing factories is to get people who understand the thing throughout. Fancy cheeses and butter, soft cheeses, and all kinds of dairy produce, I think, ought to be made as the seasons seem to favour them. But you cannot get the men who can do it. We had a lecturer from Gloucester, Dr. Bond, who would be known to some members of the Commission, I think—he is a very able man in these matters—and he said, lecturing on dairy factories, that the great difficulty was to get competent men, and that you could not get competent men, to manage these dairy factories who understood the business throughout.

41,712. (*Mr. Channing.*) What becomes of the produce of this factory?—It is sent to towns—to Birmingham and various other places.

41,713. (*Chairman.*) Do you consider that the extension of light railways would greatly assist in this industry?—Yes, I think it would; I think it would make it possible.

Light railways and waterways.

41,714. Do you think it would make it practicable to establish these dairy factories on the Cotswolds?—I think it would make it more practicable. With regard to the question of communication, representations have been made to me by some of the leading tradesmen, and manufacturers in the Evesham district in regard to the water ways. It has been represented to me that light railways may be all very well, and would no doubt do good, but there are waterways such as the Avon for instance, which have been allowed to fall into disuse altogether, and to get out of condition, so that they cannot be used; but which if they could be used, would compete successfully with the railways, and reduce the rate for the carriage of heavy traffic to a very large extent. The Great Western Railway Company has acquired them and allowed them to go into dilapidation; the locks for instance are all gone.

41,715. Has your scheme which you have been suggesting to us of dealing with the rent, been discussed by the Farmers' Association in your district?—The members of the Farmers' Association in my district are not as a rule in favour of land courts; I do not think many of the farmers are in favour of land courts.

Mr. J. C. Reynolds.
28 Feb. 1895.
Land court and judicial rents.

41,716. Then it is your individual opinion which you have given us?—It is my opinion, and it is supported by a good many farmers whom I have met with, but not in my own particular neighbourhood.

41,717. Has the matter been discussed by them in your neighbourhood?—The matter has been discussed by the North Cotswold Farmers' Association very carefully, and the North Cotswold Farmers' Association suggest for remedies the following:—Reduced railway rates, reform of the currency, readjustment of local and Imperial burdens, a law compelling the marking of foreign meat and licenses to sell the same, and a duty on all foreign imports. We have there Bimetallism and Protection together.

41,718. Am I to understand that they have discussed this plan of judicial rents?—No, they have not discussed it.

41,719. I thought you said that they were against it?—So they are.

41,720. Were they against it without discussing it?—Not as a body, but most of the individual members are against it.

41,721. After discussing the whole subject they did not put that down as one of their topics?—No, they do not name the question.

41,722. (*Mr. Channing.*) They have not discussed it publicly?—No, they have not discussed it publicly.

41,723. (*Chairman.*) But the majority are against it?—Undoubtedly they are against it.

41,724. They prefer to be left to make their own bargains with their landlords, is that it?—Yes, but at the same time they say there are "large and increasing arrears "of rent," which looks rather significant to me. I want to know how these arrears of rent are going to be dealt with as long as they are large and increasing.

41,725. I suppose you consider they are irrecoverable?—Yes. There is something wrong in the system; these men have been paying too much.

41,726. (*Mr. Channing.*) I think, if I am mistaken you will correct me, that the idea of fixity of tenure for five years if a judicial rent was fixed was not what you were contemplating when you came here?—No.

41,727. Is your idea not somewhat of this kind, that you are dealing generally with yearly tenancies?—Yes.

41,728. That you consider those tenancies as tenancies, shall go on from year to year?—Yes.

41,729. And practically as permanent tenancies, subject to notice to quit?—Yes.

Compensation for disturbance.

41,730. The compensation for disturbance which you want is the allowance which a man ought rightfully you think to have in respect of the termination of a tenancy which he contemplated as a permanent tenancy?—Yes.

Judicial rents.

41,731. Now about the determination of a rent by an outside tribunal; would not a suggestion of this kind meet your views, that where a tenant wished a reduction of rent or where the consideration of the terms of renewal of the tenancy were gone into between landlord and tenant, the whole question of the rent should be referred to an arbitrator who should determine what the tenant had done for the land?—Yes.

41,732. And mark that off from any rent that is contemplated?—Yes.

41,733. Would that be your idea of a fair rent, to leave the landlord and tenant free to bargain as to rent, but to have at any bargaining with regard to the rent a determination of what the tenant had really done for the land; or would that not meet your view?—I fancy there would be some practical difficulties in working out exactly what the tenant had done for the land. You would want to value a man in and value him out. That is the practical thing; a man should be valued when he goes in and valued when he goes out.

41,734. Would you wish then to have the total value of the land fixed by the arbitrator?—Yes, the value of the tenant-right so to speak. You want to have it valued when a man goes in, and if he has injured the land he ought to pay, and if he has benefited the land he ought to have the benefit paid to him.

Mr. J. C. Reynolds.
28 Feb. 1895.

41,735. Am I right in inferring that you would not necessarily bind yourself to a system of a term of years for which you wanted the rent fixed?—No, I had not contemplated a term of years when I came here, as I daresay you observed. I have been looking at the yearly tenants and men with two years' tenancies in my own district, and looking specially at the difficulties which I conceive them to be labouring under.

Evesham tenant right system.

41,736. There is just one other question I want to ask you, and that is about the sale of tenant-right or improvements in the Evesham district; is what you said confined to one particular estate, where this matter is recognised in the agreements of that estate, or is it general?—Have you any particular estate in your mind?

41,737. The Rudd estate?—On that estate it does prevail; there is no doubt about it; it is a recognised system.

41,738. Is it recognised in the agreements?—I do not know. I have not been able to get hold of one of the agreements. I doubt if it is recognised in the agreement, but I have never heard that it has been broken through.

41,739. Is the custom recognised outside the Rudd estate?—Yes, it applies pretty nearly to all the Evesham gardens.

41,740. And is it generally desired by tenants in a similar position, who are working in that industry?—Yes.

41,741. With regard to this point, the question I wanted to ask you was, whether the landlord on the Rudd estate, or on other estates, exercises, or has exercised in any instance that you know, the right of pre-emption and has himself stepped in in order to choose his own tenant?—I do not know whether he has exercised it: he would have that right of course. The tenants have to appeal to the landlord, they go to the landlord and say, "So-and-so wants to buy my tenant right," and the landlord can please himself.

41,742. He has a veto on the tenant if he is not a suitable tenant?—He has a veto on the whole thing; he can step in and take it himself. It is simply by his assent that payment is made.

Market gardens.

41,743. (*Mr. Everett.*) The district that you have referred to as I gather, if it does not flow with milk and honey, is a land of hills and valleys?—Yes.

41,744. And these gardens are found mostly on the sunny slopes of the hills or in the valleys?—You must remember that Evesham is not in the Cotswold country at all, Evesham and Pershore are in a different country entirely. Evesham is in the low land altogether.

41,745. Is the land tolerably flat there?—Yes, it is tolerably flat.

41,746. These garden lands, were such an enormous sum per acre is paid, when they change hands, I presume, have been turned from ordinary farm land into gardens by the tenants?—Yes.

41,747. And these great sums are paid by their successors for the enormous additional plant which has been put upon the land, so to speak?—Yes, that is so.

41,748. Speaking generally of your district, I understand you to say that there is decidedly less employment now for the people than there used to be?—Yes, decidedly; a good many houses have tumbled down.

Condition of labourers.

41,749. If the price of produce were to go up, so that the land would come into cultivation again, is it your opinion that labour there is strong enough to be able to claim a fair share of the higher prices, not that there would be more labour employed, but that it would be employed at a rate of wage in proportion somewhat to the higher price of produce?—Wages might go up a little, but I do not think the labourers would get a great deal out of it.

41,750. Do you not think the position of labour on the whole is very much stronger now than it was 30 years ago for instance?—Not agricultural labour in my district; I do not think it is stronger.

41,751. That is owing to the slackness of employment, I suppose?—Yes, partly; and the introduction of machinery of course accounts for a great deal.

Land courts.

41,752. In regard to a land court, I suppose you are aware that a good deal of land is encumbered with mortgages and family charges?—Yes.

41,753. Would it not strike you that if a land court was empowered to prevent the owner of that land getting all that he could get for it as rent in the market, that it ought also to be able to have something to say to the charges which that man was liable to pay out of his rents?—I do not feel bound to consider that question. I look at it from a public point of view, and it is not in the interest of the public that these men should be over-rented. They cannot be over-rented permanently, as, of course, we know.

Mr. J. C. Reynolds.
28 Feb. 1895.

41,754. It would not seem to you very unfair that a court should deprive a man of the market value of his property, leaving him still liable to burdens which he could not escape from?—I think the interest of the tenant has to be considered first: he has got to work on the land and I think the Court ought to see that he has a fair chance, and that he does not work 12 months and then find there is nothing for him in the end.

Tithes.

41,755. With regard to tithes, I gather from your brief that you would be glad to see the use of the tithes changed?—I should be very glad.

Losses of landlords and tenants compared.

41,756. (*Mr. Lambert.*) Which do you think have lost most in proportion to their capital, the farmers or the landlords?—I do not know, and I am not in a position to know what the landlord's capital is.

41,757. The landlord's capital would be, of course, his land?—Farmers have lost their all in many cases, but the land remains there as far as we can see.

41,758. Therefore the farmer's loss is greater than the landlord's?—It would be more in proportion.

41,759. Have you many cases in which farms have been let to new men at a less rent than that which was paid by the old tenants?—Yes, I have. I have given several cases, and I could give more if necessary.

41,760. Such cases are—I will not say common—?—Yes, they are common, and they are matter of very common complaint amongst the farmers.

Land courts.

41,761. You want some system whereby the sitting tenant, as he is called, should be enabled to get something like a fair rent fixed, or be paid for going out of his holding?—Yes, that is the point.

41,762. What idea have you as to the formation of a land court. Would a valuer appointed by the district council suit you?—I do not know whether it might be worked by the county court with assessors.

41,763. Everybody of course has a horror of law, except lawyers, and it is a question whether farmers would like to go to the county court judges, or whether they might not have more confidence in a man who was appointed by themselves, or by a body elected by the ratepayers. What do you think?—They might perhaps prefer such a man.

41,764. Is there any necessity for a county court judge to go into these matters if the law is clearly defined?—There is no necessity if you can provide some other authority, if you are not tied up to the county court judge.

41,765. But the county court judge could not practically assess the value of a holding, he must employ an assessor?—Yes, he would want assistance.

41,766. If you want an assistant why not make the assistant the principal?—There is very much to be said for that, no doubt; but I do not think the courts would be very often appealed to; I think the existence of them would prevent the necessity of appealing to them in many cases.

41,767. Still for all that, if you are advocating the formation of a court, of course, you must know what the court is to be?—Just so.

Leases and yearly tenancies.

41,768. (*Mr. Dalton.*) I think you say that in most cases the land is held from year to year in your district?—Yes.

41,769. I suppose that is because the tenants prefer that system to the taking of a lease, is it not?—I daresay a good many of them do.

Judicial rents.

41,770. How long do you think a tenancy should have lasted before the tenant should be entitled to go into court for a judicial rent?—You see, circumstances in farming change very suddenly; in 12 months you may be face to face with an entirely different condition of things.

41,771. Do you think he should go in a year after he has agreed to pay a certain rent, or would you fix some minimum period?—You might perhaps give him a couple of years.

41,772. I think you now rather go back from saying that the judicial rent should be fixed for five years, do you not?—It would be rather a long term. Of course there would be an immense deal of detail to work out in this question.

41,773. It would be undesirable to be constantly going to the court for it?—Yes, it would; but there may be

Mr. J. C. Reynolds.

28 Feb. 1895.

special circumstances that may demand a change, you see this last fall in produce has come upon us very suddenly.

41,774. Supposing land went up in value, the tenant would have the right to pay only that judicial rent for a fixed period, and he might take the advantage of the low rent for a certain period?—I would give the landlord the same right to appeal to the Court if he required it.

41,775. At the end of a certain time?—Yes, at the end of a fixed time.

41,776. But then you do not place them both on the same footing, if you do not bind the tenant to take it for that term of years; apart from any other question, supposing the rent is fixed for five years and the value of the land depreciates during that time, the tenant may give it up?—Yes. I do not think you could fix it for five years; I think five years would be rather too long. I think you would have to have a shorter period than that.

Tithe rent charge.

41,777. You have spoken of the tithes, in your district; are they very high?—Some of the land is highly tithed. My own land is tithe free.

41,778. Could you give us any idea of what the average is in your district; it seems to vary very much in different parts of the country?—I could get it you for the whole of Worcestershire very easily; it is easily accessible.

41,779. Can you say at all what it is?—I cannot say absolutely without referring to the figures, but it would be very easy to come at for any parish; I could supply you with the information.

41,780. (*Mr. Little.*) It is not easy to come at the rate of charge, is it? A statement as to the total amount of tithe in any particular parish would not show the burden of that tithe, because it might lie on a small part of the land?—The amount per acre do you mean?

41,781. (*Mr. Dalton.*) Yes?—My own hamlet is all tithe free.

41,782. It is always paid by the owner in your district, I presume, is it not?—As a rule I believe it is.

Market gardens.

41,783. Is there much land in your neighbourhood which is not now market garden, but which is capable of being developed into market gardens?—Yes, I think there is.

41,784. And which would pay for being turned into market gardens?—Yes, I think probably it would. I think that is where security is wanted for the tenant.

Allotments.

41,785. There is a great opening for allotments, I understand you think?—In some districts, decidedly, there is, but I should think they will probably get them now.

Wages of labourers.

41,786. (*Mr. Little.*) You state in your brief that your experience on the point of labourers' wages "does not bear "out Mr. Little's report, which gives the average wage "here as 15*s.*"?—Yes.

41,787. May I ask if you have read that report?—I have.

41,788. Do you find that I have anywhere stated that the wages are 15*s.*?—I offer this correction—"the earnings."

41,789. Will you allow me to refer you to page 83, where the wages of the Cirencester district are given?—Yes, I know that.

41,790. They are stated at 10*s.* 6*d.*?—Yes, and I will make this correction at once—that I should have said "earnings." The difference between the earnings and the wages which appears in your report is not comprehensible to me. To make a margin in our district of 5*s.* between their earnings and their wages would be entirely wrong; there is no such margin.

41,791. You are probably aware that my report was based upon reports from assistant commissioners, who visited the different districts?—Yes.

41,792. Have you seen Mr. Richards' report on the Cirencester district?—A part of it is included in your report, is it not?

41,793. It is a separate report on the Cirencester district?—Yes, but I am a long way from Cirencester you must understand, 25 miles.

41,794. That is the point I was coming to. Mr. Richards' report is as to a particular district, the Cirencester Poor Law Union, and in his report he says that there is a considerable difference between different parts of that district. He gives 10*s.* to 11*s.* as the ordinary wages, and then he gives particulars as to the actual earnings of a number of men in that district, and he deduces from that the conclusion that the earnings through the year of an ordinary labourer are 15*s.* You dispute that as to your particular district, but would you say that it was not true of the district of Cirencester?—My experience at my end of the Cotswolds is that that statement would not apply.

Mr. J. C. Reynolds.

28 Feb. 1895.

41,795. But if Mr. Richards states at Cirencester the earnings would be 2*s.* a week more than in the north, it is possible that he may be correct, though that experience would not exactly accord with yours?—Yes, my statement would simply mean that at my end of the Cotswold Hills the wages are not paid on the same basis as at the end which Mr. Richards reported upon.

41,796. That the earnings are not so large at your end of the Cotswold Hills as on the average of the Cirencester district?—Yes.

41,797. That would not impugn the accuracy of Mr. Richard's Report?—I do not impugn the accuracy of his report, I simply say that as far as my experience of the Cotswolds goes, the earnings of the men would not be 15*s.* a week or anything like it.

41,798. I suppose the labourers do earn extra money in harvest time?—Yes.

41,799. And at hay time?—They get some beer and sometimes a little money.

41,800. Do they make overtime?—Not very much of recent years.

41,801. Do they get a house rent free?—Only the stockmen, and you deal with them on a different basis, I see.

41,802. Then the ordinary labourer pays a rent for his cottage?—Yes, he does.

Compensation under the Agricultural Holdings Act.

41,803. I was not here in the earlier part of your examination, and I do not know whether you have been asked any question as to the amendment of the Agricultural Holdings Act, 1883, but I see that you suggest in your brief that some amendment is required?—I have not discussed that question, except so far as to say that a man should be valued into his farm and valued out of it; that is my idea.

41,804. You mean that what he takes should be valued?—Yes.

41,805. Do you mean the farm?—I mean that the question of condition should be dealt with, and that when he goes out it should be dealt with again, and that he should have the benefit, or he should pay the difference.

41,806. He should have compensation, or pay compensation, on the difference?—Yes. In regard to the restrictions on cultivation they are not very common in my district, but I think——

41,807. That is not under the Act of 1883?—No.

41,808. Is the specific amendment that you desire to see in the Act of 1883 that there should be a record of the condition of the holding at entering and at quitting, and that the tenant should be compensated, or should pay compensation in respect of the difference in condition?—Yes, I think that would be equitable.

41,809. Is that the only amendment that you desire to see?—In regard to the restrictions on sale——

41,810. That is not under the Act; I only wanted to know whether you had any specific amendment to propose with regard to the Agricultural Holdings Act?—In regard to the compensation for manures, cakes, and the like used on the land I think that whole question wants to be revised and gone into.

41,811. In what direction: do you mean that it should be more specific, or that it should include other things, or what?—I think the tenant should have a little more advantage under that in regard to the use of manures, and fertilizers, and unexhausted improvements, and the like, but it is rather a difficult question.

41,812. He has now the right to claim for any manures which he may have used; whether the claim is substantiated or not depends upon the view of the arbitrator?—He has a right to claim a proportion.

41,813. Not a proportion; he has a right to claim any unexhausted value?—I think that what I said just now might perhaps deal with that; if you value the condition of the farm when the man goes in and when he goes out—of course you would have to take into consideration what the man had put on it—you would have to take that fully into consideration; indeed, that is the only way in which you can get at it.

Restrictions on cultivation and sale of produce.

41,814. Then with regard to the restrictions as to the cultivation and sale of produce, how would you amend the present restrictions; would you by law give the tenant an absolute right to cultivate as he pleased?—What I have just said about valuing the condition of the land would

Mr. J. C. Reynolds.
28 Feb. 1895.

cover that ground. If a man injures a farm by cross-cropping there is a remedy.

41,815. Would you allow a man by law when once he had entered a farm to crop it as he pleased and to sell what he pleased?—Yes, I would.

41,816. Would you prohibit any agreement between the landlord and the tenant which determined the use of the land?—I think when a man has the land he must make the best of it according to his own judgment.

41,817. Supposing he makes the worst of it and ruins the land, and leaves nothing to compensate the landlord?—You have the suggestion I made just now, that if he injures the land he pays.

41,818. Supposing he has not got anything to pay with?—Do you think the landlord would have got it all in the rent?

41,819. Suppose the rent is nothing?—That is very often the case.

41,820. Suppose the tenant ruins the land, takes everything off it, and reduces the value of the land, and has nothing wherewith to pay?—If the landlord sees this going on he has got his remedy.

41,821. If he applies his remedy and gives the tenant notice would you compensate the tenant for disturbance?—Yes, but if he had injured the land, if he had reduced the value of the land, it would be deducted under the suggestion I have made just now.

41,822. Have you ever known cases where the landlord not only loses rent, but is quite unable to get anything from the tenant for dilapidations because there is nothing left?—No, I do not recollect anything of the sort.

Farmers' losses of capital.

41,823. (*Mr. Clay.*) With regard to the capital of the farmer, it has been gradually decreasing, you say?—Yes.

41,824. You say it has been decreasing owing to the endeavour to pay unfair rents; do you mean too high rents?—Yes.

41,825. As the capital of the tenants has been decreasing naturally the condition of the farm has gone down?—Yes.

41,826. And so the landlord is taking rent from the farmer at the expense of his property?—Yes, I think so in some cases.

41,827. Not in all cases?—No, not in all cases.

41,828. In a majority of cases?—In many cases.

41,829. Would you say in the majority or in the minority of cases?—I would say in many cases.

41,830. Do you consider over the whole country that the capital of the farmer has been gradually going down?—So far as I know.

Compensation for home-grown corn consumed.

41,831. Have you had much experience with the Agricultural Holdings Act of 1883?—No, not much.

41,832. Have you considered about amending the Act?—No, not closely.

41,833. Have you considered the right of the tenant to be paid compensation for his home-grown corn?—Do you mean that it should rank as cake?

41,834. Yes?—There is no reason why it should not that I know of.

41,835. Do you consider that a tenant should be paid for what produce of his crop he uses upon a farm?—Yes, that it should be a question of manurial value in the case of either corn or cake.

Malt tax.

41,836. Would you consider that it would benefit the farmer if the beer duty was repealed, and we went back to the malt tax?—I should like to see an Act compelling the brewer to mark the beer what it was made of, whether it was made of malt and hops, or of something else. As to the repeal of the beer duty I am doubtful.

41,837. Some have advocated here that the malt tax should be re-imposed again?—I do not think that would do us any good. I think it would do us good if the brewer were compelled to state what he makes his beer of—whether he makes it of malt and hops or whether he makes it of drugs and sugar and maize and so on.

Land court.

41,838. Regarding your examination on the land court, of course the custom of your country being yearly tenancy you could only give evidence upon that line, and not upon leases?—Yes; I prefer not to give evidence on leases.

41,839. So when the chairman was asking you questions on that point you were not qualified to speak upon it?—No, I do not think I have considered that point fully.

41,840. Might not a land court sometimes bring a landlord and tenant together in fixing rent just as a conciliation board brings the employer and employé together in fixing wages?—I think so.

Mr. J. C. Reynolds.
28 Feb. 1895.

41,841. If we have conciliation boards to fix wages there is no reason why the tenant should not have something similar in order to bring the landlord and himself together on a question of rent?—Yes.

41,842. Do you consider also that if a tenant has been long enough upon the place there is a certain amount of amenity about the place for which he may claim, and for which he should be compensated?—Yes, that is my view.

41,843. (*Mr. Whitehead.*) I think you live not very far from Winchcombe, in Gloucestershire?—15 miles.

Lord Sudeley's fruit farm.

41,844. Are you acquainted with Lord Sudeley's large fruit farm near Toddington?—Not intimately; I have been on that estate, but I have not made a minute examination of it.

41,845. Do you know whether that has been a prosperous concern on the whole?—I saw one of the leading workmen there, that is some years ago, and the report he gave me was that where the fruit is planted on good land it seemed to do very well, and paid very well, but that they planted a good deal on poor land, and that is up to nothing. My idea is that a great deal of the land has been planted which was not quite suitable for the fruit. Where the land was suitable it did very well, and was a very good speculation, but where the land was not suitable it was a losing concern, and so it always will be.

41,846. One of the features of that fruit farm, I believe, is that there is a jam factory attached to it?—Yes.

41,847. Has that helped to the profit of the farm, do you know?—I do not know, I have not seen their accounts, but I think they turn out a lot of stuff.

41,848. Have neighbouring farmers been able to send their fruit to that factory, do you know?—Not from my district; I have not heard of any that have done so.

41,849. Has the example of Lord Sudeley encouraged other persons to plant fruit?—There are jam factories at Evesham and at Pershore, which do take the fruit of farmers in the district.

41,850. Has the example of Lord Sudeley encouraged farmers to plant fruit?—I do not know whether the example of Lord Sudeley has done so, but there has been a good deal of fruit planted, and I should say that the fruit industry on the whole is increasing in the district.

41,851. It has not increased very largely, I think, in Gloucestershire, only about 3,000 acres in 10 years?—This is Worcestershire I am speaking of.

41,852. But Lord Sudeley's place is in Gloucestershire?—Yes; the two counties are very much intermixed in our neighbourhood.

Fruit farming.

41,853. You speak of your own farming as having been profitable, mainly, I think you said, owing to the fruit?—To fruit and milk. Milk is my chief thing. I do not know about "profitable." I should want to qualify that.

41,854. You said fruit, I think?—Yes, I grow fruit and it does fairly well, but it is not my leading thing.

41,855. Do you think there is room for extension of fruit farming in the country?—Yes, I think so, in the favourable districts.

41,856. That it would pay?—Yes, in the favourable districts; but you may easily throw a lot of money away in fruit planting.

41,857. If jam factories were near, that would help fruit farming to pay?—Yes, I think that would help.

Soil in Evesham district.

41,858. With regard to market gardening at Evesham, is not the land in that district very peculiar?—I do not think it is the land. I think it is the situation; it is a warm low situation.

41,859. It is alluvial soil?—Some of it is clay; it is chiefly gravel, I should say; there is a great deal of gravel subsoil.

Foreign competition and market gardening.

41,860. Have you heard that market gardeners there have been complaining of the competition of foreigners during the last two years?—Yes, they complain to some extent, but I have not anything very definite on that point.

41,861. And that consequently there has been some cessation in the demand for market gardens in that district?—I have not heard of any cessation in the demand for market gardens at Evesham. I think they are taken up quite as fast as they fall vacant.

Mr. J. C. Reynolds.
28 Feb. 1895.

41,862. In spite of foreign competition?—Yes, I think they are taken up. They have got a special line there, which the Evesham people keep pretty well to themselves.

41,863. What is that special line?—Asparagus has a good deal to do with it. Then they have their special system in their cultivation; they seem to me to be a community by themselves very much in this matter.

Market gardeners and competition of farmers.

41,864. Are they not very much interfered with now by farmers who are taking to market gardening? I think you hinted at that in your evidence-in-chief?—We compete with them in such articles as green peas, cabbages, and broad beans. But the point is that these people can get their stuff a little bit earlier than anybody else. They lie in a warm sheltered valley, and so they can get the stuff a little bit earlier; that is where they beat us. The farmer cannot compete with them as to the period, therefore when he comes in the stuff is worth about half as much money as the Evesham people can make of it.

41,865. That applies to asparagus and such things, I suppose?—Yes, and green peas and cabbages and many other things; radishes is a very large business.

41,866. Is it not in articles like asparagus that the foreigner is competing so keenly now with our market gardeners?—The foreigner does not compete with them in asparagus.

41,867. Do you not think that is likely to increase?—The demand for asparagus increases quite as fast as the supply does. I have lately had information about that, and there does not seem any danger of glutting the market in that.

41,868. May we gather that in your opinion there is room for the extension of market gardening in the country?—Yes, I think there is; always provided that it is not attempted in unsuitable districts.

Temporary pastures.

41,869. You spoke of temporary pastures being laid down in your district; would you tell me what the seed is composed of; what seed do they use? It is on the three years' system, I suppose?—They would use clover and trefoil, and then some rye grasses. I could get you a sample of the mixture if you wanted one.

41,870. They do not use any special mixture?—No, it would vary on different soils; they would keep it down two or three years and then break it up again. I think that is a Scotch system.

41,871. (*Viscount Cobham.*) Do you grow sanfoin?—Sanfoin would not do, except on chalky and stony land; sanfoin would not do well in the clay.

41,872. (*Mr. Whitehead.*) You would not include that in the mixture?—Not on the clay. On the Cotswolds I should sow pure sanfoin. I should not make a mixture of sanfoin and something else there.

41,873. (*Sir Nigel Kingscote.*) You told us that you have 164 acres of your own and 47 acres hired?—Yes.

41,874. Is that your sole occupation?—That is my sole occupation. I have been there 23 years.

41,875. Do you actually live upon that?—Yes, I do live upon that, but I did not come here to discuss my own business matters.

North Cotswold Farmers' Club.

41,876. Did I understand you that you were a member of the North Cotswold Farmers' Club?—Yes, I am a member of the Executive Committee of the Association.

41,877. Do you attend their meetings?—Not very often.

41,878. May I ask what their district consists of, where it begins and where it ends?—They go pretty near to Stow-on-the-Wold—not quite to Stow, I think—to Moreton-in-the-Marsh, Chipping Campden, Mickleton, on the way to Stratford-on-Avon, nearly to Shipston-on-Stour in another direction, to Evesham in another direction, and near to Winchcombe in another direction.

41,879. Therefore I conclude that you are pretty well acquainted with the whole of that district?—Yes.

Land out of cultivation.

41,880. That being so, and knowing the Cotswold district proper as you do, may I ask you whether a great deal of land in that district has not gone out of cultivation, or next door to it?—Some land has gone out of cultivation or next door to it, as you say.

41,881. Would you say that a very large proportion has?—No, I should not say a very large proportion. Mind you, that is not dealing with the poorer part of the Cotswold Hills. I have understood that on the Cotswold Hills there is a good deal of derelict land like that, but not exactly in the district I am referring to. Mine is not a pure Cotswold district.

41,882. I see you say in your brief that the depression does not appear to have seriously affected the large landowners. I want to ask you whether there are not very large landowners within the radius you have named who have suffered most severely?—Of course I do not know what their private affairs are, I only know that their establishments are kept up.

Mr. J. C. Reynolds.
28 Feb. 1895.

Effects of depression on landowners.

41,883. Is it not within your knowledge that several large places there have been let, as the landowners have not been able to live upon them?—I cannot call one to mind at this particular moment, but possibly if you were to name one I might be able to answer you.

41,884. (*Viscount Cobham.*) You are speaking strictly of the North Cotswold district, are you not?—I am speaking of the North Cotswold country now.

41,885. (*Sir Nigel Kingscote.*) I suppose you also know that tenant farmers have suffered very greatly up there?—They have.

Reduction of rent.

41,886. And that rents have been reduced very largely?—Yes, the rents have been reduced.

41,887. What per-centage should you say the rents have been reduced in this North Cotswold district?—I have grounded myself in regard to the Worcestershire side on the investigations which were made by the Worcestershire Chamber of Agriculture on this subject——

41,888. But Worcestershire is not the Cotswold district that you have been talking about?—Worcestershire is my end of the Cotswolds.

41,889. You cannot say that the Cotswolds are actually in Worcestershire?—No, I am not dealing with the pure Cotswold district at all; I am dealing with the northern end of the Cotswold Hills. The Worcestershire Chamber of Agriculture made careful investigations, and reported that something like 17½ per cent. represented the permanent reduction, but that there had been temporary reductions as well.

41,890. That has nothing to do with the North Cotswold district proper, situated in Gloucestershire, has it?—The Cotswold district proper?

41,891. The one you named when you gave me the area just now?—The district I gave you was not the Cotswold district proper. You could not call Shipston-on-Stour a Cotswold district.

41,892. I am talking of the North Cotswold district?—The Cotswold district proper?

41,893. No, the north Cotswold district that you described just now; you said you were on the executive of the Farmers' Association of that district; I am confining myself to that. You told us what your Worcestershire report says, but I want to know whether that Worcestershire report applies to this north Cotswold district or not?—It applies to a part of that district, but the North Cotswold Farmers Association covers a larger area. In an earlier part of my evidence I read from this report, and stated that the Worcestershire Chamber of Agriculture reported a reduction of rents for Worcestershire of 17½ per cent., with some temporary reductions in addition, but that the North Cotswold Farmers' Association reported a somewhat larger reduction, and they spoke of good clays and loams on the slopes of the Cotswold Hills being reduced by something like 33 per cent. I have no doubt the per-centage of reduction on the Cotswold Hills is larger than it is in the lower lands.

Effect of depression on landowners.

41,894. (*Viscount Cobham.*) I see you say in your brief that there has been an average reduction of rents of about 20 per cent. Then you go on to say that the depression does not appear to have seriously affected large landowners, because 80*l.* will buy more to-day than 100*l.* would have bought 20 years ago. Is there not a fallacy in that? A fall of 20 per cent. in the rent would come entirely upon the spending margin of the landowner, would it not?—Do you mean settlements and that kind of thing?

41,895. I mean putting aside debts: supposing that the up-keep of the estate and the landlord's various miscellaneous charges come to 50 per cent. of the rents, which they very often do, then the 20 per cent. reduction of rent would really be 40 per cent. to the landlord, because it would reduce his spending power by 40 per cent. apart from the up-keep of the estate?—Would it cost as much to keep the estate up now as it did 20 years ago?

41,896. I am assuming that—we have often been told that it is so—there is as much to be spent in keeping up an estate now as formerly; assuming that, does it not follow that the landowner's margin of 50*l.* has been reduced by 40 per cent., and not 20 per cent.?—He receives 80*l.* instead of 100*l.* I put it like that, and I simply say that 80*l.* to-

Mr. J. C. Reynolds. 28 Feb. 1895.

day will buy more than 100*l.*, or as much as 100*l.* would have bought 20 years ago. There may be special circumstances known to the landlord which will make the matter more adverse to him than appears on the surface.

41,897. Assuming that he has to pay for the up-keep of the estate a half of the gross rent, then the whole of the 20 per cent. reduction would fall upon the second half?—The cost of keeping the estate up does not appear on the surface. I only know what I see; I see that he gets 80*l.* for 100*l.*, and I also see that 80*l.* will buy as much now as 100*l.* would 20 years ago. What the landlord does with the 80*l.* after it has gone into his pocket I am not in a position to say.

Mr. J. C. Reynolds. 28 Feb. 1895.

41,898. Still, if my assumption is correct, my conclusion is correct?—Yes, you know more about the cost of the up-keep than I do, I have no doubt.

The witness withdrew.

Mr. GEORGE ADAMS called and examined.

Mr. G. Adams.

Mr. G. Adams.

41,899. (*Viscount Cobham.*) I believe you are a large farmer in Berkshire?—I am.

Particulars of witness's farm.

41,900. Can you tell us how much you farm and what is the character of your business?—I farm just over 3,000 acres, about half of it is arable and half of it pasture.

41,901. What is the character of your land?—I have very stiff clays; I have sand and gravel and loam.

41,902. How do you manage your farm?—I keep a little over 200 milking cows; I keep a flock of very good Oxford down sheep. I keep all my heifer calves and all my ewe lambs. I used to grow a good bit of wheat and a good few swedes.

41,903. Do you wish to give us the results of your farming during the last 15 years?—When I first began farming——

41,904. When was that?—I began farming in 1869. It was very good for the first three or four years and then it gradually got worse, and the last two or three years it has been scarcely worth doing, in fact for the last six months it looks as if it is was scarcely worth doing at all.

41,905. When did the turn in the tide take place?—It began with the very bad season of 1879, I think.

41,906. Then you do not consider that you have very much to complain of till comparatively recent years?—In recent years most.

41,907. Would you say the last four or five years?—The last nine or ten years.

41,908. In what respects have you suffered chiefly?—I think we have suffered the greatest from foreign competition.

41,909. In the prices that you get for your produce in fact?—That is it.

41,910. Have you been able to maintain the amount of produce you have put out?—Yes, I think our crops have been quite as good, except in 1893, which was a very bad season indeed, we had a very short hay crop then to begin with.

41,911. You do not consider that you have suffered more than you had a right to expect from bad seasons?—No.

41,912. You have suffered entirely from the fall of prices due to foreign competition?—That is so.

41,913. Do you consider that a farm like yours can pay its way at present prices?—It cannot. I do not think it can for a minute. If it so continues, a great many farmers will have to give up the business altogether. In fact they will be ruined.

Particulars of witness's farm.

41,914. What rent do you pay for your 3,000 acres?—I pay from 15*s.* up to about 27*s.*

41,915. Does it average a pound an acre all through?—It would be about that.

41,916. (*Mr. Little.*) Twenty-seven shillings would be for land in the valley of the Thames, I suppose?—Yes, t would.

41,917. (*Viscount Cobham.*) Is that a considerably reduced rent upon the rent of 1879?—Yes, Lord Wantage has reduced our rents nearly 40 per cent.

41,918. Do you rent under Lord Wantage?—I rent 500 acres under him.

41,919. (*Sir Nigel Kingscote.*) You do not rent all of it then under him?—No, not all of it; only 500 acres under Lord Wantage. He has met his tenants very well indeed.

41,920. (*Mr. Little.*) In what direction do your farms lie, and on what class of land?—We have a good deal up the Thames Valley, and then we have a little on the Stone Brash in Oxfordshire—almost like the Cotswolds; then we have very hot sand, and we have a little gravel.

41,921. Do you run towards Buscot?—A little. That is very stiff clay.

41,922. (*Viscount Cobham.*) Does much of your 3,000 acres represent sheep run?—About a quarter of it is sheep run.

Low prices.

41,923. Would you go so far as to say that, whatever the rent, at present prices it would be ruinous to the farmer?—Yes, if we get the land for nothing now it would not be so well as when we paid a good rent a few years ago.

41,924. You have not experienced such a fall as that in dairy produce, have you?—Dairy produce has fallen a good bit. We used to make clear nearly a 1*s.* a gallon of our milk, but now a good many can only sell it for a 1*s.* Some do it for 13*d.*, and I sell it for 14*d.*

41,925. (*Mr. Little.*) A barn gallon?—Yes.

41,926. We had better have what the barn gallon is?—The barn gallon is a very foolish measure indeed.

41,927. (*Mr. Everett.*) How many pints are there in it?—Seventeen pints. I think we quite give away the last pint.

Fall in price of dairy produce.

41,928. (*Viscount Cobham.*) Could you give us an estimate of the fall in dairy produce in the last 10 or 15 years?—I should think it is nearly 25 per cent. Butter, you see, has wonderfully gone down in price through the large importation of foreign butter.

Fall in price of barley.

41,929. In addition to dairying I see you grow barley, wheat, beans, swedes, thousand-headed kale, and other crops?—Yes, but I should like particularly to speak of barley. I think the malt duty being shifted from malt to the beer is very much against the farmer as well as against the landowner. Our barleys do not fetch the money that they used to. The brewers are allowed to make beer of anything and everything, and that is very much against the labouring men who drink it, as well as against us who produce it.

41,930. Has that affected the finest barleys?—It has very much affected them.

41,931. Do you grow the best malting barley?—Some of it I do. We grow heavy crops. Even the best barleys are very much reduced.

41,932. But the effect has been worst upon the lower grade barleys, I suppose?—I think you can take it all round, because they can buy such a lot of cheap barley coming from abroad which does not contribute at all to our taxes. Every sack we English farmers produce is taxed to maintain the poor, the roads, the schools, and everything else for which taxes are made.

41,933. What remedy for this state of things can you suggest?—I really think we ought to ask to have the beer made with malt and hops as it used to be. It was far better then. One could drink a glass of beer then. Now we are almost prohibited from it.

41,934. That would be rather a strong measure, would it not, if the beer made in the present way is wholesome?—I do not think it is so wholesome. The doctors, if you go to them, say at once, "Knock off your beer." I know very well there is a good deal of beer tampered with very much now.

41,935. Supposing you could not do that would you re-impose the malt duty?—I would, certainly, and allow the farmers to use malt for cattle under certain restrictions, mixing linseed with it or fenugreek before it leaves the limehouse, or something of the kind. That would prevent it being used for beer entirely.

41,936. There is a good deal of barley imported for feeding purposes, is there not?—There is a good bit, but I think the barley that is imported ought to bear a fair tax as our own English barleys do. We have to make the roads at the present time for the foreign barley to be carried over.

41,937. Do you grow more barley than wheat?—I ought to grow more wheat than barley, but wheat is now almost a thing of the past when you have to grow it at 10*s.* a bag.

Mr. G. Adams. 28 Feb. 1895.

41,938. Have you been using wheat much for food?—I have only sold one lot of wheat this year. We have been grinding and boiling all the wheat we grow instead of buying so much cake.

Use of wheat as fodder.

41,939. I see you breed a large number of sheep. What has been your experience in regard to the prices of mutton?—My experience of sheep is that it has been about the best thing I have done. I keep a very good flock, and I have sold sheep at from 40 to 100 guineas each. That has been my great aim for the last 20 years.

Fall in price of sheep.

41,940. (*Sir Nigel Kingscote.*) What are your sheep?—Oxford Downs.

41,941. (*Viscount Cobham.*) I suppose you find the fall in the price of sheep which has taken place is counterbalanced by the fall in feeding stuffs?—There is not such a demand now from abroad for sheep.

41,942. (*Mr. Little.*) You mean for your rams?—Yes.

41,943. (*Viscount Cobham.*) Was last year a pretty good year for your sheep?—1894 was not a good year. The demand from abroad was very small, and the English farmer will not give the price he used to do when he had the money; when he was doing better he would give a larger price for the sheep. The price for rams, I should say, fell quite 25 per cent. At the present time the best English mutton is selling at a very fair price indeed, but then there is a good deal of foreign mutton coming into our English markets and being sold as prime English. I am quite sure of that. A great many butchers buy it and bring it down into the country and sell it as English mutton.

Marking of foreign meat.

41,944. Do you think anything should be done to stop that?—I really think something ought to be done. I think the butcher ought to have it up in the shop, where he sells the foreign meat, that he does sell it.

41,945. Have you seen Mr. Jeffrey's Bill to provide for that?—Yes; I think it ought to go farther. I really think that at the hotels where they cook it, and at the restaurants it ought to be up.

Burdens on land.

41,946. Do you consider that the heavy burdens on land contribute to the depression of agriculture?—Yes, I think our land ought to be treated as the manufacturers' raw material is. I think we ought to be rated on our houses, our stables, our barns, and all that, but I really do not think we ought to be rated on the land.

41,947. Rates, therefore, should be imposed only on the house and the buildings?—Yes, but things have so wonderfully altered; we did not, years ago, have these large importations of butter, cheese, and milk, I can remember years ago when my father used to have 400 and 500 tons of cheese. Now the foreign importation does away with all that.

41,948. Have your rates increased?—They have a little, especially where you farm pretty well. But there is so much land going out of cultivation, and land which is being farmed badly.

Land out of cultivation.

41,949. Has much land gone out of cultivation in your neighbourhood?—There is a good bit of it. On the last four or five farms that I have taken the people had nearly failed, and I took them in a very bad state indeed. I am quite sure that a man with 300 or 400 acres cannot possibly get a living.

41,950. What is the character of the land which has chiefly gone out of cultivation?—In the Cotswold Hills you really can have the land for nothing if you will pay the rates. There are a great many farms you can have if you will pay the rates and taxes.

41,951. Dry hill land?—Yes, and wheat-growing land.

41,952. Are you speaking of the land in the vale?—Yes.

41,953. Stiff land?—There are lots of clay farms I really would not have at present prices if anyone would give them to me.

41,954. Would they not carry grass?—Unless you put a lot of manure on them, and make the condition first, it would be almost useless.

41,955. Do you think that ultimately such lands will have to go into grass?—They will; there are hundreds of acres let down to grass with us which are of very little use, although they are let down.

Highway rate.

41,956. Although your rates have not much increased, you complain a good deal of the highway rates, I see?—I think since the pikes have been done away with they have increased within this 20 years—since the roads were put on to us.

41,957. (*Mr. Dalton.*) Are you sure of that?—Yes.

Mr. G. Adams. 28 Feb. 1895.

41,958. What are they now?—We are paying now about 2*s.* in the £; we used to get off with 18*d.*

41,959. Is that for everything?—For everything. We are as low rated as anywhere that I know.

41,960. (*Viscount Cobham.*) Do you say it was 18*d.* plus the turnpikes?—It used to be 18*d.*, and now it has got to 2*s.*

41,961. What I meant to say was that when it was 18*d.* you had to pay the turnpikes too?—Yes, we had to pay the turnpikes. That was very little for a farmer living and going between our place and the station.

41,962. How would you deal with the maintenance of the highways then?—We have highway boards, and it has been managed by the way wardens up to the present time. Now it is taken over by the District Council.

Wheel tax.

41,963. How would you alter the present system which you complain of?—A wheel tax would, no doubt, be much the fairest way of dealing with it.

41,964. You would not bring back the turnpikes?—I would not, certainly. You might put a small duty on the foreign produce, which travels over them a great deal.

41,965. (*Mr. Little.*) Would you tax a farmer's wheels?—I should treat it as A, B, and C, something like the Income tax. Let the man who is on the roads every day be treated as A. Then take the next class, gigs and traps, as B, and then the farm carts as C.

41,966. You would have a graduated scale in fact?—Yes.

41,967. (*Mr. Dalton.*) The cost of the disturnpiked roads is now borne by the County Council, is it not?—It is.

County rate.

41,968. You have not found that your county rate is higher now than it used to be, have you—what is it for your county?—I cannot tell you exactly; I think it is higher since the County Council.

41,969. It was not higher in 1893; you have had so many Government subventions for your main roads?—We had previously, but now it comes out of the county rate, I think.

41,970. There are large Government subventions which go in aid of the county rate; are you quite sure that your county rate now is higher than it was before the turnpikes were abolished, because if not you do not seem to have any additional cost for the turnpikes being thrown upon you?—We have an addition.

41,971. What is the county rate now, do you know?—I cannot tell you exactly.

41,972. In 1893 it seems to have been 4*d.* in Berkshire?—The Berkshire roads, I think, have the credit of being better than the roads in most counties. We did them so well for many years that now we do not feel it. In the adjoining county, in Oxfordshire, the roads are very bad, and they are feeling it there much more than we do in Berkshire.

41,973. (*Viscount Cobham.*) I suppose the whole point is, that whatever the highways may cost, you consider that you pay too large a proportion of the expense?—Yes, that is what I mean.

Railway rates on milk.

41,974. How do the railway rates affect your business in milk—can you explain that?—I have to keep milk and get the cash from one cow in every seven for the Great Western Railway Company, and that, I call, a very stiff charge. If any one keeps 280 cows they have to keep and milk 40 for the Great Western. I am keeping and milking now 30 for them to pay their rates. Then, again, we have to sign a form that we will not hold them responsible for any milk spilt, knocked down, or not delivered, and that we will not call on them to refund it.

41,975. When you first began selling milk, did the railway company carry it in passenger trains?—Yes, they did, and they did not charge for empties then; now they charge us 2*d.* each for empties.

41,976. In your brief you compare the rate for the carriage of milk with the rate for the carriage of beer—is beer carried in passenger trains?—It is not; but there is a sufficient quantity of milk now to ask the railway companies to carry it separately.

41,977. The rate was fixed by the rates committee, which sat two years ago?—Unfortunately; and the farmers left it to the trade in London to represent them as they paid the carriage of the empties. But instead of representing the farmers they got the empties knocked off entirely, and the whole of the carriage is now paid by the

Mr. G. Adams. 28 Feb. 1895.

farmers. The companies will bring the empties back, but before they will load them they require 2*d.* per churn for it.

41,978. Then your interests were badly represented before the Rates Committee?—Very badly indeed.

41,979. Are you speaking not only your own opinion but that of your neighbours?—It is the general opinion of the farmers that we are charged too heavily by far for the carriage of milk. It costs close on 30*l.* a year to take one churn of milk a day to London. It is a good paying thing for them, and would pay them much better than anything else I think.

41,980. Do you sell the whole of your milk?—I do.

41,981. You only make just enough butter for yourself?—Just for myself and a friend or two.

41,982. Do you consider that the sale of milk is more profitable than the manufacture of butter?—It is much more certain. There used to be a great deal of cheese and butter made with us, but it has now all died out.

41,983. (*Mr. Everett.*) How far are you from London?—Just 70 miles.

Railway rates on sheep.

41,984. (*Viscount Cobham.*) What is your station?—Farringdon. Now we are speaking of the railways I should like to add that we can send a sheep to Hamburg for about 8*s.*, but it costs us about 8*s.* or 9*s.* to send a sheep to Kelso, in Scotland. I have sent them to both places. I used to send them to Scotland, but the high duty quite stops us from doing that now.

Commercial gambling.

41,985. I see you complain also of the gambling in wheat and other grain, and that you think that that is one of the main causes of the fall in prices; have you gone much into that question?—I have, a little; I have been in a little speculation once or twice myself with it, and I really think that until we get an alteration there we shall not see any better prices for our produce.

41,986. Is it a question that is attracting a good deal of attention among the farmers now?—I think they are beginning to think so. I think it is represented that thousands and thousands of quarters more wheat grow, and are on the market more than there actually are because you can buy it with the option, if they pay a shilling or two shillings a quarter, to sell it at any time.

41,987. You have read Mr. Smith's writings, have you?—I have read some of them.

41,988. We have had Mr. Smith here, so perhaps we need not go further into the question; is it a question that is exciting much attention among farmers?—More attention every day.

41,989. (*Captain Owen Thomas.*) Did you make any money at it?—I did at first.

41,990. Were you a bear or a bull?—I was a buyer, and then I sold. I should say it did not do at all. They could rig the market, and bring it down or take it up, just as it suited them. There is no doubt that there is a great glut of wheat shown more than there actually is, and that is why, I think, while we can buy it so far forward we shall not see a change in the prices.

Payment of labourers.

41,991. I see you have introduced a system of paying your labourers on Friday morning instead of on Saturday night. Why did you make that change?—When I first began business we used to pay on Saturday evenings, and they all went into the town together for shopping. I found that the money then did not go so far as it ought to, so I altered it to Friday morning, and now I find they are much better off; the wife gets the money, and the orders are given, and the things are brought to the door.

41,992. When do you pay them now?—I pay them every Friday morning up to Thursday night.

41,993. When does the wife get the money?—She gets the money from the husband on Friday, and that gives them a chance of going to the shops.

41,994. Do you mean that the wife goes there while you are paying the men?—No; the husband, as a rule, hands it over to his wife.

41,995. He goes home to dinner and gives it to her?—Yes.

41,996. Do you think that has had a beneficial effect?—I am quite sure it has, and I think it has had a great deal to do with my success in farming, because we get a better class of men.

Early closing.

41,997. I see that you suggest in your brief that all provision shops should be closed at 7 or 8 o'clock in the evening, but the result you have attained could be effected by farmers adopting your system without adopting such a strong measure as closing the shops so early?—I really think that if it could be carried out all through England it would be far better. I think that if you keep the shops open late they spend half as much more as they ought.

Mr. G. Adams. 28 Feb. 1895.

41,998. Might not the result you want be produced by all the farmers paying on the Friday morning as you do?—It might; but I think keeping the shops open late at night is very much against the lower class.

Import duty on flour and meat.

41,999. As to placing a duty on any class of imports, have you any opinion to express to this Commission?—I think implements and all classes of manufactured goods ought to have a small import duty put on them. We ought really to ask for that on such like foreign things.

42,000. Would you include flour in "manufactured goods"?—Yes; and dressed beef and mutton, but I would let the wheat, the sheep, and the live cattle come in free of cost: let it be manufactured here.

42,001. Would it not be rather a strain on language to call dressed beef or mutton a manufactured article?—Not more so than the flour. With the wheat we should get the bran and the pollards, and the poor man would be able to get his bran and his pollards and feed his pigs much cheaper, and we would put in work all the mills that are being shut up, and many more industries of the kind.

42,002. Have the country millers been very much hit of late years?—Very much hit indeed; a good many of them are not in work now, and there is no chance of their getting it.

42,003. Is your opinion shared in by the majority of farmers?—Yes; I am sure it is with us.

42,004. As far as you know?—Yes.

42,005. Their opinion goes a good deal further than this, perhaps?—I think the feeling is growing daily much more than it used to do a year or two ago that what I am suggesting ought to be the case. I will give you an instance of it. Not long ago I tried to send a ham to Germany. It went out to Hamburg with other things; it was overhauled, and I was written a very short letter to by the authorities for sending it. I ought to have driven 22 miles to go before a notary to declare that I bred it and fed it. They said it was to be returned or that I should pay a heavy duty on it. I said I would pay no duty, and that they were to send it back. It came back to 90, Fleet Street, and down to my house. When I came from Germany myself, we brought, I should think, 500 tons of bacon with us to London. I do not think that is fair dealing at all. The German farmer can send all his bacon to us; the English farmer cannot send a pound there at all without declaring that it is bred by himself, and paying a duty of more than it is worth.

Effect of agricultural depression.

42,006. (*Sir Nigel Kingscote.*) I suppose that you feel that the landlord, the tenant, and the labourers have suffered considerably from the agricultural depression?—I think the landlord has as much as any one; then, I think, comes the tenant.

42,007. You think the landlord has suffered as much as anyone?—I think the most.

42,008. Then the tenant, and then the labourer, who has suffered the least?—The labourer has suffered the least.

Condition of labourers.

42,009. First of all as regards the labourer, can you get labour as efficient, as good, and as cheap as you used to or not?—We have a very good lot of labourers.

42,010. And you have no difficulty in getting them?—Not now. We have a great many out of employ who would be employed if produce sold better than it does, but the farmers have not got the money to pay them.

42,011. You do not find that the young men get away into the towns or leave you, and leave behind nothing but the older men?—There is a little inclination of that sort, but I do not think it would be so much if we could employ them better than we do.

Wages of labourers.

42,012. What is the rate of wages in your district?—My milkmen can get 14*s.* a week.

42,013. They are employed seven days in the week, are they not?—Yes they are; the other men run from an old inferior labourer at 9*s.* to 10*s.*, 11*s.* and up to 12*s.* That does not include piece-work in the summer. I should think a good active man would make 14*s.* or 15*s.* a week, taking the year round.

42,014. (*Mr. Little.*) How many hours do the milking men work?—Our men come at about 5 o'clock; they have an hour out for breakfast, and an hour for dinner, and they leave at 5.

Mr. G. Adams. 28 Feb. 1895.

42,015. (*Sir Nigel Kingscote.*) Does the labourer live as well, or better than he did 20 years ago?—He lives better, because he can buy more cheaply. Half a sovereign now will buy what I should think 15*s.* used to do.

Changes of tenancy.

42,016. Then as regards the tenants in your neighbourhood; have there been many changes of tenancy?—There have been a good many.

42,017. Owing to bad times?—There is no doubt about it.

42,018. The tenants have succumbed and have been obliged to stop farming?—They have been obliged to do so.

41,019. Have many of the farms fallen into the hands of the landlords?—A good few have.

Effects of depression on landlords.

41,020. As regards the landlords and those who possess large estates—I believe there are some large ones in your neighbourhood, and on part of the Cotswold Hills—would it be your opinion that the depression has not seriously affected those large landowners?—It has very much affected them.

42,021. It has?—Very much.

42,022. Then you would not agree with what the last witness said about that?—Certainly not; in fact I am sure that it is totally different, because it is well known that you can have what land you like on the Cotswolds, and that they are only too pleased to let it at any money.

Market gardening and fruit.

42,023. (*Mr. Whitehead.*) Have you ever tried market gardening?—I have, and I have tried fruit.

42,024. What do you make at those industries?—If you get a good crop it is not worth gathering; if you get a bad crop you may make a little out of it.

42,025. There are too many in the same trade you think?—Yes, we shall find that there is going to be a great change in the country through this Allotments Act. Let there be 10 acres extra of potatoes grown in each parish—which I think there will be, and we shall find that they will not pay the cost of cultivation—we shall be sure to find that, because potatoes will not pay the poor man for planting.

Allotments.

42,026. Do you think that the allotment holders will become market gardeners, and will compete with market gardeners; is that what you mean?—That is it. I have laid out allotments myself, and given them to the men without any charge whatever. I have laid them out in half acres. The men have tried it for a year, but have said it was not worth doing. At first they took half an acre each, but they gave up three or four acres to me, to plough it, when they had no rents whatever to pay.

42,027. Is half an acre enough for them, or too much?—I think half an acre is a really good garden, and as much as anyone can cultivate to do himself and his employer any good whatever.

42,028. According to you they do not seem keen about that?—If they have got about 40 poles—a quarter of an acre—I find that is about as much as they care to have.

42,029. They cannot manage it with their other work?—No, they cannot. I make it a rule to give them as much as ever they wish for; in fact I never refuse a man, and I find they do not want too much.

Payment of labourers.

42,030. I did not quite gather at what time you pay your men on Friday morning, nor how you manage?—The first just before seven.

42,031. When they first come to work?—Yes.

42,032. And they take it home to their wives at breakfast time or dinner time?—Yes; I think they can make more of it when it is paid like that.

Butter factories.

42,033. Have you any butter factories in your district?—Mr. Henderson, of Buscot, has a butter factory; he buys of the farmers.

42,034. How does that answer?—I do not think it pays him at all.

42,035. Because the farmers do not care to send their milk there?—It is better for the farmer than it is for himself. We have got these foreign competitors coming in now, and we do not get the price we used to get. We used to get a higher price for the butter. I think this year 1*s.* 2*d.* or 1*s.* 3*d.* has been the highest price, but we used to get 1*s.* 6*d.* and 1*s.* 8*d.*

42,036. You say that it is better for the farmer than for the owner of the factory?—I think it is because it is convenient for the farmer to send it.

42,037. If factories were established it would pay the farmers to send their milk to them, and the farmers would send their milk there?—I should like to see the factories very much.

Mr. G. Adams. 28 Feb. 1895.

42,038. (*Viscount Cobham.*) Does he make cheese there as well as butter?—He does not. They tried cheese, but they found that the foreign cheese took the place of it.

42,039. (*Mr. Whitehead.*) Would it not be possible to establish a factory by co-operation as they do in America on such a very large scale by the farmers joining together in establishing a factory?—I think it would, but it is a difficult job to get farmers to combine—more so than almost anyone else.

42,040. Have you ever tried to get them to combine?—I have. Licensed victuallers, you see, will combine together, but you cannot get farmers to.

42,041. Do you think it would be important and useful to have butter factories in your district?—Yes.

42,042. And in other districts where cows are kept?—Yes.

42,043. You would rather do that than send the milk to London, do I take it?—I think myself, as I have a pretty good way of selling it, I should do better to sell my own. The dairy has got a good name, and that makes a good deal of difference.

42,044. Probably other farmers think the same, which does not quite agree with what you said just now?—For the public at large it would be best to have the butter factories, because we could send it when it was wanted at 1*s.* a gallon, and when it was not wanted it could be made up into goods. It would be best for the public to have factories. You would only send it when it would make the 1*s.*, instead of taking as you do now and then 7½*d.*

42,045. (*Mr. Little.*) And perhaps it would be best for the average farmer?—I think it would.

40,046. (*Mr. Whitehead.*) If you have got a uniform quality of butter that would compete with foreign produce, would it not?—It would.

"Buscot" estate.

42,047. (*Sir Nigel Kingscote.*) Do you know the Buscot estate?—I do, very well indeed.

42,048. Have you known it for some years?—For 30 years.

40,049. Under every sort of vicissitude?—Yes.

40,050. You have known it as a wheat-growing estate?—Yes.

42,051. And as laid down to grass with sheep?—Yes.

42,052. And now what is it?—Now it has got mostly into dairy.

42,053. I suppose, taking it from first to last, an immense sum of money has been lost upon that estate?—I should really think there has been 250,000*l.* lost there; I would not have the estate to pay what has been lost there.

42,054. What is it doing now?—It has got back into what it was 30 years ago or more.

"Minster Lovell" allotments.

42,055. Do you remember when an estate near Witney was made into small holdings by Mr. Fergus O'Connor?—Yes, just before I began to farm.

42,056. What were those holdings called?—The Minster Lovell Allotments.

42,057. You remember their being formed?—Yes.

42,058. And cultivated as small holdings?—Yes.

42,059. Everyone having a little holding and a house of his own?—Yes.

42,060. And a certain amount of buildings?—Yes.

42,061. How long did they prosper, or did they ever prosper?—They never prospered. There are no men who work so hard as those who have got them now, and they have got three or four into one hand.

42,062. Are there any of those small holders in existence now?—They have got three or four of them in one holding now. It is very rare for them to have an allotment by themselves.

42,063. Most of them have got consolidated with other holdings?—That is so.

42,064. Then you can say from your own knowledge that the whole thing has been a perfect failure?—I think so.

Reductions of rent and assessments to local rates.

42,065. (*Mr. Dalton.*) I do not think we have heard what your reduction of rent has been?—It has been 30 per cent. permanent, and then we have some extra for bad seasons. It has been about 40 per cent. think, on Lord Wantage's estate.

Mr. G. Adams. 28 Feb. 1895.

42,066. What is the rent now?—It is about 1*l.* an acre, taking it all round.

42,067. What are you assessed at for the local rates?—We are assessed at the same.

42,068. Then you have got the benefit of the reduction in your rent?—We get it on the permanent reduction, but not on the temporary reduction, and that is rather unfortunate for us.

42,069. I see from your brief that you think that one of the causes of the depression is the heavy burdens on land?—I do.

Rates on witness's farm.

42,070. Can you give the figures that you have to pay; what do you pay on your whole farm?—Really, I cannot tell you; I did not come prepared for such a question.

42,071. Is it any considerable sum?—Yes, it is a considerable sum.

42,072. Do you think it is 2*s.* in the £ now?—It is quite that.

42,073. What is your rent?—My rent is a little over 1*l.* an acre.

42,074. On 3,000 acres?—Yes.

42,075. You think the rate was 1*s.* 6*d.* in the £ some years ago?—It was 1*s.* 6*d.*, I know.

42,076. Can you say in what year that was?—I cannot.

42,077. I have not got the figures back for a great number of years, but I should have judged from the figures I have here that it must have been higher in the past?—It has been higher, and it has been lower.

42,078. On an average, what do you think it has been; how many years have you had to pay?—I have been farming since 1869.

42,079. You would not say that there was any considerable increase now as compared with the average amount that you paid 30 or 40 years ago?—It is higher, because other land has been reduced.

Rateable values of property in his union.

42,080. On the other hand, other properties in your union and county besides agricultural land have gone up very much in value?—House property has.

42,081. And railways?—Yes.

42,082. The railways are assessed very highly, I think, in your union?—We do not get a lot of railway in our union.

42,083. Which is your union?—Farringdon. We only get, I think, about three or four miles.

42,084. (*Mr. Little.*) You have a branch line?—A branch line, and the Great Western just touch us.

42,085. (*Mr. Dalton.*) According to a return which we have just received from the clerk to the Assessment Committee in your union, the rateable value of railways in your union was 22,235*l.* out of a total of 106,916*l.* for the whole union. Therefore your railways pay more than a fifth of the whole of the rates of the union?—Yes, they do.

42,086. That is a very large proportion?—I did not think it was so much as 22,000*l.*

County rates.

42,087. You also say that highway rates have pressed heavily on the land since the turnpikes were abolished, but from the return which I have here of the Berks county rates there seems to have been no rate for general county purposes at all in your county either in 1890 or 1893—I do not know whether there was one in 1894?—There is a county rate.

Maintenance of main roads.

42,088. A county rate, but not a rate for general county purposes. There is a fourpenny county rate altogether, which is for special purposes, for police and so forth, but for the years 1890 and 1893 certainly there was no general county rate, and the whole cost of the disturnpiked roads therefore must have been paid out of the Government subventions. I do not know what happened last year?—I think it is paid out of the county rates.

42,089. It is, if the subventions are not sufficient, but these are returns furnished by the Clerk of the Peace for Berkshire and they distinctly show that in the years 1890 and 1893 there was no county rate for general county purposes, and therefore there could have been no charge on the county rate in those years for disturnpiked roads in any part of your county?—I do know that we had 2,800*l.* the last three years from the County Council, that is from the county rate to support our roads in our district.

42,090. (*Mr. Little.*) Does your highway district take the maintenance of the main roads?—Yes.

42,091. (*Mr Dalton.*) Then you get it paid back to you?—Yes, out of the county rates.

42,092. Not necessarily out of the county rate; it is paid back by the County Council, but there does not seem to have been a county rate for the purpose in those two years; it is paid out of the county funds. The reason why there was no county rate for the purpose would be that the Government subvention was sufficient to meet the whole cost?—I am afraid it was not.

42,093. It must have been in those two years, in 1890 and 1893; that is quite clear; but you cannot say, I suppose, whether there was anything in 1894—whether you had to pay anything out of the rates for the turnpikes in 1894?—They had ceased to be turnpikes.

42,094. Yes, they are disturnpiked roads, as they call them now—main roads; if these returns which I have are right, there has been absolutely in some years no charge whatever on the land for these roads. You have got the benefit of not having to pay turnpike tolls, and, in two years, at any rate, no cost whatever was thrown upon the rates. You are a very exceptional county, therefore, in that respect?—We have taken for the next three years, 2,600*l.*

42,095. You get that from the county fund?—Yes.

42,096. The county did not find it necessary in 1890 and 1893 to levy a rate for that. They have had the Government subventions, and the 2,600*l.* that you get will come out of that; in the two years when they did levy anything for general county purposes, which would include a great many other purposes besides main roads, they levied in 1891 a rate of 1½*d.*, and in 1892 a rate of ¾*d.*, so that the cost of these old turnpike roads which now falls upon the land must be very small indeed in your county—at any rate, that would not at all account for the agricultural depression?—No, it would not.

Clearing of watercourses.

42,097. (*Viscount Cobham.*) Is there anything else you wish to add?—There is one more thing I should like to speak to; I think we want it changed very badly, and that is the call on a neighbour below you to get a watercourse or that done out. I believe you can get it done, but it wants some more simple machinery. Where you get a running stream going through your farm you will find the tenants at the present time unable to pay to do it out. That is a thing we want attending to very badly, as it is stopping a good deal of drainage.

Witness's experience of farming.

42,098. (*Captain Owen Thomas.*) How many years have you been engaged in farming?—I have been farming largely for 20 years.

42,099. How many acres had you at the commencement?—About 600.

42,100. Since then, have you gone on increasing your acreage?—Yes.

42,101. When did you think that farming ceased to pay?—After 1870. I have made mine pay better, because I have got a good class of sheep, and can sell them at a bigger price than many farmers.

42,102. Of course, we have since had a worse time than in the 70's even?—Yes, much worse.

42,103. But you have been taking farms very lately?—I have been taking farms which have been given up, and the landlords could not find men to take them.

42,104. What rents have you paid for those farms that you have taken on?—Where I have got to put them into condition, I have taken them as low as 15*s.* or 16*s.*

42,105. Can you make them pay?—I cannot at the present prices—that is certain.

42,106. Will you lose money by it?—I shall lose money, and have this last year.

42,107. Will you go on farming and losing money?—I hope to see better times, and I hope to see something done for the land. It is so bad at the present time that the land will all have to go out of cultivation, if something is not done shortly.

Labourers' cottages.

42,108. Have you much difficulty in getting good labour?—I can get very good labour indeed. Where you have got good cottages—and I have got the best lot of cottages of anyone here in England—you can get good labour.

42,109. You have got good cottages on your farms for your labourers?—Yes.

42,110. Do you charge them rent?—They pay 1*s.* 6*d.* a week for a really good house and a good garden.

42,111. (*Mr. Little.*) What do you call a good garden; how much?—I should think quite 40 to 60 poles.

Labourers' wages.

42,112. (*Captain Owen Thomas.*) What wages are you paying?—Fourteen shillings to milkers and carters, and 10*s.*, 11*s.*, and 12*s.* to the day men. That does not include

Mr. G. Adams.
28 Feb. 1895.

piece-work. In hay-making my men sometimes earn 4*s.* a day, and 5*s.* if we get a good day.

Quality of labour.

42,113. Do you think the quality of labour is as good now as it used to be in your district?—No, I do not think they will do as much work as they used to do years ago.

42,114. Can you account for that?—I cannot. In some places I know they are not so well off as we are, but the labouring class is being looked after in our district as well as in most districts, I think. By getting good cottages you can command a good class of labour.

42,115. (*Mr. Little.*) You have told us that you have increased your occupation, and that you have taken several farms; do you hold those farms under written agreements generally?—I have only one agreement, and I think the best agreement of all is an unwritten one and a good feeling between landlord and tenant.

Tenant right.

42,116. What is the time of entry in your neighbourhood?—Michaelmas as a rule.

42,117. What do you pay for when you enter a farm at Michaelmas?—We pay for all tillages.

42,118. Fallows, dead fallows?—Yes.

42,119. Do you pay for any rent on the dead fallows?—No, we do not.

42,120. Where roots are grown what do you pay for?—We pay for the cultivation.

42,121. The cultivation of the roots and seed and manure?—That is right.

42,122. Do you pay for the straw and the hay?—Yes, we pay for the straw.

42,123. At consuming prices?—Yes.

42,124. Do you pay for any farmyard manure?—For drawing, or reaping.

42,125. For the labour upon it, you mean?—Yes.

42,126. But not anything for the manure itself?—No.

42,127. Do you pay anything for the cake and corn consumed?—We pay half the cake for the last year and one quarter for the year before.

42,128. Are you sure?—Yes; that is, if we claim for it.

42,129. I thought it was one-third for the last year and one-sixth for the year before, or one-half on the average of the last two years?—If we claim for it we get one-half for the last year and one-quarter for the year before, but unfortunately it does not answer one farmer in 10 to claim for it.

42,130. That is to say you must claim under the Act?—You must.

Counter-claims under Agricultural Holdings Act.

42,131. And not one farmer in 10 is in a position to make a claim for fear of the counter-claim?—Not one in 20.

42,132. Is that because the counter-claim can be fairly made, or because it will be made whether it is fair or not?—I think it is likely to be made, whether it is fair or not.

42,133. You said a minute before that not one farmer in 20 dare claim?—That is on account of the counter-claim.

42,134. Do you think that a counter-claim would be made, whether there was a just ground for it or not?—Very often there would be a just ground.

42,135. You said that you had taken farms out of condition; was the valuation in those cases made directly to you or to the landlord?—In most cases to me.

42,136. You appointed your own valuer, and though it was nominally made to your landlord, it was actually made to you, and you took up the valuation?—I did.

42,137. That is the usual way, I presume?—That is the usual way.

42,138. There was no question of anything like permanent improvements, was there?—Neither landlord has claimed for improvements.

42,139. I mean tenants' improvements?—They did not.

42,140. No claims were made under the Act or otherwise for anything in the nature of durable or permanent improvements?—That is so.

42,141. So the question did not arise whether you or the landlord should pay for them?—No.

42,142. Was any claim made for dilapidations?—There ought to have been, but there was not any claim made.

Mr. G. Adams.
28 Feb. 1895.

42,143. Then you think that if a claim had been made in those cases for manures and feeding-stuffs, the landlord would have had a fair claim for dilapidation to set against them?—He would have had a double fair claim.

42,144. Do you know that he could not sustain a claim in excess of the tenants' claim?—Could we not?

42,145. That is what has been decided?—I thought while hearing your previous witness that it would be an advantage if something could be done when giving up a farm, if it could be so arranged with the landlord, for the tenant to say to him three months or six months before, "I wish to give up my farm; if I find a suitable tenant "would you accept him?"

Premiums and incoming tenants.

42,146. Do you contemplate in that case that the tenant should take a premium?—I do; that is what I was leading up to; so that the farms should be given up in a better state of cultivation, and the incoming tenant could go on doing better from the first.

42,147. Would that not rather lead to the landlord exacting the full rent?—I think where he has met his old tenants, as they have in many cases, he ought to say, "Provided you find me a good tenant at so much rent, I "agree."

42,148. Of course a tenant under a good landlord would have a better thing to sell than a tenant under an exacting landlord?—Yes.

42,149. If one tenant has a farm at 1*l.* an acre and another gives 25*s.* for a similar farm, the one would find it much easier to get an incoming tenant to give him a premium than the other—quite irrespective of condition?—I think that it would encourage better farming a good deal.

42,150. I am just putting these two cases; one man has a farm at 20*s.* an acre, and another man has a similar farm at 25*s.* an acre; the one who has a farm at 20*s.* could more easily find a customer to give him, say 100*l.* for a premium, than the one who has a farm at 25*s.*?—Yes. I quite believe in freedom of contract for the landlord to say, "Provided you find me a suitable tenant at so much "rent."

42,151. You think that would be a good policy for the landlord, but it is not a thing that you would enact by law, is it?—No, I think it ought to be left to the valuers.

42,152. Irrespective of agreement, would you leave a valuer to compensate a tenant for the difference between the value of the occupation and the actual rent?—I think that it would very much help farmers to farm better, if, when they were leaving they could command 200*l.* or 300*l.*, 1,000*l.* if the farmer has done well; and it would be to the benefit of the landlords. If the landlord got a farm of 100 acres or 500 acres out of cultivation, it would cost him 5*l.* or 6*l.* per acre to put it into proper condition. Under my suggestion I think the farm would be given up in a better condition, because the tenant would know that he would be compensated.

42,153. I am only speaking of the position in which the tenant of the good landlord would be placed, as compared with that in which the tenant under the more exacting landlord would be placed; the one would have more to sell than the other, would he not?—So he would. That is it.

42,154. He would rather trade upon his landlord's good character?—He would.

Wages and earnings.

42,155. You heard the point that was raised about the difference between wages and earnings, and you have told us that weekly wages do not represent the actual earnings of the labourer?—They certainly do not.

42,156. And that there is a considerable addition by wages earned in piece-work at harvest, hay-time, and other times?—Yes.

42,157. In your case, I think you said that a wage of 12*s.* would represent perhaps 16*s.* earnings?—Yes, it would in the summer months.

42,158. (*Viscount Cobham.*) This would include the patches of land that you have set off for them?—Yes.

42,159. (*Mr. Little.*) Are you including the special advantage that you give them of a piece of land?—Yes.

42,160. Are you including anything for the cottage and the garden, which you let at a very moderate rent?—We put that with the cottage.

42,161. But you are not putting that in the wages?—No.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Seventy-ninth Day.

Friday, 1st March 1895.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.

Mr. J. F. Hall.

Mr. JOHN FREDERICK HALL called and examined.

1 Mar. 1895.

42,162. (*Viscount Cobham.*) I think you are a landowner in Somersetshire, residing at Sharcombe, near Wells?—I am.

42,163. Do you farm your own land?—Partly. I have a good deal that I do not farm, which is let.

42,164. The land that you do farm is your own; you own and occupy it?—Yes.

42,165. I believe you are a member of the councils of the British Dairy Farmers' Association, the English Jersey Cattle Society, and the Mid-Somerset Agricultural Association, and chairman of the Wells District Technical Education Committee?—I am.

42,166. Are you an active member of those bodies?—Yes.

42,167. We will ask you to give evidence to-day upon the subject of butter dairying since 1883; will you give us the particulars of your experience in that direction?—I will. I should like, if you will allow me, first, to make one preliminary observation. I have come to give evidence on the branch of dairying with which I am most acquainted, but my evidence will be principally devoted to the question of how it is possible to make profits on butter making. I daresay I shall be expected to give evidence with regard to the system of manufacture, the process of the dairy, but I do not propose to lay any evidence before you bearing on that subject, because I apprehend that in the present level of technical education it would be quite possible to obtain the services of 20 people more capable of giving you precise information on that point than I am. I come before you rather to direct your attention to the subject which I consider is greatly neglected in this country, and that is the economical produce of milk suited for butter dairying. Butter dairying really involves the two questions; first, the economical production of milk, which question includes not only quantity but quality of milk; secondly, the processes of the dairy. The first I consider to be infinitely more important as affecting the profits of butter dairying than the second; the second seems to have been exclusively studied in this country. I, as I say, propose to lay before you evidence relating principally to the former, and if at first my evidence seems a little prolix in regard to such questions as butter ratios, which is the quantity of milk required to produce a pound of butter, I trust the Commission will recollect that it all bears on that question of the economical production of milk.

Butter dairying and the economical production of milk.

42,168. First tell us what your farm is?—I have had a butter dairy ever since 1880. Between 1880 and 1887 at Erleigh Court, Reading, I kept from 15 to 25 Jersey cows for seven years, and sold butter at 1*s.* 5*d.* to 1*s.* 6*d.* per pound, and the skimmed milk to retail dealers at 4*d.* per gallon. On removing into Somersetshire in 1887, I kept only a small dairy for experimental purposes merely. I have at the present time about 180 acres in hand, and a stock of about 75 head of Jersey cows of which 40 or more are in milk. I took my farm at Chilcote (that is the farm I speak of) in hand in March 1893. It is about 160 acres, mostly clay and lias—geologically speaking, it is the lower lias.

Particulars of butter dairies.

42,169. Did you add those to the 180?—No, I had only 20 before an experimental farm merely.

42,170. Then the addition of the 160 made up the 180 of which you have spoken?—Yes. Part of the land is the lower lias, part mountain limestone. It stands about 500 to 600 feet above the sea level, and is very bleak.

42,171. (*Mr. Chaplin.*) How many cows had you on the experimental farm of 20 acres?—From 7 to 10. This 160 acres, when I took it in hand, was worth about 25*s.* per acre. This land was composed of 40 acres of arable, 40 acres of roughish land, fit only for dry stock and young stock, and the rest a useful quality of grass land. The stock on this farm is about 65 Jerseys, 33 in milk, 5 or 6 horses, and 60 to 70 pigs. The farm produces all the food required to support this stock with the exception of a certain portion of decorticated cotton cake and maize meal used for cows in milk, linseed cake for calves, and barley meal for pigs. The young stock remains out on the hills according to the weather till December or January. I give this evidence to show that the Jersey cow will stand bleak exposure. The cows in milk and calves come in at nights in the middle of October, and are not turned out again at nights till the first week in May.

Jersey cow

42,172. (*Viscount Cobham.*) Do you consider them more hardy than ordinary English breeds?—No, I do not consider them more hardy, but I consider the English-bred Jerseys as hardy as the average English breeds. I propose to give evidence about that later on. The produce of the farm is butter and skim milk. The skim milk is used for rearing heifer calves and pigs. The Jersey bull calf is worth very little except for pedigree purposes, so we generally boil them up for the pigs. The butter is mainly sold to dealers, at the wholesale prices of the district. The farm is based on that, but I have two large private customers, one is a large institution in London, which takes about 50 lbs. of butter a week, and another is a public institution in Somersetshire, which takes about 30 lbs. Exclusive of those, I do a good deal more than that 80 lbs. to dealers, so that my evidence will be based on the dealers' prices in the country mainly.

Produce of witness's butter farm

42,173. (*Mr. Channing.*) Dealers who sell in the immediate neighbourhood?—Middlemen really.

42,174. Where do they send it to?—That depends on the time of the year. Sometimes they are glad to sell it, it is absorbed in the neighbourhood; sometimes when there is a very large supply, as in May, June, and July, they send it to Bristol and Gloucester. It may pass through two or three hands even before it gets to the consumer. The butter is mainly sold at wholesale prices to dealers, but, as I have said, I have those two large private customers. The pigs are all bred on the premises, and are for the most part fattened up to 8 to 9 score and sold to the curers. The cream is separated by a separator worked by a 8-horse-power engine which also does the farm work of grinding the cake, pulping roots, and cutting chaff, and so on. It does that as well as work the separator. During the 12 months ending 31st December last, the number of Jersey cows in milk averaged 30 for the year. The milk produced and separated was 13,228 gallons; the butter made and sold was 7,673 lbs.; the

Mr. J. F. Hall. 1 Mar. 1895.

price per lb. averaged 15½*d.*, say 15*d.* The butter ratio, or quantity of milk required to make 1 lb. of butter, averaged throughout the year a little less than 7 quarts to the pound. The important point that I want to bring before you is that the average of the year is 7 quarts to the lb. I think it has been stated that from 12 to 10 quarts was the usual rate.

Butter ratios.

42,175. These are Jerseys that you are talking about, are they not?—These are Jerseys.

42,176. (*Viscount Cobham.*) Does that ratio vary very much in the course of the year?—I will show you the chart in one moment. The butter value of the milk was 8·9, or just under 9*d.* per gallon throughout the year; that is what it returned me. I put the feeding value of the skim milk at 1½*d.* per gallon; the gross value of the milk was therefore about 10*d.* per gallon.

Skim milk.

42,177. (*Captain Owen Thomas.*) Is that a barn gallon you are speaking of?—An imperial gallon.

42,178. (*Viscount Cobham.*) Is 1½*d.* per gallon a low price to put on separated milk?—I do not think it is when separated with the separator. Of course if I was speaking of skim milk separated by gravitation, or of skim milk separated by the scalding system, that has a greater value, but you must remember that almost every trace of fat is removed out of the skim milk that results as a by-product from separation. I think 1½*d.* per gallon is a price that leaves a profit both on pig-feeding and on calf-rearing, but I do not think you can take it higher. The produce and return per head was as follows, that is per cow:—Average yield of milk, 440 gallons; average yield of butter, 255 lbs.; average yield of skim milk, 414 gallons; the produce of the butter was 15*l.* 18*s.* 9*d.* per cow; of the skim milk, 2*l.* 11*s.* 9*d.*, making a gross total of 18*l.* 10*s.* 6*d.* per cow per annum. It should be noted in connexion with this return that 25 cows out of 30 were heifers with first and second calf, which reduces the yield of both milk and butter considerably. I will put some evidence before the Commission on that further on. Now for the profit and loss account. The year ending 31st December 1893 shows a good balance on the credit side of the farm after payment of all outgoings, rent, rates, taxes, wages, purchased foods, farriers, and other bills, sundries, &c., and interest on capital employed at 5 per cent., besides 5 per cent. interest on all laid out on the farm for buildings and for landlord's improvements beyond a certain sum.

Milk and butter yield of cows.

Profit and loss account.

42,179. (*Mr. Channing.*) That was for 1893, a dry season?—Ending the 31st December 1894, I should have said.

42,180. (*Viscount Cobham.*) You had the winter of 1893?—Yes, I had the winter of 1893. I took the farm over in March 1893, and had the whole of that dry summer to go through first of all with no stock at all. In September the rain came; we got on those hills a very fair crop of grass, and I wintered with the produce of the farm through 1893.

42,181. Then does that account begin in September 1893?—It begins 1st January 1894.

42,182. A good many farmers would have very little keep indeed in January 1894, but you say in that respect you were pretty well off?—Yes, I got a very fair crop of hay and a very large crop of ensilage.

42,183. Then you do not count 1894 as an exceptional year either one way or the other?—No, but it is exceptional in this sense, that it suffers under the disadvantage that I had all young cows; 25 out of 30 being first and second calvers, there is a very heavy deduction to be made from what they would make as mature butter cows.

42,184. I was speaking as to the season?—As to the season we suffered owing to the drought of the preceding summer, but then it was through the getting in roots and silage that I saved myself.

42,185. You have not given us the profit, I think?—I have not stated the profit. I said there was a substantial profit.

42,186. (*Mr. Chaplin.*) What per-centage did it pay—what interest?—5 per cent. interest.

42,187. That is on the farmer's outlay, is it?—5 per cent. interest on the capital employed. I say it pays rent and pays 5 per cent. interest on all the capital, that is all the stock and machinery on the farm, and it has paid me also a certain sum for improvements that I have made on the farm.

42,188. (*Mr. Channing.*) Landlord's improvements?—Landlord's improvements, yes.

42,189. (*Viscount Cobham.*) As tenant, has it paid you a profit of more than the 5 per cent. interest?—Perhaps we had better dismiss the question of the interest that is paid me as landlord on the buildings; apart from that, it has paid the rent and has paid me, as tenant, a substantial profit besides. I would not wish particularly to state the profit, but I have no objection to hand it in to any member of the Commission.

Mr. J. F. Hall. 1 Mar. 1895.

42,190. (*Mr. Chaplin.*) It has paid the rent and a substantial profit?—Yes.

42,191. (*Mr. Dalton.*) What rent has it paid per acre?—It pays 25*s.* per acre and a substantial profit.

42,192. (*Mr. Everett.*) Is this all grass land?—40 acres arable, 40 acres rough land, and 80 acres pasture.

42,193. (*Viscount Cobham.*) You have enough arable to keep you in roots and green stuff, and you have not got to buy anything except manufactured food?—No, nothing. Of course, by housing in the winter one gets so much manure from the stock, and feeding on cotton-cake produces such rich manure that one has no trouble with arable land in producing heavy crops.

42,194. (*Mr. Clay.*) Does the 5 per cent. cover the extra profit you had?—Do you mean is there 5 per cent. on the capital employed besides?

42,195. Yes?—There is.

42,196. Any more?—I think I shall presently say what I do not want to say.

42,197. (*Viscount Cobham.*) But you have got something for your trouble and supervision?—Yes, I have.

Marketing produce.

42,198. (*Mr. Chaplin.*) Have you got any exceptional advantages as to a market?—I have two good customers, two large institutions; but the larger portion of my butter goes direct to the dealers. I shall not base any figures that I propose to you on an exception; I shall take the lowest figures that have been quoted in evidence before you as the price of the butter in any part of the country.

42,199. What I meant was, are you near a market?—I am near two markets, Wells and Shepton Mallett, both of them towns of under 5,000 inhabitants, and perhaps as poor markets as any in the kingdom for the sale of this product.

42,200. (*Viscount Cobham.*) You do not sell in the markets?—No, I sell to the dealers.

42,201. (*Mr. Chaplin.*) Are you put to much cost in transport?—No, none except that of sending the butter to London.

42,202. How far are you from a station?—I have a station on my own land that most of the butter goes from, within half a mile from my farm.

42,203. Then you have a great advantage in that way?—Yes.

Feeding of dairy stock.

42,204. Which would not apply to all butter farms?—No. Now I will go on to the general management. As grass at the level of 500 to 600 feet above the sea on the Mendip is late in spring growth and watery in autumn, I find it necessary, in order to maintain a good quality of milk, to put about 8 to 10 acres into rye, vetches, cabbages, &c., which forms supplementary food to grass for those seasons of the year. These are fed to the cattle in the stalls. I also make from 40 to 50 tons per year of sweet ensilage; that is, ensilage heated throughout the rick to 150 or 160 degrees before the weights are applied. The ensilage is grass, green maize, rye, &c., weighted only by earth and stones.

Ensilage.

42,205. (*Viscount Cobham.*) Is it made on the rick system?—Yes. It is the most valuable food for dairy cows if properly made and fed judiciously that I know of. But it should not be made in too small ricks, as the requisite heat will not be developed, and the ensilage will be sour.

42,206. And the proportion of loss will be much greater too?—Yes. I find that from 20 to 40 tons heated up throughout the rick from 150 to 160 degrees cuts out always the same. There is none of that sour smell with it. We put nothing on it but a few boards at the top of the rick on which the stones and earth rest.

42,207. How much of outside do you lose in a rick of that size?—On a rick of that size we lose 14 inches. Ensilage is very valuable as a change in diet, and it keeps the colour of the butter? I think it is an economical food in any case, and in wet weather it is most valuable.

42,208. (*Sir Nigel Kingscote.*) Do you intend to tell us presently how you give it? I mean after milking or before milking?—I had omitted that point, but it is generally fed after milking; it ought to have no smell whatever.

Mr. J. F. Hall. 1 Mar. 1895.

42,209. (*Viscount Cobham.* Do you put in good grass?—We put grass from almost anywhere except the hedge stuff: we do not put that in for fear of ergot.

42,210. There is some fear of that with the best grass?—Yes, we put almost anything in—any rough stuff we have got.

42,211. Practically you make the amount you require with whatever grass you have?—Yes.

42,212. (*Mr. Dalton.*) Do you grow much maize?—We grow a good quantity of green maize with vetches, and feed it green.

42,213. (*Mr. Lambert.*) Would ergot have any effect after being heated up in a stack with ensilage?—No, I do not think it would, but we avoid it in case it should in any way. Of course, the greatest danger to a herd of dairy cows is abortion, and that at any hazard ought to be avoided. I feed a certain quantity of decorticated cotton cake all the year round to cows in milk. In summer the cows have 3 lbs. per day each.

Summer and winter food for cows.

42,214. (*Viscount Cobham.*) All through the summer?—Yes, all through the summer. Of course, that helps one to crowd the stock on to the land, to intensify the farming; it maintains the butter yield at an even rate and it enriches the land, and it saves carting manure. The winter food of the cows is a matter of great importance. In my opinion it must be sufficient, it should be varied, and it must not be excessive. In winter, all my cows in milk—of course, when I say all the year round I do not mean when not in milk, but in winter all my cows in milk have 4 lbs. of decorticated cotton cake and 2 lbs. of maize meal. A certain amount of concentrated food, such as decorticated cotton cake and maize meal, are in my opinion essential to the quality of the milk, but if they are fed in excess the result is only enrichment of the manure heap at disproportionate cost; in fact, it is loss. Roots in winter are necessary to the butter dairy. I like carrots the best of all, because they are sweet food and there is no waste with them. I only wish that the light lands of Norfolk where they grow carrots so well would supply carrots to some of the big dairies. The carrot is the best of all food I think for them but it is very difficult to get.

42,215. (*Mr. Chaplin.*) For the dairies?—It is the best of all, for butter dairies especially—it is invaluable; roots like swedes are objectionable.

42,216. (*Viscount Cobham.*) Do you give some variety of food, or do you always stick to the 3 lbs. of cake in summer, and the 4 lbs. in winter?—Yes, always. The carrots I like best of all, because they are sweet food, and there is no waste with them. The tops mixed with chaff are excellent late autumn food, cows will eat them greedily. Moreover, they are a much less expensive crop to gather and garner than parsnips. Parsnips have to be forked out; carrots, even in our land, which is stiff, can be drawn out in almost every season. Carrots on stiff soils are generally considered ungrowable. I should like, however, to suggest to farmers who find their ground too stiff for carrots generally to try the Orange Giant: I do not know whether I ought to mention the firm I get it from; I get it from Carter's. I have had them grown on stiff soils for years back with excellent results. The winter ration of food at my farm is based on the tables furnished by Mr. F. Lloyd, F.R.S., which give the albuminoid standard for cows of 1,000 lbs. live weight. These standards are of course adapted to cows of 850 lbs. live weight which is the average Jersey. The actual cost of the winter ration, inclusive of all, is 11*d.* per cow per day. That is the actual cost while in milk. Of this sum 2½*d.* represents the cost of purchased food, and 8½*d.* the cost of food produced at home on the farm.

Cost of winter food for cows.

42,217. (*Mr. Little.*) Does it include labour?—No, this is the cost of food merely. The latter figure 8½*d.* is based on the market values, not on producers' values, so of course it leaves a profit.

Economical feeding of dairy stock.

42,218. (*Viscount Cobham.*) Will you proceed to the next heading in your proof?—The next point I was going to deal with has reference to the economical feeding of dairy stock. I am of opinion that dairy farmers, generally speaking, greatly need to study or to be taught the principles of economical feeding. As far as my own experience goes where cake is used, the tendency is to overfeed stock rather than to stint the food. Many instances have come under my notice in past years of wasteful and extravagant use of food in dairy districts.

42,219. You would call your system a system of rather high feeding, would you not?—Certainly not.

42,220. Not as compared with that adopted by most tenant farmers?—No, I think not; 3 lbs. of cake in the summer is not a large amount.

42,221. Surly the average farmer would never give cake at all during the grass months?—No, but then he would not have on 80 acres of pasture, great deal of which is laid up for hay, 30 head of milch stock. You see the cake enables you to crowd cattle on to the land.

Mr. J. F. Hall. 1 Mar. 1895.

42,222. Then if you had more grass would you give less cake?—With more grass I would give less cake—but not as a butter maker; as a butter maker I think cake is essential.

42,223. (*Sir Nigel Kingscote.*) All the year round?—All the year round in order to keep up the even quality of the milk. It is for that reason that I use it. When walking out and shooting in Wiltshire, Somersetshire, and elsewhere, I have frequently seen unmistakeable evidence of unassimilated cake in the droppings of the cattle and much more direct evidence of the same sort has reached me. Only this week I met at Chilcote, at my farm, a rather inexperienced, but very intelligent, young farmer from my neighbourhood who told me he was daily feeding his cows now with 10 lbs. of cotton cake, giving them in addition 3 lbs. to 4 lbs. of barley meal besides the usual quantities of hay and straw chaffed, and roots. It appeared that he fed on this plan for the whole winter. The cows were probably from 1,000 lbs. to 1,200 lbs. live weight. I told him I thought this was very extravagant; and on reaching home I took down Lloyd's tables, and took out what that amount of feeding actually meant in constituents. The constituents of the foods are, as of course you know, flesh formers (albuminoids), heat formers (carbo-hydrates), fat, and dry matter. I found that with the exception of dry matter that food represented exactly double the amount of the theoretical ratio of food per cow of that size; that is to say that amount of food was just double what was requisite according to the theoretical standard.

42,224. (*Mr. Little.*) Might I ask what the object of this gentleman was; was it to sell the cows fat as they fall off from milk?—No, he is producing milk; at present he has not that in view.

42,225. He is not like the London dairymen, who keep the cows fat for the butcher?—No, he has a milk and a butter dairy.

42,226. (*Viscount Cobham.*) Is it chiefly milk or is it chiefly butter that he sells?—That I can scarcely answer. I believe in the theoretic ratio, because by adhering to it as closely as practice will permit I find that I get an average production of butter, &c., fully as large as the past records of the Jersey breed warrant me in expecting. Now as to the milk yield of the cows. The average milk yield per cow at my Chilcote farm is 440 gallons. The animals are chiefly first and second calf heifers.

Milk yield of cows.

42,227. Is the average arrived at by taking the whole herd?—Yes; that is the average of the whole herd in the year.

42,228. In milk and out of milk?—Yes.

42,229. How much is that per day?—I have not calculated that; it is 440 gallons per year. You ought to take them as being 46 weeks in milk if you want to get the average per day, because for about six weeks in the year they are dry.

42,230. (*Mr. Everett.*) And you get 440 gallons in the year?—Yes, with first and second calf heifers. This is not quite an average yield on the breed, but the animals were selected for butter rather than for milk, and have been fed for butter rather than for milk.

42,231. (*Viscount Cobham.*) I think it comes to about 5 quarts a day; is that not about it?—That would be it.

42,232–3. Would you call that a very fair yield for Jerseys?—No, I should not. It is not equal to the average; it is not equal to what it should be.

42,234. But you go for quality more than for quantity?—I go for quality more than for quantity. In regard to the economic production of milk, in order to illustrate the importance of keeping milking records, I wish to submit a statement of the individual yield of these cows for a period of 12 months, namely, from the 22nd September 1893 to the 26th September 1894. The evidence that I have been giving, I should say parenthetically, has been from January to December, but I did not happen to have those records at hand and made up, so I brought what I had, and, if I may, I will submit it now. It will be seen that the individual record varies extremely; that while the best cow in the list gives 557 gallons in the year, the last one gives 294 gallons only, yet one cow was in milk 46 weeks and the other 45.

42,235. What do you do under such circumstances?—I breed from the better one.

Mr. J. F. Hall. 1 Mar. 1895.

41,236. Do you get rid of the worse one?—Not necessarily. Of course we are speaking still of milk, and I have to come to the question of the butter-fat in this milk. A cow may be a poor milker and yet rich in quality. Of course you cannot treat either quantity or quality alone; they must be treated together. I am speaking now of the milk, and you will see from the table I put in how much the returns from the various cows differ. (*See Appendix* A. XXIV.)

Butter yield of cows.

42,237. I see they vary between 557 gallons and 294 gallons, as you say?—Yes. I think those variations will be found in almost any herd. Now as to the butter yield. The average yield per cow in butter is better than the average milk yield. 255 lbs. per cow is the average, and is, in my opinion, fully equal to the average Jersey at this age. A herd two or three years older could not be expected to average more than 275 lbs. per cow. Now I come to the next point which is that of butter ratios, that is, the quantity of milk required to make a pound of butter. The most important point for the practical buttermaker is the butter ratio of his milk. By butter ratio I mean the quantity of milk that is required in the dairy to make 1 lb. of butter. Practically 10 lb. is the equivalent of 1 gallon of milk. The point specially to be noted in the performance of the Chilcote herd is the favourable butter ratio. Throughout the year 1894 30 Jerseys, mostly heifers, have yielded butter at the rate of 1 lb. from less than 7 quarts. This is not unprecedented, but is unusual. The late Mr. Simpson, of Reigate, who was well known in the Jersey world, used to estimate 1 lb. of butter from 6 to 7 quarts of milk. Mr. Dumbrell, of Ditchling, near Brighton, who kept 80 head of Jerseys, took 7 to 8 quarts of milk, as a rule, to make 1 lb. Mr. Champion, of Surrey, reckoned 1 lb. to every 7½ quarts. The Stonefield Dairy, Lincoln, in 1886, made 14,000 lbs. of butter at less than 7 quarts of milk to the pound; and the same dairy in 1891 made 16,000 lbs. of butter from a little over 6½ quarts to the pound. Those are all statistics of Jersey cows. I submit a diagram showing the weekly fluctuations in the butter ratio of Chilcote milk for 1894. (*See Appendix* A. XXV.) Those figures on the side, those lateral lines, mean 1 lb. The diagram shows how many pounds of milk are required to make 1 lb. of butter. A gallon of milk weighs 10 lbs. This plan begins at the top, that is 14 lbs., then the next line 15, the next 16, and so on; it goes from a little under 6 quarts to 2 gallons.

Butter ratios.

42,238. (*Mr. Little.*) Are those weekly rates?—Yes.

42,239. (*Viscount Cobham.*) I see it varies between 6 and 8 quarts to the pound of butter?—The whole variations are between 6 and 8 quarts to the pound, taking the whole year. You will see there is a sharp drop in April. That was caused by bringing in six heifers with the first calf. In that month I bought six heifers and brought them in in calf, and their milk being poorer it instantly dropped down, as you will see. The other heavy drop I shall give you an account of; that was through having to buy shorthorn milk to make up some butter contracts for the year.

42,240. If you struck out those two extremely low ones your average would be still higher?—Yes, it would be still higher. The importance of the ratio I shall show presently. I may say that the shorthorn milk that I introduced lowered it from 16 to about 19. It was only about 50 gallons of milk a week that I bought, and we were using 250 of Jerseys, and yet it had that effect of dropping it down at once to the point shown on the diagram. If I might just say so, with my small herd every advance of 1 lb. in the butter ratio, that is to say, a reduction, say, from 20 to 19 or from 18 to 17, involves a difference in gross produce of something like 40*l.* per annum. The importance of the butter ratio I do not think is at all fully understood, but it really is in my view the crux of the whole butter trade.

42,241. The general ratio throughout England I see you would put at something between 10 and 12 quarts of milk to 1 lb. of butter?—From 25 lbs. to 30 lbs.; that is to say, 10 or 12 quarts. I have shown in the case of Jerseys that six to seven quarts has been obtained; it has been done under 6½, and I myself look forward to its being produced in a few years on a very large scale from six quarts. The most favourable ratio shown by my table is early in November, when less than six quarts of milk made 1 lb. of butter; the least favourable was in April, when it required eight quarts to produce 1 lb.

42,242. Would that have been the case putting aside the animals you introduced at that time?—I think it would always in the first half of the year be less favourable, and it would always, I think, in the latter half be more favourable.

Mr. F. Hall. 1 Mar. 1895.

42,243. Is the inference from that that artificial food produces better results than grass, ordinarily speaking?—I think the inference from that is that you calve the cows either late in the autumn or early in the spring, as a rule, and that the milk yield is being reduced towards the end of the year; consequently the butter ratio rises. What I mean to say is, that supposing the butter deposit in the milk is constant, and you reduce the quantity of milk, the ratio rises.

42,244. I believe you have read some evidence which has been brought before us with regard to dairying?—Yes.

Comment on Mr. C. S. Read's and Mr. Bear's evidence.

42,245. Have you any comments to make on any part of it?—Yes, I have. The economic importance of the butter ratio of milk will be better appreciated if I am allowed to refer to the evidence given to the Commission by two previous witnesses. Messrs. Clare Sewell Read and W. E. Bear have both borne important testimony to the quantity of milk required in ordinary farms to make 1 lb. of butter. In Volume II., page 77, in answer to question 16,171, Mr. Read says: "I consider that if you "take the average price of butter at 1*s.* per lb. you do not "get above 4*d.* per gallon for your milk." In other words, Mr. Read estimates three gallons of milk to a pound of butter as a fair average in Norfolk. Again, in Volume II., page 456, in answer to question 27,516, Mr. Bear says: "I think it is very difficult to make a profit out of butter. "It would be an extremely good average for 2½ gallons to "make 1 lb. of butter." Mr. Read's ratio, therefore, is 1 in 30, and Mr. Bear's ratio 1 in 25, against which I wish to put the ratio that I have read you this morning of 1 in 17. The figures of Mr. Read and Mr. Bear reveal a discrepancy which may, I think, be accounted for on the supposition that Mr. Read refers to the experience of old-fashioned Norfolk farms where cream is still raised by gravitation. Mr. Bear, on the other hand, probably or possibly refers to farms where the separator and more modern appliances are used.

42,246. I think dairying on Mr. Read's farm is a very subordinate part of the business?—I think the evidence I have just quoted represents a very large average of the ordinary farm experience of this country, and I think I shall be able to give evidence of it, showing that it really is unassailable on the ground of its accuracy. The use of the separator in shorthorn milk would, I maintain, unquestionably reduce this bad butter ratio, of 1 in 30 to the less bad ratio of 1 in 25; but substantially I am able to assert from my own experience that these statements in regard to the quality of ordinary farm milk are true. One lb. from three gallons is, I should say, the rule; 1 lb. from from 2½ gallons is the sorry exception.

Quality of milk for butter and cheese-making.

42,247. Are those bad results the result of breeding the wrong classes of animals or of bad management?—I think they are due to the absolute neglect of the consideration of what is economical milk in the case of a butter dairy. They are the results of assuming that all milk is the same, and that you may take the same milk for cheese, and that you may take the same milk for sale in the towns, but it is not so.

42,248. There is necessarily a great difference between the milk produced for the different purposes?—Between what is required for the butter dairy, and what is required for sale in towns. I do not, however, think there is all the difference in the world between what is required for the butter dairy and what is required for the cheese dairy. I believe that the influence of a better quality of milk would be felt in the cheese, only to a less extent than it would be felt in the butter. Inasmuch, however, as Government regulates the quantity of butter fat required in whole milk selling, the farmer has been taught to reduce the quality of his milk to the very lowest point, I do not know whether I make myself clear, but the farmer has applied the same principle to cheese and to butter as to milk, and he has injured the cheese and ruined the butter.

42,249. (*Mr. Little.*) On the point of cheesemaking, is it not found to be the case that the richer the land becomes the worse the cheese becomes?—I think you must take all those things until observations are more careful with a very great caution.

42,250. You know it is asserted——?—I know it is asserted.

42,251. That you may increase the quantity of cheese, but greatly depreciate the quality?—I think I would rather confine my evidence to butter making, which I do know, than extend it to cheese, which I only know as one living in the centre of the Cheddar district.

Mr. J. F. Hall.
1 Mar. 1895.

Superiority of Jerseys as butter cows.

42,252. (*Mr. Dalton.*) Are these bad results in Norfolk and elsewhere the result of the breed or the result of carelessness in feeding?—I think I shall be able to bring that out more clearly in evidence. In my opinion the breed is the main thing in the butter cow, and I think I shall be able to show why the Channel Islands breed—if I am asked on that point—really by a series of circumstances have been specialized as butter cows. I will give you some instances taken from my diary. I always put down facts that I hear in regard to questions bearing on dairying. I have not taken extreme cases from this diary, but just one or two cases to illustrate what I mean about the butter ratio of farm milk.—"27th September 1892, Mr. —— "called on me to consult about the butter business. He "has six shorthorn heifers calved in May and June; they "are now averaging two gallons of milk daily, but of so poor "a quality that he only gets 1 lb. of butter from each four "gallons of milk." "25th January 1894.—Saw the same "gentleman about the butter yield of his shorthorn cattle. "He complains that he does not get more than 1 lb. from "22 pints of milk (27·50)—22 pints would be 11 quarts "and a half."

42,253. (*Viscount Cobham.*) A pint is about a pound, is it not?—A pint is 1 lb. 4 ounces. I should say that a little improvement is shown in his results. I had suggested a little alteration in his feeding and so on. Still he has only reduced it from 16 quarts to 11 quarts and a half, and as he sells for 1*s.* 2*d.* per lb. he cannot make the business pay. Of course he could not; nobody could. Again, during the course of this winter, I, myself, have bought a certain quantity of shorthorn milk for butter-making to fulfil conrtacts—say 50 to 70 gallons per week. The cows which supply this milk are good dairy animals of the local type, well fed, getting 6 to 8 lbs. of concentrated food daily, and housed at night during the cold weather. This milk was separated in the same way as my own Jersey milk, and the following are the butter ratios: December 6th, 1894, 1 lb. from 10 quarts; January 26th, 1895, 1 lb. from 11½ quarts; February 2nd, 1 lb. from 12 quarts. That shows a deteriorating ratio, due mainly to the very hard frost, but still the best was 1 lb. from 10 quarts of milk.

42,254. (*Mr. Little.*) The worst was 1 from 12?—Yes. In the *Field* newspaper of February 16 last, there was an interesting series of letters on the subject of butter ratios, and I think most if not all of the writers agreed that you could not expect a continuous yield from any milk exceeding a pound of butter from ten quarts. I merely state this to show how utterly vague all the notions of the public are as to what can be done in butter-making.

42,255. (*Viscount Cobham.*) I suppose they were not speaking of Jersey milk there, were they?—If not, they were excluding the only animal that is a butter cow. In Ireland a few years ago the butter ratio of the milk was even worse than the bad English ratio. For instance Mr. Lane, giving evidence before the House of Commons Committee, in 1885, said, "With the present very inferior "breed of dairy cattle in Ireland, the average annual "production of milk per cow may be put down at 430 "gallons. It requires three and a half gallons of this milk "to produce one pound of butter by the ordinary process "of setting and churning." That is, the butter ratio in 1885, as estimated by this witness, was 1 to 35. Since 1885 a considerable improvement has taken place. During 1893 many of the Irish creameries used to publish the butter ratios of their milk in the dairy journals. I cut out the figures in August 1893 referring to 13 such creameries. The creameries in question dealt with quantities of milk varying from 600 to 4,000 gallons daily. The variations in the butter ratios of the milk as recorded by the various creameries ranged from 10 to 12 quarts per pound that is to say exactly between Mr. Bear's and Mr. Read's English butter ratio. The average appeared to be one pound from 21 pints in 1893 as compared with one pound from 28 pints in 1885. That represents a very material advance in the butter industry of Ireland.

42,256. (*Mr. Little.*) Did you say a pint was a pound and a quarter?—A pint is 20 ounces, a quart is 2 lbs. 8 ozs., a gallon is 10 lbs. I could produce a great deal more evidence on this point if it were necessary, but the fact is unfortunately notorious that the milk of an ordinary farm house in England is drawn from cows which first are not butter cows at all, and, secondly, are neither fed nor bred with an eye to the butter quality of the milk. So the farmer who gets one pound from 10 quarts is rather a clever man than otherwise, and the farmer who gets a like quantity from 12 quarts will find plenty of his neighbours to console him with even worse results.

Separators.

42,257. (*Viscount Cobham.*) You use the separator exclusively in your business, I think you said?—Yes.

Mr. J. F. Hall.
1 Mar. 1895.

42,258. What has your experience been of the value of the separator?—I think the separator will have a greater effect on shorthorn milk than it will on Jersey milk. I do not know that I need trouble the Commission with stating the reasons why I think so, because after all the question is not one of very great importance; but I think that on shorthorn milk it will produce the effect of a 15 per cent. reduction of the butter ratio. That is to say, it will collect more butter-fat out of the milk to the extent of 15 per cent. than if the ordinary processes of gravitation are used. I shall, perhaps, seem to be subtilising over this matter, but I do not mean to say that you will get it all in butter; you will get the fat out of the milk, but inasmuch as a proportion of the butter fat in shorthorn milk appears to be unchurnable—you may get the butter-fat out, but you will not get the butter. That is a point which, perhaps, I need not introduce to this Commission, because it is really a further point. It is not entirely a chemical question; it is a physical question also, as regards the quality of milk for butter-making. Perhaps I might further explain myself. As regards the suitable economical quality of milk for butter-making there are two questions—the chemical and the physical; the chemical means that there is a certain amount of butter-fat in milk, and the physical means that butter-fat may be either churnable or unchurnable. Do I make myself clear?

42,259. Yes. You claim for Jerseys ——?—I claim for Jerseys larger globules.

42,260. That is, a larger proportion of butter-fat?—A larger portion recoverable by the churn than with other milk. That to my mind is the essence of a butter-cow—that you shall not only have the fat present in her milk, but that you shall have it procurable by the churn.

42,261. But whatever milk you use you advocate the use of the separator?—Certainly, for economical purposes. The small loss in the value of the skim milk, which is unquestioned, is counterbalanced by the large gain in the butter-fat extracted.

The scalding system.

42,262. Does it show markedly better results than the west country system of scalding?—Yes, it is better. The west country system of scalding is intermediate between the old-fashioned setting of raw cream and the modern separator. You get less butter-fat left in the skim milk by scalding than you do by the old processes of gravitation, but you get more left than you do by the separator.

22,263. In small dairies of from five to six cows such as you will find in many of the smaller farms, would you advocate the use of an expensive machine like the separator?—No, certainly not.

22,264. Do you think that the scalding system would be preferable there?—The scalding system in the west of England, where the butter finds a ready sale, is a sound and useful system. I think the scalding system is undervalued in the present day. It produces an excellent quality of skim milk, and pigs and calves are reared much easier by it. The only thing is that the scalding wants scientific treatment, as everything else does. Farmers ought to be taught that if they do not scald at a certain temperature, which must be accurately observed, they will leave a lot of curds in the butter, and the butter will be cheesy, as the dealers call it, whereas if they scald at the scientific point—the proper point—the butter will be free from those defects, though it will never have the quality of raw cream butter. It is a wide subject, but I think in the west of England, where scalded cream butter is appreciated and liked, that it has a life before it.

Superiority of Jerseys as butter cows.

42,265. You say that the butter value of milk is a question more of the breed of the cow than of feeding, and, as I understand you, you strongly advocate Jerseys as against any other breed?—Yes.

42,266. Have you anything more to add on that point?—I think it will come out clearly in the course of my evidence that it is a question of breed rather than of feed. It is my distinct opinion that though feed may be so managed as to produce even results and regular results, yet the effects of feed are limited, and I can see at present no limits to the effects of breed and of selection. What are the effects—if I may go on—of these bad qualities of milk on the industry of butter-making? I think that a brief examination will lead to the conclusion that they are mainly responsible for the stagnation of the home industry in butter-making, and for the bad repute which attaches to this branch of the dairy industry among farmers. I believe that they prevent young farmers from taking up butter-making as a means of livelihood, and cause older farmers to exclaim, as a well-known farmer did a few years ago, that butter-making would break the Bank of England; or, as a Somersetshire farmer did, not long ago

Quality of milk for butter-making

Mr. J. F. Hall. 1 Mar. 1895.

in my presence, at the Mid-Somersetshire Agricultural Association: "As for butter-making, I consider it beneath my notice." In comparing the milk of butter cows with that of other cattle, I propose to assume a standard average quality of milk in butter breeds of 1 in 20, or of 1 lb. of butter from 8 quarts. I have already given evidence which shows that is not an excessive estimate. I have shown how it can be produced from 6½ on a large scale—something like 8 tons a year. I have shown you how it can be produced from 7 and 7½, and so on. I could produce any amount of evidence to show that it has been done from 8. But I will take only the evidence that has come under my own knowledge—the evidence of my own small dairy of 15 cows to 20 at Erleigh Court, and of 7 to 10 at Sharcombe, conducted on the old-fashioned system of scalding the milk. I have here the records of six years, three at Erleigh Court and three at Sharcombe. In not one of those years did the milk of cows, varying from 8 to 20 in number, exceed the butter ratio of 20 lbs. to 53 lbs. (or just over eight quarts). During those years they frequently went below 20 (19 being the lowest) even with those old-fashioned systems, and less than eight quarts being the average of those six years. So that I maintain if, with such a system as the scalding system, Jersey¾ milk is equal to producing 1 lb. of butter from 2 gallons of milk, that it is a fair thing to assume that can be gained generally from Jersey milk. I look upon such a result as obtainable by everyone keeping Jerseys who gives ordinary care and intelligence to the business. Seven quarts to the pound is at present a ratio which can only be expected at creameries and on large farms where the separator is used, but 6 quarts to the pound I look upon as the goal in the immediate future. I should, I think, astonish the Commission if I were to show them what results had been obtained in butter-making from tests which have been carried on by the Royal Agricultural Society and others. We get constantly results, and I do on my own farm get constantly results, that point to extraordinary butter cows, and to the development in the value of the butter cow in future. I might remind you that I have put before you this morning the evidence that a herd of 30 cows can give milk for more than a week which will yield one pound from less than six quarts, and I have got it from a little over five quarts. But I have tried to exclude from my evidence all exceptional cases. I look upon it, as I say, that in the immediate future with Jersey cows, we shall get one pound of butter from six quarts of milk; but the present standard I take it is 1 lb. from 8. Mr. Read has stated in his evidence that one shilling per pound is the average price at which the farmer would expect to market his butter. It is a very low price for fresh butter of ordinary quality, but let us accept it as the present bed rock of the fresh butter trade. What price will it give per gallon for milk to the farmer? Mr. Read's ratio gives 4*d.* per gallon,—Mr. Bear's 4¾*d.*: at the ordinary Jersey ratio of 1 lb. from eight quarts it would be 6*d.* per gallon, at the creameries ratio, and at the improved ratio it would be 6¾*d.* per gallon.

42,267. (*Mr. Dalton.*) Have you allowed anything for the skim milk there?—Nothing for the skim milk. I hope I am not labouring this point too far, but it seems to me to be at the very root of the whole butter question. It follows from what I have said that, with a selling price of one shilling per pound for fresh butter, shorthorn milk is clean out of the running; by shorthorn milk I mean to say ordinary farm milk. At the selling price of 1*s.* per pound it cannot live, because at 4*d.* or 4¾*d.* a gallon no farmer can make it pay.

42,268. (*Mr. Little.*) In the eastern counties, which you have referred to, the cattle are not kept for milk or for butter, but for breeding purposes, are they not?—For fattening.

42,269. For grazing stores, for which your Jerseys would be no use at all?—I am looking at this question solely from the point of view of a butter-maker, and to see how a vast business can be recovered for the nation.

42,270. (*Sir Nigel Kingscote.*) You are confining your remarks to butter?—Simply to butter. I take the Danish price at about 1*s.* per pound, and I want to show that it is possible to produce butter at that price, without loss, even in England. It requires a special effort, a special cow; yet this vast foreign fortress in our midst can be attacked successfully. It is twelve and a half millions a year that we are talking about.

42,271. (*Viscount Cobham.*) In your calculations do you assume a special value for Jersey butter?—Not at all at present; I am going to add that afterwards. I am taking 1*s.* per pound as the bed rock price at present. If prices go on falling we shall get lower, but on the basis of the Jersey breed I will go so far as to say we will beat Denmark with her Augeln cow. Jersey milk giving 6*d.* or 7*d.* per gallon at the same selling price of butter may be better able to survive. Let us see how these figures compare with the returns per gallon employed in other branches of dairying, such as selling milk wholesale and the making of cheese. The farmers in my district do a large business in selling milk to dealers in Bristol, London, &c. A large quantity also goes to local factories, such as Gillingham. In winter the milk frequently commands high prices and, deducting 1*d.* per gallon for carriage, from 6½*d.* to 7½*d.* the Imperial gallon may be looked upon as occasionally realised. But in the spring and summer these prices fall heavily. Last year the manager of one of our largest factories stated to a neighbour of mine that he could have bought thousands of gallons at 4*d.* per gallon. Again, a very large purveyor in Bristol gave prices in summer last year which only yielded 4*d.* per gallon to the farmer. Moreover, in estimating the returns of milk selling, some deduction should be made for the cost of cart, horse, and delivery to rail. It is a heavy matter; it is not like butter. I was asked this morning a question about butter, but there is not so much cost of carriage in the delivery of butter. In milk it is a very serious matter. You have to deliver it daily, and the butter you do twice a week, or something of that sort, and it is not so big a matter. So I think 5½*d.* per gallon would represent the full return to the farmer in Somersetshire selling milk wholesale all the year round. I think 5½*d.* per gallon is a liberal estimate. As to cheese-making, the quantity of milk required to make 1 lb. of cheese is generally estimated at one gallon per pound. The late Lord Vernon pointed out at the Dairy Conference at Nantwich on June 4th, 1885 that this was not a correct estimate. His words are these: "It seems to be recog-
" nised that three gallons of milk will make 1 lb. of
" butter, and that one gallon of milk will make 1 lb. of
" cheese. So it will when fresh; but considering that
" cheese shrinks at least 25 per cent. before being sold, a
" quantity of it is lost, so that really it takes a gallon and
" a quarter to make 1 lb. of cheese. When, therefore, a
" farmer tells me he made 70*s.* a cwt. by his cheese,
" as one in point of fact told me last week, really
" he only made 6¼*d.* to 6½*d.* per gallon on his milk."
I think that an average price paid to the farmer in the Cheddar district would be somewhere between 50*s.* and 60*s.*, that is, by the dealer who goes round and buys his cheese—say in round figures 56*s.* per cwt. If there was no shrinkage this would give a return of 6*d.* per gallon for milk; but Lord Vernon says we must allow 25 per cent. for this shrinkage. Let us compromise it at 12½ per cent.; that would make the price in the Cheddar district 5¼*d.* per gallon. Of course I am trying to get at the average price, and not to touch either extreme. There would be some who would get more and some who would get less, but I think that is a fair average. I am perfectly certain that it is a favourable average as compared with butter at 1*s.* per lb. The best results, I think, are secured by those farmers who combine the sale of winter milk with the manufacture and sale of cheese during the summer and autumn months; by this means I think an average of 6*d.* per gallon might be obtained. Comparing the sale of fresh butter at 1*s.* per lb. with that of milk at market prices and cheese at 56*s.* per cwt., the returns come out as follows: Jersey milk, treated by improved processes such as I imagine creameries would adopt, 7*d.* per gallon for butter-making; milk got from Jersey cows and treated, 6*d.* per gallon; the combined sale of milk and cheese, 6*d.* per gallon; whole milk sold all the year round, 5½*d.* per gallon; and cheese alone, 5¼*d.* per gallon. I here record my opinion, that in spite of all that has been said about it, the making of butter from Jersey milk, even at the low selling price of 1*s.* per lb., and not allowing a single penny profit for the superior quality, comes out at the head of the list.

Mr. J. F. Hall. 1 Mar. 1895.

Prices of butter compared with those of milk and cheese.

42,272. Have you given us what you yourself have got?—I have given you that, but I have left that behind for the moment, because I have shown you that I have got 10*d.* a gallon selling at 15*d.*; but then I say selling at 1*s.* a pound, which is the bed rock at present of the butter industry, and making butter from Jersey milk, the returns ought to be 6*d.* to 7*d.* per gallon. I say that Jersey milk is at the top of the list and there is nothing to touch it in the way of profit at the present time; that is my conclusion. In comparing these figures it must be borne in mind that both cheese-making and butter-making possess an advantage over milk selling in their by-products of whey and skim milk. Milk selling does not admit of the rearing of pigs without extra expense for feeding. The value of skim milk is generally admitted to be about double that of whey so that if skim milk is worth a penny a gallon whey is

Mr. J. F. Hall. 1 Mar. 1895.

worth a halfpenny. Therefore putting the value of the milk in a butter dairy for butter-making, together with the value of the skim milk for pig-feeding, you get (on the basis of 1*s.* per lb. for butter) 7*d.* per gallon for the milk; and on the basis of cheese-making at 56*s.* per cwt., together with the value of the whey you get 5¾*d.*; and in the sale of whole milk which has no by-product you get 5½*d.* But this statement does not do justice to Jersey milk when made into butter. For some cause not fully understood, but probably a physical one, the butter produced from Jersey milk is invariably firmer in texture, and better in grain than that produced from shorthorn cows. This difference amounts to a preferential price paid in the market of not less than a penny per lb. in every district with which I am acquainted. Therefore when Danish and other butters fetch 1*s.* a lb., fresh Jersey butter sold wholesale to our west country dealers will fetch 1*s.* 1*d.*, at which price it returns 6¾*d.* per gallon to the maker, besides a penny for the skim milk, or 7½*d.* per gallon. I do not think that is forcing the matter; I think that it is true that the quality always produces that much more and ought to be taken into account. I wish now to say something as to the cost of producing Jersey milk as compared with shorthorn or other ordinary farm milk. A rough notion of that may be gained as follows: Ordinarily speaking, two fair milking shorthorns will weigh as much as three Jerseys, and presumably an acreage which will support two of the large breed will support three of the small. Two country shorthorns will be good cows if they give 600 gallons of milk each per annum—that is 1,200 gallons together; but three full grown Jerseys should give at least 1,500 gallons, and that would give 2*l.* 10*s.* profit in favour of each of the Jerseys, taking milk at 6*d.* per gallon; in other words the Jersey milk would be about 1*d.* per gallon cheaper to produce than the shorthorn. That is an estimate based on the weight of the two cows; I am taking the economic value of the milk for the butter-making and the weight of the cows placed upon the land, and I find that the Jersey cow is a more economical milk producer than the other.

Cost of producing Jersey and other milk compared.

42,273. You are not taking into consideration the value of the animal when sold to the butcher, are you?—That I will come to afterwards. I am trying to bring out every point which bears on the questions of butter production at a profit; and that is a point which must be taken into consideration too.

Effect of age on cow's milk.

42,274. I believe you wish now to say something as to the effect of age on the cow's milk?—The age of the cow is the next point, and that has an important influence upon the quantity and quality of the milk yield. This point was formerly well understood in dairy counties, but it appears to be forgotten or disregarded now to the great detriment of the butter branch of dairying. Yet both the milking trials of the British Dairy Farmers' Association, and the butter tests of the English Jersey Cattle Society, bear decisive witness to its existence as a law, and to its direct bearing on the profits of the butter dairy. 376 Jersey cows and heifers have been tested by the English Jersey Society since 1886; of these, 43 animals between three and four years old yielded, as an average, one quarter of a pound each less butter per day than 112 cows between the ages of six and eight years. On an ordinary farm I consider that a Jersey cow of seven years old would give from 25 lbs. to 35 lbs. more butter a year than a cow of 3½ years.

42,275. (*Mr. Little.*) Do you suffer from the drop in the older cows, I mean milk fever; do they fall after calving?—I do not think so.

42,276. There is a general impression with us that they do after three or four calves?—You constantly, in Arthur Young and in Billingsley and writers of that sort, who wrote at the end of the last century, find that cows were kept even to the age of 20 years, to put extreme cases.

42,277. But not with very artificial keeping; it was with purely natural keeping, was it not?—Possibly artificial feeding might affect it, but I have never personally attempted artificial feeding; I never attempted the American system of feeding.

42,278. I mean that in the old days cows were kept principally upon the food that they could get from the grass and from hay, and therefore would be less subject to milk fever than those which are highly kept on cake?—Yes, but if the cow ceases to give milk, you drop off all artificial feeding and keep her for six weeks dry and very poor. I think in those cases the risk of dropping is very greatly diminished. I had intended to bring with me a plan which has been issued by the English Jersey Cattle Society which shows the results of their tests on this point. I am sorry to say that I have not the plan with me, but I will send it up. (*See* Appendix A. XXVI.) The plan shows very strikingly that as they get older the milk and butter produce increases up to a certain age; after that the cows maintain their highest rate for a certain time, and after that they seem to decline in yield.

Mr. J. F. Hall. 1 Mar. 1895.

42,279. (*Viscount Cobham.*) At what age would they begin to drop?—I should say that it would be at from nine to ten years old. That affects the beef question very materially, because if you can keep cows in profit up to that time the beef value has disappeared, and the cows have ceased to have almost any value to the butcher. The conclusions I wish to draw from the evidence I have already given are, first, that butter-making for the wholesale market as practised by the ordinary farmer cannot pay, and is bound to die out. I cannot think that there can be any dispute about it; one sees it all round one; it is dying out, and on the lines at present followed, namely, 4*d.* per gallon and 4⅜*d.* per gallon, it cannot support the farmer. And that is not the worst; as I showed you this morning there are some who are only earning 3*d.* per gallon, which is about as much as the New Zealand factories pay their farmers, so that they cannot live by it. The second point I wish to assert is that butter-making from Jersey butter cows is still a practicable and paying industry, even at the low selling price of 1*s.* per lb. I do not wish for a moment to introduce any controversial matter before this Commission, but it seems to me that it is desirable that the head of the State, to which ever party he belongs, should not hold unsound views about cows. I find that in the "Pall Mall Gazette" of April 29th, 1893, an interview was reported between Lord Salisbury and Lord Winchilsea on agricultural questions generally, in the course of which a remark was made by Lord Salisbury to the effect that he presumed the profitable life of a cow was from three to four years. It will not affect international relations, but at the same time I am bound to say—without saying to which party I belong—that it will affect the faith of the average farmer in the head of the State to find him expressing so heterodox an opinion as that on the value of the cows. This is really a little digression.

42,280. What average age would you give to the cow?—Nine to ten years for a butter cow.

42,281. (*Mr. Little.*) Taking the country through?—From two to eleven is what it ought to be. I have some cows of my own which are nearly ten years of age, and which I would not part with for anything. They are the best cows I have got. No one ought ever to part with a good cow till she has ceased to produce profit in the dairy, when there is an industry like this sought to be recovered in England.

42,282. (*Mr. Channing.*) I thought when you started this farm you were using young heifers?—I have bred them now for 15 or 16 years. The best blood is not to be lightly obtained, and when you get it there is nothing more certain in the analysis of careful breeding than that individual qualities differ greatly, and that they can be transmitted by inheritance. The consequence is that you ought never to kill a good dam. I do not suppose anybody would kill the dam of a good racer, and why should you kill the dam of a good butter cow.

42,283. (*Captain Owen Thomas.*) You are speaking of an exceptionally good cow, and not of the average cow, are you not?—I am treating the thing broadly. I am not taking the case of the bad cows. If you have a bad cow, the sooner she is killed the better. Taking butter cows, seeing that they rise constantly, their average of production will be better at the age of seven or eight than it will be at the age of three or four.

42,284. And one or two out of 20 would be good at 10 years of age?—Yes.

42,285. But not more?—No, I do not think more would.

Importance of economical production of milk for butter-making.

42,286. (*Viscount Cobham.*) What do you think are the obstacles in the way of the improvement of our butter industry?—First, the general lack of knowledge on the part not only of the farmer, but extending to his guides and teachers, as to the conditions upon which the profitable working of a butter dairy really depends. Few appear to recognise the great importance both as to cheese and as to butter, but especially as to the latter, of the production of milk in proper quantities and of proper quality—that is what I mean by the economical production of the milk. Milk is the mere raw material of both trades, and is of vital importance. If I may quote from a passage I wrote lately on this subject—it has been published—I should like to do so. I said:—"The quality of his milk is to the butter maker what "the quality of his wool is to the cloth-maker. It

Mr. J. F. Hall. 1 Mar. 1895.

" is the raw material, upon the right selection of which not " only the excellence of his goods but the profit of his " undertaking must in a great measure depend. If the " cloth maker buys bad wool and buys it dear, can " he retrieve his error by introducing new and im- " proved methods of dealing with his staple in " the process of manufacture? Certainly not. Yet the " ordinary farmer buys, or rather produces, a bad raw " material, and a dear raw material, and is taught by his " advisers that if he only gives increased attention to the " processes of manufacture in a dairy it will turn out all " right. For years past the whole attention of the farmer " and of the public has been directed and concentrated, " through the combined energies of the press, the agricul- " tural societies, professional teachers and lecturers, " migratory butter schools, etc., upon the question how to " make good uniform butter; and it has been assumed " and often expressly taught that this covered the whole " question of profitable butter-dairying." I think that the proof is not far to seek that the production of the raw material as a potential source of profit is of much greater importance than the process of manufacture. I have rather brought this into prominence, because I see that in this very inquiry several witnesses have come before the Commission and have said that the difficulty in the way is the production of good and uniform butter. I do not think so. I think now-a-days that a great deal is known about the production of good and uniform butter, and that the real obstacle in the way is the production of the right milk. I will give you an illustration. Most country towns publish weekly the prices of fresh butter, in the local market. Such is the practice at Shepton Mallet; and throughout the year the measure of the difference between the best and the inferior butters is only about 2*d.* per pound, that is to say, prices run from 1*s.* to 1*s.* 2*d.*, and from 11*d.* to 1*s.* 1*d.*, and so on. If this measure be applied it appears, therefore, that 1*d.* per gallon on the milk returns is all that the question of quality really involves. I do not know whether I make that clear —it is two-thirds of a 1*d.* really, but I put it at a 1*d.* Whereas if a farmer makes butter, and sells it at a 1*s.* a pound and it takes him three gallons of milk to make a pound of butter, then, if he succeeds in learning how to make it from two gallons, it makes a difference to him of 2*d.* per gallon—that is double the former instance. If, besides improving the quality of his milk he improves the yield of his cows 100 gallons per annum, as has been done over and over again, he adds to the difference. So I really think the importance of studying the economical production of milk as compared with the importance of studying the better manufacture of butter is possibly represented by more than three to one, and is certainly represented by two to one. The second obstacle exists in the strong prejudices, gradually, I think, giving way in the South and West of England, against the type of butter cow. There is considerable justification for this feeling. Jersey breeders in England in former years have been much to blame for pursuing fantastic aims, and encouraging ridiculous fancies about tints, and tongues, and tails, and the like. But, perhaps, of even greater influence in discouraging the breed have been the notions formed by the farmer of the delicacy of the Jersey, owing to his experience mainly of the Island breed of Jerseys. There is no doubt that lack of constitution in the case of a large proportion of Island Jerseys has discouraged the farmer from meddling with them. The first year of their acclimatisation, especially in the autumn, is a very critical time with the Island breed. I have had my own experience of it, but have never found the same difficulty with English bred Jerseys. Nature seems to have endowed them with robustness as a compensation for the lack of refinement which is so distinguishing a characteristic of the Island cows, and has made them the idols of the show-ring.

Prejudice against dairy cows.

42,287. (*Mr. Channing.*) Is the amount of fat in their milk as great as that of the Island cows?—Yes, I think so. The third obstacle to which I wish to call attention is the constantly-recurring objection to the Jersey on account of her deficiency in carcase. This may be regarded, not only as a prejudice, but even as a mischievous prejudice, which stands in the way of the advancement of the butter industry, for it demands that a butter cow should be also a beef cow, whereas experience shows that a beefy cow is *ipso facto* a bad butter cow. Some people say that it is easy to show that English Jersey cows, accidentally disqualified as butter producers by sterility, &c., are capable of yielding a return at the shambles not altogether disproportionate to their live weight. I think that is true; the farmers forget that one cow is 850 lbs. and the other 1,100 lbs., and I have, in my own experience, always a sale for Jerseys if they should happen to be disqualified for the dairy. But I am prepared frankly to abandon any claims for carcase value on the part of the Jersey, and to maintain that, kept for the production of butter and skim milk alone, they are more profitable animals in proportion to their size than the cow which produces both milk and beef. Nobody can well dispute the practical value of the Jersey cow for butter production. We may rest the case on farm accounts such as those of the late Mr. Dancey, of Horwood Priory, Bucks, who, in the year 1865, received 1,600*l.*, or an average of 32*l.* per cow, for butter alone from a herd of fifty Jerseys. That is a case, of course, in which Mr. Dancey supplied butter retail. It is a surprising record I think, of butter production, but he had, I am told, the Queen's table to supply in those days, and certainly he had a first-rate connexion, and that may partially account for it. I might say, that if one had been resting the case of the Jersey upon cases like Mr. Dancey's, I could have quoted very large herds of Jersey cows—well known if I mention the names—that are selling their butter, one at 2*s.* a pound, and another at 1*s* 8*d.* a pound, but those are retail prices and so on. But more important in their effects on the public mind have been the published butter tests such as those of the Royal Agricultural Society at Chester, the large tests open to all England at Lord Rothschild's at Tring Park, as well as those conducted by the Bath and West of England Society, the British Dairy Farmers' Association, and the Royal Counties Agricultural Association. The most important of all was the great test of butter and cheese production from different breeds organised in America, and held at Chicago in 1893, which lasted from five to six months. I need not go into the details of these, I think, because they are well known, but I have got some figures here about them. I think I should mention that, in the thirty days' tests for butter, 15 Jerseys, 15 shorthorns, and 15 Guernseys were entered. Taking the results of the tests of the first 25 cows in order, the whole 15 Jerseys passed out, eight Guernseys passed out, and two shorthorns only, that is to say Jerseys really topped the list, then came Guernseys, and then two shorthorns. One of the shorthorns was third on the list in merit of production of butter, but even there the characteristic differences were seen: for whereas the leading Jersey made one pound of butter from six quarts of milk, this exceptional shorthorn took exactly 10 quarts of milk (Mr. Bear's estimate), to make a pound of butter. In all the tests, the 90 days' test, the 30 days' test, and the 15 days' test, the Jerseys head the list. 25 cows were employed in some cases of each breed and 15 in others, but the Jersey in all headed the list as a butter producer. In all these cases the value of the Jersey as a practical butter cow has been indisputably established. The results of these tests can be found in Mr. Cheeseman's Report to the British Dairy Farmers' Association, published in the journal for 1894 (page 41). American Jerseys are held mainly by farmers, and not, as in this country, by rich men; they are not the fashion of the opulent. Ten years ago the Jerseys registered by one club only in the United States of America numbered 40,000, and the breed has vastly increased since. But we need not resort to America or Canada for evidence that the Jersey is adapted to the ordinary farmer's purposes. Ample evidence exists in Arthur Young's books that the Jersey—or Alderney, as she was then called—was in the last quarter of the 18th century widely spread in the dairy farms of the south and south-western counties, and her extraordinary butter-making qualities were then widely recognised, then came the great beef movement, and the popularity of the Jersey waned. Now that butter cannot be made to a profit from shorthorn milk, and that beef contributes less than it did to the dairyman's income, it seems as if farmers were inclined to reconsider the question of the Jersey. Much evidence comes before us in the Jersey Society on that point. Even if England is not yet ripe for the reception of the butter type of cow, other countries are less backward. Ireland, Belgium, France, Portugal, Sweden, and even Matabeleland, were all buyers to a greater or less extent of Jersey stock last year; Sweden alone received in one shipment 240 cows and heifers, and forwarded a further order for 40. It is an extraordinary circumstance that Sweden with its climate should be buying Jersey cows. Denmark, as is well known, possesses a type of cow in the Augeln greatly resembling the Jersey in size, appearance, &c., but less valuable as a butter cow; but the weight is almost exactly the same. They have based their immense butter business on a cow of the Jersey type, but not such a good butter cow. There is one point I should like to point out, that though we cannot shake the foreign hold on the market in regard to improvements in the manufactured article, though we cannot surpass the quality of the best French and Danish butter, we can beat them hands down in regard

Mr. J. F. Hall. 1 Mar. 1895.

Superiority of Jerseys as butter cows.

Result of tests of butter at Chicago, 1893.

Use of Jersey cows abroad.

Mr. J. F. Hall. 1 Mar. 1895.

to the quality of the milk. I could give evidence as to the quality of Normandy, and of Danish milk for butter production; they are not at all equal to the Jersey.

Butter ratios.

42,288. Cannot you give us the ratios one by one; what, for instance, is the ratio of Denmark?—I took these figures when I wrote a pamphlet in 1892: the Jersey is 1 in 20, the Augeln of Denmark is 1 in 25, the ordinary English is 1 in 27·50; the ordinary Irish (this was on the basis of Mr. Lane's evidence) 1 in 31; the ordinary Norman, 1 in 31·25, and the ordinary Dutch, 1 in 33·75.

42,289. (*Viscount Cobham.*) According to you the whole of those industries ought to be unremunerative?—They have certain advantages that we do not have. You would have to treat them separately. I do not think they have rates as we have, nor taxes as we have, and I do not think their labour bill is the same; all those points affect it.

42,290. (*Mr Dalton.*) Is their rent high?—It is speaking really too broadly to speak of rents where so many countries are concerned, but those figures all favour them. *Cæteris paribus*, the Jersey will beat them as a butter cow, there is no doubt.

Importance of the butter-making industry.

42,291. (*Viscount Cobham.*) I think you consider that the public efforts hitherto put forward by the agricultural societies and county councils are inadequate to deal with the question of the economical production of the raw material required for the butter dairy?—Yes. That is a question that I can deal with very briefly. It seems to me that the importance of this industry is not appreciated. I believe, if we think of it, we shall see that it is the only hopeful direction in which British agriculture can expand. We cannot expand in the direction of wheat; I do not think we can expand much in the direction of beef and meat. We cannot affect the frozen mutton trade, and even if we could, after all, it seems to me that 10 millions, which was the total import of meat, apart from pig-meat and live cattle, is not very much to compare with 36½ millions, which is the total import of butter, margarine, cheese, bacon, ham, lard, and pork.

42,292. What you look forward to is the displacement of this great foreign importation by home-grown produce?—I think everything seems to show that British agriculture must expand in that direction, and in that direction chiefly. If we could produce all the poultry and eggs it is only 4½ millions; if we could produce all the vegetables and fruit it is only 6½ millions.

42,293. Do you think a little improvement has been manifested recently in the manufacture of butter in England?—Yes, but I do not think that touches the economic question. We have undoubtedly raised the technical level of our dairymaids, but that is only flooding the counties with people who have no immediate prospect of occupation. They know perfectly well that it takes three to four gallons of milk to a pound of butter.

42,294. You consider that sufficient attention has not been paid to the production of the milk from which the butter is made?—It is my notion that that side of the business must be developed.

42,295. Have you any suggestions to make as to more efficient methods, and the more energetic handling of this question, besides what you have already put before us?—I should like to make a few suggestions, and I will make them very briefly. I have come rather to point out where the evil is, as it seems to me, where the canker is at the root of this business, and that is ignorance of the economical production of milk. In the first place as to the State: the State publishes yearly in the agricultural statistics notes of the produce of the principal crops, live stock, &c.; might not the attempt be made to collect at the same time statistics of milk, cheese and butter produced by the farmer?—I do not know that that would succeed, but it would be valuable if we could get it. Then it is the general impression that despite laws to the contrary, a great deal of adulterated butter comes into the market. I hear that constantly asserted in the British Dairy Farmers' Association, and I am going to suggest why cannot the butter be examined at the port of entry instead of being examined in the shops. The latter seems to me like checking the evil at the floodgates instead of at the source.

Adulterated butter.

That is a suggestion I should like to make. Then with regard to our county councils and their migratory butter schools, which is one of the means they adopt for technical education, that I think is open to objection, because, as I have been trying to point out all along, it deals only with the question of manufacture. Many of the pupils never see milk. They buy cream, put it in the churn and turn out the butter, which they sell. The consequence is that these pupils become excellent dairy maids, but they know nothing whatever of how to produce butter economically. As I pointed out they may affect the value of the butter to the extent of two-thirds of a penny per gallon of milk, but that is all they can do.

Mr. J. F. Hall. 1 Mar. 1895.

Technical education.

42,296. Still, even that is important?—Yes, but the other is so very much more important. What I wanted to suggest on that head was that migratory butter schools should be held, as cheese schools are. The cheese school in Somersetshire is held at a farm, and the pupils go there. Now why could not the county councils take a small farm, give the farmer 25*l.* or 20*l.* for use of his premises, &c.; he should supply the milk; the scholars could make it up into butter; they would have the opportunity of seeing the butter ratio of the milk; they would observe the cows being fed; they would weigh the cows' milk one day in the week, and would study it rather on the lines which I have been indicating, and it should be part of their business to record the results. I think in that way both the pupil would be benefited and the farmer himself. I want to see something brought to bear on the farmer himself to teach him these things.

42,297. The county councils are endeavouring to produce good dairy maids, rather than good milk producers?—That is it. There are more good dairy maids, I think, at this moment in the county of Somerset, than there are good butter cows; that is my impression. Another thing I attach a great deal of weight to—I wish I had more time to impress it upon the Commission—is, that I really think that in order to improve the quality and quantity of milk, in order to draw attention to it, it would be most valuable for the county councils to appoint inspectors. I would take assistants from some good chemist's laboratory, men of some scientific training, and say "Look here, I shall "pay you a certain fixed salary; you shall go to any farm "where you are invited, and test by the Babcock tester or "one of those simple things"—I would not go through the whole process of chemical analysis—"the whole of the "cows, and let the farmer know what each one produces."

Inspection of butter by county council inspectors.

42,298. (*Mr. Channing.*) And warn him from producing butter from the cows that had a less proportion of fat than a specific standard?—Yes. It would only take an hour to do about 50 cows by the Babcock testers.

42,299. (*Viscount Cobham.*) The farmer would have to keep the proper glasses and measures?—I think that would not be necessary. I would let the inspector carry those round with him. It is only a small thing. He could carry the apparatus round to every one. I would pay the inspector a certain fee and make the farmer pay another fee, and then I am quite certain if the quality of the milk was tested four times a year it would give a very good clue to the value of the individual cows. It is a thing I should use myself at once; it would save me a great deal of trouble. Then as to agricultural shows, I should like to suggest that more of them should follow the example of the British Dairy Farmers, and test, at any rate, dairy cattle, by results, and not simply be content to bring dairy cattle into the ring and inspect them as though they were beef cattle. It is a farce to a great extent. It has had its day, and it is played out. The dairy cattle cannot be judged in that way, especially a butter cow cannot be. I should like also to urge one notion that we have in the English Jersey Society; we are giving prizes now for bulls. Of course many people say if you give all the prizes for results only you sacrifice all that our experts have done in breeding symmetrical and beautiful cows. We have hit on this compromise: we will give prizes for cows only on their butter produce; bulls we will give prizes for on account of their appearance, only they must be bulls descended from cows which have made good butter results, so we hope in that way to preserve both utility and beauty.

Improvement of tests of dairy cattle at shows.

The witness withdrew.

(*For Mr. Hall's further evidence see page* 355.)

Adjourned to Thursday, 14th March, at 12 o'clock.

Eighteenth Day.

Thursday, 14th March 1895.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
JOHN GILMOUR, Esq.
ROBERT LACEY EVERETT, Esq., M.P.
WALTER HUME LONG, Esq., M.P.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq. } *Assistant*
ALAN MACKINNON, Esq. } *Secretaries.*

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

Mr. CORNELIUS NEALE DALTON, C.B. (a member of the Commission), examined.

42,300. (*Chairman.*) You are one of the assistant secretaries of the Local Government Board?—Yes.

42,301. And you have been for some years charged with all questions affecting local taxation?—I have been connected with the Statistical Department since 1882, when I was appointed assistant secretary. I have seen all the returns that have been issued since that date, and have had more or less to do with their compilation.

42,302. In 1893 you were assisting Mr. Fowler, the then president, in preparing the memorandum on the subject of local taxation?—That is so.

42,303. There have been two special inquiries into the increase or decrease of the local taxation within recent years, made at the instance of the Treasury, one by Mr. Goschen, President of the Poor Law Board in 1871, and the other by Mr. Fowler, to which I have already referred, in 1893?—Yes.

42,304. In each case a full report was published as a parliamentary paper?—Yes.

42,305. Mr. Goschen's report brought the statistics of local taxation down to 1868?—Yes.

42,306. And Mr. Fowler's brought them down to 1891?—Yes.

Mr. Goschen's report on local taxation.

42,307. What was the general purport of Mr. Goschen's report?—The scope of Mr. Goschen's report was considerably wider than that of Mr. Fowler's report. Mr. Fowler's report was confined to the local taxation of England and Wales, while Mr. Goschen's report dealt not only with the local, but also with the Imperial burdens borne by real property in the whole of the United Kingdom and the rest of Europe. At the commencement of his report, Mr. Fowler gives an account of Mr. Goschen's report. He says: "In 1871 "Mr. Goschen (who then presided over the Poor Law "Board) in accordance with your wishes, made an "inquiry into the progressive increase of local taxa"tion, with special reference to the proportion of local "and Imperial burdens borne by the different classes "of real property. He also inquired into the system "adopted in foreign countries for raising the funds "necessary for local purposes, and endeavoured to "ascertain, as accurately as possible, whether the "proportion of taxation borne by real property in this "country was in excess or not of the share borne by "the same class of property elsewhere. In his report "of the results of that inquiry, Mr. Goschen, in the "first instance, analysed the receipts and expenditure "of the local authorities of England and Wales for "1868, the latest year for which statistics were then "available, distinguishing, as far as practicable, the "transactions of urban and rural authorities. He "next dealt with local rates for the purpose of show"ing:—(1.) Historically—(*a.*) What had been the "increase during the preceding 50 years in the gross "amount of money levied by rates at different "periods? (*b.*) What rates exhibited the greatest com"parative increase? (*c.*) Whether the increase in the "value of the property bearing the burden of rates "had been greater or less in proportion than the "increase on the sums collected? and (*d.*) How the "increase in value, and the increase in the burdens "borne, had been distributed between lands, houses, "and other classes of real property, respectively? "(2.) Geographically, in what parts of the country the "increase in rates, if any, had been most marked." Mr. Fowler stated that he proposed "to continue the "inquiry into the increase in the local taxation of "England and Wales, so as to bring it as nearly as "practicable down to the present time, and to com"pare the facts and arguments contained in Mr. "Goschen's report with the condition of things now "existing." He added that in so doing he would confine himself to the local taxation which was within the cognizance of his department, and would make no attempt to deal with the Imperial taxation falling on lands, houses, and other classes of real property.

42,308. Then Mr. Goschen's report compared the state of rural rates in 1868 with the earlier years of the period?—Yes.

42,309. What was the general result of his investigation?—On page 20 of his report he says: "It is "certain, from all the data which have been sub"mitted, that the progress in the burdens on lands for "local purposes has not been, as has been constantly "asserted, greater than the increase in their value, "but on the contrary considerably less."

Mr. Fowler's report on local taxation.

42,310. Then Mr. Fowler in his report continued that investigation till 1891; and what was his conclusion?—He found that there was a fall in 1891 as compared with 1868 (the year which Mr. Goschen had taken), in the average rate in the £ in rural districts of the aggregate rates, excluding rates raised by Commissioners of Sewers and Drainage and Embankment Boards, which are in the nature of rates for the improvement of property. And he arrived at the conclusion that "at no time during the "present century, for which statistics are available, had "the average rate in the £ of the rural rates been so "low as during the years 1890 and 1891."

Rates in 1803 and 1890–1 compared.

42,311. Was that conclusion supported by figures of which you give a resumé in Table 1, of the appendix to the brief of your own evidence. (*See* Appendix A. XXXII., Table 1.)?—I think so. It appears from that table that the average rate in the £ of the rural rates, which was 4*s.* 5½*d.* in 1803, had fallen in 1890–91 to 2*s.* 2½*d.*, that is to say, it was half what it had been in 1803. In various counties the fall was considerably greater than that. For example, in Carmarthen it had fallen from 12*s.* 9*d.* to 2*s.* 6½*d.*; in Pembroke from 11*s.* 8½*d.* to 2*s.* 6½*d.*; in Cardigan from 9*s.* 1*d.* to 3*s.* 5*d.*; in Sussex from 8*s.* 7½*d.* to 2*s.* 3¾*d.*; and in Monmouth from 7*s.* 11½*d.* to 2*s.* 8*d.* In 1803 the highest average rural rate in any county was 12*s* 9*d.*; in 1890–91 it was 3*s.* 5*d.*

42,312. Was the year 1803 taken on the ground that it was a year of very high rates, or not?—No, on the contrary, I should say. It was taken apparently, as far as one can judge from the report, because it was a year for which the least imperfect statistics were

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

available. If I may refer to page 69 of Mr. Goschen's report, which gives the expenditure for relief for a large number of years, it will be seen that the expenditure on relief in 1803 was smaller than that in any subsequent year in the Table with the exception of 1837. Of course in many of the intervening years the rates and the expenditure on relief were enormously high. For example, in the five years, from 1817 to 1821, the expenditure on relief varied from 6,910,000*l.* to 7,870,000*l.*, and in the five years from 1829 to 1833 from 6,332,000*l.* to 7,036,000*l.*, whereas in 1803 it was only 4,077,000*l.* (*See* Appendix XXXII., Tables 2 and 3.)

42,313. You are now referring to the expenditure on poor relief only?—Yes, which was the greatest of all the local burdens that then fell upon the land. It is perfectly clear from the reports of the Select Committees of the House of Commons and the House of Lords in 1817, and from the Report of the Poor Law Commission in 1834, and from the table at page 69 of Mr. Goschen's report, that in those 10 years the poor rates were enormously higher than they were in the year 1803, which is the first year taken here.

42,314. In 1803 the gross expenditure was 4,077,000*l.*?—That is so.

42,315. And the rate in the £, 3*s.* 4½*d.*; I am talking now of the gross expenditure taken for the poor only?—Yes.

42,316. For a moment confining ourselves to the Poor Law expenditure in 1813–14–15 the average expenditure was 6,123,000*l.* and the rate in the £, 2*s.* 4¼*d.*?—Yes.

42,317. Apparently between those dates the rental of land had been considerably increased; I suppose, owing to the high prices of wheat in the war time. You see the gross expenditure had increased 50 per cent., whereas the rate in the £ had fallen by nearly 30 per cent.; therefore the probability is that in the interval there had been a great rise in rent due to the high prices of the war time?—I think it is very difficult to get the assessment for 1803. The assessment for 1814 can be got from Table VI., which I have put in. I have put in some of the assessments for the earlier years for the income tax which have been taken from Mr. Goschen's report, but I have not got the assessment for 1803.

42,318. I only draw the inference from the figures that there must have been a rise of rent in the interval, due, probably, to the war, and resulting in this: that although the gross expenditure was increased 50 per cent., the rate in the £ was reduced nearly 30 per cent.?—That appears to have been the result. In the table on page 69 of Mr. Goschen's report the annual value of property for the Income Tax Returns is given at 34,864,000*l.* in 1802-3.

42,319. (*Mr. Giffen.*) That was the total of Schedule A.?—Yes, I had not observed that.

42,320. (*Chairman.*) In 1803?—Yes. It is therefore, no doubt, the case that the assessment had risen very greatly between those two years.

42,321. (*Mr. Giffen.*) But probably the machinery for assessment was very defective in those years, and the rateable value was not very closely ascertained; would that be so?—That might possibly be the case.

42,322. (*Chairman.*) You have given the fall in rates in Wales by way of illustration, but in some of the counties in England the fall was very considerable, was it not?—Yes.

42,323. Take Sussex, Essex, Hereford, Surrey, and so forth?—In Sussex it had fallen between 1803 and 1890–91 from 8*s.* 7½*d.* to 2*s.* 3¾*d.*; in Hereford from 5*s.* 8½*d.* to 2*s.*; and in Essex from 5*s.* 11½*d.* to 3*s.*

42,324. Apparently the main fall took place after the year 1826, because I observe that for Sussex the rate is 8*s.* 7½*d.* in 1803, and 6*s.* 9¼*d.* in 1826?—That is so.

42,325. It fell to 3*s.* 7·44*d.* in 1868, and again in 1890–91 to 2*s.* 3·74*d.*?—Yes.

42,326. Making a fall in 1890–91, as compared with 1868, of 1*s.* 3·70*d.*, and as compared with 1803 of 6*s.* 3·76*d.*?—Yes.

Church rates.

42,327. The figures for 1803, 1813, and also for 1826 include church rates, do they not?—Yes.

42,328. Can you state what the amount of the church rate was at that time?—The church rate varied very greatly in different places. Sometimes it appears to have been a very high rate. Taking the country as a whole, if the church rates had been spread over the whole valuation of the country when they were about their maximum, I think the average would have come to between 2*d.* and 3*d.* in the £.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,329. Therefore it was an inconsiderable amount, taking the average of the whole country?—Yes.

42,330. But here and there I suppose, where a church had to be repaired it might have been heavy?—It is clear that it was very heavy in certain parishes at various times.

42,331. The church rate continued to be included until after 1868, did it not?—Yes. It has been included in some parishes up to a very recent date. When church rates were abolished, they were still allowed to be levied for the repayment of existing debts, and I think until a very few years ago some of these rates continued to be raised.

Rates in 1803 and 1890–91 compared.

42,332. These tables which you are putting in relate to rural rates only, do they not?—To rural rates.

42,333. You have excluded the urban districts?—What has been done in reference to the years 1890–91, is that all purely urban rates have been excluded; and in a union which is partly urban and partly rural, the rate in the £ for the rate which is raised for the relief of the poor and other Poor Law purposes, which are common to the whole union, has been averaged and added in.

42,334. In a union of that character the same rate would be levied in the urban part of the union as in the rural?—Yes, and the average has been taken and put in the table in the same way that the county rate has been dealt with. There are no purely urban rates in this table at all.

42,335. Since 1868 there have been added two new rates, namely the Rural Sanitary Rate and the Rural School Board Rate; is that not so?—That is so.

Poor rate. Select Committee of 1817.

42,336. (*Sir Nigel Kingscote.*) Might we have an explanation with regard to the highways?—I would like to take the poor relief to start with. I should like, if I may, to quote from the reports of 1817 and 1834, to show how very high the rate for this purpose was then in certain parts of the country. The report of the Select Committee of the House of Commons in 1817 contains a petition:—"From the Minister, Churchwardens, "Overseers of the Poor, and all the inhabitants and "occupiers of the lands and mines of the parish of "Wombridge in the county of Salop who pay poor "rates." They state that "the property in the "parish is rated at its actual value, the greater "part being held at a rack rent and rated accordingly; and the other portion is rated at the rent "that might be had for it, and not according to the "low rent paid." It is clear that in many places the practice then was to rate upon the gross and not upon the nett. They further state: "That the expenditure on relief for the last three months was "602*l.* 7*s.* 4*d.*, and will consequently at the present "rate amount to 2,611*l.* 3*s.* 6*d.* per annum, which is "1,066*l.* 19*s.* 6*d.* more than the yearly value, being 33*s.* "in the £";—"that the parish officers in the expectation of obtaining assistance from some other "parish or parishes have repeatedly applied to the "proper authorities for relief under the 43rd of Elizabeth by a rate in aid";—"but that such relief "has not been obtained, and the magistrates give "them no reason to expect any, so that most of the "occupiers of the land in the parish, who have for the "last three years paid 15*s.* in the £ poors rate "(consequently were possessed of but little property "previous to the commencement of the present year) "are now from the excessive burden of the poor rates "reduced nearly to insolvency, and that in some "instances warrants of distress have been issued, and "their goods sold, and at the present time the farming "stock of the largest farm in the parish is about to be "sold up to pay the poors rates. It will therefore "appear to your Honourable House evident that the "annual value of the lands, mines, and houses in this "parish is not sufficient to maintain the numerous and "increasing poor, even if the same were to be set free "of rent, and that these circumstances will inevitably "compel the occupiers of the lands and mines to "relinquish them, and that the poor will be without "relief and without any known mode of obtaining it, "unless some assistance is speedily afforded them." In another parish—Hindon, in Wiltshire—the poor rates are said to have been as high as 50*s.* in the £. That was a very exceptional case. The explanation given of this enormous poor rate was as follows: "It is "a borough town sending two members to Parliament; "and every inhabitant of the town that does not

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

" receive from the poors rate has a vote, consequently " they have had an interest in remaining in the town; " that vote has been an inducement for them never to " leave the town, and that has induced others to crowd " as much as possible into the town of Hindon; the " paupers at a former period have exerted themselves " to the utmost to keep themselves off the parish " books, but owing to the present circumstances of the " times they are thrown suddenly on the parish books " from necessity." The same report contains a very large number of cases in which the rates in the £ of the poor rates were enormously high.

42,337. (*Mr. Everett.*) That was dated when?—1817, after the great war.

42,338. Have you any means of knowing whether those rates continued more than a year or two?—Judging from this table of the expenditure on relief, which I am quoting from Mr. Goschen's report, page 69, the expenditure on the poor rose after 1817. In 1818 it was very much greater; it was nearly 1,000,000*l.* more, rising from 6,910,000*l.* in 1817, to 7,870,000*l.* in the following year: and it did not fall below what it was in 1817 until the year 1822.

42,339. What had it been five or six years earlier than 1817?—In 1803 it was 4,077,000*l.*, and in 1813 it was 6,656,000*l.*

42,340. The rates rose very much after the Peace?—They did.

42,341. After the fall in prices began——[(*Chairman.*) They rose also during the war, apparently]?—The amount of the expenditure on relief rose during the war. In 1813 it was 6,656,000*l.* In 1814, towards the close of the war, it was 6,294,000*l.* In the next two years it fell to 5,418,000 and 5,724,000.

42,342. The main rise was during the war, from four millions to six?—That rise was spread over 10 years.

42,343. Yes, it was spread over 10 years, but still it was during that time, which was a period of war, with high values in corn?—Yes. I do not know whether the Commission would like any further figures from the reports of 1817. There are a great number to be found in those reports. In Coventry, the aggregate rate upon land was 17*s.* in the £. There was certain land that came up to the city, which was rated to the poor as high as 5*l.* and even 6*l.* an acre. In Birmingham the rates were equally high. In the report of 1834, which is probably better known to the Commission, there are a great number of cases where the poor rate was enormously high. In one parish, the parish of Cholesbury, the poor rate " suddenly ceased " in consequence of the impossibility to continue its " collection; the landlords having given up their rents, " the farmers their tenancies, and the clergyman his " glebe and tithes." The rector recommends that the whole of the land should be divided among the able-bodied paupers, and says, " that he has reason to think " that at the expiration of two years, the parish in the " interval receiving the assistance of rates in aid, the " whole of the poor would be able and willing to support themselves, the aged and impotent of course " excepted." Downing College, it is stated, " has a " property of 5,000 acres lying principally in the parishes " of Tadlow, East Hatley, Croydon and Gamlingay; it " is found impossible, notwithstanding the lowering the " rents to an extreme point, to obtain men of substance " for tenants." There are a great number of other cases in that report.

Poor rate.

Select Committee of 1834.

42,344. I think there are some quotations from pages 54 to 56 of that report which it would be interesting to the Commission to hear?—Yes. " Mr. Majendie states " that in Lenham, Kent, at the time of his visit, some " of the land was out of cultivation. A large estate " has been several years in the hands of the proprietor, and a farm of 420 acres of good land, tithe " free, and well situated, has just been thrown up by " the tenant; the poor rate on it amounting to 300*l.* " a year. He mentions another place in which a farm, " well situated, of average quality, was in vain offered " at 5*s.* an acre, not from objection to the quality of " the land, but because men of capital will not connect themselves with a parish in which the poor rates " would keep them in a constant state of vexation and " anxiety." " Mr. Pilkington's description of several " places in Leicestershire is equally alarming. In " Hinkley, he found the poor rate exceeding 1*l.* an " acre, and rapidly increasing, and a general opinion " that the day is not distant when rent must cease " altogether. On visiting Wigston Magna in November 1832, he was informed that the value of property " had fallen one half since 1820, and was not saleable " even at that reduction. It does not appear, indeed, " that it ought to have sold for more than two or " three years' purchase, the net rental not amounting " to 4,000*l.* a year, and the poor rate expenditure " growing at the rate of 1,000*l.* increase in a single " year. And on his return to that neighbourhood " three months after, the statement made to him was " that property in land was gone; that even the rates " could not be collected without regular summons and " judicial sales, and that the present system must " ensure, and very shortly, the total ruin of every individual of any property in the parish." In another paragraph of the report it is stated, " If some material " change does not very soon take place, the time is not " far distant, when the whole rent will be absorbed in " the poor's rates." " In the neighbourhood of Aylesbury, there were 42 farms untenanted at Michaelmas " last; most of these are still on the proprietors' hands, " and on some no acts of husbandry have been done " since, in order to avoid the payment of poor rate. I " attribute these circumstances principally to the operation of the poor laws." There are many similar instances given in the report.

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

42,345. (*Mr. Everett.*) And all the worst of those cases would be after 1817—in the twenties, and in the earlier thirties, I suppose?—These reports, published in 1834, were quotations from the reports of the Assistant Commissioners, and the witnesses which the Poor Law Commission of 1834 had before them.

42,346. And related mainly to the 12 years behind them, I expect?—I think that they related to the time when the reports were made. 1832 was the highest of the five years preceding the report; the expenditure on relief then was 7,036,000*l.*

42,347. (*Mr. Whitehead.*) Those very high poor rates are not given in the tables you have appended to your brief, I take it?—No.

42,348. They are exceptional?—I am quoting them to show that in the tables I have put in I have not taken those very exceptional years which it would have been no doubt unfair to have taken. Those tables appear to be fairly representative tables of the earlier years of the century in which exceptional distress did not prevail.

Poor relief, 1818–20.

42,349. (*Mr. Everett.*) The general condition of the poor, I have gathered, was better in the first 20 years of the century than it was in the second 20; I do not know whether your researches would run to confirm that?—If you have got the table on page 69 of Mr. Goschen's report before you, you will find that the three highest years of the expenditure on relief given there are the years from 1818 to 1820.

42,350. (*Chairman.*) It seems to have been extremely high during the war?—It undoubtedly was.

42,351. (*Mr. Giffen.*) Would that not be due to the high prices at that time?—I have no doubt they would have a great deal to do with it.

Parochial assessments in 1813–15 and 1826–27.

42,352. (*Chairman.*) Apparently about the years 1813–15 the rates appear to have been calculated not on the rateable value, but on the gross income tax valuation, and therefore the rate in the £ does not give us the full burden of the rates?—I will quote, if I may, from pages 14 and 15 of Mr. Goschen's report as to that. He says: " It is to be regretted that no returns of the " rateable value exist previous to 1841. Various Parliamentary Returns profess to give the rates in the £ " to which parochial assessments or rates amounted in " the years 1813–15 and 1826–27; but the rate in the £ " appears to have been calculated for the years in " question on the income tax returns of the year 1814, " and not, as in the years subsequent to 1841, on what " is called the rateable value." " Taking the lower " per-centage, that which we should now call the rateable value, would, in 1813–15, have been 25 per cent. " less than 53,495,000*l.*, *i.e.*, 40,121,000*l.*; whereas the " rates in the returns which have been mentioned," " have been calculated on 51,898,000*l.* The rates per £, " therefore, given for the years 1813–15 are at least " 20 per cent. lower than they would have been shown " to be if the same deductions from the gross value " had been made in those years as have been shown " to be made since 1841; nevertheless, in the present " report the rates of 1813–15 have been dealt with as " if the actual rateable value had been 51,898,000*l.*" The figures taken here for 1813–15 are therefore 20 per

Mr. C. N. Dalton, C.B.

14 Mar. 1895.

Fall in rural rates.

cent. lower than they would have been shown to be if they had been calculated on what we now call the rateable value.

42,353. Now, Mr. Fowler in 1893 reported that "the "fall in the rate in the £ of the rural rates was mainly "due to the fall in the poor rate levied to meet the "expenses of Poor Law authorities"?—Yes, that is quite clear.

42,354. And that "it was also attributable to the "disappearance of the church rate, and to a fall in "many counties in the highway rate and the county "rate"; that "as against these falls the new rural "sanitary rates and rural school board rates had come "into existence since 1868"; but that "the decreases "in the rate in the £ of the old rural rates, i.e., the "poor rate, the highway rate, and the county rate, "were considerably greater than the average rates in "the £ of the new rural rates"?—That is so.

Expenditure on poor relief in rural unions in 1868 and 1893.

42,355. Will you give some figures to show what has been the reduction in the actual expenditure upon the poor in rural districts?—Yes. Perhaps I may first take Table 3, which I propose to put in, and which gives the rate in the £ of the expenses for the relief of the poor for a large number of years. (*See* Appendix A. XXXII., Table 3.)

42,356. Are you confining yourself now simply to the actual poor rate or to the expenditure upon the poor?—Table 3 only relates to the expenses of relief. It will be seen from that table that the total expenses, taking the whole of the country, have increased, and that they were higher in 1893 than in any preceding year. But those expenses, of course, include the relief of the poor in towns as well as in the country. I have, however, got out a table containing the expenditure on relief in 1868 and 1893 for the 142 unions in England and Wales in which there were no urban districts. (*See* Appendix A. XXXII., Table 3(*a*).)

42,357. They are, therefore, purely rural unions?—Absolutely rural.

42,358. And give some indication therefore of what has resulted in rural districts in the way of decrease of actual expenditure?—Yes. Perhaps I may put that table in. (*See* Appendix A. XXXII., Table 3 (*a*)).

42,359. Will you just state the effect of it?—It gives for each of those 142 unions the gross expenditure on relief of the poor in the year 1868 and in the year 1893. The total was 715,876*l.* in 1868, and it had fallen to 530,070*l.* in 1893. I think it is fair to infer from that table that as a general rule, in rural districts, the expenditure on relief has probably fallen. Of course, in many of these districts the population has also fallen.

42,360. But not in anything like that proportion?—No; I should say not.

42,361. You have not got the population of the two periods?—No; but I can get that added to the table.* The decrease in the expenditure amounts to 26 per cent.

42,362. (*Mr. Giffen.*) Does the table represent all parts of the country?—It represents every purely rural union. Of course, it is rather difficult to get a purely rural union. You get again and again some small town or large town in the union. But we thought it best, in getting out this table, to take every union in which there was no urban district.

42,363. In that table, do you give the details so that we can see, county by county, where the reduction was greatest or least?—Yes. There are two of these unions in Surrey, four in Kent, seven in Sussex, 11 in Hampshire, four in Berkshire, five in Hertfordshire, two in Buckinghamshire, four in Northamptonshire, one in Bedfordshire, two in Cambridgeshire, four in Essex, five in Suffolk, nine in Norfolk, six in Wiltshire, three in Dorsetshire, two in Devonshire, three in Cornwall, three in Somersetshire, and so on. I think they are fairly representative, and spread over nearly all the country.

42,364. (*Sir Nigel Kingscote.*) Those you have mentioned are only in the south?—That is because I have been reading them in their union-county order. Perhaps I had better state in what counties there are none. There are none, of course, in London, none in Middlesex, none in Oxfordshire, none in Huntingdonshire, none in Derbyshire, none in Monmouthshire, none in Brecknockshire, nor Carmarthen, nor Radnorshire, nor Montgomeryshire, nor Flintshire, nor Merionethshire, nor Carnarvonshire, nor Anglesea. Leaving Wales and Monmouth out of consideration, there are only five English counties in which there are not any purely rural unions. I think the unions in this table are pretty well spread over the whole country.

Mr. C. N. Dalton C.B.

14 Mar. 1895.

42,365. (*Mr. Long.*) May I ask whether, in selecting those 142 unions, you have been governed by the fact that there are no urban districts within them, or whether you have made yourself any special examination into their character?—The table was only made out a day or two ago, and we decided to take all the unions in the country in which there were no urban districts.

42,366. In which there were no urban districts?—No urban districts of any kind.

42,367. That is hardly to be accepted as an absolute indication of no urban characteristic within the union, is it?—I think there is a great tendency, where there are towns of any importance, to wish to have urban districts set up.

42,368. But that is not always complied with, I believe, is it?—When the Local Government Board set up urban districts, I think they drew the line generally, unless there were exceptional circumstances, at a population of about 4,000 or 5,000. In watering places and exceptional districts they would allow an urban district to be set up with a very much smaller population. But I should think that most towns with a population of 4,000 or 5,000 would be urban districts.

42,369. (*Chairman.*) Looking through the list I see there are some unions in which there are small towns like Midhurst?—I think nearly all of them would have a small town in them.

42,370. Midhurst is a small town although not in an urban district. Of course, as the honourable member says, there are cases in which there are districts of an urban character in a purely rural union, districts which have not been turned into urban districts. There are some cases of that kind: and if one analysed it still more and came down to purely and absolutely rural districts in which there is no parish of an urban character the probability would be, would it not, that the per-centage of decrease in the poor rates would be still greater? I see there is one here, Hartley Wintney, which I know something about, which does contain an urban population; there there is an increase in the rates of from 5,700*l.* to 9,000*l.*, and that, of course, disturbs the whole per-centage?—Yes. I think in the great majority of cases, indeed, in nearly all of those cases there would be some little country town which would be the centre of the union, where the workhouse was in a market town or something of that kind. I think it would be very difficult to find many unions which did not have some centre of that sort.

(*Mr. Long.*) My object in asking Mr. Dalton the question was to bring out the fact that we were dealing with places which are technically either urban or rural. As the Chairman knows, there is a great deal of misunderstanding in the country in consequence of the use in two totally different senses of the words "urban" and "rural." A district may have certain urban places in it because a countryman would understand a country town as being urban, being a town as it is; but for the purposes of this return that town would be disregarded, unless it were governed by a popularly elected authority, unless it were, in other words, technically under the Public Health Act, an urban sanitary district or whatever it would be now—now it has got a new name.

(*Chairman.*) That is to say some of the unions contained in this return may contain urban districts which are not technically urban districts, although they are places with a town population. That may be so, but if those were excluded, the probability is that the average reduction on poor relief would be still greater.

(*Mr. Long.*) It is possible; that is a deduction which may or may not be justified. My question is of some importance in connexion with the further figures that the witness is going to give us with regard to the population.

(*Chairman.*) It would be very important to supplement this table* by the population, but I take it that the reduction of the population cannot approach to 26 per cent., or anything to be compared with it.

* It appears from the table subsequently put in that the population of these unions fell from 1,673,481 in 1871 to 1,642,721 in 1891, being a decrease of less than 2 per cent.

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

(*Mr. Long.*) The difficulty in appreciating the full value of this return will be that the population in some cases has only migrated from the country village to the small town where there is some particular industry which has attracted it. If you could obtain the actual rural population, that is to say, the population which is dependent upon rural pursuits, I think the depopulation in many of these unions would be quite equivalent to the reduction in rates, because, in a large number of cases, there is no doubt that in the early part of the century up to 1834 destitution was relieved by poor rates; now destitution finds for itself, in a great number of rural cases, its own relief by migrating or emigrating; and that makes it somewhat difficult to enter into any comparison of statistics of pauperism or of pauper relief as between now and a period when migration and emigration were practically impossible. One of these towns which Mr. Dalton quoted just now as being treated as a town in the Poor Law report, the town of Hindon, I make no doubt figures in this very interesting evidence in two capacities. It has been quoted with considerable emphasis as a town, and I make not the slightest doubt that Hindon is in one of these purely rural unions. I only point that out as showing the difficulty we are under in estimating the value of these figures. Hindon has never been worthy of the dignified name of a town; it is a country village in the centre of Salisbury Plain, in the middle of a down.

(*The Witness.*) When I referred to the town or borough of Hindon, I was quoting from a report; I did not give that as a present description of the place. At the time of the report it was, I believe, a parliamentary borough, sending two members to Parliament.

42,371. (*Mr. Everett.*) I suppose in those days the Poor Law relief was grossly abused, and that really a great deal of the relief then paid was in aid of wages?—Yes.

42,372. (*Chairman.*) The actual expenditure upon Poor Law relief through the whole country has increased between the year 1868 and 1893 from 7,498,000*l.* to 9,217,000*l.*, but the rate in the pound has decreased from 1*s.* 6*d.* to 1*s.* 2*d.*, owing to the great increase in the assessment?—Yes, that is so.

42,373. Taking out these 142 rural unions, it appears that the actual expenditure upon relief has decreased by 26 per cent.?—Yes, in those unions.

42,374. (*Mr. Long.*) That expenditure upon poor relief includes establishment charges, does it not?—It includes everything. It is the total expenditure upon relief, without taking into account any grants in aid or other receipts, if any.

42,375. It includes all establishment charges, such as charges for workhouse buildings, and workhouse infirmaries?—Yes.

42,376. Of course in estimating these figures, it must be borne in mind that within the last 20 years there have been gigantic strides in the provision of more accommodation for the poor, and accommodation of a far better character; that there has been a large amount of improvement, although there is plenty of room for more.

(*Chairman.*) That makes the decrease of expenditure in purely rural unions still more conspicuous.

(*Mr. Long.*) I am dealing now with the amount spent; the gross expenditure between 1868 and 1893 over the whole country has increased.

(*Chairman.*) The fact you have just referred to no doubt accounts for the gross expenditure being increased.

(*Mr. Long.*) What I meant was this: We are rather getting into a difficulty because we are endeavouring to draw comparisons between the amount expended in poor relief at one period of the history of the country, and the present time, and laying stress upon the fact that there is a considerable increase over the whole country, with a decrease in the rural districts, but I think a great amount of that increase in the urban districts is to be attributed to the very vastly improved accommodation which is provided for the poor within the urban districts.

(*The Witness.*) There can be no doubt at all about that.

(*Chairman.*) No doubt it is also caused by the increase of population; the increase of population has been in the urban districts, and therefore it is to be expected that taking the whole country through there would be an increase.

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

(*Mr. Long.*) Is that so? Is it not the case—I have not got the figures here—that comparing 1868 with 1893 the ratio of paupers per head of population has extraordinarily decreased.

(*Chairman.*) It has no doubt.

Decrease of pauperism

42,377. (*Mr. Long to the witness.*) The number of paupers has gone down in 30 years, if my memory serves me, nearly 30 per 1,000 of the population?—It has gone down from 53 per 1,000 in 1863 to between 25 and 26 per 1,000 in 1893.

Expenditure on poor relief in rural unions 1868 and 1893.

42,378. (*Chairman.*) In the table we are now on, you are dealing solely with the expenditure on Poor Law relief?—Yes. You will see from Table 3, that the rate in the £ of the gross expenditure on relief fell from 3*s.* 4½*d.* in 1803 to 1*s.* 6*d.* in 1868. The gross expenditure rose in amount from 1868 to 1893 from 7,498,000*l.* to 9,217,000*l.*, but the rate in the £ on rateable value fell from 1*s.* 6*d.* to 1*s.* 2*d.* That table does not show the net expenditure which fell upon the rates during the years prior to 1868. Prior to 1868 the receipts in aid of expenditure were so small that it does not seem to have been thought necessary to take them into account in arriving at the rate in the £ of the expenditure on relief. Since 1868 they have very largely increased, mainly in consequence of the Treasury subventions, and payments made from the exchequer contribution accounts of county and borough councils. By this means, and by the increase in the rateable value of the properties contributing to the poor rate, the net expenditure on relief borne by the rates fell in the provinces from 1*s.* 4·86*d.* in 1868 to 9·09*d.* in 1890, 8·18*d.* in 1891, 8·74*d.* in 1892, and 8·87*d.* in 1893; the gross expenditure in the whole of the country having, as already stated, fallen from 3*s.* 4½*d.* in 1803 to 1*s.* 6*d.* in 1868.

42,379. In the provinces, therefore, the reduction had been 50 per cent., or as nearly as possible 50 per cent. on the rate in the £?—On the net expenditure falling upon the rates between 1868 and 1893, in the provinces.

Expenditure on poor relief in London.

42,380. In London it fell from 1*s.* 5·28*d.* to 1*s.* 3½*d.*?—Yes. The fall was less in London owing to the large increase of expenditure on relief for the improved accommodation of the poor and for infirmaries, and so forth.

42,381. (*Mr. Giffen.*) The net expenditure in London provided for by the rates increased between 1868 and 1893, although for the whole of England and Wales it diminished?—It fell in London, I think, from 1*s.* 5¼*d.* to 1*s.* 3½*d.*

42,382. That is the rate in the £, but the total amount increased from 1,219,000*l.* to 2,155,000*l.*, did it not?—Certainly; the total amount increased very much.

42,383. In the whole of England and Wales I observe that the total amount between 1868 and 1893 did not increase?—That is so.

42,384. (*Chairman.*) That has not increased?—Not the net amount falling on the rates.

42,385. I see that the net expenditure provided for by the rates fell from 7,101,000*l.* to 6,750,000*l.*?—Yes.

Rates in the £ of poor rates.

42,386. (*Mr. Giffen.*) Although, as your table shows, the net amount falling on the rates in London increased very considerably in the same period?—That is so. The figures of this table simply relate to the expenditure on relief of the poor. Table 4 relates to the rates in the £ of poor rates, including various other expenditure. (*See* Appendix A. XXXII., Table 4.)

42,387. (*Chairman.*) But excluding precept rates?—Excluding precept rates, that is the rates raised for school boards, the county rate, and the highway rate, and the amounts raised in the poor rate for burial boards and rural sanitary authorities.

42,388. (*Mr. Giffen.*) Is that not the same thing then as the other table?—It includes a variety of other expenses such as expenses under the Vaccination Acts, the Acts relating to the registration of births, deaths, and marriages, the Union Assessment Committee Acts in the provinces, and the Valuation (Metropolis) Act in London, the cost of legal proceedings, the salaries of parochial officers, part of the expenses of parliamentary, municipal, and county registration, the preparation of jury lists, the expenses of school attendance committees, the payment of school fees for non-pauper children, and other miscellaneous expenditure.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,389. But those items are very small altogether?—They do not amount to anything very large altogether. The expenditure on relief is the main part of this expenditure. When we come to the rates we cannot find the actual rate levied for the relief of the poor, but we can find the actual rate levied by the Poor Law authorities which includes this other expenditure.

42,390. (*Chairman.*) Regarding it from that point of view, has there been a considerable reduction in the rate levied in all these counties?—With the two exceptions of Staffordshire and the East Riding of Yorkshire, where the rate is about the same, there have been very heavy falls in the rate in the £ in the poor rate in most counties. Take the first five which stand on the list, where the fall has been greatest, namely, Sussex, Berkshire, Buckinghamshire, Essex, and Wiltshire; the fall there varies, comparing 1891 with 1868, from 1*s.* 2½*d.* to 11½*d.* Those are the counties in which there has been the greatest fall.

42,391. Taking it generally, it would appear that the greatest fall has been in the rural counties?—Sussex is a mixed county, but the other four, I think, are mainly rural counties.

42,392. When you come lower down there is not quite so large a decrease?—No.

42,393. But still there is a considerable decrease when you get to Dorsetshire, Bedfordshire, Northamptonshire, Gloucestershire, Monmouthshire, Suffolk, Huntingdonshire, Norfolk, and so forth?—Yes.

42,394. In all which there has been a fall of upwards of 8*d.* in the £?—Yes.

County rate.

42,395. Now we come to the county rate as distinguished from the poor rate; what have you to say upon that?—In the county rate it is very difficult to trace the rise or fall.

42,396. (*Mr. Giffen.*) What table are you referring to now?—I have not put in a table of the rate in the £ of the county rates. I must refer to Mr. Fowler's report on that. The Local Government Act made an immense alteration in the areas of the counties, and it took into some counties a great number of boroughs which were not formerly in the county for various purposes; it took the county of London out of the counties of Middlesex, Surrey, and Kent, and it took a large number of county boroughs out of the counties. Therefore the areas are not comparable with one another, but you can compare the rate in the £ of the county rate actually levied in each county, and if you do that you find that there were more counties in which the rate in the £ fell than counties in which it rose. It is very difficult to get an average, or to put in a table, considering the great changes which have taken place, but I think it is quite clear from Mr. Fowler's report, and from the figures which are given in the appendix to that report, which give the county rate for various years for every county in the country, that there has been no considerable rise or fall, but that, taking it altogether, there are more counties in which there has been a fall than counties in which there has been a rise, and that in neither case is the rise or fall considerable.

42,397. (*Chairman.*) What is the average county rate?—In 1891 Mr. Fowler came to the conclusion that "If "a fair average rate in the £ could be got at for the "whole of the extra-metropolitan county rates levied "in the two years 1889–90 and 1890–91, it would be "under 5*d.* in the £." Of course the county of London must be excluded.

42,398. Does it vary very much in different counties?—Yes.

42,399. (*Mr. Long.*) These tables are all dealing only with figures which are now three years old?—I am just going to quote from the latest returns, if I may; the ones I have quoted so far have been only up to 1891, with the exception, I think, that in the poor rate table I have gone to 1893.

42,400. Are you going to quote the figures of 1894 now?—I cannot possibly quote the figures for 1894; we have not got them, but most of the figures for 1893 we have. There is a table in the last county return which gives the rate in the £ of each county in the years which have followed the passing of the Local Government Act, that is to say, in 1889–90, 1890–91, 1891–92, and 1892–93. Summarising those figures, I may state that there were 33 counties in which the rates in the £ for the general county rate had decreased, and 27 in which they had increased. It is very difficult to get the average rates of the special county rates, which are levied over the various portions of the counties, but, taking the general county rate, that was the result, that there were more counties in which it had fallen since the passing of the Local Government Act than counties in which it had risen. But the fall or the rise is not very large, I think, in most counties.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,401. (*Mr. Long.*) That is only up to 1893?—That is up to 1893.

42,402. And does not take into account the figures for 1894?—No, I have no figures for 1894.

42,403. (*Mr. Giffen.*) Is it likely that the county rate would change very much from year to year owing to the nature of the expenditure?—I think the expenditure to some extent has increased. Of course the county rate is levied not only upon land, which has gone down in value, but upon all the other properties in the county, many of which in most counties have gone up very considerably.

42,404. I am referring more to the other purposes for which these county rates were expended; they are not likely to change from year to year?—That I think is true taking the country as a whole, but there are certain counties in which it is quite clear that there has been a tendency to spend more on main roads, and in which the lunatic asylum expenditure has increased. There are one or two counties which have taken over a good many main roads, and where they do that they relieve the highway rate, but their own expenses go up.

42,405. (*Mr. Long.*) And in the case of a great many out of proportion to the relief that they afford to the highway rate?—Very possibly; it is not, however, a rate which is likely to rise with the rapidity with which certain other rates may rise.

Expenditure included in county rate.

42,406. (*Mr. Whitehead.*) There is a great deal of mystification on the part of ratepayers as to what is actually included in the county rate proper; could you therefore define exactly what is included in a county rate?—There is expenditure in some counties which is considered to fall upon the county rate, but which does not fall upon it in consequence of the subventions which the County Councils have got. There are a certain number of counties in which there has been no general county rate levied in certain years, because the subventions have been large enough to cover it. The various purposes for which county councils expend money would be found in Part II. of the Local Taxation Returns. Of course, one great item is the police; another is lunatic asylums; another is main roads. Then other heads of expenditure are county bridges, and, of course, technical education—but that is nearly all covered by the grant, I think.

42,407. (*Mr. Long.*) Weights and measures?—Yes; there are a great number of small miscellaneous items.

42,408. There is a question I should like to ask you now, arising out of the question which has just been asked by Mr. Whitehead: Do you consider that an accurate description of the purposes for which the county rate itself is raised would be that it is to meet the deficit in connexion with the proper county expenditure after due allowance has been made for the grants in aid?—Certainly.

Variations in county rates.

42,409. (*Chairman.*) What is the variation of rates in the different counties—what is the range of difference; I believe you were just now going to state that?—I am afraid that without examining this table I could not say what was the maximum and minimum, but I can put that in. There is considerable difficulty in giving quite an accurate answer to that question. If we add all the special county rates together we should be wrong in certain cases, because we should be adding together rates that were levied in different areas. To find a maximum county rate you would have to take the rate levied for general county purposes, and in most counties you would have to add the rate levied for special county purposes, which, in ordinary cases, would be the rate for the police, or some expenditure of that kind for which some borough did not contribute money. In certain counties such as Lancashire, the special county rates are levied in one part of the county for one purpose, and in another for another purpose, so it would not be right to add them all together. There were seven counties in which there were no rates for general county purposes, and there were 15 counties in which there were no rates for special county purposes. The highest rates for general county and special purposes in the administrative counties were 9*d.* and 7¾*d.* respectively, and the lowest ¼*d.* and ½*d.* in the £. But that

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

does not give the maximum of the two put together, and it would be very difficult to get it. (*See* Appendix A. XXXII., Table 4(*a*).)

42,410. What do you consider was the average which Mr. Fowler found?—Mr. Fowler found that the average would be under 5*d.* in the £.

42,411. Can you state whether that average has been reduced since then, or has been maintained?—I think it is clear that it has not been increased, but you cannot get an average in the same way that you can in an ordinary district, because you have a different valuation for your special county purposes apart from your general county purposes.

Highway rate.

42,412. Now let us pass on to the next rate affecting rural districts—the highway rate?—Table 5 deals with that. In that rate there has been a material fall as compared with the earlier part of the century.

42,413. In the actual amount?—No; in the rate in the £. The highway rates levied in 1817, according to this table, were 1,415,000*l.*, and in 1892 they were 1,353,000*l.* The figures for 1893 are not yet completed, but they will clearly be more than that. There are one or two districts for which we have not got the returns, and I think the total will be over 1,400,000*l.* However, I think you may take it as being practically much the same in 1893 in amount as it was in 1817.

42,414. (*Mr. Everett.*) Were the Turnpike Acts in existence in 1817?—Yes.

42,415. So that what was raised by the turnpikes was an addition to the expenditure on the roads by the parishes?—Yes, that is so. Of course there would be very few roads that were turnpike roads—there would be some, but not many—which are now thrown upon the highway rate; the majority of them are the main roads thrown upon the county rate.

42,416. (*Chairman.*) In some of the years between 1868 and 1892, which is the last year you give, there had been a considerable rise in the highway rate, had there not?—Yes.

42,417. I see that in 1878 the amount was 1,775,000*l.*?—That is so.

42,418. In 1880 it was 1,821,000*l.*?—Yes.

42,419. Then from that it began to fall?—Yes. That is attributable to the fact that in those years the expenses of many disturnpiked roads did fall upon the highway rate. The turnpike roads were disturnpiked very rapidly, and until that process had been going on for some years no Government grant was given in aid of the expenditure on those roads.

42,420. (*Mr. Everett.*) Their cost was added to the rates?—The maintenance fell upon the highway rates.

42,421. (*Mr. Long.*) The Government grant was not given before 1878, was it?—No, not until 1882, and until after 1878 no part of the maintenance of those roads fell upon the county. The Act of 1878 threw one-half upon the county, but now the highway rate has been relieved from that expenditure.

42,422. The rates in Table 5 are solely rates which are levied by highway districts or highway parishes; is that not so?—That table gives the highway rates in rural districts (*but see question* 45,714). As I was saying, the amounts raised practically stand the same now as in 1815, but of course the valuation has increased immensely since then. The valuation of those rural highway districts now is about 53 millions, which is equivalent to what in those days was the gross annual value of the whole country.

42,423. (*Chairman.*) Fifty-three millions, do you say?—It is 53 millions according to this table. In 1814, according to Table 9, the gross value of the whole country was 53,495,000*l.* (*See* Appendix A. XXXII., Table 9.)

42,424. Since the year 1879 there has been, has there not, a slight decrease in the rateable value of these highway districts, namely, from 55,800,000*l.* to 53,274,000*l.*?—That is partly owing to the formation of urban districts. This area included in the rural districts which contribute to highways is constantly being encroached upon by the formation of towns which are taken out of these districts; that is one reason.

42,425. And *pro tanto* there would be some decrease on that account in the expenditure?—There should be. But it has gone up in 1893; I do not know what it may be for 1894. I hope to put the figures for 1893 in in a few days' time; but I may at once say that it has gone up from 1892 to 1893 from about 1,353,000*l.* to something over 1,400,000*l.*, and the rate has gone up from 6·1*d.* to 6·7*d.*; in other words, it has gone up a halfpenny in the year. (*See* Appendix A. XXXII., Table 5.)

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,426. Taking the average of highway districts, the rate has gone down?—It has gone down as compared with the earlier years undoubtedly.

42,427. And that has been partly due I presume to the main roads being taken out of the highway districts and thrown upon the counties?—That is so.

42,428. But taking the county rate also, that appears to have been about maintained, and therefore there has been no real increased rating due to the highways apparently?—That is so, speaking of the country as a whole; it consequently follows that the aggregate rate in the £ of the three old rates, the poor rate, the highway rate, and the county rate, has fallen. I think there can be no question as to that.

School board rates.

42,429. Now going on to the new rates, the sanitary rate and the school board rate, will you state how those have affected the rural districts?—Those are rates which fall heavily in some cases on particular parts of rural districts. Of course a very large number of parishes are exempt from the school board rate. I cannot say at the present moment what is the number of rural parishes in which there are school boards, but the figures for 1891 have been taken out, and I have them here. In 1891 there were altogether 12,563 rural parishes, and the number of those parishes in which there were school boards was 1,740, so that approximately one out of every seven rural parishes had a school board. I have a table also which I can put in showing the number of school boards which then existed in each county.

42,430. (*Sir Nigel Kingscote.*) That is in 1891?—In 1891. I have not got the figures for a later date. Where those school board rates fall upon an extra metropolitan parish not included in a borough they averaged in that year 6·8*d.* in the £ in England, and 8·0*d.* in the £ in Wales. The total amount of school board rate raised in purely rural parishes in that year was 350,652*l.* If that had been spread evenly over the whole of the rural area it would have amounted to less than 2*d.* in the £, but as a matter of fact it was high where it fell, and there was no school board rate in six parishes out of seven.

42,431. (*Chairman.*) Then it comes to this as regards the school board rate: that it is only one out of every seven rural parishes which is subject to this rate?—That was the case in 1891.

42,432. In the case of the 1,740 rural parishes which have school boards the average is about 6*d.* in the £?—Yes, or a little over.

42,433. There are cases, of course, where it is much larger, and other cases where it is much smaller?—That is so.

42,434. But taking the average it is about 6½*d.*?—That is so.

Rural sanitary rates.

42,435. Then we will take the rural sanitary rates?—The rural sanitary rates were in much the same position as the rural school board rates, except that every rural parish contributes to the general sanitary expenses, salaries of officers, and so forth, which amounts to a very small rate. Particular parishes pay for their own sewerage and water supply; for that there is a special rate which sometimes is a very heavy one, but in the majority of parishes there would be no such rate. In 1891, if the whole of the rural sanitary rate had been spread evenly over the rural sanitary area it would come to something under 2*d.* in the £.

42,436. Do you know what it is in those parishes where there is a special sanitary rate?—It would entirely depend upon the extent of the works that were carried out. Sometimes a sewerage scheme will be very costly; sometimes it will be very light; it will vary; sometimes there will be no rate.

42,437. As we know agricultural land is specially exempted from three-fourths of the rate?—Yes, it pays only one-fourth of the rate in the £ levied on houses, but still in certain parishes, principally those parishes which are growing into towns, or which are only technically rural and practically urban, the rate is very high.

42,438. But not on the land?—The land would pay a fourth of the rate in the £ levied on houses.

42,439. The land would pay proportionately a fourth?—Yes.

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

42,440. (*Mr. Gilmour.*) Is there not a limit over which they cannot go in these special drainage districts?—No, there is no limit to the sanitary rate.

42,441. (*Chairman.*) I suppose railways and other properties of that kind also have the same exemption?—Railways contribute in the proportion of one-fourth to it.

42,442. The rate then falls only upon the houses?—The full rate falls only upon the houses.

42,443. What about other property, such as, say, waterworks?—I beg your pardon, the full rate would fall upon waterworks and certain other properties. There are certain properties set out in the Public Health Act which are only rated at a fourth; tithes for instance pay a fourth, and market gardens, woodlands, and canals, as well as arable, meadow, and pasture ground.

42,444. Now you have gone through the five principal rates—the poor rate, the county rate, the highway rate, the sanitary rate, and the school board rate; and the nett result of all is shown in your first table, namely, in a reduction of the rural rates from 4*s.* 5½*d.* in 1803, to 2*s.* 7*d.* in 1868 and 2*s.* 2½*d.* in 1891?—Yes.

42,445. Can you give the figures for 1893 too?—We have not got them out, and I am afraid it would be a matter of very great labour to get them out—the rural school board rates especially.

Cause of decrease in rural rates.

42,446. Now will you shortly go through the causes of this great decrease. The first I think you have already to some extent explained, namely, the decrease of the expenditure upon poor law relief?—Yes. One of the main causes has been the Treasury subventions.

42,447. But the first cause is the decrease in expenditure on the poor rate that you have already described—I am talking of the rural districts?—It is so difficult to separate the gross expenditure for rural and urban districts. No doubt there has been a very great decrease in many unions which were formerly very badly administered. In those cases there has been undoubtedly a very great decrease, especially if you go back earlier than 1868. If you go back to 1834 I think you will find that in most rural districts there has been an undoubted decrease.

42,448. Still, in those 142 purely rural unions which you quoted, and where you have shown the reduction of expenditure upon poor law relief has been 26 per cent., that must largely account for the reduction of the rates in those unions?—Yes. It accounts for it to some extent; but I think that some of the other causes have had a still greater effect.

42,449. I am going on to the other causes now. The next great cause is the increase of subventions from the State, is it not?—Yes.

Effect of State subventions in the rates.

42,450. Now will you show how far the subventions from the State have operated to effect a reduction in the rates?—Table 6 which I put in gives the amount of these subventions in 1867–8, 1887–8, and 1893–4. They amounted altogether in 1867–8 to 1,420,000*l.*; in 1887–8 they had risen to 6,870,000*l.*, and in 1893–4 they had risen to 13,146,000*l.* (*See* Appendix A. XXXII., Table 6.) There is an increase of not much less than 12 millions there, which has gone in one form or another in aid of local expenditure. It has not all gone in relief of the old rates, or anything like it. A part of it has gone in relief of the old rates, but a large part of it has gone in aid of the local expenditure imposed by new legislation. For example, the elementary education grants for day and night schools, the fee grant, and so much of the residue of the additional beer and spirit duties, transferred to county and borough councils, as has been expended on technical education. Then there are the grants in aid of disturnpiked main roads, which have also gone to reduce the new expenditure which was thrown on the locality by the abolition of the turnpikes. But some of these subventions have gone in aid of the old rates. The two principal ones which have gone in that way have been the grants for pauper lunatics and union officers and the balance of the revenue transferred to the county councils after they have paid the other grants out of them. That balance goes in aid of the general county expenditure. Some of these subventions, although they have not reduced the burdens on the rates, have gone in reduction of local expenditure which is not on the rates, such as voluntary schools. It is very difficult to draw a line as to what you may call a Treasury subvention and what you may not call a Treasury subvention; and the only practicable way seems to be to take the whole of the moneys that are expended by the State for local purposes and put them together. Taking the grant which is given in aid of the voluntary schools, if it were not for that grant, those schools might come upon the rates.

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

42,451. (*Mr. Long.*) I do not quite understand what you are referring to now; what grant is given in aid of the voluntary schools?—The elementary education grant and the fee grant.

42,452. The grant which is given on results you mean?—That pays a very considerable part of their cost.

42,453. Why distinguish voluntary and non-voluntary schools in that respect; is it not given to both alike?—Yes. I am saying that many of these grants do not go directly in aid of the rates, and I was taking that as an example. We are obliged to put the grant for school boards as going in aid of the rates, because if it was not paid to the school boards the rate would be higher; and it would be unfair in dealing with these subventions to put one in and leave the other out. Therefore, I was anxious to explain that this table includes all the parliamentary grants for local purposes, and not merely those which go to reduce the rates.

Increase in State subventions.

42,454. (*Chairman.*) Taking that which I may call an extreme view of the case, the parliamentary grants in aid of local purposes have increased as you have told us from 1,420,000*l.* in 1867–68 to 6,870,000*l.* in 1887–88, and to 13,146,000*l.* in 1893–94?—Yes.

42,455. But of that great total for 1893–94 how much is represented by the education grants?—There are three of them, and they take a very large proportion of it.

Grants in aid of education.

42,456. More than six millions goes in aid of education?—That is so. The full history of all the grants in this table is given in Mr. Fowler's report. Some of them are very small grants, and some are very large grants. I do not know that it is necessary to explain the purposes for which they are all given; it would be rather a long business. The most important are the education grants, the grants to the union officers, the grants for pauper lunatics, and the grants for police; those would be the grants which are largest in amount; and to these I ought to add the surplus revenues transferred by the Local Government Act of 1888. Some of the earlier of these grants were given for purposes of efficiency rather than for aiding the rates. That was the case of the grants for teachers in poor law schools, for poor law medical officers, and for vaccination purposes. To some extent, I suppose, that would also be the case with the police grant. The police grant gives a very substantial relief to the local taxation, but at the same time the grant is not paid until there is a certificate of the Secretary of State that the police force has been properly maintained. It has been objected to some of these grants that they increase centralization; that may be the case with some of them, but it is not the case with others.

Object of grants.

42,457. (*Mr. Giffen.*) Take, for instance, the police; is it not the case that there is practically not much relief of rates involved because the requirement of efficiency increases the total expense?—That is what I mean. There are certain grants which have a two-fold object—to relieve rates and to promote efficiency. In those cases it is very difficult to say how far the efficiency brings about an additional expenditure. There are other grants which have been given on a totally different principle; for example, those which are given by the Local Government Act of 1888 where a certain amount of revenue was handed over to certain authorities—county councils and the councils of county boroughs—over and above the then existing grants, and the Government had no control, and had nothing to do with the expenditure of that surplus; in those cases I do not think it can be said the grant in any way promotes centralization. But there are hardly any two of these grants which stand on quite the same footing.

42,458. (*Chairman.*) Sometimes that contribution out of the local taxation account has been ear-marked for a special purpose as in the case of police superannuation?—That is so.

42,459. Presumably, if it had not been for that, that additional charge would have had to be borne by the ratepayers?—It would.

42,460. The State met it in advance, so to speak, by contributing out of the taxes a sum which would meet that charge?—That is so.

Mr. C. N. Dalton, C.B.

14 Mar. 1895.

42,461. The contributions from the State which seem to go in reduction of the rates previously existing, are the grants under the Local Government Act 1888, amounting in 1893–94 to 5,053,000*l.*, and the residue of the spirit duties amounting to 786,000*l.*, making a total of 5,839,000*l.*, is that not so?—Are you taking those figures for 1893–94?

State subventions in reduction of rates.

42,462. Yes?—Those go in reduction of local taxation.

42,463. Those are the two most important items to consider with reference to the reductions which have occurred in the rates over the country, are they not?—Yes.

42,464. Or at all events in rural districts?—Of course the school grant has kept the school board rate from rising even further than it has done. The school board rate is very high in many districts, but if it had not been for these subventions, it would have been very much higher.

42,465. In fact those to a limited extent only affect rural districts?—Yes.

42,466. That is to say they do not affect six out of seven rural parishes?—The grants to voluntary schools do.

42,467. Quite so, but I think we may leave aside the question of educational grants which is a special subject of its own, implying rather that the State there has made subventions in order to meet a growing and a new demand?—Yes.

Expenditure on technical education from residue of beer and spirit duties.

42,468. Looking at those contributions of the State which have affected local rates and in rural districts have accounted for a reduction of the rates, must we not confine ourselves in the main to those two items, namely, the grant under the Local Government Act of 1888 from the probate duty and local taxation licenses amounting to 5,000,000*l.*, and the 786,000*l.* the residue of the beer and spirit duties?—Yes; I should say as regards that residue, although it is not required to be expended on technical education which is a new purpose, a very large amount is so expended.

42,469. How much of that is so expended, or how much was appropriated possibly for that purpose?—During the four years ended the 31st of March 1894, out of 3,126,353*l.* 2,204,645*l.* was expended or appropriated for the purpose of technical or intermediate education.

Effect of State subventions on reduction of rates in rural and urban districts compared.

42,470. Now, taking those two items, what has been the result of the relief in rural districts as compared with urban districts?—Taking rural districts as a whole?

42,471. Yes, perhaps you cannot do it under that heading?—No.

42,472. But you can show what has been the effect upon London, can you not?—I can show what has been the effect of the relief given in London, in county boroughs and in Extra Metropolitan administrative counties, but of course the administrative counties include the towns in those counties. The relief in the £ given by the whole payments which are made out of the local taxation account to London was in 1891 8·6*d.*, in county boroughs 10·2*d.*, and in administrative counties outside London, 9·6*d.* Taking the average for the whole of England and Wales it was 9·5*d.* I am taking it for 1891. I have got later figures, but I think it comes to much the same in later years. The county boroughs get slightly the largest relief in the £ on their rates, the administrative counties next, and London the lowest. I will get the precise figures out for 1894. (*See* Appendix A. XXXII., Table 7.)

42,473. If you take it in proportion to population it would work out in a very different way, I suppose?—Yes, London would receive considerably less than it does at present, if the revenue were divided in proportion to the population, and the county boroughs would receive undoubtedly more.

42,474. And the administrative counties probably rather less?—I do not feel quite sure as to that; I have not made the calculation, but I should expect to find it so. (*See* Appendix A. XXXII., Table 8.)

42,475. Now the whole of that relief has been given, or practically the whole of it since 1867–68, has it not?—The greater part of it has been given since 1867–68. Some of that money has gone for purposes for which there were grants before 1868, for instance, for police, for which there was a grant in 1868.

42,476. The total grants amounted to a very small sum in 1868, namely, to 800,000*l.*?—They amounted to 801,000*l.* in aid of the rates. If you deduct that 801,000*l.* from the figures that you have mentioned then the difference would be the increase.

Mr. C. N. Dalton, C.B.

14 Mar. 1895.

42,477. And comparing it, it would be about six millions as compared with about three quarters of a million?—That is so.

42,478. I do not know that we need go further with the question of the effect of Government subventions in causing relief?—Manifestly they have given very considerable relief.

Relief of rural rates by increased assessments of railways and other property.

42,479. Now the third considerable head under which relief has been given in rural districts has been by the increased assessment of railways and other property, has it not?—That is so. I have put in three tables, 9, 10, and 11, which give information as to the annual value and rateable value of lands from the beginning of the century till now. Another return is also being prepared, but it is in the hands of the printers now. We have got the general effect of it, but it is not ready for publication. It will bring the annual value of lands down to 1894. Commencing at the beginning of the century in 1814, if I may take that figure, the gross annual value of lands for the purposes of the income tax was 37 millions. (*See* Appendix A. XXXII., Tables 9, 10, 11.)

42,480. (*Mr. Everett.*) On what basis was the income tax collected then, do you know?—I cannot say. It rose, you will see, very steadily.

42,481. (*Chairman.*) I suppose the land dealt with in these tables is agricultural land, including tithes and certain analagous properties?—There are a great number of properties included besides agricultural land, but agricultural land no doubt forms the bulk of it. It includes lands which are or could be used for agricultural purposes, ornamental grounds and parks, and open spaces, gardens attached to houses when exceeding one acre in extent; farmhouses and farm-buildings are also included in it, tithes, and other items.

42,482. Practically it coincides with what is rated to the poor under the head of "lands," I suppose?—All these are rateable properties; they are all rated to the poor clearly. The valuation went up from 37 millions in 1814 to 42 millions in 1843; 47,766,000*l.* in 1868, and reached its maximum in 1879–80 when it came to 52,474,000*l.*

42,483. Then there was a considerable increase between the years 1869–70 and 1878–79?—That is so.

42,484. The agricultural depression appears to have commenced from the year 1879–80?—So far as can be judged from the Income Tax Returns.

42,485. And from that time to the present there has been a considerable decrease?—There has been a very rapid decrease.

Assessments to Income Tax and local rates compared.

42,486. Have you got the latest assessments to the income tax?—According to the latest income tax assessment for 1893–4 it has fallen to 40,062,000*l.*

42,487. What is the per-centage of decrease?—The decrease from the maximum in 1879–80 is 22·7 per cent.

42,488. That is for the whole country of England and Wales, is it not?—That is for the whole of England and Wales, and it has fallen now to very nearly the same as it was in 1814.

42,489. Now is it not the case that the assessments for local rating purposes have always been considerably below the assessments for the income tax?—That is so, speaking of the assessments as a whole, and this return which we are getting out now will show that the gross estimated rental of lands for the local assessments is very slightly over 37 millions and a quarter, whereas it is 40 millions for the income tax assessment.

42,490. That is the gross?—That is the gross estimated rental.

42,491. And the net?—The net rateable value has fallen to 33½ millions.

42,492. How do you account for the difference between the gross estimated value of the land and the assessment for the income tax?—They ought both to coincide; they do coincide in London—they never have coincided

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

in the rest of England. It is no doubt due to the fact that the assessment committees put a different value on rateable property from that which the surveyor of taxes places on it.

42,493. That would rather tend to show that the assessment committees are a little more lenient in their assessments than the Government officers who assess for the income tax?—It looks like it, but I am afraid I do not know practically enough about the manner in which these assessments are got at in different parts of England by the surveyors of taxes and by the assessment committees to say. As a matter of fact there has always been a considerable difference between the two assessments.

42,494. The proportion of the one to the other has been about maintained year by year apparently, so far as we know?—Yes, I think that they have shown of late years a symptom of getting nearer one another than they were a good many years ago.

42,495. I took out myself the proportions between the assessments of 1869–70 and 1894 and I found the proportions were exactly the same?—You are speaking only of land perhaps?

42,496. Yes, of land?—I was speaking of properties generally.

42,497. I wish you to confine the matter to land?—For land one has only got the rateable value of the land for two years to go upon—one year being 1870 and the other 1894; but we have the figures for a long series of years in the case of other properties——

42,498. Quite so; but I want the evidence confined to the land, as we are dealing with that. Taking those sets of figures with which you are acquainted, namely, the assessment of land in 1870 as compared with the present time, the proportion between the assessment for rating purposes and the assessment for income tax purposes is exactly the same, is it not?—I daresay that is so.

Amount of property assessed for local purposes 1870.

42,499. In 1870 I believe a return was prepared and laid before Parliament showing all the amount of property assessed for local purposes, distinguishing lands, houses, railways, and other properties?—Yes.

42,500. And the Local Government Board has within the last few weeks prepared a similar return to the present time, showing also the different assessments of these different classes of property?—Yes, it has.

42,501. Will you state shortly the result of the comparison of the one period with the other?—The return in 1870 was confined to the rateable value, and therefore the figures I give now will be rateable.

Rateable value of land in 1870 and 1884.

42,502. We will exclude gross estimated rental, and confine ourselves merely to the rateable value?—In 1870 the rateable value of lands was 39,835,000*l.*, and in 1894 it had fallen to 33,654,000*l.*

42,503. That is a decrease of 15·5 per cent., is it not?—Yes.

42,504. That, I need hardly observe, does not show the real decrease in the value of land as compared with its period of maximum value?—No.

42,505. Because, as you have already explained, the value of land went up from 1870 to 1879, and the decrease shown by the income tax valuation from 1879 to the present time is 22·7 per cent.?—Yes.

42,506. That probably is a real decrease in the valuation of land over the whole country for the assessment for local purposes, as well as for the income tax?—It is the nearest we can get from the returns.

Rateable value of buildings and railways in 1870 and 1894.

42,507. But comparing the year 1870 with 1894—that is to say, comparing last year with 24 years ago—the assessment of land all over England and Wales has been decreased by 15·5 per cent.?—Yes, that is the decrease in the rateable value. On buildings, on the other hand, the rateable value had very largely increased. It had increased from 55,157,000*l.* to 102,661,000*l.*, which is an increase of 86·1 per cent. The increase in the rateable values of railways has been still greater. The rateable value of railways in 1870 was 4,871,000*l.*, and in 1894 it had increased to 13,871,000*l.*, which was an increase of 184·8 per cent.

42,508. (*Mr. Giffen.*) What table are you quoting from now?—I am quoting from returns which you have not got yet before you.

42,509. (*Chairman.*) These are returns which I have had made out at the Local Government Board quite within the last few weeks for the purpose of comparison with the year 1870. (*The Witness.*) It is a return which has been moved for in the House (*Parliamentary Return*, 204, *Session* 1895). The increase in other kinds of property——

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

42,510. What do these other kinds of property consist of?—They would consist of quarries, mines, iron-works, gas-works, water-works, canals, markets, tolls, &c. I should think the quarries and mines would represent a very large proportion of them, and waterworks, gas-works, and canals another very large part.

42,511. What has been the increase there?—The increase there, has been from 5,000,000*l.* to 10,894,000*l.*, which is an increase of 117·6 per cent.

42,512. Then the general result is, that whereas the lands in 1870 formed 38 per cent. of the whole property assessed, they now represent only 20·9 per cent.?—That is so.

42,513. And whereas buildings were then 52·6 per cent. of the whole property assessed, they are now 63·7 per cent.?—Yes.

42,514. And whereas railways were 4·6 per cent. of the whole, they are now 8·6 per cent.?—Yes.

42,515. And other property which was at that time 4·8 per cent. is now 6·8 per cent.?—That is so.

Reduction of Income Tax assessments, 1870–71 and 1893–94.

42,516. You have shown that the decrease in the assessment of the value of land as compared with 1870, for the whole of England and Wales has been 15·5, and presumably having regard to the income tax assessments the reduction since 1879 has been at the rate of 22 per cent.?—Yes.

42,517. But that is the average for the whole of England and Wales?—Yes.

42,518. And the proportion is very much greater for those counties where the depression has been greatest?—Yes. This table that I have from the Inland Revenue gives the gross annual value from the income tax returns in each county for the years 1870-71, 1879–80, and 1893–94; but I should say in handing that in, that the counties, for the purposes of that table, differ from the counties for the purposes of our local assessments. (*See* Appendix A. XXXII., Table 12.)

42,519. The boundaries do not quite coincide?—No.

42,520. That is to say it is disturbed by some of the unions being in more than one county?—That is so.

42,521. But substantially, though it may not accurately compare with this return, yet for the purposes of the per-centage of the decrease or increase it may be relied upon?—Certainly.

42,522. And that shows a very considerable decrease in the valuation of agricultural land in all the eastern counties as compared with the western counties?—Yes. In Essex the decrease from 1879–80 to 1893–94 is 39·1 per cent.; in Suffolk it is 38·1 per cent.; in Norfolk it is 31·1 per cent.; in Oxford it is 30·8 per cent.; in Wiltshire it is 35·1 per cent. It varies very much in different counties, but there is a decrease in every county with the exception of Carmarthen. In some of the Welsh counties the decrease is small.

42,523. What is it in Westmoreland and Cumberland?—In Westmoreland it is 13·7 per cent.; in Cumberland it is 12·1 per cent.

42,524. As much as that?—Yes; it is small in Cheshire and Cornwall.

42,525. Six per cent. in Cheshire?—It is 6·1 in Cheshire and 6·2 in Cornwall, but in every other English county it is over 10 per cent. In Lancashire it is 11·4 per cent.

42,526. This reduction of the assessment for the whole county does not probably indicate what has been the real reduction in the assessment of purely agricultural land even in those counties, because in those counties there may be a considerable amount of land near to towns which has maintained its value?—That is so, undoubtedly, and I should say that in some of the counties, where the fall has been the greatest, the fall in the tithe has not been so large as the fall in the agricultural land, and that would also affect the figures to some extent.

42,527. Then there may be favoured districts even in some of the worst counties where the grass land has maintained its old rates?—Yes.

42,528. Or, at all events, where the reductions have not been so great?—I think it is quite clear from the Local Government return that lands in close contiguity to towns have not gone down very much; in some cases they have even gone up—occupation land.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,529. Then there is a good deal of land which is attached to houses?—That is so.

42,530. Where probably the value is still maintained?—That would be in the residential localities.

42,531. I observe, for instance, in the return which gives the assessment for unions that there are unions in Surrey where the value of land has gone up?—That would be quite natural, because these include gardens of more than one acre in extent.

42,532. The explanation of that is that it is residential land?—That is so.

42,533. That of course would affect the total for that county, and affect also the total for the whole of the country?—Very considerably in those particular counties.

42,534. Then looking at this return showing by unions the reduction of assessment, it shows very clearly the parts of the country where the depression has been worst, and those parts of the country which have been unaffected by causes such as you have referred to?—I think, roughly speaking, that is undoubtedly the case. Of course, one must make some allowance for the different methods of assessment adopted by assessment committees; but, speaking generally, I should say that was certainly the case.

Increase in assessments of railways and other properties.

42,535. Now one very conspicuous result brought out by this return, is the enormous increase in the assessment on railways?—Yes.

42,536. You have already stated that the assessment of railways has increased by 184 per cent., from 4,800,000*l.* to 13,800,000*l.*?—That is so.

42,537. That is comparing 1870 with 1894?—Yes.

42,538. The difference is considerably more than the reduction in the assessment on land in the interval?—Yes.

42,539. On the other hand there has been also a large increase in the assessment of other property from 5,000,000*l.* up to 10,890,000*l.*?—Yes.

42,540. That increase in the assessment of great railways and other properties has been a great relief in purely agricultural districts?—In those purely agricultural districts in which the railways have been situated. I should say that the railway property is, of course, very roughly distributed amongst different districts. I have got a statement of the unions here which contains the maximum proportion of railways, and another statement which gives the minimum proportion. Taking the maximum statement first, there are 125 unions, in each of which the railways form more than 15 per cent. of the total valuation; there are two unions in which more than half the valuation of the union is railway property. Taking the aggregate of those 125 unions the value of the railways is 4,659,000*l.*, whereas the total rateable value of the 125 unions is 22,778,000*l.* The per-centage is 20·5 per cent. Therefore, in those 125 unions taken as a whole, more than a fifth of the valuation is railways, and the total acreage of those unions, which are nearly all rural unions, is 7,449,000, which is about a fifth of the acreage of the whole country. Those are the unions in which the relief has been the greatest. (*See* Appendix A. XXXII., Table 13.)

42,541. Then it may be presumed that in all these cases, at all events, it is probably the case that the increased assessment of railways made up for the reduction in the assessment of land?—I should think in those particular cases it probably has done a great deal more than that. Taking the minimum statement, there are five unions besides the Scilly Islands, in which there are no railways whatever. There are 95 unions in which the per-centage is not over 2 per cent., and taking the 95 unions together the average per-centage was only 1·3 per cent. This shows that the relief that has been given by this cause is very unevenly distributed in the different unions.

42,542. (*Sir Nigel Kingscote.*) Have you got the acreage there?—Yes. I will give the acreage of these other minimum cases. The total rateable value of railways in those 95 unions is 144,679*l.*; the total rateable value of the unions is over 11,000,000*l.*; the acreage is 5,794,116. Those, like the preceding 125 unions, are mainly rural unions. Perhaps I might give next the unions in which other properties than railways are very high. They would be mainly in the mining districts. I have a statement of unions in which these other properties amount to 20 per cent., or upwards, of the total rateable value. There are 42 of such unions, and the average per-centage of the whole rateable value is 28·9. In those unions, therefore, there has been a great relief to the rates caused by the rise in the assessment of these particular properties. Those are a limited number of unions; those are only 42 unions. (*See* Appendix A. XXXII., Tables 14, 15.)

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,543. (*Chairman.*) If you look at this return which has been made out on the rateable value of lands, &c., 1869–70, and gross estimated rental and rateable value of lands, &c., 1894, you will find that some unions have gained enormously in the last 24 years in the increased assessment of railways?—Certainly.

42,544. Look at the county of Berkshire; you will find that in the Union of Newbury, where the railways in 1870 were rated at 789*l.*, at the present time they are assessed at 6,241*l.*?—That is so.

42,545. In Wokingham the assessment of railways has risen from 6,600*l.* to 33,000*l.*?—Yes.

42,546. In Cookham from 8,500*l.* to 31,600*l.*?—Yes.

42,547. Then to illustrate it from another county, Cambridgeshire, the assessment of railways in Newmarket has risen from 1,200*l.* to 14,400*l.*?—Yes.

42,548. And in St. Austell, in Cornwall, from 896*l.* to 9,700*l.*?—Yes.

42,549. In Poole, in Dorsetshire, from 854*l.* to 12,200*l.*?—Yes.

42,550. The relief has been extremely unequal?—Very unequal indeed.

42,551. If you turn to London there are some very remarkable cases there of inequality. There is the Union of St. George-in-the-East, where the assessment of railways has risen from 1,300*l.* in 1870 to 3,700*l.* in 1894; while in St. George's, Hanover Square, the assessment on railways has been increased from 19,000*l.* a year to 83,000*l.* a year?—Yes.

42,552. In Mile End Old Town the assessment of railways has risen from 2,400*l.* to 8,600*l.*, and in Stepney from 4,600*l.* to 5,400*l.*; while in Shoreditch, with a population about the same as Mile End, the assessment of railways increased from 29,000*l.* to 69,000*l.* a year?—That is so.

Variations in assessments of railways.

42,553. Are there the same extraordinary variations and inequalities in rural districts?—Certainly; there are some unions in which the railways practically give no assistance, and there are others in which they give very great assistance to the rates.

42,554. If you look down the list to the county of Norfolk you will find that they appear, for some reason or other, to have derived very little advantage from the increase of the assessment of railways; you will see that the totals are comparatively small?—Yes, in the great number of the unions.

42,555. In one union I find it is only 1,200*l.*; in another it is 600*l.*; in another 800*l.*?—That is so.

42,556. (*Sir Nigel Kingscote.*) Is this in the county of Norfolk only?—Yes.

42,557. (*Chairman.*) If you turn to the county of Westmoreland, which is a purely rural county, you will find in the three unions of which it consists the assessment of railways is 37,000*l.* a year in one, another 26,000*l.* a year, and another 15,000*l.* a year?—That is so; Westmoreland does very well in railways.

42,558. It seems difficult to understand what the causes of these enormous differences can be; I suppose Norfolk is traversed by railways in the same way, though not, perhaps, by such important railways as Westmoreland?—I think, as far as I have been able to examine these figures (they have come in very recently), the unions which get the most relief from railways have been those which have been on a main line, with a great number of lines either running straight out of London or near towns. If you take a by-county like Norfolk, I should think it would not get nearly so much as one that lay between London and Scotland or the manufacturing counties.

42,559. (*Mr. Giffen.*) Westmoreland gains much more than Norfolk?—Yes, Westmoreland has for that reason a larger proportion of relief than Norfolk. I have not examined the figures properly, but I have no doubt that would be one explanation.

42,560. (*Chairman.*) Still it is difficult to understand the enormous increase in some cases, and the stationary character of others?—In some cases no doubt there have been new lines since 1870.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,561. One would think in the case of Westmoreland, although it may be traversed by one or two main railways, that the number of branch railways cannot be considerable?—I think there is one element to be taken into account, and that is that some unions have probably got their railways raised to their full valuation, whereas other unions have found a difficulty in doing so, and have not cared to go to law with the companies. But that is a mere supposition; that is very difficult to tell, I think. In one or two cases where I have endeavoured to examine the lines on the map, I have not come to very satisfactory conclusions as to why the rateable value in some unions is as large as it is, and so small as it is in others.

42,562. I observe in the county of Stafford that there is a rural district, the Union of Uttoxeter where the assessment of railways has gone up from 1,700*l.* to 12,000*l.*, and in another one, Wolstanton, where it has gone from 1,600*l.* to 23,300*l.*?—I do not know whether there is a new line there at all.

42,563. At all events the return is full of strange variations of that kind?—Very great variations both in the amount of the assessments and in the amount to which the rateable value has increased since 1870.

42,564. But speaking generally of the rural districts, they have gained largely by the addition to their assessments of railway property?—A very large number of the unions have certainly done so.

42,565. And the probability is that that accounts considerably for the alleviation which is existing in many rural districts in respect of the rates?—Yes, it must have either prevented the rates from rising, or have brought them down.

42,566. Now I think you have prepared a few cases showing the results of all this in the reduction of expenditure, the subventions by the State, and the benefit derived by the increased assessments in respect of particular unions in rural districts?—Yes. This statement merely relates at the present moment to six unions. Certain unions were selected some days ago for the purpose of examining the exact fall in the rural rate, but it is a very difficult thing to get out, and will take some time, and I have at present only six of these. They can be got out for most other purely rural unions, I think, that may be required. The first of these is Amesbury. (*See* Appendix A. XXXII., Table 16.)

Fall of rural rates in Amesbury.

42,567. I do not think, if I recollect right, that Amesbury has gained much by railways?—Amesbury has gained something. The rateable value of the railways in Amesbury was 1,816*l.* in 1870, but had risen to 4,120*l.* in 1894. That bears a small proportion to the rateable value of the whole union. That union is selected because the lands have fallen so very greatly in rateable value; they have fallen from 56,000*l.* in 1870 to 28,000*l.* in 1894; therefore there is a reduction of 50 per cent.

42,568. And presumably there has been even a greater fall since 1879?—Presumably a greater fall from 1879.

42,569. The fall from 1870 has been at the rate of 50 per cent?—That is so.

42,570. And the probability is that you must add at least 7 or 8 per cent. to that to estimate the true reduction of the value of the land there as compared with the highest period, which would be 1879?—I should say so in all probability. I suppose you could hardly find a union in which the agricultural depression as shown by the valuation lists is greater.

42,571. (*Mr. Long.*) Could you give us the figures for Pewsey Union in the same county?—I will have those worked out. The rateable value of the Amesbury Union has fallen from 64,000*l.* in 1870 to 40,000*l.* in 1894.

42,572. That is the whole property?—That is the whole property in the union. Consequently, if the expenditure had not fallen and if no relief had been given by subventions, of course the rate in the £ would have increased proportionately. Fortunately for Amesbury the amount of the rates collected has fallen. The rate in the £ has not fallen owing to the great fall in the rateable value. The total amount of the rates raised in the Amesbury Union in 1867–8 was 6,215*l.*, which represented a rate of 1*s.* 11·2*d.* in the £. In 1878–9 it had fallen to 5,378*l.* a rate of 1*s.* 7·7*d.* in the £. In 1892–3 it had fallen to 4,086*l.*, which showed a rate of 2*s.* 0·7*d.* in the £. So that notwithstanding the great depression in that union, which might have been expected to bring about a very great rise in the rate in the £, the rate as a matter of fact increased only by 1½*d.* I should say that in speaking of all these rates in the £ I am not speaking of the rate actually raised. One can only take the Poor Law valuation for calculations of this kind. The calculation does not take into account leakages such as irrecoverable rates and so forth; so that the actual rate in the £ in both years was probably somewhat higher.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,573. (*Chairman.*) But that would affect both cases?—That would affect both cases. The rate in the £ here has risen to the extent of 1½*d.* in this union—from 1*s.* 11·2*d.* to 2*s.* 0·7*d.*, but of course the rise would have been very much larger if it had not been for other causes.

42,574. What has been the rate per acre?—The rate per acre, of course, has fallen very considerably. The rate per acre has gone from 1*s.* 8·6*d.* to 10·9*d.*, that is practically one half; and the rateable value of the lands has practically gone down one half, as I said just now.

42,575. Therefore, the holders of agricultural land are practically paying out of pocket for rates about one half what they did in 1867–68?—Very slightly over one half—a halfpenny over a half.

Rural rates in Garstang.

42,576. Take the case of Garstang, in Lancashire, where there has been no considerable reduction, I think, of value. Garstang is a very exceptional union in one respect, namely, that the rateable value of the land is considerably larger than it was in 1870. The total rateable value has gone up from 86,000*l.* to 121,000*l.*, the rateable value of lands having increased from 68,000*l.* to 83,000*l.* In that case the rates levied in 1892–93 were 6,665*l.*; in 1867–68 they were 6,810*l.* There was a very slight difference in the total amount raised, but the rate in the £ in that union, owing to the rise in the rateable value, has gone down from 1*s.* 6·9*d.* to 1*s.* 1·2*d.*, and the rate per acre is 1*s.* 6·2*d.* as compared with 1*s.* 9·8*d.* That appears to be a case which simply shows that the union has got the benefit of the rise in the rateable value of the lands. It has also got the benefit of a very considerable rise in the assessment of the railways?—Yes.

42,577. They have gone up from 10,000*l.* a year to 20,000*l.* a year?—Yes, that is so.

42,578. "Other property" has gone up from 800*l.* to 7,700*l.*?—That is so; the fall in the rates there is due to the increase in the rateable value.

Rural rates in Hatfield.

42,579. Now take Hatfield?—In Hatfield the amount of rates—I am speaking of the rural rates in all these cases——

42,580. In Hatfield, I may mention, the population remains almost stationary, does it not?—The population was 6,359 in 1871, and 6,963 in 1891.

42,581. And the value of the land is maintained?—It is very nearly stationary. It has slightly gone up.

42,582. Still, it has remained practically stationary in value?—Practically, as compared with 1870; it has slightly increased, namely, from 22,975*l.* to 23,194*l.*

42,583. The railway assessment has increased from 9,000*l.* to 24,000*l.*, has it not?—Yes, no doubt that is one of the large lines running out of London.

42,584. What has been the result there with the population remaining stationary?—There is also the advantage in that union that the amount of rates raised has diminished from 6,398*l.* in 1868 to 5,968*l.* in 1893. I am speaking of rural rates simply. The result has been a fall in the rate in the £, from 3*s.* to 1*s.* 11½*d.*, while the rate per acre has fallen from 2*s.* 11·2*d.* to 1*s.* 9·8*d.* That is a case where the union has benefited to a very great extent by a rise in the rateable value of railways, and to some extent by the rise in the rateable value of buildings, as well as to some very small extent by the decrease in the amount of rates raised.

Rural rates in Langport.

42,585. Now, what is the next case?—The next case is Langport in Somersetshire. There, there has been a great depreciation of lands from 91,000*l.* in 1870 to 77,000*l.* in 1894.

42,586. There has been no alleviation there from railways, as the assessment has been increased from 300*l.* to 800*l.* only; is that not so?—That is so; there has been a slight relief in buildings, but the rateable value still is considerably lower in 1894 than it was in 1870. Notwithstanding that, there has been a decrease in the rate in the £ owing to the smaller amount of the rates raised. The rural rates raised in 1867–8 were 12,312*l.* They fell to 11,346*l.* in 1878–9,

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

and to 10,380*l.* in 1892–3. The rate in the £ on the poor law valuation fell from 2*s.* 4·1*d.* in 1867-8 to 2*s.* in 1892–3, the rate per acre having fallen from 3*s.* 7·1*d.* to 2*s.* 8·7*d.* The next union I have is Ongar, in Essex. There there has been a great fall in the rateable value of the lands, a slight increase in the rateable value of the buildings, and no advantage whatever from the railways, at least the railways have only risen from 300*l.* to 400*l.* The consequence of that has been that although the amount of the rates raised in that union has diminished, the rate in the £ has increased from 2*s.* 8·7*d.* in 1867–8, to 3*s.* 0·4*d.* in 1892–3. It would, of course, have increased to a much larger extent if the amount of the rates levied had not fallen, but that is a case where there is an increase. The rate per acre, however, has fallen there from 3*s.* 5·7*d.* to 2*s.* 9·5*d.*

Rural rates in Whitchurch.

The only remaining union that I have here is Whitchurch, in Hampshire. In Whitchurch, the lands have fallen considerably—from 33,000*l.* to 20,000*l.*—the buildings have gone up a little, and the railways have gone up considerably.

42,587. The railways, I believe, have gone up from 2,000*l.* to 11,000*l.* ?—That is so; and the increase in the railways and the buildings has more than counterbalanced the fall in the lands. The rateable value in 1894 is slightly larger than that in 1870. The amount of the rates raised has also fallen considerably in that union from 5,392*l.* in 1867–8 to 4,464*l.* in 1878–9, and 3,332*l.* in 1892–3. The net result of that has been that the rate of 2*s.* 8*d.* in 1867–8 has fallen to 1*s.* 6·3*d.* in 1892–3, and that the fall in the rate per acre there has been very considerable, namely, from 2*s.* 9·7*d.* to 1*s.* 0½*d.* I may say that these six unions have not been selected for any particular reasons except that they are illustrative, and that certain other unions have been selected, the figures for which are being worked out now. If any particular rural unions were named we would do our best to get the figures out for those also. These are purely rural unions.

Assessments of railways and other properties.

42,588. Then may we take it that the increased assessment on railways, and the larger proportion that they bear to other property, and also the increased assessment on other properties, such as mines, waterworks, and all the other kinds of properties that you have mentioned, to some extent introduce the element of the rating of personal property ?—Yes, I think that railways afford a very striking instance of that. No doubt railway shares are personal property, and a great quantity of water-works shares—in fact, nearly all water-works shares. All gas-works shares, most canal shares, and so forth, are personalty, and have always paid probate duty. These have been brought under increased contribution of late years to a very great extent, and to that extent personalty has been rated. Those classes of personalty it is possible to rate.

42,589. Because they are fixed to the soil in those particular localities ?—Yes.

42,590. Therefore they cannot escape, so to speak ?—That is so.

42,591. (*Mr. Giffen.*) And of course a large part of house property is personal property ?—Certain interests in household property are technically personal property, leaseholds and so forth, but formerly, for the purposes of probate duty, the freehold would not pay the duty; it would not be reckoned as personalty for that purpose.

42,592. But that is a very small matter compared with the total value of house property, is it not ?—You would find one house which was entirely a freehold; you would find another which was split up into different interests, and the leasehold interest might be the most valuable part of it; it would be very difficult to divide the interests for statistical purposes.

42,593. (*Chairman.*) On those two kinds of properties—railways and other properties—the aggregate now is over 24 millions, is it not ?—Yes.

42,594. The assessment in these two kinds of properties is 24,765,000*l.* as compared with the value of land of 33,650,000*l.* ?—Yes, that is so.

Relative position of land and other property as contributors to local taxation.

42,595. And land now, speaking of land as realty as distinguished from houses, railways, and other property, forms only one fifth of the whole ?—That is so. Perhaps I may read a passage in Mr. Goschen's report of 1871. He says: "It appears that a complete revolution has "taken place in the relative position of lands and other "classes of property as contributors to local taxation. "While in 1814 lands, speaking broadly, represented "70 per cent. of the total value of real property, they "now represent only 33 per cent., or less than half of "the previous per-centage; houses, which in 1814 contributed only 27·84 per cent., or little more than one "quarter of the value of real property, now represent "47·47, or nearly one half; while railways and other "property, which in 1814 contributed only 2·88 to the "whole, now contribute 19·53." Of course those figures have been altered very much since, and are far more striking now than they were then.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,596. Whereas the value of the land at the time Mr. Goschen wrote was about one third of the whole value of property assessed to local rates, it is only one fifth now ?—Yes, that is so.

History of the rating of personalty in England and Scotland.

42,597. It has been suggested by various witnesses to this Commission that other kinds of personalty should be rated; would you explain what has been the reason in past times why no attempt has been made to include personalty ?—I have set that out in a memorandum which I should like to hand in, on the history of the rating of personalty in England and Scotland. (*See* Appendix A. XXXIII.)

42,598. I do not think it would be necessary to read that ?—No; shall I give a sketch of it ?

42,599. Yes; will you just give a summary of it ?—I have endeavoured to put in it everything of interest bearing on the question on each side. I commence with an account of the different leading decisions on the section of the statute of Elizabeth, under which it was ultimately held that certain classes of personalty were rateable. There are other decisions, but I think that these sufficiently state the case for the purposes of the Commission. They have been examined by the legal adviser to the Local Government Board, and he says that they fairly set out the old law on this subject. The result was that stock-in-trade and certain other classes of personalty were ultimately held under certain conditions to be rateable. That was the state of things prior to the passing of the Parochial Assessments Act of 1836. I then set out a minute of the Poor Law Commissioners, which they addressed at that time to local authorities, stating their views on the Parochial Assessments Act of 1836. They were evidently of opinion that it had stopped the rating of personal property. It was, however, held in a case decided, in 1839 I think it was, that these classes of personal property, which had been held by the judges to be rateable, still continued rateable. That case was Reg. v. Lumsdaine, and I set out the decision in that case. The result of that decision was that the Poor Law Commissioners had to inform the various rating authorities of the country that this class of property still continued to be rateable. They endeavoured to tell them as clearly as possible what was the state of the law upon the subject, and as will be seen from pages 5 to 8 of this memorandum, the result was to raise strong protests from boards of guardians throughout the country, insisting upon the impracticabilty of carrying out the law as regards the rating of these properties. Ultimately an Act was passed in 1840 exempting stock-in-trade and various other classes of personalty from rating for one year, and that Act has been continued annually, and is continued annually at the present time. If the Annual Continuance Act did not contain this Act in any year these classes of personalty would have to be rated again. I think the impracticability and the hardship of rating personal property on the lines laid down by the judges is very clearly stated in the copy of the report of the Poor Law Commissioners to the Marquis of Normanby on the 14th May 1840. Perhaps I may read a few passages from that. They say: "For a century and a "half after the passing of the statute the liability "of inhabitants to be rated for personal property "was not agitated. The rate had been laid universally "on the tithe holders and on the occupiers of the "real property subject to the rate; but whether it "was owing to the small relative value of stock-"in-trade in the rural districts, or to other causes, "the liability of inhabitants to be rated in respect of "their stock-in-trade was not established for more "than a century and a half after the passing of the "statute of Elizabeth. Lord Mansfield, in the earlier "cases before him, with the other judges, resolutely "denied the general liability, and required a custom "to be proved in each parish, in order to legalize the "rate. Lord Mansfield strongly insisted on the im-"possibility, as well as the impolicy, of making "the rate; and he described many of the anomalies "and anticipated most of the practical difficulties "which have since been experienced. The general "liability was, however, finally established by Lord "Kenyon; and a practice of making rates on stock-in-"trade was extensively adopted in the clothing district

Mr. C. N. Dalton, C.B.
14 Mar 1895.

" of the west and south-west of England after long " contest and litigation, in which the interests of the " declining manufacturers unsuccessfully opposed the " interest of the occupiers of land and the owners of " tithes. A tax so heavy as the poor rates were in " this district (which after the commencement of the " practice of rating stock-in-trade rapidly became one " of the most pauperised districts in England, the " pauperism constantly increasing as the manufactures " declined) must have operated very disadvantageously " in diminishing the inducements to the application " of capital, and may reasonably be supposed to have " had a large share in turning the scale (notwith- " standing the long possession by these districts of " this staple industry, their superior skill, their " proximity to the ports of London and Bristol, and " their equal advantages in possession of coal) in " favour of their rivals in the north of England, where " industry was not subjected to the like burden. The " practice of rating inhabitants for their stock-in-trade " was adopted but very partially as regards the whole " of England and Wales, but when once adopted, had " usually been continued until the passing of the " Parochial Assessments Act in August, 1836." They say afterwards: "By the statute of the 43rd Elizabeth, " the relief of the poor was to be provided for by " taxation of every inhabitant, according to the ability " of the parish. The courts have decided that these " words make an inhabitant rateable in respect of " stock-in-trade. But any rich possessor of stock-in- " trade may escape the tax at his pleasure; it is only " the poorer inhabitants who cannot escape the tax. If " the owner's concerns are sufficiently extensive to " allow of his warehousing his stock-in-trade in a parish " in which he does not reside, or if he is sufficiently " opulent to reside out of the parish where his stock is " kept, he, not being a resident inhabitant there, is not " rateable; thus, three partners carried on business " upon premises in which their foreman and his family " resided, but they themselves resided in another " parish; they were held not rateable. The owners " of ships, packet-boats, &c., in places where these are " rated, contrive to escape the tax by taking up their " residence out of the parish of the ship's home." " The tax is thus commonly escaped by the opulent " owners of stock-in-trade who do not reside in the " parish in which their stock lies. The escape from " the rate of a large stock would indeed often be more " than sufficient to pay the expense of a country resi- " dence." "Even amongst persons of exactly the " same condition the operation of the tax is strikingly " unequal and anomalous; thus, of several partners, " one resided on the premises; he alone was rateable " as an inhabitant for his share of the stock, to the " extent of his interest in it. The persons thus escap- " ing the rate on their stock-in-trade, in the parishes " where it is kept, cannot be taxed for it in the parishes " where they reside." "Another source of inequality " in the imposition of the tax is contained in the rule " laid down by the courts, that the profit is not to be " presumed, but must be proved, and that it is not on " the whole profit made, but on what is in excess after " payment of all debts." "The rate on stock-in-trade, " dependent on the amount of profit as before described, " cannot be made without minute investigations into " the concerns of individuals; investigations so difficult " and the results of which are so fallacious, that a right " conclusion can scarcely be obtained, while to the rate- " payers every inequality, the result of a wrong esti- " mate, is a subject of dissatisfaction necessarily " begetting disputes and litigation. From these diffi- " culties and from a desire to avoid appeals, another " kind of injustice has ensued in places where stock-in- " trade has been rated. Those who could most success- " fully conceal their profits or could most easily reside " elsewhere, or keep their stock away from the parish, " have been able to make the best terms with the over- " seers, to which terms, rather than lose all, the over- " seers have been compelled to submit." " There is " good reason to believe that there is no parish in the " kingdom in which the overseers have ever been able " fully to carry out the law."

Effect on rural districts of taxation of personalty.

42,600. The general effect of that report was to show the impracticability of carrying out what was then really law, namely the taxation of stock-in-trade?—That is so. There was a general outcry to alter the law consequent upon the decision of *Regina* v. *Lumsdaine*. That is clear, I think, from the debates in Parliament, and from the protests from the local authorities that I have set out in this memorandum on the rating of personalty.

42,601. Have you considered what would be the effect of any proposal to tax personalty in purely agricultural districts, especially so far as it concerns the occupiers of land, that is the tenant farmers?—I suppose there can be no doubt that the capital of the tenant farmer would be the first thing that would be taxed in most rural districts.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,602. (*Mr. Long.*) Why?—Because it is at once identified as being in the parish. I am speaking of the capital he has employed in his implements and in his stock.

42,603. But surely the system which is universal now of assessing a farmer upon his rent has covered the possible idea of taking his capital, because his rent represents the value to him of his capital?—Perhaps I may quote from the evidence given by Sir George Cornewall Lewis in 1850.

42,604. Was not the practice entirely different then; was anything in the shape of the union assessment system in vogue then?—I do not fully understand the question. Do you mean whether under the old law, a farmer's stock-in-trade was liable to be rated, or whether if personalty was to be rated it would be necessary to bring that stock-in-trade under assessment?

42,605. As I understand it, you are telling the Commission that if personalty is to be rated, the first personalty which would come for rating would be the stock-in-trade of the farmer?—In rural districts. I think it would be exceedingly difficult to tax the stock-in-trade of a tradesman in urban districts, that is to say the capital employed by a tradesman in an urban district, unless you at the same time were to tax the personal property, that is to say, the capital employed by a farmer in a rural district.

42,606. (*Chairman.*) Supposing you tax all the property which people living in a parish have, you would tax the landowner for his land, you would tax the tenant farmer for his stock-in-trade, and you would tax the shop keeper for his stock-in-trade; and in purely rural districts the stock-in-trade of the farmer would form the principal amount of additional subject of taxation?—I should have thought so.

42,607. (*Mr. Channing.*) It is most visible and least removeable?—Yes, and would be identified as being stock-in-trade in the parish, in the same way as the goods of the tradesman would be stock-in-trade in the parish.

42,608. (*Chairman.*) Then the total rate in the £ probably would be reduced by the introduction of this new subject matter of taxation, and the effect might be that the owner of the land on whom ultimately now the rate falls, would be relieved of the expense of the tax put upon the stock-in-trade of the farmer; would that not be so?—I have great doubt as to where it would ultimately fall. My own impression is that it would ultimately fall upon the owner in very much the same way as it does now. That was the view of Sir George Cornewall Lewis, namely, that the owner would get less rent.

42,609. I suppose you would agree that agricultural rates, in the long run, fall upon the land?—I should say that in the long run a great proportion of all rates must fall upon the land, and that where rates are stationary for a long period, the greater part of them must fall upon the land.

42,610. Then, in your opinion, the effect of taxing the farmers' stock-in-trade would practically work out the same as now, and it would fall ultimately upon the land?—As far as I can make out, the authorities upon the subject have held this opinion: that if the farmer was to be rated for his stock-in-trade, or the shopkeeper was to be rated for his stock-in-trade, each would be inclined to pay a lower rent for the premises, and if they did that, the landlord would, of course, receive less rent than he does, in the same way that rates are to a certain extent taken into account now when a tenancy is created.

Effect on rural districts of rating personalty.

42,611. In the case of railway property if the property is to be treated as personalty and to be rated where the owner of the personalty lives, the effect might be that many of these rural parishes would lose the advantage which they now get from the assessment of railways within their district, and that the money would go to the benefit of the rates in towns where the shareholders of these railways live?—I think if a local income tax was practicable, it is quite clear that it is impracticable, but if it was practicable, you would expect that in many cases the owners of personalty in a

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

fashionable part of a town, for instance, such as London, would own no property in the country, and their personalty would go in aid of the rates of their own rich parish, which is probably not very much in need of it. It would certainly not come into the rural districts.

42,612. I have illustrated that by the case of railways; it comes to this, that you could not tax railways twice over; that is, both locally and through their own shareholders?—I do not think that you could fairly do so.

42,613. Therefore, if you put the rate upon the personalty, so as to levy it in the place where the owner lives, the effect would be very detrimental probably to the rural district which now gets the benefit of the assessments upon the local railways?—It would wherever the owner lived out of the rural district. I may say that it is sometimes considered that although railways are rated, the whole of the debenture stock is not rated; but as a matter of fact the railway is rated at its full value.

42,614. As a going concern?—Yes. The railway has been provided partly out of the money raised by the debenture stock and partly out of money subscribed by the shareholders, and therefore the question whether the debenture holders are to be rated is a matter simply between them and the shareholders, and does not affect the owners of rural properties.

Difficulty of taxing Consols.

42,615. It does not affect the parishes where the railway exists?—That is so. Then exaggerated ideas prevail as to the benefit that would result to agriculturalists if the owners of Consols contributed to the local rates. It would be exceedingly difficult to put a special tax upon Consols; and I have noticed in the earlier reports of the commissions and committees which have inquired into the question of rating, that they have been very careful to avoid any suggestion of that kind. It would certainly depreciate the national credit, and would bring about this result; that if you were to put a tax of 1*s.* in the £ on the interest on Consols it would give little more than 1*d.* in the £ relief if divided amongst the ratepayers of Great Britain and Ireland.

Impracticability of levying a local income tax.

42,616. Is there anything more that you wish to bring before us upon that point?—The impracticability of levying a local income tax was very fully set out, I think, by Sir George Cornewall Lewis in 1850, before a select committee of that year. He also referred in his evidence to the rating of means and substance in Scotland, where the same difficulty was discovered. In Scotland they had what I should have thought a better system of rating personalty than they had in England, but it only lasted twenty years longer than the English system, and it had to be given up on account of its impracticability and was given up with common consent.

Nationalisation of the poor rate.

42,617. Is there anything else you wish to bring before us in your examination-in-chief?—There is one other proposal which has been made by some of the witnesses; that is to say that the expenditure on relief should be made a national charge. I have put in a memorandum upon that point, merely giving, without any comment, the views of the Select Committee of the House of Lords in 1817, the views of the Poor Law Commissioners in 1834 and Sir George Cornewall Lewis' evidence in 1850. (*See* Appendix A. XXXIV.)

Effect on rent of rating farmers' stock-in-trade.

42,618. (*Mr. Everett.*) In regard to the rating of the farmer's stock-in-trade you have expressed the opinion, in which I entirely agree, that if it were rated directly the probable effect would be that he would pay less rent?—Yes.

42,619. That being so does it not follow that his stock in trade is rated indirectly now in the rent, and that the rent is a larger sum in consideration of the employment of the farmer's stock-in-trade on the farm?—If that is so, then the stock-in-trade of a tradesman you would, I suppose, contend is also rated in the same fashion.

42,620. It would slightly lower the rent of his shop, I dare say?—That is so; and, in the case of the manufacturer, factories would come down in rent in the same way.

Rating of personalty.

42,621. But there you have the question of how much of the machinery in the factory is included in the assessment?—Yes. The point I was most anxious to make was this; that it has been found impracticable to rate certain classes of personalty; certain classes of personalty are rated and certain classes may be rated, but others cannot well be rated because of the inconvenience.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,622. I hope that these very interesting papers which you have given us on the rating of personalty, and the proposal that the expenditure on the relief of the poor should be made a National charge, will be included in our Minutes; they are full of valuable matter for reference to on these subjects?—I have endeavoured merely to give the history as given in the documents of the time: I have not made a single comment of my own in any part of them.

Rating of ships.

42,623. The memorandum on the rating of personalty is a very valuable digest. Ships, as I understand from it, at one time were rated?—They were rateable where the owner of the ship lived in the place which was called the ship's home.

42,624. They have been relieved of rating by the Act which was passed in 1840, and which is annually renewed?—That is so.

Effect of abolition of church rate.

42,625. (*Mr. Long.*) I want to ask you two or three questions from the point of view of the burdens which fell upon local ratepayers, rather than from the point of view of the actual amount of rate which you have been giving us so much valuable evidence upon. In the early part of your evidence, in answer to the Chairman, you mentioned the church rate as one of the rates which had formed a basis of relief to ratepayers: the question is, whether the abolition of church rates has only, as a matter of actual practice, affected those people who no longer contribute to the maintenance of churches?—I will put it in this way: It has altered the incidence of the rating. Formerly, the rate would fall on all the land in the parish: now, if there are any expenses required for the church, it falls upon those who are willing to contribute. It does not necessarily fall on the owners of one class of property or of another; but no doubt to the extent that payments are made towards it by landowners in consequence of their owning property in the districts, and so on, the rate falls upon them, and in the same way upon such farmers as contribute to it; but it is not a compulsory rate.

42,626. It is not necessary to limit the effect of your answer, surely, either to owners or to farmers—we can leave them both out and say any church people can we not?—The owners and farmers had that burden before; the payment of those rates formerly fell upon those two classes in most rural districts.

42,627. But now the money, which was previously provided by a church rate, has to be provided by some of the same people only under a different heading?—So far as new churches are necessary to be built, but I take it that that would be mainly in urban districts. Of course in some cases a church has to be rebuilt in a rural district.

42,628. (*Mr. Whitehead.*) A church rate would be for the maintenance of the church, and not for its erection?—Formerly a good deal of it was for the building. Large debts were incurred for that purpose.

Rate in rural unions.

42,629. (*Mr. Long.*) I have already asked you one or two questions with regard to the 142 unions that you selected and on which you quoted the figures; and I do not therefore propose to ask you any other question now upon them, because I know that these figures have been prepared under very great stress, and with very great difficulty?—They have; and I may say that they have merely been selected on the lines stated, and that they take the whole of the unions which contain no urban district technically so called. Of course, a very large number of unions consist partly of urban and partly of rural districts, and are of a mixed character, and in some one class predominates, and in others the other. We thought that if we eliminated all the unions, in which the towns had been considered of sufficient importance to be turned into urban districts we should have got practically what were the most rural areas of the country.

42,630. Still the method adopted would admit the possibility of including in your rural unions some unions which contain towns where there are industries, which would not altogether justify the description of the union as a purely rural union?—I think you cannot get such a thing as an absolutely purely rural union in any part of the country except in very rare cases.

Rates in Amesbury Union.

42,631. Let me take you to your own evidence that you gave with regard to the union of Amesbury; I understood you to say that the total amount of the rates had fallen?—Of the rural rates.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,632. There are no others in Amesbury?—I was not aware of that at the moment.

42,633. But the amount of the rate in the £ has slightly increased?—Yes, it has slightly increased.

42,634. The ratepayers on the agricultural land, you said, in answer to the chairman, only pay half of what they paid in 1870?—Yes.

42,635. Does that not rather point distinctly to there being some very considerable class of property in this rural union other than that of agricultural land?—The statement that I shall put in will show that the buildings in that union are rated to the extent of 6,776*l.*, that there are also railways rated to the extent of 4,120*l.*, and that there is other property rated to the extent of 1,002*l.* Those are not large additional contributions, still they make up between them more than a fourth of the rateable value of the whole union. I think you would not find that buildings, railways, and other property form a smaller proportion than that in the great majority of rural unions. There are five unions in England which have no railway at all, but only five; there are none which will not have buildings; and there will be a comparatively small number which have not got some of this "other property." So that other ratepayers besides the farmers will be contributing to the rates in every union in the country.

42,636. What are those other ratepayers, can you tell the Commission at all, in a purely agricultural union?—In some cases—the cases where there is a very large proportion of "other property"—you have coal mines or quarries and so forth; you also get—which would not be the case probably in a district like Amesbury—waterworks, gasworks, and so forth. I cannot say what this 1,000*l.* of "other property" in the Amesbury union is, because so many classes are lumped together; but I may say that the largest amounts that we find under that heading are in the mining counties undoubtedly, and I suppose there are no mines in Amesbury.

42,637. I am afraid not?—In Cornwall and other counties mines come in as a considerable element.

42,638. In your Table 3, which deals with the rate in the pound for the expenses of the poor, I see you are able to bring us up to 1893?—Yes.

Difficulty in bringing returns up to date.

42,639. That which appears to be the latest information that you can give us is nearly 18 months behind the times at present, is it not?—Yes. I am sorry to say that our returns are always necessarily very much behind the times. I mentioned that we had not yet been able to complete our Highway Returns for 1893, and I have therefore had to make a guess at that to some extent. I may say that is owing to certain of the accounts not having yet been received from the auditor. We like to take audited accounts where we can get them, because of their greater accuracy, and when any one account is outstanding it delays the return for the year. As a general rule the auditor's work is dealt out on the assumption that during his year he will audit a year's accounts, and therefore we are always necessarily one year behind.

42,640. I am afraid one year is not quite the extent of your shortcomings?—No, but that is the first difficulty we have to contend with.

42,641. In Table 1 I notice that your latest figures are for 1890-91?—Those figures are taken from Mr. Fowler's report.

42,642. I know that?—I have not made out the table again for this reason: In order to get that table out, we had to work out the school board rates in rural districts, and that took several men six weeks to do. I did not want, if possible, unless it was necessary, to stop all our other work for the purpose of bringing it out again. That is the only year for which this particular return has been given. We could get it out for another year, but it would mean a very great deal of labour. The Education Department do not separate their rural school board rates from their urban school board rates, and so they all have to be picked out with the utmost care.

42,643. I am sure we are very much indebted to you for the figures which you have presented to us, which involve an immense amount of labour; but still it is a fact, is it not, that these figures which are presented by the Local Government Board each year are, owing to a variety of causes, representative of a period considerably past?—That is clearly so. I wish we could give them up to date.

42,644. Therefore would it be possible, do you think, for some of the witnesses who have been here protesting that there has been an increase of rates, to be speaking of that which is the result of their own knowledge in consequence of cheques which they have drawn during the current year, and yet at the same time that your information being 18 months or two years short of theirs should be equally correct with theirs?—Yes. I have no reason, with a very few exceptions, to doubt the accuracy of the figures which have been given us by the witnesses. In these figures that I have given I do not profess in any way to prove that there are no unions in which the rate in the £ has gone up. In fact Amesbury was one of the selected unions which I mentioned in which it has slightly gone up. I have no doubt that if we were to look carefully for them we should find others in which it has gone up. We might get these cases brought before us by witnesses. But I am not at all prepared to say what the figures for 1894 are, and that they are not higher than the figures for 1893.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.
Rates in 1894.

42,645. The figures for 1894 have not been before you yet?—Not at all.

42,646. Do you think it would be possible to have figures furnished by the local authorities to the Local Government Board which would justify presentation for the purposes of comparison? It would be of great assistance to people who are interested in local taxation if they could ascertain what were the local taxation figures up to the end of last year, we will say; at present, of course, we have to wait until the accounts have been audited, and can deal with nothing but absolutely audited and passed accounts?—Certain of our returns we could get out earlier than others; for example, we could get the London rates out earlier; but I am afraid we could not get out the rural rates earlier, for I do not think we should have any means of obtaining them earlier.

Difficulty in bringing returns up to date.

42,647. You could have them if they were not audited, could you not?—I think there would be a great disinclination to furnish them, and that they would not be so accurate as the audited financial statements. There is great difficulty in getting any returns in promptly. I think it is impossible for anybody who has not gone through it to know the trouble we have whenever we ask the local authorities for any information which they are not compelled to give. Take this return we have just been preparing; I am almost afraid to say what is the number of letters that we have had to write, sometimes there have been very many letters to one person before we could get the return in. When we get the county council statements no additional labour is imposed upon the local authorities. We get the audited financial statement sent up to us, and we make out our return from it. If we were to write to the clerk of the county council, and ask him to furnish us with an estimate of figures, or anything of that kind, I think that he would very strongly object to going through the labour of doing it, at any rate a certain number of the county council officials would, because it would be giving them extra work. Our difficulty at the Local Government Board is this, that wherever we ask for a return from a local authority we have no power to pay for it: a man constantly writes and says, "what "am I to be paid," and we have to tell him that he cannot be paid. He may then decline to send the return, and if so he has got to be induced to send it, and perhaps threatened that Parliament will insist on the return being furnished. It is an exceedingly difficult thing to do. To get the local taxation returns promptly from all local authorities we should have to send to an enormous number of local authorities, and to many of the local officials we should be giving work which they would not be paid for, and which they would rather not undertake. So we have to wait until the regular return that the local official has to make comes round, and then we get the figures from him with a great deal of trouble. I am afraid that if we were to try to get them before that time we should have the greatest difficulty.

42,648. Can you suggest any increased powers which might be conferred upon the Local Government Board, which would enable you to get these figures more easily and without all this immense trouble?—I do not think it would be fair unless the man was paid for it.

42,649. Do you not think, having regard to the immense value of these figures to all who are interested in local taxation, that some payment would not be an

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

unjust thing to suggest?—If Parliament would vote payment for it we might get our returns more rapidly.

42,650. Therefore the public could have in their possession information which would necessarily be more reliable because it would be more up to date?—Yes, it would be more up to date.

42,651. (*Mr. Giffen.*) How much more money would it be necessary to devote to that?—I am afraid of saying what might be necessary. In reference to this return which we have sent to 648 boards of guardians, a very large number of the officials demanded payment. They said, "If this return is wanted by Parliament, Parliament should pay for it." In certain cases it has undoubtedly given them a great deal of labour. We have told them that the Assessment Committees can take it into account in fixing their remuneration, but many of them have replied that the Assessment Committee have declined to do so, and they think it is a case for Parliament paying them.

42,652. (*Mr. Long.*) Are you of opinion that it would be a good thing for Parliament to sanction some payment which would enable the Local Government Board to get this information?—There is a very great difficulty in our making the payment. I may say that in reference to the return for 1870, of which this is a continuation, a sum was voted by Parliament for that purpose; and I think that there was more discontent aroused in distributing that sum than there has been in refusing payment this year. Many officers said the remuneration offered was insufficient. It is exceedingly difficult, supposing that a sum were devoted for the purpose, to distribute it amongst 648 unions. The labour in one of these unions would be very great, and in another very small, and we should have to determine what we would have to pay to each man for it. It is much easier for the local authority, if they will pay him, to estimate the amount of labour which is involved in the preparation of the return.

42,653. If the local authority could do it more easily is there any reason why they should not be repaid out of the Imperial Exchequer?—I am afraid they would pay him rather liberally if they were sure of being repaid.

42,654. That is possible, but it surely is not fair that the local authority should be called upon to furnish figures for public purposes at the cost of the local exchequer?—No, and that consideration weighs very much with the Local Government Board when returns are asked for by Members of Parliament. If they are returns which are absolutely necessary for public purposes, they do not like to refuse them.

42,655. Is it not the case that frequently returns are moved for, or asked for by Members of Parliament which would be of the utmost possible value in regard to local expenditure and local taxation, but which are declined because the Local Government Board has not got the power to pay and the Treasury declines to sanction the extra payment?—No; I think, as a rule, it is the other way, I think more returns than are necessary are asked for? It is very difficult to refuse a return which has been asked for in Parliament without Members of Parliament thinking that we have got some reason behind and that we want to hide something. I think that occasionally returns are moved for and insisted upon which really it would have been better not to have had; they certainly have thrown a great deal of labour upon the local authorities, and they have not only thrown labour upon the Local Government Board, but they have cost a great deal. A great many of these returns cost a great deal of money and many of them are very seldom read.

Highway rates.

42,656. You said something about the highway rates; you told us that the highway rates have fallen; I do not know whether you can tell the Commission whether any allowance has been made for the cases which have arisen during the last two or three years of county councils taking over the expenditure upon highways and absorbing the powers of the highway authorities?—Where they have done that, that ought to have diminished the rate. I may say that I am very disappointed with the figures of 1893 to find that there was that year an increase in the highway rate, although undoubtedly there are counties where the county councils have done a great deal in that way. The county councils may now not only take over the main roads, but may contribute to any highway. I was under the impression, and I am still under the impression, that in certain counties a great deal of the county money has been expended for that purpose, but notwithstanding that the highway rate has not fallen, and in 1893 the figures, when I am able to give them will certainly be seen to be higher than they were in 1891 and 1892.

Mr. C. N Dalton, C.B.
14 Mar. 1895.

42,657. That is a fact which throws rather an unsatisfactory light upon the position of the highway rates themselves, because in the cases where the counties have taken over the control of the highways other than main roads, in other words, have absorbed the duties of the highway board, there will be a rate in respect of that which will be levied by the county councils?—Yes.

42,658. Which will be additional to this rate which is correctly described as a highway rate, is that not so?—Yes, so far as the county highway expenditure is not met by the Treasury subventions.

42,659. Of course only as regards the difference between the subvention and the cost?—Yes.

42,660. (*Mr. Whitehead.*) Would that be included in the general county rate?—Yes, in the general county rate when they contribute to the highways.

Relief of rates by State subventions in London and other districts, 1894, compared.

42,661. (*Mr. Long.*) You gave us some information with regard to the relief given to London, to the county boroughs, and to the administrative counties, and I think you suggested that you might want to alter those figures, which were given as 8·6*d.*, 10·2*d.* and 9·6*d.*?—I took them because they were calculated in Mr. Fowler's report for 1891. I had not at hand at the moment the figures for 1894, and I do not know whether we have them, but if we have them I should be most happy to put them in. I think it is only a matter of making a calculation. I think we can bring those up to 1894.*

42,662. Can you say off-hand whether the effect is not rather to equalise the relief as between the three different local authorities; or would you rather reserve that point until you have got the figures?—I think if you take the rate in the £, which is the rate that we were giving there, London will undoubtedly receive less than the other two; but I do not want to express an opinion whether London rightly receives less or not; there are many reasons that explain it, but I do not know that that question comes in here.*

42,663. It appears London gets about 2*d.* less than the county boroughs?—To some extent, though not to any great extent, that may be due to the fact that the valuation in London is higher than that in the rest of the country; it is the same as the income tax valuation.

42,664. But on the whole the distribution of this relief taken altogether, is as fair between the different local authorities, I mean the county councils, and so forth, as it was possible to arrange for at the time?—I think the difficulties in the way of distributing it were enormous, and I have not intended to say anything that would suggest for a moment that there has been the slightest unfairness in it. I am sure more time and trouble were taken in Parliament and out of Parliament in endeavouring to make a fair distribution than I ever remember to have been taken in any other distribution of Government subventions. I do not think it at all follows that because London has a lower rate in the £ of relief than the rest of the country, it necessarily has been treated unfairly. It never was proposed by Parliament to distribute these grants on rateable value. If they had been distributed on rateable value you would have given all districts the same rate in the £ of relief, *i.e.*, you would have given the most to the richest places.

42,665. Certainly?—That was repudiated altogether when the Bill of 1888 was under discussion in Parliament. In giving these figures, I hope I have not conveyed the impression that London was unfairly treated. I have only stated that London has a lower relief in the £ than the other places.

42,666. I do not think you conveyed any such impression; but there is, as you know, a contention to that effect, and I only wanted to bring it out. I say that so far as human ingenuity can do it, there had been a fair distribution between the different authorities?—I think there was every intention to treat them fairly; and I believe, on the whole, that the distribution has given satisfaction. London has complained of it, but if London had received its share on its population, it would have received nearly a quarter of a million less a year than it does at present.

* *See* footnote * to page 302.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,667. In dealing with that very interesting return, which we have not received yet, but which you told us about, showing the difference in the assessment values of different classes of property now, you pointed out the remarkable increase in the assessment of railways?—Yes.

Variation in assessing values of railways.

42,668. You told us, also, that there was a considerable variation in the assessment value of railways; can you trace at all what the cause of that variation is; is it a variation in the assessment by the assessment authorities, or is it due entirely to local causes?—I have no means of ascertaining. Of course it is evident that certain main lines with, perhaps, 10 or 12 lines of railway on them, are far more valuable than a line in another part of the country with only one line; and the lines that run out from London into the country must have an enormous value. I should think they are rated at an enormous value, probably, and that as you get into a by-line, or anywhere like that, they are probably rated on a very much lower value. We have heard that in Scotland, they divide their railways according to the mileage, independently of the number of lines upon them; you would expect, therefore, to find there a great deal more uniformity in the amount of the contributions which the different parts of the country receive from the railways than you would in England.

42,669. As a matter of fact there has been a singular uniformity in the raising of the assessments upon railways in England going on in the last few years, has there not?—I think that there has been a great tendency in that direction. I think that local authorities have been constantly recommended to go for an increased assessment, but I imagine that the railway companies have taken care that they have not been unduly assessed, which almost points to the conclusion that in the past they were hardly rated sufficiently in some districts.

Effect of assessments of railways on local rates.

42,670. You pointed out that in some of these unions considerable assistance was given to the rate-paying power of the district by the railways?—Undoubtedly.

42,671. As a matter of fact, does that work equally?—It helps the particular district in which the railway is situate, but it is exceedingly difficult to alter the principle of only rating the property locally situate in a union. If you do it in the case of railways you will be called upon to do it in the case of other properties, which would be very difficult; and besides that you would be calling upon various unions to give up property which is in their district, and which they have had the benefit of.

42,672. You quoted one or two unions—the union of Amesbury, I think, was one—where the railway assessment has considerably increased; now I will take two unions in the same county—I do not want to trouble you to look at the figures—the unions of Pewsey and of Swindon; roughly speaking you would, I presume, be familiar with the figures of those two unions?—Certainly.

42,673. Is it not the case that in Swindon, where there is a considerable amount of property of different kinds——?—Yes.

42,674. That the relief given by the increased assessment of the railways is proportionately far greater than the relief given in the case of a poor union like Pewsey, where the need for relief is much greater?—I should think that is very likely the case. There are several methods by which it could be rectified, but they would all involve questions of Poor Law administration. You can throw a couple of unions together, and by that means get the benefit of a railway, but, then, before starting to do that you must see that it will not be injurious to the Poor Law administration of the district. I do not at all know the local circumstances of Amesbury, but there are a great many unions in England which appear from the figures to be very much smaller unions than you would form at the present day, and possibly by throwing some of these together you might to some extent get rid of the anomaly.

Nationalisation of the poor rate.

42,675. You have given us a very interesting paper upon the relief of the poor being made a national charge; without going into that very large question, would it not to some extent minimise these inequalities with regard to assessment if the areas for rating at all events were very much extended compared with what they are now?—Yes.

Relief of the poor as a county charge.

42,676. Without going so far as making a national charge for the poor rate, would some movement in the direction of a county charge not lessen the inequalities?—Yes, and that has been found necessary in London. You have not only a certain number of charges thrown on the Metropolitan Common Poor Fund over the whole of the county of London, but you also have applied the same principle to other rates than the poor rate, you have had the Equalisation of Rates Bill with the view of the richer parts of London helping the poorer. I presume legislation of that kind would be possible in the provinces. There would be many difficulties in the way, but I do not think there would be any objection on principle to it.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,677. Is there any other way which occurs to you, or which you care to state to the Commission, of removing this inequality which exists at the present time as between a very poor union in one part of a county, and a more prosperous union in another part of a county, with regard to the relief that they respectively receive from railway property?—Of course, a poor union as regards its county charges is no worse off than a rich union, because if its assessment is low, its contributions become low also. As far as you can properly make local charges, county charges, you are relieving the poor unions and bringing the rich ones under contribution in the county.

42,678. Therefore, if you were to merge your unions and extend your area, at all events for the purpose of levying your rate, you ought to be able to relieve the poorer unions in the county, and to bring under contribution the richer unions, on the principle of the Metropolitan Common Poor Fund, which means that St. George's Hanover Square, say, is rated upon its capacity, and receives upon its pauperism, and so on?—Yes, but I think there can be no doubt that although that system has some advantages you would expect to increase the expenditure by doing it. I am not suggesting that the expenditure might not be properly increased, but, of course, it is practically having a common purse to dip into.

42,679. In London it has worked very well because there have been certain powers of control which the Local Government Board have exercised?—I do not think that the powers of control which the Local Government Board have got in the case of the Metropolitan Common Poor Fund have enabled them to keep down the expenditure. I am not suggesting that it should be kept down. The expenditure on the Metropolitan Common Poor Fund has enormously increased, but the money has been well spent, I have no doubt, in infirmaries for the poor, and in improved indoor accommodation. I do not think there is the smallest doubt that the effect of the Metropolitan Common Poor Fund has been not only to increase the efficiency but also the expenditure.

42,680. I do not know whether you would care to answer this question, as it does not come immediately under your notice; but is it not the fact that the poverty of many of the unions in England is a serious obstacle at this moment in the way of the improved accommodation which is urgently required?—I should think it is exceedingly likely, but I cannot say of my own knowledge that it is the fact.

42,681. It has not come before you?—No.

Nationalisation of the poor rate.

42,682. I do not propose to ask you any questions about the nationalisation of the poor rate, because that is a very large question, to which your paper is a very valuable contribution, which I would not attempt to go into now; but having regard to the extension of the area over which the poor rate is distributed, and the diminution of the responsibility of the authority distributing the poor relief, and applying to those two questions your memorandum, it would appear that a general objection is offered to any alteration by Parliament of the system under which those who pay the rates are responsible for their distribution; am I right in so describing the effect of this memorandum of yours?—All I think that that memorandum on making the relief of the poor a national charge does is this: it goes to point out that if you agree to pay the whole cost of the relief of the poor in any case out of Imperial funds, the whole cost of the relief will increase to a very alarming extent, and with very mischievous results. I am not suggesting that if you give, as is done in London by the Equalisation of Rates Act, and as is done by the Local Government Act in the grants to county councils—an endowment which does not increase in proportion to the expenditure, any such proposal as that is open to anything like the same objection. But to make any proposal to the effect that the more the local authorities spend on the Poor Law

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

relief the more they shall have, is, I think, to admit a very dangerous principle. I do not say that poor unions should not receive relief from richer ones, either by an Equalisation of Rates Bill or by any other system that may be devised, provided that the relief is not given in such a way that the more they spend the more they shall have.

42,683. This memorandum contains certain opinions on the subject; for instance, there is an extract from the Poor Law Commissioners' Report of 1834, and there is also a very valuable quotation from Sir George Cornewall Lewis—a statesman, for whose opinion on these questions of course we have all got the most profound respect; but were not those opinions of the Commissioners and of Sir George Cornewall Lewis delivered at a time when it was correct to describe the people who administered relief as those who also paid the rates out of which that relief was administered?—Yes.

42,684. Would that apply with equal force at the present time, when the electorate has been enormously extended, and when the incidence of the rate, whatever its ultimate effect may be, is not immediately upon those with whom rests the decision as to what the administration shall be?—I think there is a wholesome dread in most districts of the rates going up, and always has been, although the rates have been administered to a great extent by those who do not bear the main burden of them. I hope that feeling will continue.

Effect of an extension of the Poor Law areas.

42,685. We are getting on rather a dangerous subject now, and I must sheer off it. Would you go so far as to express a qualified approval of an application to the rest of the country possibly in some modified form, of the principle which has now been adopted in London ever since the Metropolitan Common Poor Fund was established, and which has now been confirmed in London by the application of a somewhat similar principle to the sanitary rate?—I think that enlarging the area over which the expenditure can be thrown, so long as due control of that expenditure is exercised, and no incentive is given to increase that expenditure, greatly minimises the hardships of rating.

42,686. Would you only approve of an extension of Poor Law areas provided that there were some statutory limitation as to the expenditure?—I am afraid I do not know enough practically of Poor Law administration to be able to speak upon that matter. My experience has not lain in that direction. I think it is perfectly clear that the size of some of the unions in England is very much smaller than would be now recognised as desirable if the unions were being formed for the first time.

Rate in the £ and rate per acre.

42,687. There was one question I wished to ask you with regard to some of the figures you quoted; you quoted the incidence of the rates in two different forms, namely, the rate in the pound, and also the amount of the rate per acre. Do you think that a statement of the amount of the rate per acre is altogether a fair way of describing the incidence of rates in an agricultural district?—I think in considering the extent of the burden you must also take into account the rent per acre.

42,688. And do you not want to go even a little further than that, and differentiate between the land which is actually let and the land which is merely occupied at practically no rent; you take the amount of the rates and the number of acres, and then you arrive at the number of shillings that are to be attributed to each acre; but in a great number of the poorest agricultural districts, which are the most affected by this question of local taxation at the present moment, would it not be fair to say that if you took the land which is absolutely rent-producing now, and excluded that for which no allowance for rent is made by the occupying tenant or the owner, that the rate per acre would be largely increased? Take a union, for instance, like the Amesbury union, which was the one to which particular reference has been made; do you not think, from the information you have received, either here on this Commission or in the Local Government Board, that if we were to deduct out of that union the acres which are occupied nominally, but for which practically no rent is being paid, that would make a considerable addition to the amount of the rates per acre over the land which is actually in cultivation?—Certainly, to the extent of any land which is not occupied, and is not paying rates, the rate per acre must be increased. This is a rate per acre reckoning in every acre in the union, and not only reckoning in the acreage of the agricultural lands, but also (we are compelled to do it in the rough estimate) reckoning in the acreage of the buildings and the railways; everything is reckoned in there.

Mr. C. N. Dalton, C.B.
14 Mar. 1895.

42,689. Everything?—Everything, except water; we have left the water out.

42,690. That is taking the best aspect of the district that you can?—I think these tables were made out rather for the purpose of comparing the rate per acre at one period with that of another. I think it is quite possible in such a union as Amesbury, that there were more acres unlet and were not producing rent in 1893, than there were in 1868.

Effect of rating land at 75 per cent. reduction.

42,691. I should like to put one question with regard to a question or two asked you by the chairman about the differential form of rating as between agricultural and other lands in urban districts. He asked you whether it was not the fact that rural land in an urban district is rated upon only one-fourth of its value according to its poor law assessment for the general district rate?—Yes, and it is also rated at the same value for the special sanitary expenses in rural districts.

42,692. Is that a principle which you think might be extended a little further with regard to local taxation in the country?—If further relief is to be given to lands that has always struck me as a very much more feasible way of doing it than by attempting to levy a local income tax. That, you will see, was the opinion of Sir George Cornewall Lewis, which I have set out in one of these memoranda.

42,693. That practically is following out the old principle that the area of taxation shall follow the area of value, is it not—that where the benefit is conferred there there shall be, so far as you can fix it, a proportionate payment?—Yes. I think that as regards some rates, land does get its equivalent from the local expenditure.

42,694. Perhaps you did not quite understand my question. What I meant was that the principle of rating land at a 75 per cent. reduction was practically an adoption of the principle that according to the amount you get out of taxation so you shall contribute?—Yes, that is so.

42,695. Would you think it would be possible to apply the same principle in any way to the poor rate?—It would be possible to do it, if it were thought desirable.

42,696. I ought to have said desirable, not possible? It would be possible, of course; do you think it would have the result of, in any way, lightening the burden upon those who are at the present time least able to bear it?—It would undoubtedly lighten the burden on agricultural land to some extent in every district. In many districts it would lighten it very considerably.

42,697. Do you think it would be a fair change to make in the law of rating?—I think it is very desirable that we should have Scotch evidence upon that subject. So far as the Scotch evidence has yet gone, it appears to be recognised as a fair and proper thing in Scotland. But we have only had one witness upon it at present, and I certainly think it is a subject which should be further pursued, and on which we should have further evidence. I am rather afraid to speak confidently about it at the present time. Of course, as you know, there is the question—which I have been most careful to avoid in my evidence, because it is a contentious question and one on which a great deal is to be said on both sides—as regards hereditary burdens. The poor rate is an old rate. I do not want it to be thought that I have got any strong opinion against doing what you have suggested. But there is a great deal to be said on both sides about it, and I should like to hear the Scotch evidence before expressing any confident opinion.

Rating of personalty.

42,698. With regard to this excellent memorandum upon the rating of personalty you seem to confine your criticisms to the inevitable necessity, as I think you regarded it, of taxing the stock-in-trade either of the tradesman or of the farmer. Mr. Everett asked you a question which covered the ground, I think, as fully as we could desire it to be covered with regard to the farmer's position; and I only repeat it in order to emphasise the fact. Is it not the case that in assessing a farmer upon his rent you assess him upon what you estimate to be the actual value to him for all purposes of the land which he covers either with implements or with cattle, or with labour—it is the outside value to him; it is considered that the landowner gets the best

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

rent he can, and that the tenant pays the rent which he believes his means would enable him to pay if he embarks a certain amount of capital in the land. Surely no tenant would contemplate paying the rent which he now offers unless he also contemplated putting into the land capital which would enable him to pay rent; therefore surely the rent is the estimated value of everything the tenant puts into the land in the shape of capital, or labour, or skill, or personal industry at the present moment, and, therefore, he is at this moment rated upon everything that he contributes towards making the land productive?—I hope it is not thought that I suggested that the stock-in trade of a farmer should be rated. I do not think that all personalty should be rated locally. I think that if you want to rate some kinds of personalty you ought to rate them centrally; you might distribute the money afterwards. I mentioned stock-in-trade, because as a result of all those decided cases in England stock-in-trade practically became the most important residuum of personalty which the courts held could be rated; and then I said that I thought the capital of a farmer stood in very much the same position as the capital of a tradesman, or of a manufacturer.

42,699. Is this not a case which is frequently put; so long as turnpikes existed the man who used a road with his carriage paid for the use of it in the shape of the toll?—Yes.

42,700. The tolls are now abolished, and those roads are maintained out of contributions from the Imperial Exchequer, plus the rates?—Yes.

42,701. The man who previously drove in his carriage and paid his toll at the gate, may now live in a house rated at a comparatively speaking small sum, and not pay a contribution equal to that of the farmer in the same parish who never has used anything but a gig which is essential to him for his farming operations, and which really forms part of his stock-in-trade; therefore, is it not the fact that the farmer is at this very moment for the purpose of the maintenance of the road rated upon his stock-in-trade, whereas the man with an income drawn from other sources escapes any contribution whatsoever, except in so far as he contributes to the contributions which are given by grants in aid?—That would depend to some extent upon what his property consists of. If it consists of railway property or of waterworks shares, and gasworks shares, or anything of that kind, he is paying rates somewhere else on his income.

Mr. C. N. Dalton, C.B. 14 Mar. 1895.

42,702. He is paying no more rates now than he did before. Does it help the ratepayer in highway district A., whose roads have to be maintained for the benefit of somebody else, that that somebody else is paying rates in highway district B.? It may be the law of equity, but it will not help the unfortunate individual who has to maintain the roads for somebody else to drive over?—Unless they have got somebody else who is living outside their district and paying towards their rates.

42,703. Surely if the carriage folk, as they are called, paid a toll which they no longer pay, somebody else has to find the money?—I think the wheel and van tax was a very desirable tax; but unfortunately Parliament would not pass it.

42,704. Would you go so far as to say, because it would be a very valuable contribution to our information on the subject if you would, that in your opinion there ought to be some contribution in respect of that form of local expenditure towards which people used at one time locally to contribute, but towards which they make no local contribution now?—I am not prepared to say that there ought not to be greater contributions from personalty if they could be conveniently got, than there are at present; but you cannot have local government without local taxation, and there are many kinds of personalty which you cannot locally rate. The great difficulty is that you cannot say where the money is situated. If a man owns property in several districts it is impossible to say which district should get the benefit of the rating of his personalty.

Parish councils.

42,705. In all your estimates with regard to rates, their increase, and their rise and fall, you have made no allowance, I imagine, for the possible increase of rates resulting from the new local authorities recently created?—No. We have not got the expenditure of the parish councils yet, and we cannot possibly say what they will spend.

Adjourned to to-morrow at 12 o'clock.

(*For Mr. Dalton's further evidence see page* 412.)

Eighty-first Day.

Friday, 15th March 1895.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., } *Assistant*
Alan Mackinnon, Esq., } *Secretaries.*

Mr. T. H. Elliott. 15 Mar. 1895.

Mr. Thomas Henry Elliott re-called and further examined.

(*For previous Evidence see pages* 100, 140, *and* 191.)

Mr. T. H. Elliott. 15 Mar. 1895.

Drainage and improvement of land.

42,706. (*Chairman.*) You are here to-day to give an account of that portion of the functions of your department which has relation to the drainage and improvement of land and the advance of loans to landowners for that purpose?—Yes.

42,707. You hand in a memorandum summarising the various enactments bearing upon the subject?—Yes. (*See Appendix A. XXVII.*)

Public Money Drainage Acts.

42,708. These Acts commence with the year 1846?—Yes; in 1846 the Public Money Drainage Act was passed, by which the Treasury were empowered to make advances not exceeding 2,000,000*l.* for Great Britain and 1,000,000*l.* for Ireland for the promotion of the improvement of land by drainage.

42,709. Do you know the motive for that Act; was it in consequence of the adoption of Free Trade and

Mr. T. H. Elliott. 15 Mar. 1895.

the idea that it would assist landowners at the commencement of Free Trade?—I do not know whether that was the case, but there was a general impression at that time that the productiveness of English land might be very materially increased by the extension of drainage, and that fact is stated in the preamble to the Bill.

42,710. The preamble says: "Whereas the productiveness and value of much of the land in Great "Britain and Ireland are capable of being greatly "increased by drainage, and the extension of the "operation of drainage is calculated to promote the "employment and effectiveness of agricultural labour, "and tends also to prevent disease and to improve "the general health of the community"; then 2,000,000*l.* were set apart for lands in Great Britain and 1,000,000*l.* for Ireland?—Yes.

42,711. Was that specially confined to drainage on that occasion?—That Act was specially confined to drainage.

42,712. Then the repayment of that was by a rentcharge of 6*l.* 10*s.* spread over a period of 22 years?—Yes, those were the terms of repayment.

42,713. And took precedence, I presume, of all other charges upon the land?—Yes, with the exception of tithe rentcharge, or any quit rent or chief rent incident to tenure.

42,714. But it took precedence of all mortgages and all other charges?—Yes, it took precedence of mortgages and the ordinary charges upon land.

42,715. Was there any limit as to the amount which could be loaned to any single landowner?—Yes, I think the original limit was 10,000*l.*, but it was subsequently reduced by the Act of 1850 to 5,000*l.*

42,716. Then in 1850 another appropriation was made of 2,000,000*l.* to Great Britain, and 200,000*l.* to Ireland?—Yes.

42,717. Under those two Acts 2,116,510*l.* was advanced in England and 1,874,367*l.* in Scotland?—That is so.

42,718. Scotland therefore appears to have availed herself more of the opportunity offered than England did?—Yes, in proportion to the area of the land in the country.

42,719. In 1851 apparently a portion of the fund was diverted to another purpose?—Yes, from the original purpose of draining.

42,720. What was it given to?—The preamble of the Bill stated that great distress prevailed in certain parts of the Highlands and islands of Scotland which would be most effectually relieved by affording facilities for the voluntary emigration of a portion of the population of those districts; and it was considered expedient that owners should be able to defray the cost of emigration. I do not know whether any sums were actually advanced under that provision.

42,721. Then were the terms the same in the Act of 1850 as in the previous one?—Substantially. There were some slight extensions of the works for which moneys might be advanced, but the terms were substantially the same.

42,722. Then of the amounts lent under those two Acts almost the whole has been by this time repaid?—Yes, with the exception of two small sums of between 4,000*l.* and 5,000*l.* in the two countries.

42,723. Are those sums irrecoverable or are they still due?—They are not yet due, and I think there is no doubt that they will be recovered. The outstanding balances are being reduced at the rate of about 1,500*l.* a year; so that in about three years the whole transaction will be closed.

42,724. These works were all executed, I suppose, under the supervision of your Department?—Under the supervision of the Inclosure Commissioners, now the Board of Agriculture.

Improvement of Land Act.

42,725. Then in 1864 another Act appears to have been passed?—Yes. That is the Improvement of Land Act, under which a great many operations still continue to take place.

42,726. Does this contemplate loans from the State, or is it for the purpose of facilitating loan companies advancing money?—It is for the purpose of facilitating the employment of private monies provided either by the incorporated companies working under special Acts of Parliament, or by private individuals.

Mr. T. H. Elliott. 15 Mar. 1895.

42,727. Giving the same kind of facilities, the same priority to charges of this kind as had been given by those two previous Acts?—Yes.

42,728. But contemplating money being provided from other sources than the State?—That is so.

42,729. The improvements under that Act, I believe, included the drainage of land, the irrigation of land, the embanking of land, the enclosing of land, reclamation, making of permanent farm roads, clearing of land, the erection of labourers' cottages, farmhouses, and other buildings, planting for shelter, the constructing or erecting of engine-houses and so forth, the construction of jetties and landing places where there are rivers, and the execution of all such works as in the judgment of the Commissioners may be necessary; but I think the planting was confined to planting for shelter, not general planting?—Under the Act of 1864 planting was required to be for shelter only.

42,730. Not general planting?—Not general planting.

Settled Land Act.

42,731. Has there been any extension of that by a later Act?—Yes. That limitation as regards planting was removed by the Settled Land Act of 1882, which enacted a new schedule of improvements which could be made first charges under the Improvement of Land Act of 1864.

Limited Owners' Residence Acts.

42,732. Then there is the Limited Owners' Residence Acts of 1870 and 1871?—They were designed to enlarge the scope of the previous Acts, and to enable charges to be made for the building, or improvement, or enlargement of mansion houses.

42,733. Then come the Settled Land Acts of 1882 and 1890?—Yes.

Settled Land Act.

42,734. Have those extended the improvements and given a fresh term of years of repayment?—No, the term of years for repayment was not altered, but under the Acts referred to the works on which trust moneys may be expended, are wider and more numerous than those contained in the Improvement of Land Act, the enumeration of which was extended so as to comprise all improvements contained in the Settled Land Acts.

42,735. The Settled Land Acts enable the settlement money to be expended for this purpose?—Yes, they enabled what lawyers call, I believe, the land money to be expended for those purposes.

42,736. The same Acts enable the sale of only settled land and the expenditure of the proceeds upon improvements?—Yes, that is so.

42,737. (*Mr. Little.*) Without any condition as to repayment of the principal?—Without any condition as to repayment of principal in that case.

42,738. (*Chairman.*) There was no term of repayment?—There was no term of repayment in that case; the money might be expended.

42,739. Upon all these works?—Upon all those works, the object being to prevent encumbrances upon estates. That may be said to be one of the main objects of the Settled Land Act.

42,740. (*Mr. Clay.*) That Settled Land Act did not apply to Scotland?—It did not apply to Scotland, nor did the Limited Owners' Residences Act.

42,741. (*Chairman.*) I presume it was all subject to the inspection of the Agricultural Department. Did the Settled Land Acts of 1882 and 1890 provide that these improvements should be only undertaken with the consent of your department?—No; the Board may be called upon to perform certain duties as regards the approving of surveyors nominated by trustees, and certifying as to the reporting the expenditure of capital monies, but they do not necessarily control the expenditure of monies on these improvements.

42,742. Then what is the security under those Acts that the money is expended upon works which are beneficial to the estate?—The trustees can see that the capital money is expended properly, and they can certify that the works have been properly executed,

Mr. T. H. Elliott.
5 Mar. 1895.

and that the surveyor by whom the works are inspected is a competent person.

42,743. But there is no obligation on their part to come to your department?—There is no absolute control by any Government Department over operations under the Settled Land Act any more than in the case of a single individual.

42,744. Have they in fact in practice come to you?—Yes; especially for the approval of surveyors.

42,745. (*Mr. Little.*) Have they to submit a scheme to you for approval beforehand?—In applications for the approval of surveyors they describe the nature of the works and the estimated outlay, but they do not submit plans and specifications.

42,746. Do they not submit an outline scheme with the name of the surveyor who is to certify?—They do so in cases in which they wish us to certify that the works or operations have been properly executed.

42,747. I thought a scheme was always submitted?—Our requirements vary according to whether a surveyor is to be approved or the works are to be certified.

42,748. Have you not always to approve the surveyor?—I think not always, but we do approve of surveyors in a very large number of cases.

42,749. (*Chairman.*) The certificate of the surveyor is necessary under the Act?—For the protection of the trustees.

Improvement Act, 1864.

42,750. Then under the Improvement Act of 1864 the term of years over which repayment could be made was somewhat extended?—Yes, the term of years under the Improvement Act of 1864 was extended from 22 years, which it was under the Public Money Acts, to 25 years.

42,751. Several of these companies which advanced money for the purpose of improvements have been incorporated and have obtained private Acts, I believe, enabling them to lend money and to get priority of other charges with somewhat different terms?—Yes, there are four companies. The maximum term of years in the case of three of them is 25 years; and in the fourth case the term is 31 years.

Expenditure under Drainage and Improvement Acts.

42,752. Now what have been the financial results of these later Acts?—Perhaps in the first place I may put in a statement, showing the statutes now in force under which charges can be made on land for agricultural and other improvements, and the Companies Acts under which money is or may be advanced (*handing in statement, see Appendix A. XXVIII.*). With regard to the expenditure which has been charged on estates for different descriptions of improvements under the several Drainage and Improvement Acts, I may put in a table showing the expenditure for each year from 1873 to 1894 under each of the principal heads of improvements and drainage (*handing in table, see Appendix A. XXIX.*).

42,753. Would you state the effect of it?—During the years from 1873 to 1894 about a million and a half has been expended on drainage. The highest figure on drainage was 152,000*l.* in 1882; the lowest figure was 8,500*l.* in 1893. In 1894 the amount rose to 17,600*l.* Then as regards farm buildings, the total expenditure during the period I have mentioned has been 2,827,000*l.* The highest figure in any one year was 209,000*l.* in 1878, and the lowest figure 49,100*l.* in 1891; last year the figure was 71,000*l.* Then with regard to labourers' cottages, the total expenditure charged during the period was 725,000*l.* The highest amount charged in any one year was 68,300*l.* in 1876; the lowest amount charged was 8,300*l.* in 1890. The amount in 1894 was 17,700*l.* On embanking, the expenditure is comparatively small—50,600*l.* in the whole period. For roads 84,700*l.* was charged, the amount charged last year being very small indeed, 330*l.* Under the head of reclamation, the amount charged was also small —14,600*l.* during the whole period; for clearing, 15,500*l.* in the whole period; for planting, 48,620*l.* in the whole period. That item fluctuates very much, the largest sum in any one year being 8,688*l.* in 1885; in 1889 the expenditure was only 155*l.*; and last year 483*l.* I may say that the total figures for the last six or seven years are in every case very small, and very much under the average of the preceding years in the period.

Mr. T. H. Elliott.
15 Mar. 1895.

42,754. (*Mr. Giffen.*) What was the total expenditure in the whole period for all purposes?—Rather over 6,000,000*l.*, I think.

42,755. Then in the last five or six years the expenditure on every item has been less than in the period before?—Yes, I think that may be said quite broadly; there may be one or two exceptions.

42,756. (*Mr. Dalton.*) It would be so in the aggregate?—It would be so undoubtedly in the aggregate.

42,757. (*Chairman.*) It has been dwindling, in fact, since 1882, which appears to have been the year in which the largest amount was expended?—Yes. Looking at the figures broadly, I think that may be said.

42,758. It gradually fell off, and since 1886 it has been rapidly falling off?—Yes, but I should qualify that by saying that last year the amount was 151,000*l.* in excess of either of the three years, 1891, 1892, or 1893; but still, comparing the figure for 1894 with the years prior to 1891, it is very small, and the lowest on record, I think.

Expenditure on mansion houses.

42,759. (*Mr. Dalton.*) There is a very large expenditure on mansion houses in 1890; is there any explanation of that 77,000*l.*?—No, these amounts fluctuate; it is extremely difficult to say why the fluctuation takes place. One can only say that a landowner takes it into his head in a particular year to come to us for sanction to a particular charge.

42,760. But as a general rule of late years the mansion house figures seem to have been the only ones that have increased as compared with the preceding years?—Yes, I had noticed the fact to which the Commissioner refers, and I had wondered myself whether it meant that new people were taking old estates and spending, perhaps, money acquired commercially in the improvement of mansion houses. I think that cause may have operated to some extent.

42,761. (*Chairman.*) Of course, the expenditure of money on enclosures has fallen off in consequence of the almost complete cessation of enclosure; is that closening under the Enclosure Acts?—No, that is not closening under the Enclosure Acts, I should suppose; it would merely mean the construction of stone walls and work of that kind.

42,762. Do you know what the reason for the gradual falling off in this business has been?—I think the main reason has undoubtedly been the smaller amount of profit derivable from the improvements, and the increasing inability of landowners to further reduce their incomes by charging their estates for works of improvement. It has also been suggested that the operation of the Settled Land Acts has withdrawn from our cognisance moneys which would otherwise have come under our notice under the Improvement of Land Acts; but we think the reasons to which I have referred are probably the true reasons for the great falling off. Of course, to some extent, there is also less room for improvement; as drainage is effected there is less necessity for drainage; but still, I think, as far as I can ascertain, that a very considerable room for expenditure on some of these improvements, especially on such matters as labourers' cottages still remains.

42,763. This table does not include any expenditure under the Settled Land Act, does it?—It does not include any expenditure under the Settled Land Act.

42,764. This is only expenditure under the Land Improvement Acts?—That is so.

42,765. Which is specially certified by your inspectors?—Yes.

Loans for planting under Settled Land Act.

42,766. (*Mr. Little.*) Can these companies lend money for planting except for shelter?—Yes; in England the limitation as to shelter was removed by the Settled Land Act.

42,767. That is what I mean?—The limitation as to shelter in Scotland, was removed by a short Act which the present Board passed in the session of 1893.

42,768. (*Chairman.*) In point of fact the operations in that direction have been extremely small?—The operations in that direction have been extremely small. At the same time I may point out that it is not to be supposed that this table represents the whole expenditure on improvements of agricultural property. That, of course, is understood.

Mr. T. H. Elliott.

15 Mar. 1895.

42,769. Of course they spend their own private means?—Yes.

Expenditure on settled estates.

42,770. This is only an expenditure on settled estates where, in order to charge the estate, they have to come to you?—That is so, only not necessarily on settled estates, but on any estate on which money is to be borrowed and a permanent charge is to be made, having priority to existing charges.

42,771. So that in the case of a mortgaged estate which is held in fee by the owner, the owner might equally come under these Acts in order to get priority over the mortgage?—Quite so.

42,772. Then you have no data as to the extent to which the Settled Land Acts have been used for the purpose of improvements of this kind?—I will make inquiry on the point, but except as I have mentioned, it was not until 1886–7, that is four or five years after the passing of the Settled Land Act, that any substantial falling off in the amounts charged under the Act of 1864 was shown.*

42,773. I rather gathered that that has not been one of the main causes of the falling off?—That would be so; on the other hand it may of course be that the powers of trustees under the Settled Land Act were not fully known for some years; but I apprehend that there can be no doubt that the work of improvement has fallen off, owing to the inability of landlords to find money without a reduction of income which they could not afford.

42,774. (*Mr. Little.*) Still, whatever has been spent under the Settled Land Act would probably have been borrowed under these other Acts?—No doubt.

Charges of land improvement companies.

42,775. (*Chairman.*) What is the general charge which these companies make for advancing money to be repaid in 25 years?—I have had a table prepared for the information of the Commissioners giving particulars of each of the charges created on land under the different Acts during the year 1894. [*See* Appendix A. XXX.] I find that there were 199 of such cases, and I have classified them according to the rate of interest and the term of repayment. Out of these 199 cases there were at the rate of five per cent. five loans for terms of 31 years.

42,776. (*Mr. Little.*) Is that simple interest?—Five per cent. is the simple interest. Of course the resulting rentcharge is higher than that, because it includes the repayment of principal.

42,777. (*Mr. Giffen.*) What is the amount of the loans?—I have not summarised the amount of the loans. I only have them in detail.

42,778. (*Chairman.*) Do you know what the charge for 31 years would come to in that case at 5 per cent.?—Yes, the charge would be 6*l.* 7*s.* 7*d.* Then at the rate of 4½ per cent. there were 22 loans for 25 years, one loan for 22 years, two loans for 20 years, and one loan for 12 years.

42,779. What would the charge at 4½ per cent. for 25 years work out to?—The charge would be 6*l.* 14*s.* 1*d.*

42,780. Then the additional six years makes an important difference?—Yes.

42,781. Even though the additional rate of 5 per cent. is charged?—That is so.

42,782. Then if money could be lent by the State at 3 per cent. or under, that would be a very important reduction?—Yes. I shall be glad later on to give some details of the comparative cost. At 4⅜ per cent. there were 21 loans for 25 years; at 4¼ per cent. (a very common rate of interest) there were 57 loans for 25 years, one loan for 14 years, and one loan for seven years. Then at 4⅛ per cent. there was one loan for 25 years; at 4 per cent. (also a very common rate of interest) there were eight loans for 31 years, 63 loans for 25 years, one loan for 24 years, and one loan for 20 years. Then at 3¾ per cent. there was one loan for 31 years, and one loan for 25 years. At 3¾ per cent. there were six loans for 25 years; at 3½ per cent. there were four loans for 25 years; and at 3 per cent. there were two loans for 25 years.

Mr. T. H. Elliott.

15 Mar. 1895.

42,783. Will these companies lend at those lower rates of interest?—These are not all companies cases. There are cases in which the landowners have borrowed money from private sources. I think the most common rate at which the companies lend is 4 or 4½ per cent.; but the companies have made many loans at lower rates of interest than that. Of course a great deal depends upon the amount of the loan.

42,784. (*Mr. Little.*) They are competing companies?—There are four competing companies.

42,785. It is presumed that they lend at the price of the market, is it not?—No doubt they get as much as they can for their loans.

42,786. (*Captain Owen Thomas.*) Do you know of any cases in which the borrowers have failed to repay the money?—No, I do not. We have no record of the history of these charges after they are made. We sanction the charge and we know nothing officially after the charge has been made.

42,787. (*Mr. Little.*) They have had to foreclose in some cases and to sell the land, have they not?—I believe the experience of the Public Money Drainage Act, which was exceptionally good from a financial point of view, is not altogether inapplicable to the loans of private moneys. There may have been cases, probably there have been cases, of default, but these charges are accepted as very good security by those into whose hands they come.

42,788. (*Chairman.*) If there are four companies competing together for this work, the competition does not appear to result in very much business?—The competition of four companies is not, I should say, a very serious competition.

43,789. They divide the work between them and they do not appear to realise very much by it—the amount of work is very small?—Yes, I think that is so.

42,790. (*Mr. Giffen.*) I suppose the companies have other business—it is not their exclusive business?—I do not know that they have.

42,791. (*Mr. Dalton.*) Do you know what dividends they declare?—No, I do not.

Expenditure on improvements since 1847.

42,792. (*Chairman.*) Now look at your Table II. (*See* Appendix A. XXXI.) The aggregate of expenditure upon improvements from the commencement of the Public Money Drainage Acts in 1847, and under the Improvement Companies Acts, is considerable?—Yes; about 16½ millions of money.

42,793. Of which about 9 millions was drainage, and 4,700,000*l.* farm buildings, a million labourers' cottages, 430,000*l.* fencing, and so on; planting is represented, by the small sum of 93,000*l.*?—Yes.

42,794. Mansion houses by 566,000*l.*?—Yes.

42,795. Then apparently the great bulk of this was expended before the year 1873?—The great bulk was expended before that year.

42,796. The totals in 1873, judging from the previous table are comparatively small?—Yes.

42,797. It is not much more than 5 millions?—It is between 5 and 6 millions.

42,798. Of late you have had very few applications, I presume, for planting?—We have had very few applications for planting. Last year the expenditure sanctioned was only 483*l.*

Expenditure for planting.

42,799. I suppose the difficulty of making charges for planting is this: that for some years the owner would have to pay the charge without receiving any return for it?—Yes, that would be so.

42,800. Whereas in most of the other works, if they are beneficial to the estate, his income might be improved immediately to the amount of the charge. For instance, in the case of drainage I presume the owner would charge his tenant with an increase of rent equal to the charge which he has to pay?—He would either obtain an enhanced rent from his tenant, or, what comes to practically the same thing, he would be able

* Mr. Elliott subsequently wrote—

"I enclose a return, from which it appears that the estimated outlays on works included in applications, submitted to the Board of Agriculture for their approval of surveyors nominated by trustees, and the actual outlays, where certified by the Board under the Settled Land Acts 1882 to 1890, amounted in the aggregate to, 203,501*l.* in 1893, and to 201,121*l.* in 1894."

Settled Land Acts, 1882 *to* 1890.

RETURN of estimated outlays on Works included in Applications submitted to the Board of Agriculture for their approval of Surveyors, nominated by Trustees, and actual outlays certified by the Board, under the Acts during the years 1893 and 1894.

1893.	£	s.	d.
Estimated outlays	200,706	19	5
Outlays certified	2,883	13	2
	203,590	12	7

1894.	£	s.	d.
Estimated outlays	200,321	4	8
Outlays certified	800	0	0
	201,121	4	8

Mr. T. H. Elliott.
15 Mar. 1895.

to maintain his rent. A great deal of recent expenditure has been incurred in order to maintain rents rather than to obtain enhanced rents.

42,801. In order to avoid a reduction?—In order to avoid a reduction of rent.

42,802. That is equivalent to an increase of rent for that expenditure?—Yes, I should say so.

42,803. In the case of planting, the land is generally in hand, and there is no return to the owner for some years?—No, the return is much longer deferred—much more remote.

42,804. (*Mr. Whitehead.*) Does "planting" include the planting of fruit trees?—Yes.

Expediency and financial results of planting.

42,805. (*Chairman.*) Have you any experience in your department as to the expediency of planting—whether where it has been undertaken it has been beneficial; have you any return that has been made, or no?—I may say that a good deal of difference of opinion exists on that subject, but one view that has been presented to us by a competent authority is that in the case of planting, the amenities of the estate, are very much increased—that planting has a value apart from what one may call the actual produce of the timber, and that a well-timbered estate commands a higher price in the market, quite equivalent to the expenditure on the planting. That, probably, is in the experience of the Commissioners.

42,806. Have you any experience as to the financial results of planting apart from the increased value given to the estate?—No, I can hardly say that we have any experience which I should like to place before the Commission as to the results of planting. As I mentioned before, we never obtain information, nor can we well do so, from landowners who plant, as to the actual commercial results of the operation. That would be a matter upon which it would be better that the Commission should examine some expert in actual estate management.

Planting on Lord de Samaurez' estate.

42,807. There was a gentleman who was prepared to come and give evidence here, who acted as agent to Lord de Samaurez, who had obtained the sanction of your Board for charging his estate for planting about 400 or 500 acres, I think, of land. Unfortunately this gentleman has been unable through illness to come before us, I thought perhaps you might have some knowledge as to the result of that operation?—No, not knowledge which I should, I think, be justified in putting before the Commissioners. That would be a matter, on which it would be better that an estate agent—someone who has actually carried out work of the kind—should give evidence. A good deal of difference of opinion exists on the subject.

42,808. This gentleman told me that he had originally considerable difficulty in inducing your Board to sanction the advance, but that finally Sir James Caird had gone very carefully into it, and had been convinced that it would be beneficial, and that he had consequently sanctioned the expenditure, and that the result had turned out to be satisfactory?—Yes, I can understand that that would be the case, and I should suppose it would be the case in respect to the majority of the charges which we have sanctioned. Our view would be that every possible facility should be given to landowners for the purpose of obtaining loans for improvements and work of this kind, but of course it is very necessary for us in all these cases to emphasize the fact that the responsibility rests with the landowners themselves. It is one thing to give facilities and another thing to take the responsibility of recommending that those facilities should be taken advantage of in particular instances.

42,809. Yes, but of course you have to sanction the giving priority over other charges?—We have to sanction the giving of that priority, and that, of course, is the duty which we perform in each specific case which comes before us, on the report of an inspector as to the particular property to be planted, and the particular description of planting.

Mortgagees and expenditure on improvements.

42,810. (*Mr. Giffen.*) Do you give an opportunity to the people whose rights are postponed to argue the matter before you if they take a different view?—I am not quite sure. So far as I know mortgagees do not object to these improvements; at any rate no complaints on the subject have been brought under my notice.

42,811. (*Chairman.*) Notices, I suppose, are given to the mortgagees that charges are going to be made taking priority over their charges?—I am not quite sure whether that is the case.

42,812. Is that not so?—I do not think so.

Mr. T. H. Elliott.
15 Mar. 1895.

42,813. In practice you do not find that it leads to any difficulty?—No, I have never seen any protest from mortgagees with regard to these charges.

Advantages of State loans as compared with those of private companies.

42,814. On the supposition that the loans might be made by the Government instead of through those companies, would you compare what the relative advantages would be?—The matter seems to me to be one which may be considered from three points of view. First of all, that of the rate of interest; secondly, the period over which repayment should extend; and thirdly, the expenses attendant on the loan. With regard to the rate of interest it will be seen from a statement which I have put in that the rate of interest charged by the companies is in a large number of cases either 4½ per cent. or 4 per cent. At the former rate of interest the rentcharge payable half-yearly—say for 25 years—is 6*l.* 10*s.* 8*d.*; and at 4 per cent. 6*l.* 7*s.* 4*d.* per cent.; at 3¾ per cent. the rentcharge would be 6*l.* 4*s.* per cent.; at 3½ per cent. it would be 6*l.* 0*s.* 9*d.* per cent.; at 3¼ per cent. 5*l.* 17*s.* 6*d.* per cent.; and at 3 per cent. 5*l.* 14*s.* 4*d.* per cent. If, therefore, the rate of interest were reduced from 4 to 3 per cent. the reduction of the rentcharge would not be more than 13*s.* per cent.; but I do not think it probable that so low a rate as 3 per cent. would be accepted for Government loans, having regard to the rates charged for advances for other purposes.

42,815. I suppose the smallness of the difference arises from this; that an accumulation of the money for the purposes of repaying the loan at the end of the term, at the lower rate of interest bulks for more than the interest itself?—Yes, that is so. I may mention that I have made some inquiry as to the rates of interest charged by the Public Works Loan Commissioners for Government loans. The lowest rate charged to local authorities who desire to borrow for allotments and sanitary purposes is 3½ per cent., and for small holdings and working-class dwellings, 3¼ per cent., for terms not exceeding 35 and 20 years respectively.

42,816. When 2¾ per cent. Consols are very considerably above par there might be some argument in favour of reducing the amount still further, might there not?—I am not sure whether that has been considered by the Public Works Loan Commissioners, but of course the Treasury would insist, and properly so, on a sufficient margin between the amount at which the Government could borrow, and the amount at which the Government would lend. In connexion with several of these purposes, it has been the desire of the Government, I know, to lend money at the cheapest rate possible, and in the case of the housing of the working classes, the rate of interest is 3¼ per cent.

42,817. In what year was that provided?—In 1890:—The rate of interest is 3¼ per cent. not exceeding 20 years; 3¼ per cent. not exceeding 30 years, 3⅜ per cent. not exceeding 40 years; and 3½ per cent. for terms not exceeding 50 years.

42,818. I suppose in that case the increased rate of interest would probably dispose of the whole of the advantage of the longer term on the other side?—I do not think it would.

42,819. Not?—No, I do not think the increase of the rate of interest from 3¼ per cent. to 3½ per cent. would anything like dispose of the advantage of extending the term from 20 to 50 years.

42,820. (*Mr. Giffen.*) Can you tell us the reason why the rate of interest is increased when the term is lengthened?—It is always considered that a long charge is not so secure as a comparatively small charge, because as a matter of fact the position of the lender does not so speedily become secure in the former case, because a smaller amount of capital is repaid during the earlier portion of the term.

42,821. (*Chairman.*) Is it not intended rather to discourage the prolongation of the term; is that not the main object of the increase in the rate of interest?—That may be one object, but to take, for example, the case of a loan for 20 years, after five years the lender is in a very secure position, but if the loan is for 50 years he is in nothing like so secure a position at the end of one-tenth of that period; he has not been repaid so much capital, and he has not got the same margin of capital, in his own hands.

42,822. But of course 50 years is a very long term?—It is.

42,823. You are giving the different terms for 20, 30, 40, and 50 years in the case of the Housing of the Working Classes Act, are you not?—Yes.

Mr. T. H. Elliott. 5 Mar. 1895.

42,824. Could you put in a table showing what the charges would be for those terms at the different rates of interest?—Quite easily; I should be very glad to do that.

TABLE of the annual sums which will pay off 100*l.* with Interest by way of Annuity at the several Rates, and for the several Periods understated, calculated upon the basis of the Payments being made half yearly.

No. of Years.	Rate 3½%.	Rate 3¾%.	Rate 3¾%.	Rate 3¾%.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
20	6 15 3	6 16 10	6 18 4	6 19 10
30	5 3 2	5 4 10	5 6 6	5 8 2
40	4 8 0	4 9 8	4 11 6	4 13 4
50	3 19 4	4 1 2	4 3 1	4 5 0

42,825. (*Mr. Little.*) The Government lends to local authorities in Ireland at 3¼ per cent. for 35 years, does it not?—I have not the Irish tables with me.

42,826. (*Mr. Dalton.*) On the other hand, in the case of the insurance companies, when they lend the money, is it not the fact that they prefer that the rate of interest should be fixed for a long period?—I should have said myself that they prefer to have the charge for a reasonable period; they certainly object to very short periods, and they certainly object to very long periods.

42,827. Where they have had very long charges they insist, do they not, when the local authority desires to pay them off, upon very heavy compensation being paid to them on the ground that the rate of interest is falling, and is likely to fall, and that they prefer to have as long a period as they can for a fixed rate of interest?—Yes, but on the other hand, I think it is the general experience that where the term of years is extended beyond a certain point, a higher rate of interest has to be charged; that certainly is the practice of the Public Works Loans Commissioners.

42,828. (*Mr. Giffen.*) I am not quite satisfied as to this question of security. The reason of the less rate of interest for the short period is, that the loan is repaid earlier, and that there is better security, because, as I understand, all these loans are loans really of the most gilt-edged description, as far as the security is concerned, and not much turns upon the additional security, which you get by the loan being repayable early; there is still an enormous margin whether the loan is repaid early, or late?—There is still a margin, but having regard to the fact that 4 per cent. and 4½ per cent. are obtained by the companies, I do not think it can be said that the security is what is usually known as gilt-edged. 4½ per cent. is a very high rate of interest for a gilt-edged security.

42,829. (*Mr. Dalton.*) There have been no bad debts incurred under these Acts, have there?—That we should not know.

42,830. (*Mr. Little.*) In the case of a loan for drainage extending over 25 years, the improvement may have been entirely exhausted before the loan is paid off?—Yes. The cardinal principle to be observed is that under any circumstances the term must be, and ought to be, completed before the value of the improvement is exhausted, so that the term of years must have some relation to the character of the improvement done.

42,831. (*Mr. Dalton.*) You allow the same term, do you not, for all these improvements—for farm buildings for instance—the term would be the same as for drainage?—Not necessarily. The maximum term under the Act of 1864 is 25 years, but as will be seen from the statement which I made just now to the Commission, it frequently happens that the term allowed is less than 25 years. It depends upon the character the improvement.

42,832. (*Chairman.*) I think you said that one of the companies is enabled to give a term of 30 years?—One of the companies has a maximum of 31 years.

Loans for drainage.

42,833. And all that is subject to your sanction, I suppose; and in the case of drainage you would not sanction the charge for so long a period as 31 years?—I see that there are four cases in which a term of 31 years has been sanctioned for drainage; one case in which it was only 25, and another case in which it was 24 years, which shows that discretion has been used with regard to the particular work in particular cases.

42,834. (*Mr. Little.*) Does the drainage include arterial drainage, or is it all land drainage by pipes?—I have not the particular information before me, but I think it is usually land drainage by pipes.

Mr. T. H. Elliott. 15 Mar. 1895.

42,835. (*Chairman.*) Does your department consider that the value is not exhausted until 30 years afterwards?—I should not like to adopt any general principle, and I should not like to make any general statement. I can only say that we should always endeavour to avoid sanctioning a term of repayment which would extend beyond the term during which the improvement continued of value. I could not possibly lay down a general proposition that we consider a particular term of years desirable in the case of such an improvement as drainage.

42,836. At all events, in four cases you have granted a term as long as 30 years?—In four cases during the year 1894 as long as 31 years.

42,837. (*Mr. Little.*) It would depend very much upon the character of the soil?—Quite so; it would depend upon the particular circumstances present in the particular case.

Security for loans for improvements.

42,838. (*Mr. Giffen.*) You suggest that the security, a charge upon the land, is not gilt-edged on account of the rate of interest being as high as 4 per cent.; but would it not be the case in those cases, for instance, where you give a prior charge to existing mortgages, which would probably be for about one-half or two-thirds the value of the land, that the security is really gilt-edged, and that the difference in repayment would not practically make much difference in the value of the security?—It entirely depends upon the meaning which one attaches to the term "gilt-edged." As I know it, and as probably the Commissioner knows it, it is used with reference to bills of the very first financial houses which are discounted at perhaps 1 or 1½ per cent. One has no hesitation in saying that the security is a very good security, and I should hardly have used the expression "gilt-edged" myself in reference to it.

42,839. "Gilt-edged" is more applied to securities on the Stock Exchange than to loans of money for short terms where the rate of interest is regulated by different considerations?—Yes, I have heard it usually applied to securities of that class.

Term of years for repayment of loans.

42,840. (*Mr. Dalton.*) The security does not take precedence of tithe, I think, does it?—I think not. I should like, if I may, to give to the Commission figures showing how much more important a matter the term of years over which the repayment is to run is, than the rate of interest. I find that at 4 per cent. the annual charge for 25 years is 6*l.* 7*s.* 4*d.* for every 100*l.*, for 30 years it is 5*l.* 15*s.* 1*d.*, for 35 years it is 5*l.* 6*s.* 9*d.*, and for 40 years it is 5*l.* 0*s.* 8*d.*; so that an extension of the term from 25 years to 30 years, is, so far as regards the amount of the annual repayment, about equivalent to a reduction of the rate of interest from 4 per cent. to 3 per cent.

42,841. (*Chairman.*) Would your department be disposed to favour an extension of the present term in the case of buildings generally, roads, and so forth?—Yes, we are disposed to think that some longer term than 25 years might be allowed in the case of buildings generally, roads, railways, canals, docks, markets, and market-places, subject, of course, to the manner in which they are executed.

42,842. (*Mr. Giffen.*) Would that apply to labourers' cottages?—That would apply to buildings generally, including, of course, labourers' cottages. As to land drainage, it is perhaps doubtful whether it would be advisable to extend the time; there are so many contingencies likely to operate to the disadvantage of that class of improvement. Many things have to be taken into account; the work is hidden from view, and defects cannot therefore be detected so readily as in works above ground. In any case great care would have to be exercised by us in extending the term over which charges might run for works generally, so that it should not exceed the time when the work carried out might be considered to be exhausted.

Term of years for repayment of loans for planting.

42,843. (*Chairman.*) Now we will take the case of planting; would you extend the period there?—Planting stands in such an exceptional position that we are disposed to think that some exceptional arrangement might with advantage be devised. It is doubtful whether at the outset a longer term than at present should be allowed. The first 7 or 10 years is, I understand, the critical period of planting. If trees survive beyond the 10 years, then the term might very well be extended considerably beyond 25 years, and I think it is possible that some arrangement might be devised under which the term

Mr. T. H. Elliott.
15 Mar. 1895.

might be originally fixed at 25 years, and then, in the event of a satisfactory inspection by an expert at the end of 7 or 10 years, the term might be prolonged according to the circumstances of the particular case; but having regard to the precarious nature of the improvement during the first period, to the question of disease, and to the question of the survival of the trees, we are rather indisposed to suggest that at the outset a longer term should be given.

42,844. Would it not be almost more important in the case of planting to provide for the postponement of the commencement of the repayment of the principal, because during the first 7 years, as you have already pointed out, a landowner is getting nothing in return for his outlay?—Yes, but, as I understand it, in some cases it may be that at the end of 7 or 10 years the improvement would have disappeared, and practically there would be no value in it. In that case, of course it would have been very desirable indeed that a substantial repayment should have been made during the first 7 or 10 years.

Risks of planting.

42,845. (*Mr. Giffen.*) Does it happen frequently in the case of planting that there is no value at the end of the first 7 or 10 years?—Perhaps that is putting it too broadly, but I understand that during the first 7 or 10 years the improvement may be said to be in considerable danger. If the trees survive the first 7 or 10 years then there is a very substantial improvement, but during the first portion of the period the improvement is a somewhat risky one.

42,846. Have you any idea of the per-centage of cases in which the results turned out badly?—I could not reduce it to per-centages, but I am informed by experts in these matters that in a considerable number of cases the value substantially disappears, and that there is a distinct risk of loss.

42,847. There is no system of insurance against it, is there?—There might be a system of insurance against it; in these days insurance can be effected for almost anything; but whether landowners who planted trees have ever insured the value of the improvement I do not know.

42,848. On a landed estate where planting is going on in different localities on the estate the chances are that a failure would not occur in more than a per-centage of the places where the planting occurred?—Of course on paper that would appear to be so, but on the other hand the disease which has affected so many trees in this country in recent years tends to manifest itself in particular districts—the doctrine of averages might be upset by natural forces.

42,849. (*Mr. Dalton.*) The season would have some effect upon it?—Yes.

42,850. (*Mr. Little.*) It would depend on keeping out the rabbits in some places, would it not?—Yes.

Cost of planting.

42,851. (*Chairman.*) Do you know what, on the average, it would cost to plant, say, 10 acres of land?—No, I do not. That is a matter on which the Commission would be wise to consult an expert.

42,852. Of course there is the expense of trenching and things of that sort?—Yes, I presume that would be so.

Difficulty in extending time for repayment of loans for planting.

42,853. It seems to me that the main difficulty in the way of extending this business is the fact, especially in a time of agricultural depression, that the landowner has to meet the charge in the first seven years, and gets no repayment at the end of the seven years, or after a certain term he may get repayment by thinning the plantation?—Of course we are bound to contemplate an alternative, and that is, that he finds that his labour and money have been thrown away.

42,854. (*Mr. Giffen.*) And he does not get repaid for about 20 years, is that not so?—I should think even longer than that.

42,855. (*Mr. Little.*) On the other hand if you extended it much beyond 25 years he might cut down the whole of the trees, supposing they were larch?—Yes; but I think that could be easily provided against.

42,856. (*Mr. Clay.*) Is it not the case that when the landlords plant, the people who supply the trees and plant by contract are bound to keep up that plantation for two or three years?—I have not heard of that arrangement, but that obviously, to some extent, reduces the danger.

Cost of planting.

42,857. You do not know what it costs to plant per acre generally?—No, I do not.

42,858. Is it not between 4*l.* and 5*l.*?—I do not know; I am not an expert in such a matter.

Mr. T. H. Elliott.
15 Mar. 1895.

Effect of extension of term of repayment and reduction of interest on State loans.

42,859. (*Chairman.*) Is it your opinion, broadly, that if the terms of repayment were extended, and the rate of interest reduced by the amount loaned by the State, the joint operation of those two things would result in giving greater inducement for improvements?—Yes, I think so. I think a reduction in the rate of interest (although I do not think there is much room in that direction) plus the extension of the term of years, subject always to the condition I have mentioned, as to the duration of the improvements would render the work of improvement much easier in the hands of landlords.

42,860. Would there be any diminution in the expenses connected with it?—I think so, although the companies doubtless take into account the profit they derive from their commission, and have regard to their expenses in deciding at what rate of interest they will make their advances. But undoubtedly it would be possible for the Government to abstain from making any of those initial charges which the companies now make, in conformity with their powers in their Acts.

Advantages of State loans as compared with those of private companies.

42,861. Then the companies have liberty to recoup themselves, not merely by the rate of interest, but by charging for that operation, and for the expenses of the original transaction?—I think they must derive a substantial profit from that source, although of course they would probably say that the benefit which they confer in return is a fair equivalent.

42,862. Could you give any examples showing what reduction of expenses could be made?—I have had five typical cases taken out; four cases in which the money has been lent by the companies, and one in which the money was not lent by companies. In the first case for a loan of 1,214*l.* the companies charged 60*l.* 14*s.* 2*d.* for commission, and 2*l.* 17*s.* 9*d.* for office and registration charges; and the Board's expenses were 28*l.*, making a total of about 92*l.* In the second case, the company's commission for a loan of 1,000*l.* was 53*l.*; the company's office and registration charges were 3*l.* 12*s.* 6*d.*, and the Board's expenses and fees were 13*l.* 16*s.* 6*d.*

42,863. In the case of a loan from the Government, that 53*l.* might be saved, I suppose?—That might be saved, assuming, of course, that the Treasury did not think it necessary that fees should be charged sufficient to cover all office expenses. I think, however, that in any case there would be a saving, and that the expenses of a Government department would not be so heavy. But it is a financial question for the Treasury to consider, to what extent the person coming for a loan should pay for the expenses of the business conducted on his behalf by a Government department. We already charge fees in those cases for our services.

42,864. Would your expenses be largely increased if the loan was made by the Government direct, instead of through those companies?—I can hardly think that they would be largely increased. My impression is that whatever arrangements the Treasury might make for recouping the expenses to which the Government department might be put, the charges would be much smaller than those of the companies.

42,865. The owner would come to you direct instead of coming to you through one of those companies?—That would be so.

42,866. But the main function which you would perform would be exactly what you now perform, namely, certifying that the improvement is a desirable one, and seeing that it is carried out?—Yes.

Land improvement in Scotland.

42,867. Have you anything to bring before us about Scotland?—It has been suggested to us—and I think the matter is very well worth consideration—that with regard to the question of land improvements, Scotland is not in so advantageous a position as England. A representative of one of the companies which has powers in Scotland, has told us that they have many letters of inquiry as to whether they can advance money for the erection of mansions, and for numerous other works allowed by the Settled Land Act of 1882. The Settled Land Acts do not apply to Scotland, and the statement made to us is, that if they did there would be a considerable amount of money spent in those directions. We did extend, as I have already mentioned, the provision of the Settled Land Act, allowing money to be spent for planting, otherwise than for shelter, to Scotland in 1893; and at that time it was proposed that the list of possible improvements in Scotland should be further extended. The Bill then before Parliament was, however, a very limited one,

Mr. T. H. Elliott. 15 Mar. 1895.

and it was not possible to alter its whole character at that time, but we thought then that the whole question of Scotland did deserve consideration. Undoubtedly there are not as full facilities for improvements in Scotland at the present time, as in England and Wales.

42,868. (*Mr. Clay.*) Is it your opinion that the same law and the same privileges should be extended to Scotland as in England?—I think the matter is very well worth consideration. I believe some difficulties have been suggested, but it is a subject certainly quite ripe for consideration.

42,869. What are those difficulties?—They have not been precisely stated, and whether they really are substantial I should hardly like to say. My own impression is that they are not, but I should not like to go further than to say that I think the whole position of Scotland ought to be considered.

Loans for planting.

42,870. (*Sir Nigel Kingscote.*) Do none of those Acts apply to Scotland?—The Lands Improvement Acts apply to Scotland, but the Limited Owners Residences Act and the Settled Land Acts do not apply to Scotland.

42,871. (*Chairman.*) Is there anything more that you have got to say on this question?—I think there is nothing more that I need say.

42,872. (*Sir Nigel Kingscote.*) As regards planting, has the Board had applications for an extension of time to repay, simply on account of planting?—We have had no such applications; probably because the conditions of the existing Acts are so perfectly well known to the companies and to borrowers.

Diseases and insect pests.

42,873–6. (*Mr. Whitehead.*) You alluded to the diseases to which young trees were liable. I suppose you were thinking of the larch disease specially?—I was thinking specially of that disease, which seems to have been very fatal.

42,877. It is very fatal to young trees?—Yes.

42,878. Then there are also insect pests which are fatal?—Yes, there are insect pests which we feel very well deserve further investigation.

42,879. They would naturally attack trees in their youth, and attack them most seriously?—Yes.

Land improvement in Scotland.

42,880. (*Mr. Clay.*) As a rule, the Scotch proprietors have made a very liberal use of the Improvements Act, have they not?—I have not any classification of loans as between Scotland and England, but certainly a large amount of business is done in Scotland.

42,881. Have they not taken up more money proportionately for the general improvement of the land under the Drainage Act than England has done?—They took up a great deal of money under the Public Drainage Acts of 1846 and 1850.

42,882. More in proportion than what England has done?—Yes, I think so; they took a very large proportion of this four millions.

42,883. That shows that the Scottish landowners and tenant farmers have been very much alive to the benefit of draining, and in other ways improving their land?—We think that the Scotch landlords are always very much alive to their own advantage.

42,884. Would not the fact that the land is so very much improved be the reason why they are better able to meet the times than some of the English landlords and tenant farmers, whose land has not been improved?—I daresay that may be so. They have certainly shown great ability to stand the depressed conditions of the last 10 or 12 years.

42,885. I think I have gathered from you that you would like to see the Limited Owners' Residences Act, and the Settled Land Acts of England applied to Scotland?—There are certainly grounds for thinking that it would be desirable. The matter wants to be fully considered, and we want to hear what are the objections to it; we want to thresh out those objections. I have heard it suggested that there are legal objections, but I think the whole thing requires to be considered.

42,886. You have heard rumours of objections you say; what are the objections of these Scotch lawyers, do you know?—I am not prepared to answer that.

"Subscriptions to railways."

42,887. (*Mr. Dalton.*) I see one of the items in your list of expenditure for improvements is "subscriptions to railways"?—Yes.

42,888. Is that authorised by the general law?—It is authorised, I think, by the Improvement of Lands Act 1864; it certainly was authorised by the Settled Land Act.

Mr. T. H. Elliott. 15 Mar. 1895.

42,889. In what way do the owners take shares in projected railways?—Landowners take shares in projected railways which are likely to benefit the land served.

42,890. Has their doing so been beneficial do you think?—Yes, I think so. It is under the Act of 1864, "If a landowner desires to subscribe for shares in a railway or canal company, or in any branch, extension, or deviation thereof whereby his property will be benefited, he may apply to the Board to have the subscription made a charge on the lands so to be improved"; and when the work is completed, and the railway or canal open for traffic throughout, and the shares subscribed for, are fully paid up, and the certificates deposited with the Board, an absolute order is made charging the amount subscribed on the inheritance of the lands.

42,891. Would that apply to light railways, if they are made hereafter?—Yes, I do not think there would be any limitation of the term "railway company."

42,892. I see that those charges are postponed to the tithe; in your opinion is there any sufficient reason for that?—That is not a matter which I have considered, and I should like to have an opportunity of consulting our legal adviser on the subject. If it would be convenient to the Commission, I should be very glad to put in a memorandum explaining the position. [*Mr. Elliott subsequently wrote:*—"With reference to the relative positions of charges for advances under the Land Improvement Acts and of tithe rent charges, I may observe that the charges and incumbrances over which the improvement of land charges take priority under the 'Improvement of Land Act, 1864' and the several Companies Acts for the improvement of land, are charges and incumbrances on the land of the landowner, but tithe rent charge does not belong to the landowner, and he has no estate in it, and so an improvement of land charge is not allowed to take priority over tithe rent charges."]

Money advanced under Lands Improvement Acts.

42,893. (*Mr. Everett.*) In Table II. (*see* Appendix A. XXXI.), which you have put in, you show that some 16 millions and a half has been advanced under the different Acts. Of that money four millions is public money advanced by the Exchequer, and the rest has been found through the several land improvement companies under their special Acts, and by landowners themselves under the Improvement of Land Act of 1864, and the Limited Owners' Residences Acts?—Yes.

42,894. Is the money advanced under these Acts in any sense Government money?—No, it it not in any sense Government money.

42,895. Have you to be consulted in the borrowing of it?—Yes, we have to determine that the charge may, with propriety, be made a prior charge upon the estate, ousting of course other charges, as well as mortgage interest.

42,896. That is your place?—That is our *raison d'être.*

42,897. And there exist no Government funds now available to be loaned out in this way?—No Government moneys are available for loans.

42,898. The nature of these bargains entered into by those who borrow this money, is, to pay a certain quantity of gold every year for a long term of years, is it not?—That is so.

Effect of appreciation of gold on loans for improvement.

42,899. If it is the fact, as many contend, that gold has for the last 15 or 20 years been steadily appreciating in value, and is steadily pursuing the same course, have we not a very intelligible reason why it is unsafe for borrowers to enter upon these long contracts?—The contracts I should say are not very long, using the the term in a relative sense. The maximum period under the Act of 1864, is 25 years, and in many cases the term is shorter.

42,900. If, as many contend, the value of gold has increased 50 per cent. in the last 15 years, a term of 25 years might involve the borrower in an obligation double as heavy before he got to the end of it, as it was when he started?—Yes. Of course in regard to this particular matter the borrower would be in the same position precisely as any other borrower. If he has contracted to pay a certain sum in gold, the weight of the burthen upon him very much depends upon the question of the prices of commodities generally.

Mr. T. H. Elliott.
15 Mar., 1895.

42,901. We have had it testified before us, that farmers are very unwilling to take leases even for five or seven years now, and much less, therefore, are borrowers likely to be willing to borrow on what would be practically a lease extending over 25 or 30 years?—No doubt the experience of the last 15 years has made all persons interested in agriculture reluctant to enter into contracts for long terms of years.

42,902. And that fact of the appreciation of gold is having a very serious effect on the improvements through borrowed money which were going on prior to the current of this new course of events setting in?—I am myself not clear as to the extent to which the great change in the prices of commodities which has taken place, is due to the appreciation of gold. I should rather say that reluctance to enter into contracts for a term of years is due to the alterations which have taken place in prices in recent times, but as to the extent to which those prices have been affected by changes in the standard of value, and how far by other changes, I can hardly say.

42,903. You are aware, I daresay, that by legislation in a number of countries, in recent years, gold has been called upon to do the work which gold and silver in conjuction hitherto did?—I do not know that I should quite put it in that way, I am not an expert on currency questions, but I am quite aware that the statement of many currency experts is to the effect that the Commissioner has mentioned.

Repayment of State loans.

42,904. (*Mr. Dalton.*) When the Government advanced the money did they allow the borrower to repay it at any moment? The Public Works Loan Commissioners are willing at any time to take back the principal, but the insurance companies are generally very loth?—Yes, the rentcharge was redeemable.

42,905. At any moment?—Yes, by the owner.

42,906. Therefore, if he could borrow at a lower rate of interest, it would be worth his while at any time to pay it off, if the rate of interest fell?—I do not know whether that would be so; a good deal turns upon the terms of redemption, but I should suppose it would be so.

Expenditure under Settled Land Acts.

42,907. (*Mr. Little.*) You have said, I think, that you have no record at the office of the amount of money expended under the Settled Land Act?—My impression is that we have not, but I shall be glad to make inquiry on the point. (*See note to page* 321.)

42,908. You do not attribute the falling off of late years in the expenditure under the Improvement Acts very largely to the effect of the Settled Land Act, do you?—We have not done so hitherto; the view of those who are actually engaged in the administration of the Act is, that what is generally known as agricultural depression—the reduction of landlords' rents—has made them less able and less willing, to undertake works of improvement.

42,909. Your figures show that it was not until 1886 that a very considerable falling off in the expenditure took place; but would it not take three or four years for the landowners to become acquainted with their powers?—No doubt it would. I do not attach very much importance to the fact, but I should attach more importance to the general impression prevailing amongst those who are actually engaged in the administration of those Acts.

42,910. There was a difficulty at first, was there not, as to the powers of trustees; trustees had to be specially appointed, where trustees had no power of sale?—No doubt it took some time for the provisions of the Settled Land Acts to become generally known.

42,911. You are aware that very considerable sums have been spent under the Settled Land Acts?—I have no information on the point; I have heard very different opinions as to the operations under the Settled Land Acts.

42,912. One great inducement to spend capital funds under that Act, is, is it not, that there is no repayment of principal?—That is so.

42,913. The landowner gains by that?—That is so; on the other hand, of course, he may lose income by such expenditure.

42,914. Do you know what the cost of the application to the Land Commission is, under that Act?—There are certain fees. On the issue of the approval of the surveyor under the Settled Land Act, the fee payable is 10*s.*; on the issue of a certificate by the Board, of works executed, and of the amount payable by the trustees under the Settled Land Act, it is 5*s.* per cent. on the amount certified; and on the issue of a certificate by the Board, prescribing the maintenance of works, under section 28 of the Act, it is 1*l.*

Mr. T. H. Elliott.
15 Mar. 1895.

42,915. But it is only the first that is usual, is it not?—It is only the first.

Nomination of surveyors under Settled Land Acts.

42,916. Once you have appointed a surveyor, his certificate is sufficient security for the trustees?—Yes. I may perhaps state the number of nominations under the Settled Land Act. The number of nominations of surveyors approved and certificates issued under the Act by the Board were 55 in 1883; they rose to 114 in 1886, and 120 in 1887. Then in 1890, they were 128, and in 1891 they rose to 191; in 1892 to 205; in 1893 they were 190, and in 1894, 230. That would distinctly suggest that the operations under the Settled Land Act, in recent years, have been much above those in the earlier years.

Expenditure under Settled Land Acts.

42,917. (*Chairman.*) I suppose you have no idea what amount of capital is expended?—No, we have no record of that.

42,918. (*Mr. Little.*) You do not record the schemes which are laid before you?—In the cases where we merely approve the surveyor, I think we do not.

42,919. (*Chairman.*) Perhaps you will look and see, and if the schemes do contain any information, have them looked through?—I shall be glad to make inquiries, and put in a memorandum on the subject. (*See note to page* 321.)

42,920. (*Mr. Little.*) In some cases they have to go to the Court of Chancery, do they not?—Yes.

42,921. There you would have no information?—We should have nothing at all.

Operation of Land Drainage Act.

42,922. You have not given us any information as to the Land Drainage Act?—I had hardly proposed to give evidence on the subject of the Land Drainage Act, which is a question really of the powers of drainage conferred upon public authorities.

42,923. I was only going to ask you whether that had been largely made use of?—We have but little information on that subject. Since the Act of 1861 was passed we have constituted 13 Commissioners of Sewers over drainage areas of about 31,000 acres, and we have constituted about 30 separate drainage districts extending over about 68,300 acres.

42,924. Those would be elective drainage districts?—They are elective drainage districts.

42,925. Do Commissioners of Sewers appointed under your recommendation have the same powers as the old Commissioners of Sewers?—Most of the old Commissioners of Sewers are, I think, governed by private Acts.

42,926. The old Commissioners of Sewers are governed by the general law, are they not?—I am speaking of the County Drainage Commissioners.

42,927. I presume that the Commissioners of Sewers appointed on your recommendation have the general powers of Commissioners of Sewers?—That is so.

42,928. And the elective drainage districts have an entirely different constitution and rating power?—Yes, that is the case under the Act.

Repayment of State loans under Settled Land Acts.

42,929. (*Mr. Dalton.*) If it is right on principle not to fix a term for the repayment of money spent under the Settled Land Acts, why is it necessary to fix so short a term when money is advanced for the same purposes by the Government?—As I understand, the object of the Settled Land Act was to facilitate the removal of encumbrances on land, and to give powers of sale, so that, with a view to limit the estate and to remove encumbrances, a portion of the inheritance might be sold. The value of the inheritance was not in any way affected, but the inheritance was consolidated—concentrated, as it were—and freed from encumbrance.

42,930. But the benefit of the expenditure, according to the view taken in the other Acts, is of a temporary character?—Yes.

42,931. You are, therefore, parting with the inheritance for a temporary benefit?—Yes, but the tenant-for-life would have to keep up the property, and if he did not do so he would be liable to an action for waste.

42,932. (*Chairman.*) Supposing it is a case of drainage, it cannot be said to be waste if he refuses to drain, or neglects to drain, the land?—Not for neglecting to

Mr. T. H. Elliott. 15 Mar. 1895.

drain, but it would be requisite for the tenant-for-life to keep up and maintain the drains.

42,933. In the case of new drainage, as I understand it, under the Settled Land Act, the tenant-for-life would be justified in expending money which is settled with the land, but outside the land in draining the land?—That is so, and at the end of 25 years, the value of that drainage would disappear, and therefore the reversioner would not get the value of the expenditure unless it were perpetually kept up and maintained.

42,934. Unless it was afterwards done again at the end of the 25 years, the value of the drainage may disappear; that is a reason for the short term in the matter of Government loans, or loans through the improvement companies?—Yes. We have certain administrative duties under the Settled Land Acts, but I hardly venture to present myself for examination upon the Settled Land Acts.

Mr. T. H. Elliott. 15 Mar. 1895.

42,935. Perhaps you would look into that point, whether it is possible under the Settled Land Acts to advance settlement money for temporary improvements such as drainage?—Yes, I shall be very glad to do that. [*Mr. Elliott subsequently wrote that "drainage, including "the straightening, widening, or deepening of drains, "streams and water courses" is an improvement upon which capital trust money may be expended in pursuance of the 'Settled Land Act, 1882.'*]

42,936. Of course, if it is a question of building a mansion, or erecting farm houses, it may be considered a permanent improvement?—Yes.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Eighty-second Day.

Thursday, 21st March 1895.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., } *Joint*
Alan Mackinnon, Esq., } *Secretaries.*

Mr. De Rinzy James Brett called and examined.

Mr. De R. J. Brett. 21 Mar. 1895.

42,937. (*Chairman.*) I believe you are a large owner in the Argentine Republic in the Province of Santa Fé?—Yes.

42,938. And that you have been resident in the Republic for the last 35 years?—That is so.

Particulars of witness's farming.

42,939. Have you been engaged the whole of that time in the rearing of cattle?—I have been engaged all the time in the rearing of sheep and cattle, excepting the last two or three years, when I have given a good deal of attention to the growing of wheat.

42,940. What is the extent of your estate?—20,000 acres.

42,941. Is it within reach of a railway?—It is within 4½ miles of a railway.

42,942. When did you begin to grow wheat there?—Three years ago.

Increase in wheat cultivation.

42,943. Has the cultivation of wheat been largely extended within the last four or five years?—Within the last two years it has very much.

42,944. How do you account for the great increase during the last two years?—It is to be accounted for, to a great extent, by the land in the north of the province being worn out. The people from that part of the province have invaded us something like locusts, coming down in our direction, and taking up land near the railway. The land in the south of the province, where I live, is really the best land in Santa Fé.

42,945. Do I understand that the completion of the railways has induced a large migration of people?—Yes.

42,946. And as the population has increased, the cultivation has been directed more to the growth of wheat than to the rearing of cattle?—Yes.

42,947. When did this great increase of wheat cultivation begin?—I should say three years ago.

42,948. Is your district specially adapted for wheat?—Yes.

42,949. Is the bulk of the wheat grown by the Italian Colonists?—Yes.

Mr. De R. J. Brett. 21 Mar. 1895.

Colonists in Argentina.

42,950. Are there also Swiss and French Colonists?—There is a Russian Colony in our neighbourhood, but I know of no French and Swiss colonies: that is to say, colonies of those people; there are Swiss and French mixed up with the others.

42,951. Are the immigrants mainly Italians?—Yes.

System of produce-sharing with colonists.

42,952. What are we to understand exactly by the word "Colonists;" are they people who come and hire land, or do they buy land?—We call a colonist any man who comes along and takes up a certain area of land and works it.

42,953. Do they come and act as labourers, or do they cultivate the land for themselves?—They cultivate the land which they take up. They take up 400, 500, 600, and even up to 1,000 acres.

42,954. Do they buy the land or hire it?—They are hiring it now.

42,955. In the case of your own property, do you let land?—No, I work with the people on halves. I supply the machines, the implements, the animals and everything else; and I advance them food for a year, giving them a limited amount—so much a plough. Then I give them half what the land produces. I may say that I did not go in for wheat growing as a business. I only went in for it to make it a stepping stone for Alfalfa.

42,956. Is what you have been describing what is called the metayer system in the south of Europe; that is to say, do they hire the land from you?—No, they do not hire the land; they are given half of the net proceeds of the land which they work.

42,957. Each man has a definite bit of land?—Yes.

42,958. And then you supply the house and the cattle?—The house, the oxen, wells, troughs—everything in fact.

42,959. Then at the end of a year, account is taken, and they supply you with one half of the produce, is that it?—The whole thing is in my hands. I liquidate the whole business, and I give them half the profits.

42,960. (*Viscount Cobham.*) It is a profit-sharing business, then?—Yes.

42,961. (*Chairman.*) It is not exactly hiring, but it is something nearly approaching it. Is the agreement made for a term of years?—My contract with those people, and I am now speaking of a case in point, was rather peculiar, because I was the first to start it. I made a contract for three years; but, as a matter of fact, at the end of two years, I made a proposition to those people to work that same land for me, and put in it the seed which I gave them, I undertaking to pay them at the rate which the colonists made in three colonies that were around us, and also to pay them for breaking new land for me without sowing wheat at all at so much per acre. They all accepted it immediately, so I have sowed no wheat this year.

42,962. (*Mr. Channing.*) How much per acre?—Seven dollars paper in money for a square of four acres for one ploughing.

42,963. (*Chairman.*) How much land do these men take up?—They take from 400 to 800 acres, according to their means, and according to the number of people they have in their families who work.

42,964. Do they work themselves, and their families?—Yes.

42,965. Do they hire labour?—For the harvest.

42,966. But only for the harvest?—Yes.

42,967. And at other times of the year, only they themselves and their families work?—Yes; except at a busy season, such as when they are sowing or preparing a certain amount of land; then they might need a man, for which I should pay at the time; that is, I would advance them two or three months' wages for a man if it so suited me, but I am not obliged to do it at all.

System of cultivation.

42,968. Supposing a man takes 500 or 800 acres, how much of that would he cultivate in wheat?—He leaves 15 per cent. for feeding animals on, and all the rest is cultivated in wheat. My agreement was, for the first year Indian corn, and for the second year wheat; but I did not want any more taken out of the land than that.

42,969. At the end of the third year, what is done?—We put lucerne in in the third year.

42,970. (*Mr. Little.*) Permanently?—We lay it down permanently to grass then.

Nature of soil.

42,971. What is the nature of the soil?—We have got about a foot and a half of alluvial soil, with a mixture of red sand, and then, accordingly as we go down, it gets more sandy till we reach the water, which is down about an average of 20 feet.

Tenure.

42,972. (*Chairman.*) Is this arrangement that you speak of common in the country, or is it only one which you yourself have made?—There have been isolated cases of it.

42,973. What is the general tenure there?—The general tenure is that you give the colonist so much land and he pays you in time all the way from 9 per cent. to 18 per cent. of what he produces, according to his position and the distance from a railway station.

42,974. Then he does not pay in money?—As a rule the colonists pay in kind.

42,975. Then, as it were, the quantum of wages does not affect the matter; it is a certain proportion of the produce of the land which is given to the landlord?—That is it. He is obliged as a rule to deliver the produce at the railway station.

42,976. Is that the general system there?—Yes.

42,977. Are there not many cases where the cultivator comes in and buys the land himself?—There have been, but for the last two or three years that has gone off, because proprietors have not been inclined to take lower prices for their lands than they have been selling at previously, and of course the land has not been producing so well. So the system has changed to a certain extent. The old colonists all bought their land. There must be 100 or perhaps more colonies in Santa Fé of from 1 square league (9 square miles) to 20 square leagues, in which all the colonists have purchased their lands. There are large towns there, built by the colonists. You have got this anomaly there of two or three towns near Santa Fé itself, the capital of the Province, in which they do not speak the Spanish language at all. The Government were not interested in them and did not give them public schools, and so these people taught their children their own languages and were appearing as foreigners and passing as foreigners, a lot of them, and fought as foreigners in the late revolution there.

Mr. De R. J. Brett. 21 Mar. 1895.

42,978. However, the general system now is, as you say, that they do not purchase their lands but rent their lands from the larger landowners, paying a produce rent varying from 9 per cent. to 18 per cent. of the crop which they produce?—That is the general system to-day. It has been changed within the last two or three years.

42,979. Are the colonists a very hard-working class of men?—Yes.

Employment of women and children.

42,980. They and their women and children all work on the soil?—They all work, down to the children of 10 or 12 years old—they plough.

42,981. Do children as young as 12 years old actually drive the plough?—Yes.

42,982. Actually drive the plough?—Yes, children as young as 10 actually drive the plough. They have nothing to do but to drive the oxen.

42,983. (*Mr. Channing.*) The soil is very light, I suppose?—It is a very easily worked soil.

42,984. (*Mr. Lambert.*) How do they do about turning the plough?—There is a lever by which they raise the plough out of the ground.

42,985. It must be a very slight movement for a child to attend to?—It is a very slight movement—indeed, you can do it with one finger.

42,986. (*Mr. Little.*) Are they riding ploughs?—No, not with oxen; we do use gang ploughs, but with horses.

42,987. (*Mr. Channing.*) Do they not ride on the ploughs?—Those are the gang ploughs that they ride on.

Size of farms.

42,988. (*Chairman.*) How many acres can an average family, with a little assistance in harvest time, cultivate with wheat?—400 acres.

42,989. As much as 400, a single family?—Yes.

Produce per acre.

42,990. What would be the average produce per acre?—A matter of 15 bushels.

42,991. 15 to 16, or only 15?—15 bushels.

Sale of land.

42,992. Under this system, has the land been rapidly taken up in your district?—The land has been taken up very fast. In the district that I live in, they have sown a matter of 10,000 squares, of 40 acres per square, more wheat this year than last.

Cultivation of maize.

42,993. I no not quite understand why wheat has taken the place of maize?—Maize does not pay once you get 10 leagues, or 30 miles from the coast. The expense of handling it and drawing it to the railway station, and of the transport over the line is so much more on maize, that it does not pay once you get a matter of 30 or 40 miles from the coast.

42,994. The bulk being greater the handling is more expensive, and on the whole, therefore, wheat is the best crop to grow?—Once you get a distance away from the coast. All along the coast of the Parana it is nothing but maize; you do not grow wheat there at all.

Export of flour.

42,995. (*Viscount Cobham.*) Is any wheat made into flour for exportation?—They export flour to Brazil only. I do not think any flour comes here, though they produce splendid flour in the country.

Hire of implements, &c., on credit.

42,996. (*Chairman.*) Do these colonists obtain their machinery and implements from the storekeepers on credit, paying a certain percentage of the crop to be produced?—Yes.

42,997. If they cannot pay off in a year, is another year's credit given to them?—Yes.

42,998. Are the older colonists, who are owners of the land, generally in debt or not?—They are not at all in debt, they have all got money.

Labourers.

42,999. Is there any large class of labourers in the country who have not got land themselves?—No, there

Mr. De R. J. Brett. — 21 Mar. 1895.

is not a very large class of labourers, because, generally speaking, the industrious man who is good for anything is working on his own account.

43,000. He readily gets a plot of land?—There is no trouble at all in getting land to work.

43,001. Therefore there is no large class of labourers?—No.

43,002. (*Viscount Cobham.*) Are the natives any good as labourers?—When they are good they are very good men.

43,003. Is there any substantial number of them employed?—They are pretty well all coming into work now, the same as other people.

Importation of labourers for harvest.

43,004. (*Mr. Giffen.*) Is there not some importation of labourers from Europe who go back after the harvest?—Yes, a large number of Italians come every year for the harvest and the threshing season.

43,005. (*Chairman.*) And go back to Italy afterwards? Yes; and they have been carrying our paper money backwards and forwards to Italy for the last two or three years.

43,006. (*Mr. Dalton.*) What wages do they receive?—An average wage of about 2*s.* 6*d.* to 3*s.* a day.

43,007. In paper?—No, I am talking of gold. Two dollars and a half and food is about the average wage for common men, but when you come to a man who knows how to stack, or a man who can attend to a reaping machine, he will be paid about 1*s.* 2*d.* a day more than the average.

43,008. (*Mr. Giffen.*) For how long a time in the harvest does that go on?—It is not a good harvest with us that lasts more than 25 days. Taking it all together, the harvest, the threshing, and the gathering of a certain amount of maize, (for almost everybody sows some), 80 per cent. of these men are employed for a matter of almost four months.

43,009. (*Mr. Little.*) How many days in the week do they work?—Seven days.

43,010. (*Mr. Giffen.*) And it pays them better to go back to Europe than to stay on in the colony for the remaining eight months?—Evidently, it does.

43,011. (*Chairman.*) One does not quite see why they do not remain in the country when prospects seem so good to the cultivators?—You must always bear in mind that the prospects are not to-day as good as they were three years ago. There is not so much made by it now. A lot of those men might not be able to produce sufficient capital to buy oxen, or cows, or a part of their implements. Of course, the storekeepers will not trust them with everything. If a man who is working land has two or three yoke of oxen, and a plough, and so on, and is working, actually, he will have no difficulty in getting trust for a reaper and binder when the season comes along. Most of those men would require some little capital in order to start.

43,012. Or they must get the capital by working as labourers and remaining in the country some time?—Yes.

43,013. But many of them think that they will do better by going home after the harvest is over?—Yes.

43,014. I suppose there is no very great demand for labour after the harvest is over?—No, there is not.

43,015. Is there a great demand during the harvest?—During those 25 days there is a great demand.

43,016. But after the harvest is over there is no considerable demand?—That is it.

43,017. And these men go home because they find they cannot get work really as labourers the remainder of the year?—I do not know but that they might: perhaps a lot of them count on getting as good wages for their time in their own country as they would be paid in the off-time with us there now: because when you come to calculate the wages we pay now in gold, they are very low indeed—much lower than here.

Cost of wheat production.

43,018. At what price do you consider on these kind of terms can an Italian colonist produce wheat in your district?—An Italian colonist can sell his wheat at 4 dollars 25 cents.

43,019. (*Mr. Channing.*) Paper money?—Paper money—on the spot. He makes more money by that than any wage that he can earn in the country.

43,020. (*Chairman.*) Will you put that into sterling, because value of the paper money varies from time to time?—It actually comes to be an average of about 11*s.* per quarter.

Mr. De R. J. Brett. — 21 Mar. 1895.

43,021. (*Mr. Channing.*) On the farm without any cartage or anything?—Yes.

Cost of cartage.

43,022. (*Mr. Lambert.*) What does the cartage cost?—85 cents. paper will put it on board. I am speaking now of the district that I live in, which is a matter of 90 to 100 miles from a port.

43,023. How much is that in gold?—It would be from 5*s.* 6*d.* to 6*s.*

43,024. (*Mr. Channing.*) You said 85 cents.—that must be a mistake?—I am now calculating it all the way to this country.

43,025. 85 cents. is not so much as that?—No, it is not.

43,026. (*Chairman.*) You mean that it costs from 5*s.* 6*d.* to 6*s.* to send the wheat from your district to London?—Yes.

43,027. I suppose you are rather favourably situated?—There are a lot of places which are more favourably situated than where I am living. From where I am in those 100 miles there are at least seven or eight large colonies.

43,028. When you go further inland and further from the railways I suppose the expenses increase?—The expenses increase slightly, of course, but it is a matter of railway freight alone. There is a little extra expense in carriage by the railway; all other expenses will be equal.

Extent of virgin soil.

43,029. Now is there great room for further extension in that district?—Yes.

43,030. And in the Republic generally?—Yes, there is a very large amount of land untouched.

43,031. A very large amount?—An immense amount.

43,032. Is it being gradually filled up; is there a continual flow of emigrants there?—Yes, to our district; all along that line of railway there is a very large flow of agriculturists.

43,033. (*Sir Nigel Kingscote.*) Is it equally good land?—Yes, the land is very equal.

Extension of railways.

43,034. (*Chairman.*) Are the railways being extended or not?—At the present time, no.

43,035. Why is that—want of capital?—I should say that they find a certain amount of difficulty in England in raising the capital to extend the railways now.

43,036. The investment has not been of such a favourable character that people are induced to invest further sums in making railways, is that so?—I should say so. I think it is wise on their part too. I think we have got railways enough for the next quarter of a century, although the world moves very fast now. We are near the whole of them.

43,037. I suppose the building of these railways has been one great cause of the extension of cultivation and of the immigration of these people?—Yes; without the railways we should have done nothing. As a matter of fact I myself have turned cattle into about 400 acres of Indian corn which it was a pity to see them going into. That was on account of not having a railway.

43,038. Because you could not ship it?—Yes, it would not pay to gather it and ship it.

43,039. (*Mr. Lambert.*) What did you do with that cattle?—I sold them in the market afterwards.

Reduction in cost of wheat producing.

43,040. (*Chairman.*) Do you think the cost of production might still be reduced by the delivery of the wheat in bulk instead of in bags?—Yes; the bags cost a considerable price.

43,041. Are there elevators on the railways?—Yes, we have got elevators on our especial railway. We have only one grain elevator now on our railway; we had two, but one was burnt down, and the manager of the railway instead of spending 20,000*l.* or 25,000*l.* in reconstructing that elevator made sheds, because at that port—as happens at a lot of ports on the Parana—the banks are so high that they admit of ships being put under wooden shoots, so that you can load the ship without an elevator at all.

43,042. (*Mr. Lambert.*) Are not appliances coming into force so that you may dispense with bags?—We have had those appliances for a long time; I do not know how it is but the buyers stick to the bags.

Mr. De R. J. Brett.
21 Mar. 1895.

43,043. (*Chairman.*) Is attention being more directed in the Republic to the possibility of increasing the export trade to this country of live cattle?—Yes; you are actually receiving 10,000 sheep a month now.

Export of live cattle.

43,044. I believe you have come to England in connexion with that?—That is my mission in England.

43,045. Your own farm is mainly a cattle farm, is it not?—Cattle and sheep.

The rearing of stock.

43,046. Has there been a great importation of good blood for the purpose of improving the cattle in the Republic?—Very great; it has been going on for years.

43,047. What is the great advantage which the Argentine breeder has in rearing stock?—He has got no hand feeding of the stock at all and no housing; they forage for themselves.

43,048. And there is no necessity for erecting buildings?—None whatever.

43,049. The stock never require housing?—Never.

43,050. Nor hand feeding?—No.

43,051. Is the winter a very mild one?—If you compare it with European winters you can hardly call it a winter. We have only snow there once in 10 years, and we do not have it on the ground for more than an hour, except it happens to snow at sunset, then it will be there all the night, but it is gone in an hour the next day, and that, as I say, is once in 10 years.

Argentina in competition.

43,052. Do you think the Argentine Republic can compete with advantage with the United States and Canada in the exportation of live stock?—With the world, I believe.

43,053. Has the number of cattle and sheep greatly increased?—Not very greatly, because a lot of the owners of the fine inside lands, lands producing the fine grasses, have been overstocking, and they have made no preparation of leaving anything like land reserved as paddocks for feeding the stock in a bad time. They have had some pretty severe losses, but they are learning better now. That is the reason why the stock has not increased so much as it might within the last four or five years. We count something like 90 millions of sheep there, and from 25 to 30 millions of horned cattle.

43,054. Is the greater part of the country which is not under cultivation in wheat or maize devoted to some extent to cattle?—Yes.

Increase in land under cultivation.

43,055. I see in a report of Mr. William Gastrell, our Consul at Buenos Ayres, it is stated that there has been an enormous increase in the cultivation of land of late years; and that whereas in 1869 there were only 180,000 acres cultivated, "in 1891 the probable "area was 7,500,000, and this year it is doubtless double "that amount, or 15,000,000 acres." Do you think that that is an accurate statement?—Double the amount of what year? It is certainly not double the amount of last year.

43,056. Mr. Gastrell, I think, is comparing 1891 with 1895?—I have no doubt it is very nearly correct, then.

43,057. It is double the amount?—Yes, I have no doubt.

Area suitable to cereals.

43,058. Then he goes on to say: "The area esti- "mated to be suitable to cereals has been put at "375,000 square miles"? That must be very nearly correct now.

43,059. "Of which only 5 per cent. are now culti- "vated, so that there is practically unlimited room for "extension in the future. Stock raising now covers "most of that area and is not likely to be replaced by "agriculture to any great extent, except near railways "and water ways, especially as the price of wheat in "Europe has fallen so low as to leave but a small profit "now to the wheat grower, even here where land and "labour are so cheap." Do you agree in the main with that?—In the main I agree with it. But Mr. Gastrell, has forgotten for the moment that nearly all those lands within a certain radius are now within reach of ports, because we have got quite a number of lines of railway in that country now. If you take a radius of 14 or 15 miles on each side of a line of railway, you are not a very great distance from the 14 or 15 miles radius of another line.

Effect of low price of wheat.

43,060. He goes on to say that of the cultivated area, "A large portion of the increased acreage this year, "however, has passed under linseed on account of the "poor prices ruling for wheat in Europe, which make "the net profits so much below what they have been in "past years"?—That is so.

Mr. De R. J. Brett.
21 Mar. 1895.

43,061. With wheat at 18*s.* or 20*s.* a quarter, apparently the inducements to grow it are not so great as they have been in the past?—They are not so great. I have sold wheat myself at 10 dollars, but last year I sold it at 5 dollars 25, which is almost 50 per cent. off.

43,062. Would you say that it is better to produce cattle rather than to cultivate for wheat?—I think not, I think a lot of those people may combine the business, particularly those that have bought lands of their own. They might put a certain amount of the land into lucerne and cultivate a certain amount of it with various cereals, such as Indian corn, and with flax and wheat. Up to the present they have been working on the principle of putting all their eggs into one basket. The wheat was giving large returns, and so they were going for wheat altogether. It is about the easiest thing also to be handled, and it is the surest crop.

43,063. What you say would rather tend to show that the very low prices lately have tended to check the cultivation of wheat, and have induced the people to go into other things, such as linseed, and so forth?—I do not think it has up to the present, but in the future it may do so.

43,064. I thought you rather agreed with Mr. Gastrell, that "a large portion of the acreage this year "has passed under linseed on account of the poor "prices ruling for wheat in Europe, which make the "net profits so much below what they have been in "past years"?—In the old colonies, a fair amount has been put under linseed. The price of linseed this year has been very high; they have been selling it at about three dollars in gold, that is from 12*s.* to 13*s.* per 100 kilos.

43,065. Then I understand you that in the older districts, where the cultivation has gone on for some time, the inducement has been lately rather to substitute something for wheat, whereas in the new districts, where the colonies are extending, it is mainly wheat that is cultivated?—That is exactly the case.

43,066. Then wheat is the crop of the new comer?—Wheat is the crop of the beginners.

43,067. And the more rapidly the land is taken up the greater the growth of wheat?—Yes.

Price of cattle.

43,068. Now will you tell us a little more about the cattle; at what price in Europe can cattle be raised?—I am afraid you are encroaching on business now on which I cannot answer you with candour, because I am on a mission here at this present time with a view to exporting cattle from that country, and I cannot answer any question that would compromise my own business, naturally.

43,069. I am sure the Commission do not wish you to give any information which you think may be detrimental to your own interest; but if without going into any details of that kind you can say what are the prospects of the present position we shall be very glad to hear you?—I consider that we can land 90 stone cattle at Deptford in good condition at 13*l.*

43,070. (*Sir Nigel Kingscote.*) What age?—Three to four years old.

43,071. (*Mr. Everett.*) What stones?—90 stones of 8 lbs.

Veterinary examination of cattle.

43,072. (*Mr. Long.*) Have you any restrictions as to the health of your cattle, or any examination before they leave?—The restrictions are not needed, because we have got no unhealthy cattle there.

43,073. How do you know that?—Any man, of course, who has been a number of years amongst cattle will know when they are sick.

43,074. They think that in England too, but there are certain restrictions in England which sometimes reverse the opinion of the individual owner; have you got any restrictions as to the cattle before they leave your country?—Yes, they are examined by veterinary surgeons.

Increase in cattle, sheep and horses.

43,075. (*Chairman.*) I see Mr. Gastrell says: "The "estimated number of cattle, sheep, and horses are "now, perhaps, 25 millions, 80 millions, and 5 millions "respectively, as against about 17 millions, 71 millions, "and 4 millions in 1887," so that there has been a very considerable increase since 1887?—Yes, and the increase will be more now.

Mr. De R. J. Brett. 21 Mar. 1895.

43,076. (*Mr. Giffen.*) I understand that there is no export of live cattle at present?—Yes, there is, I have seen several lots landed at Deptford.

Frozen meat.

43,077. (*Chairman.*) This report says: "The exportation of live animals is greatly increasing, while that "of frozen meat is almost at a standstill"?—The frozen meat business seems to fail.

43,078. Why is that?—I do not know. The people here do not take to it. The employers of labour will eat it all right, but the labourers will not eat it; they are epicures in a way.

43,079. (*Sir Nigel Kingscote.*) Does that apply to mutton as well as beef?—Yes, so they tell me here; I do not speak from experience.

43,080. (*Viscount Cobham.*) That does not apply to New Zealand mutton and beef does it?—Not to the same extent to New Zealand mutton. The price it is sold at in the market will tell you.

43,081. (*Mr. Channing.*) Is that in any way owing to the greater cost of ice in the Argentine?—No, but the people here have got such an objection to frozen meat. It is a foolish objection which the working people have got, but it is a tremendous objection. They simply decline to take it.

Price of cattle.

43,082. (*Mr. Lambert.*) Do you think you can deliver fat beef here at 4½*d.* per lb.—that is the figure it works out to if you can sell 90 stones of 8lbs. for 13*l.*—and get a substantial profit out of it?—At that rate the profit would not be large. I am counting on a little more than that; I am counting on 14*l.* I am giving you an average of 13*l.* At 13*l.* the profit would not be large, but it would be a business that would pay at the same time.

43,083. That would be for cattle brought here to be slaughtered at Deptford?—Yes.

43,084. How long would they take on the voyage?—You could not call it less than 27 days, I suppose; it would not be safe to say less.

43,085. (*Mr. Giffen.*) What is the current freight upon the cattle that are brought now?—They are paying all the way up to 5*l.* 10*s.* per head and 11*s.*, 12*s.*, and 13*s.* for sheep.

Price of frozen meat.

43,086. (*Mr. Dalton.*) What is the price of the frozen meat delivered in London? I understood you to say the people will not take it except at a very low price?—I do not think the Argentine frozen meat is saleable in the Smithfield market in London, in quantities at over 2½*d.*

43,087. But it is cheaper to bring it over, I suppose, than to bring the live cattle over?—Much cheaper, but the live cattle are more saleable.

43,088. (*Mr. Lambert.*) It would pay better to get 4½*d.* per lb. for the live cattle than 2½*d.* for the frozen meat?—Yes.

43,089. You state in your proof that "a steer, three "years' old, can be raised in the Republic and sold "with a profit to the breeder at 3*l.* gold." Is that so?—Yes.

43,090. If the freight is 5*l.* 10*s.* does that not mean that you can lay down a steer at 8*l.* 10*s.*?—You are at liberty to draw any deductions you want or care to from what I have stated. What I have stated are facts, but I decline to go into the question of details; that is my business, the object of my mission here.

The currency.

43,091. (*Chairman.*) Has your business been much impeded by the difficulties of the currency?—No, it has not. The country as a rule loses, of course, by a depreciated currency, but individuals who produce more than they consume have a temporary profit, inasmuch that the man I paid 25 dollars a month to when the premium was only 100 I pay him 25 dollars a month yet.

43,092. Do you get paid in gold for what you sell?—The price paid me has got to be calculated, and I have nothing to do with it. I sell in paper, but they have to make the calculations on the gold basis. In the case of everything they export, of course, they must make their calculation on a gold basis.

43,093. You speak of temporary profits; what do you mean—that after a short time the other things adjust themselves?—No, they never really adjust themselves as long as the premium remains high. We never get more than 60 per cent. of the benefit of the premium, but if I produce, say, a thousand, and I only need to spend a hundred, I get an advantage, because I am producing so much more than I spend, and further on everything that I buy about 60 per cent. of the premium is charged me, and I pay my people for their work only what I paid them before when paper was at a par.

Mr. De R. J. Brett. 21 Mar. 1895.

43,094. Do not all those things adjust themselves after a time?—They have not up to the present, and I think it will be a long time before they do. The country generally loses by it, of course.

43,095. (*Mr. Giffen.*) Do you not pay gold prices upon all imported articles, and do you not lose as much in that direction as you gain in what you sell?—Importers have been doing a poor business; I do not import anything, but I buy on the spot for paper.

43,096. (*Mr. Everett.*) Your country exports a great deal more than it imports, does it not?—Yes.

43,097. Immensely more?—Immensely more now.

43,098. (*Chairman.*) You say the country loses by the depreciation of the currency?—I should say that all countries would lose.

43,099. Would you explain how that is; apparently, according to you, the producers temporarily gain; what is the process of reasoning by which you say the country loses?—I cannot go into that process of reasoning, because I am not strong on political economy; but I have always heard it said that all countries with a depreciated currency in the end lose. I have always heard that and accepted it as a fact; I presume that we can be no exception.

43,100. You believe it to be the case?—Yes.

43,101. You do not believe that this enormous increase of exportation and reduced imports, in the long run, is good for the country?—I would not care to go into that.

43,102. You would not express an opinion?—I could not go so far as that.

43,103. (*Viscount Cobham.*) Do you know the fare from Italy and back for a labourer?—I have been thinking since yesterday about that. I do not know, but I do know that it is very low for third class passengers, I am sorry that I cannot tell you what it is, though I came in an Italian steamer and might have known.

Hours of labour.

43,104. How many hours a day do these Italian labourers work?—As many hours as they get light.

43,105. It comes to a great number of hours then?—It comes to 16 or 17 hours in the harvest time; of course you must strike off that the time they have for taking their food.

43,106. What quality of wheat is grown mainly in Argentina?—It is a red winter wheat as a rule that they prefer. It is a rather small round grain; I think it was originally an Italian wheat.

43,107. What are its milling qualities in England?—It is very strong and contains a lot of gluten.

Exportation of flour.

43,108. Do you contemplate that in course of time much of the grain will be converted into flour before exportation?—I do not know that. I have got to make some inquiries about that here, and to ascertain whether it would pay to bring flour instead of wheat. A large miller, a French gentleman, who has got two very large establishments—the most modern in the country—asked me to make some inquiries. I have not made the inquiries yet. The flour that they make in Argentina is excellent.

43,109. Is it mixed in England generally by the millers?—I understand that there are millers in England who buy our wheat in order to strengthen the English wheat. Near the spot that I was born in there are millers who receive consignments of our wheat for that purpose.

Railway rates.

43,110. Do your railways at a distance from the coast carry at a very low mileage rate?—I am 100 miles from the coast and they charge on the ton six dollars 50 in paper money, or 65 cents a hundred kilos; we call a thousand kilos a ton.

43,111. Is that a very low mileage rate compared with the short distance rate?—It is a reasonably low rate, but it is not a very low rate.

43,112. Does the mileage rate fall with the distance?—Yes, it is a reasonably low rate—it is a fair average.

43,113. Are those rates sufficiently high to pay the railways?—That railway has been paying now.

Mr. De R. J. Brett.
21 Mar. 1895.

43,114. Generally speaking, is it the case that the railways are now paying fairly well?—As a rule yes. Of course the very high premium on gold is against remitting it here, but the railways have improved very much—all of them.

43,115. Do you think that the rates may still fall?—No, I do not think so.

43,116. They are quite as low as they can be?—I should think they are as low as they can be.

Railway rates and the gold premium.

43,117. (*Chairman.*) The railways, you say, lose by the high premium on gold?—Yes.

43,118. Do they raise their fare in proportion to the fall?—Yes, but they can never raise it to the full extent. They are not allowed to raise it to much more than half.

43,119. But they do raise it to some extent?—Yes, they do. Every week they adjust their gold premium. The Great Southern gold premium, for instance, is adjusted every week.

43,120. (*Mr. Everett.*) Do you mean that they adjust their fares only?—Their rates generally, both for fares and for freights. That is published every week—"This week up to such and such a date the premium "collected will be so much." The following week it may be 5 per cent more or 10 per cent. less.

Railway dividends.

43,121. (*Mr. Dalton.*) What dividends do they pay?—At the present time, I think, the Great Southern Railway is only paying 5 per cent.

43,122. (*Mr. Lambert.*) In paper?—In gold.

43,123. (*Viscount Cobham.*) Are they not guaranteed by the Government?—There are some of them guaranteed, but there are not many now; they compounded with some of them.

43,124. But some are guaranteed?—The guarantee was about being arranged when I left Buenos Ayres by the minister who had just gone in then.

43,125. (*Chairman.*) There appear to have been violent fluctuations in the value of the proper money?—Yes.

43,126. I suppose those are damaging to trade interests?—They are very damaging.

Quality of beef and mutton.

43,127. (*Viscount Cobham.*) How do your mutton and your beef compare with English mutton and beef?—Than our mutton there is no better in the world: not even the Welsh mutton.

43,128. And your beef?—Our beef is not so good. We have not arrived at the highest quality yet.

43,129. Is it improving?—It is improving very much.

Price of frozen meat.

43,130. How is it that Argentine mutton sells at so low a rate as 2½*d.* and 3*d.*?—That is frozen mutton.

43,131. Is it entirely owing to its being frozen?—Yes.

43,132. When you say frozen, do you mean chilled?—No, actually frozen. They have tried chilling it, but they have had to throw a lot of meat away by doing so.

43,133. It has not succeeded?—No.

Comparison with New Zealand meat.

43,134. How do you compare with New Zealand in beef and mutton?—Our mutton is just as good as New Zealand mutton. The beef I cannot speak about, as I have never seen any New Zealand beef.

43,135. (*Mr. Giffen.*) Does your mutton command as good a price as the New Zealand mutton?—Not, perhaps, quite as good a price, but that is natural—blood is thicker than water.

Fertility of the soil.

43,136. (*Sir Nigel Kingscote.*) You told us that the soil is a very good alluvial soil; is it likely to keep up its fertility for any length of time without having manures or any such things put upon it?—I think five years of wheat growing would be sufficient for that soil.

43,137. Has some of it deteriorated since you have been cultivating it; are you obliged to help it in any way?—No, we never help it. If we find that a plot does not produce well, we pass on to a new piece.

Land laid down with lucerne.

43,138. When it is wearing out for grain you lay it down to pasture?—Yes, with lucerne.

43,139. And then it is permanent?—Yes.

43,140. Do you never lay out any money upon it in the way of manures?—Never.

Mr. De R. J. Brett.
21 Mar. 1895.

43,141. (*Mr. Lambert.*) Will it continue to produce lucerne permanently?—I have been watching one piece in lucerne for 29 years, and it gives a splendid crop yet. In the neighbourhood of where I am living, there is a piece 11 years old, and it is certainly one of the best pieces of land I have ever seen.

43,142. (*Mr. Whitehead.*) Is that without manures?—No, you cannot call it without manures. You see the circumstances are changed altogether, because on those lands and paddocks we have our sheep running all the time. We do not bring them into yards at all. You get a lot of your manure in yards, and you are obliged to put it back on to the land, but we put it back on to the land straight from the animals. You cannot call that without manure. When you leave your stock out day and night you are manuring the land through the animals all the time.

43,143. (*Mr. Channing.*) You do not artificially feed the animals, I suppose?—No.

Climate.

43,144 (*Sir Nigel Kingscote.*) You told us you have no winter?—Practically none.

43,145. Have you suffered from droughts?—Yes.

43,146. Often?—No, not particularly so.

43,147. Does that lose you your grain crop or your wheat?—I have never seen a wheat crop lost by drought. Wheat is a grain that needs very little rain; I presume you are aware of that.

43,148. Have the cattle suffered from drought?—Our cattle and sheep have suffered a good deal.

43,149. Have you had any losses?—Personally, I have never had a loss in my life, but the people who do lose lose through not minding their cattle and through not taking measures to bring their cattle where there was grass on which they could live. We have always plenty of room for that.

43,150. (*Mr. Lambert.*) What is the heat there?—It is very warm from about the middle of December to the middle of February. Up to the 20th of February it is a bit warm.

43,151. What would you call "a bit warm"?—When it runs up to 94 and 95 degrees.

43,152. (*Mr. Everett.*) In the shade?—In the shade.

43,153. (*Sir Nigel Kingscote.*) During that time you have mentioned, when it is so very hot, are you obliged to employ any labour, or what do you do?—I have gone out at half-past four in the morning and come in when I could not see any more, just the same as when it is not so hot.

43,154. You have worked through?—I have worked right through.

43,155. You do breed, I suppose?—Yes.

Cattle, sheep, and horse breeding.

43,156. Is there much loss in breeding a large number of cattle, sheep, and horses?—Very little.

43,157. I mean when they are calves, or lambs, or foals?—Very little.

43,158. Is there no disease?—Practically speaking, there is no disease; scab in the sheep is all.

43,159. Are they very prolific: does not the hot weather affect them?—They are very prolific.

Improved breed of cattle.

43,160. Do you say that the breed of cattle is improving?—Very much.

43,161. Does that apply also to sheep?—Sheep have been improved. We have been working with English crosses for about 10 years, but before that we had in the Rambouille and the Merino as good sheep of that class as the world produced.

Quality of mutton.

43,162. I presume you are aware that the merino sheep is not a good sheep to eat, and I suppose you are doing what the Australians are doing, namely, trying to get out of the merino breed and to get into a better mutton sheep; is that so?—It all depends. I come here to England, and I consider that the sheep here are not good sheep to eat. It is a matter of taste altogether.

43,163. (*Mr. Lambert.*) Perhaps you get the Argentine mutton or the New Zealand mutton here?—No. I confess to you one thing that happens here. There is not a bad carcase of mutton which comes into this country which is not called Argentine, no matter where it comes from. All the tail end of the New Zealand, Australian, Canadian, and American mutton which comes here is every bit of it stamped as Argentine.

Mr. De R. J. Brett.
21 Mar. 1895.

43,164. (*Sir Nigel Kingscote.*) Is the importation of cattle and sheep and horses stopped now?—To a certain degree. I only know at the present time of one gentleman who continues it.

Importation of cattle, sheep, and horses.

43,165. Is that for want of money, or is it because they think there is no further good to be got by taking out these well bred animals?—It is due to want of capital.

Alluvial soil.

43,166. (*Mr. Whitehead.*) You speak of the land being chiefly alluvial. That would be merely in the valleys, I take it, would it not?—No, our best alluvial soil is on the hills.

43,167. Really?—Yes, the best in the district that I live in—and it is a very large district there—is on the hills.

43,168. The alluvium?—Yes. It is accounted for in this way; that it was not until a matter of 12 or 13 years ago that that part of the country was taken in. Where I am living now I have been in it when it was a desert. The ground on the hills was so soft that no rain ever came to run; it took all the rain like a sponge, and your horse would cover his hoof in the ground; it was so soft. The ground took up the heaviest rains like a sponge, so there was nothing ever running from the hills to the valleys.

43,169. Do you say that that kind of soil is practically unlimited?—It is unlimited.

Extension of railways.

43,170. You spoke of the railways not being extended and, as I understood, that that tended to decrease the cultivation of the land, is that so?—No. They have a lot yet to cultivate on the two sides of the existing railways. After that land is all taken up, if the railways are not extended of course it will have a tendency to decrease.

43,171. Will that affect the production of cattle?—No, I do not think it will.

43,172. Not to a corresponding extent probably?—I do not think it will. The fact of the matter is, I think, that the cattle will rather improve, because a lot of small holders there will have to go in for cattle and to farm on the European principle. A man who has got 1,000 acres of land, for instance, will have to apply a certain amount say to agriculture, and a certain amount to breeding horses, cows, sheep, pigs, or whatever he can make most of.

Cattle-breeding.

43,173. What is the particular breed of cattle that you find answers best in Argentina?—The short-horns.

43,174. Imported from this country?—Yes; to which we must come for everything good in the shape of horses or cattle.

43,175. Up till lately there has been a large importation of that kind of cattle into Argentina, has there not?—Yes, for the last 12 or 15 years.

43,176. From the best herds?—From some of the best herds.

Sheep-breeding.

43,177. With regard to sheep, what is the particular breed which has been imported?—We are crossing almost 85 per cent. with Lincolns.

43,178. Would that be on account of the wool and the large carcases?—Yes, it is the sheep that assimilates best with our Rambouillett and Negrete crosses.

Exportation of wool.

43,179. (*Viscount Cobham.*) The exportation of wool has very largely fallen off, has it not?—No, I think not.

43,180. I think the table in the Consular report shows a falling off of some 11 millions a year?—That is in value is it not.

43,181. (*Chairman.*) The quantity appears to have somewhat fallen off?—It may have done so, somewhat.

43,182. In 1889 it was 141,000 tons, and in 1893 123,000 tons; although in 1892 it was 154,000 tons. Perhaps, therefore, you might say that it has remained about stationary?—Yes, I should say so.

43,183. But the value has fallen off by more than 50 per cent.?—Yes.

43,184. (*Mr. Whitehead.*) The produce of wool is very important is it not?—Yes.

43,185. (*Viscount Cobham.*) Would the 1889 export represent mainly merino wool and the 1893 export a much larger proportion of English wool?—I would not say that even the 1893 export represented a larger proportion of English wool; I think there would be a larger proportion of merino wool even yet.

43,186. May we say a larger relative proportion in 1893 than in 1889?—Yes.

Mr. De R. J. Brett.
21 Mar. 1895.

43,187. (*Mr. Whitehead.*) Do you say that it is the want of capital which is causing the decrease in the importation of valuable stock from England?—Yes.

Importation of breeding stock from England.

43,188. In spite of the probabilities of the exportation of these live animals paying so well?—Very few people have got any conception of the possibilities of that business yet.

43,189. That is at present in the air to some extent is it?—No, it has been worked practically.

43,190. Do you think that is likely to attain to very large proportions?—It must be limited for this reason: That the River Plate can only afford a limited number of steamers. Purely cattle steamers can never go to that country and the cattle that are exported from that country must be carried on steamers that are plying in the general trade.

43,191. The question of transit therefore will stop it to some extent?—Yes, the exportation will be limited.

43,192. (*Mr. Lambert.*) Why cannot you get more steamers on the River Plate?—Because we cannot put the loading underneath them. In the States they can go to any port and be loaded up underneath the animals, but the number of steamers that can ply between this country and the Plate must be limited, because we have a limited supply of loading power from that country.

43,193. There are plenty of steamers?—Yes, but we have got nothing to put in them.

43,194. Do you want something as ballast, do you mean?—No, we want something that would pay.

43,195. (*Mr. Whitehead.*) With regard to swine, do you do anything in them?—Little or nothing; I may say nothing.

Linseed cultivation.

43,196. You spoke of the cultivation of linseed; that would be chiefly for the seed I take it?—It is for the seed altogether: the fibre is thrown away and burnt.

Cattle disease.

43,197. I think in answer to Sir Nigel Kingscote you said there is no cattle disease at all in the country?—That is so.

43,198. Is foot and mouth known at all?—We had some foot-and-mouth about 25 years ago, and I have never seen it since.

43,199. Then it has been in the country?—Yes.

43,200. And pleuro-pneumonia in the same way?—About the same time; it is 25 years ago or more.

Premium on gold and prices of commodities.

43,201. (*Mr. Giffen.*) I think you told us that your profit as a producer arises temporarily from the premium on gold; that you sell your produce practically for more paper than you did?—Yes.

43,202. And that at the same time you are not paying any more to your labourers substantially?—Yes.

43,203. I suppose that not only do you get more money for your produce, but the prices of other commodities, such as imported commodities, have all gone up in proportion to the depreciation of the paper?—No, not in proportion.

43,204. But to a large extent they have gone up?—They have gone up to a large extent—up to 60 per cent. perhaps, or a little over 60 per cent.

43,205. Have not the imported commodities gone up in proportion to the depreciation?—No, they have not. They have not gone up over 60 per cent., which proves one of two things; either that the importers are doing a bad business now and perhaps losing money, or that they were doing a very good business before; I cannot explain it otherwise.

43,206. Or possibly there has been a fall in the gold price of commodities elsewhere?—That may be too; that would of course assist.

43,207. As far as the depreciation of paper is concerned the prices of commodities must have gone up in proportion, or some people would be losing money?—Either that, or there was somebody gaining a lot more money than they ought to have been gaining before.

Labourers' wages.

43,208. I am quite satisfied with the statement that there has been a considerable rise of prices. Would not the inference from that be that as you are only paying the labourers the same money that you formerly paid them, the labourer is worse off than he was some years ago?—There is no doubt at all about that.

Mr. De R. J. Brett.
21 Mar. 1895.

43,209. That is the case?—There is no doubt at all about it.

43,210. Would there have been the same proportion of profit to yourself as a producer, if in any form the remuneration of the labourer had not diminished?—We have had a profit, and of course everything that comes out of his pocket just walks straight into ours.

43,211. Practically your profit arises, when we analyse it, from the diminution of the reward of the labourer?—Not exactly that; it is a factor, but it is not so much that.

43,212. Whereas the agriculturist in this country loses a profit because substantially the reward of the labourer has increased in the last 10 or 15 years?—There is something else to be added besides that; the value of the article produced has fallen.

43,213. But still when we analyse it, we find that the labourer is getting a larger share of the gross produce than he did before?—You pay your labourers well here; you pay them a good deal better than we do.

43,214. We find from what you tell us that the labourer is worse off in the Argentine Republic than he was some years ago?—There is no doubt at all about it.

Immigration to Argentina.

43,215. Then is it not the case that immigration into the Republic for settlement has diminished during the last few years?—It has diminished, no doubt.

43,216. Is there any immigration at all at the present time?—Yes; we had a balance, I think, of some 40,000 in our favour last year.

43,217. Some years ago you had 200,000, did you not?—Some years ago we had over 100,000, but there was a lot of that which was artificial. There were a lot of assisted passages then by the Government.

43,218. Who are the people who chiefly come for settlement; are they Italians?—Italians.

43,219. And Spaniards?—Yes.

43,220. Spaniards from the Basque Provinces?—Those are the best immigrants that we get in the country.

43,221. The Spanish?—The people from the Basque Provinces both from France and from Spain; the Spaniards particularly; they are the finest men we have got in the country.

Labourers' wages.

43,222. Would you not connect the fact of the smaller return which the labourer gets with the diminution of immigration into the country?—I have no doubt at all about it.

43,223. If wages were to rise to a point which would encourage immigration, you would not be able to produce quite so cheaply as you are doing now?—The matter of wages is not such a very great matter. I cited you a case to show that we are only paying in paper what we had to pay in gold. It is quite true that the employment of labour is not so very large. If wheat was a little better, or if those men had a little money and a lot of ambition, many of those men who go there would stop to work in the country; they would get plenty of people to give them all the land they wanted to work, and to assist them as well.

Production of wheat.

43,224. Do you anticipate that the production of wheat will always go on?—I think it must go on.

43,225. Even without much advance?—Yes.

Droughts.

43,226. Then with reference to what you said about drought in the country and the losses of stock in consequence; can you tell us whether there are any means of preventing or mitigating these calamities?—There are.

43,227. The drought is not a necessary evil?—It is not a necessary evil at all. When people learn to manage their places on intelligent ideas instead of working all the time from hand to mouth the difficulty will cease. As it is, as soon as they see a bunch of grass growing they want to put something to eat it, and so leave the ground perfectly bare all the time. So long as they do that they will always have droughts and always have losses. When that has happened a few times to them and they get the firm conviction that they must leave paddocks for certain seasons, then they will have no losses whatever. They need not have had any at all, but they have been crowding on to the land almost as many animals as could stand on it, and so naturally when a drought comes along anybody would know the result.

Mr. De R. J. Brett.
21 Mar. 1895.

43,228. Can you tell us anything about the freights on the river steamers from the neighbourhood of your farms to Buenos Ayres?—I cannot tell you anything about that, but I can tell you that the freights on the steamers are very low, as compared with railways, they are only about 50 per cent. of the railway charges.

Freight charges.

43,229. What about the difficulty of the steamers to which you alluded. The freights which must be paid to the usual steamers on the river would not apply to the conveyance of cattle and produce from Buenos Ayres to Europe, because at Buenos Ayres they can be put on any number of steamers they like?—No, they cannot. Our number of steamers must always be limited, because we have not got loading except for a limited number of steamers. We have only got one or two ports to load in, and we have only got loading for the holds of a limited number of vessels.

Limited freights.

43,230. That is out of Buenos Ayres?—Yes. One firm here, Lamport and Holt, have about 75 steamers in that trade, and Messrs. Houston have got several steamers, and there are several other lines running to that country.

43,231. Is there then a limited dock and harbour accommodation?—No, not that; we are limited as to the freight. We have only a limited quantity of material to send away in the steamers. They cannot send cattle steamers to that country as they do to the States. We have not got the wherewithal to load the steamers, so there must be always a limit. I think myself that the limit would be a matter of from 5,000 to 6,000 beasts a month. There is another thing, too, connected with that. They cannot send their 10,000-ton steamers there; such very large steamers cannot get within 100 miles of us. I do not think they can pass more than 6,500-ton ships. We were scraping the bottom coming out of La Plata on the 18th January with a 6,500-ton steamer. They cannot get within five miles of Monte Video. You will also understand that to load cattle they must go into a dock.

System of produce-sharing with colonists.

43,232. (*Mr. Clay.*) Is the share system between landland and tenant in farming increasing?—I think not, excepting on the lines of receiving a certain amount in kind as rent. But you cannot call that shares exactly; that is receiving a rental for your land in production, and not in money.

43,233. The owner of the land gets the produce, and he converts it into money?—It is not done that way. Where the man goes and you give him a piece of land which he works with his own family, and his own implements, and pays all his expenses connected with it, that man will deliver to you at the railway station all the way from 9 per cent. to 18 per cent., according to the contract, of what he has produced. But you have got no intervention at all in what he sells; it is his own, but he hands this per-centage over to you.

43,234. If he hands it over to you he hands the produce?—Yes.

43,235. And you sell it and convert it into money?—Yes.

Droughts.

43,236. Does drought affect you much in the country?—No, not particularly. For instance, I have stated that I have never seen a loss of wheat from drought. A maize crop I have seen lost from drought.

43,237. How does it affect cattle and sheep?—Badly, when it comes to those who act injudiciously and overcrowd their lands.

43,238. As in Australia drought brings very serious results?—It is not the same at all with us as with Australia. All over our country, at a distance of 20 feet under the surface, you have got good water, but in Australia that is not the case.

43,239. Have you artesian wells?—Not as a rule, but there are some artesian wells in the country. We do not need artesian wells for cattle or sheep. What we use are pumps with endless chains to draw the water. If the paddock is a small one we use an old Spanish means of drawing water by what they call a bucket without a bottom; it is elevated over two rollers by two ropes, and when it comes up it empties.

43,240. Is that worked by manual labour?—It is worked by a horse.

Probable development of wheat production, and of sheep and cattle.

43,241. As I understand from this valuable evidence which you have given, the production of wheat, and perhaps sheep and cattle, can be largely developed in your country?—Yes, very largely.

43,242. And you can lay the wheat down here at 18*s.* per quarter and have a profit?—Yes.

Mr. De R. J. Brett.

21 Mar. 1895.

43,243. Can the wheat land be developed in proportion to other things?—I think so.

43,244. The cultivation of the land is still open to the growth of these cereals?—Yes, we have only just begun.

43,245. Can the production of sheep and cattle be largely increased as well?—It can be very largely increased.

43,246. Has any of that produce gone to the States?—No.

43,247. You know they are a little afraid of your producing powers there?—According to the report which has got into the States they are. I saw the American Minister three months ago, and he was in a very big fright, and he has reason to be.

43,248. According to the evidence we have had here they are a little afraid that you will be their great competitors?—I beg your pardon, that is not the term; they are in a big fright; they are not a little afraid at all. I saw the minister who has been through the country, and gone through the colonies three months ago, in Rosario, as I tell you, and he was astounded.

43,249. (*Mr. Long.*) Who was?—The American Minister, Mr. Buchanan.

43,250. (*Mr. Clay.*) And you think that will really be a certainty?—There is no doubt at all about it.

Quality of sheep.

43,251. As I understand it, the quality of your cattle at the present time, and especially of your sheep, has been rather of a lower grade?—No, the sheep especially have been a good grade of the kind; that is the Rambouillet and the Negrete.

43,252. Have you been in the Metropolitan Market?—I have not been in the Metropolitan Market. It is necessary to find out whether the sheep you saw there, if they were bad ones, were Argentine or New Zealand sheep, because, unfortunately, everything in the shape of sheep that comes in, and which is bad, is all put down to Argentina.

43,253. What is the price of your sheep, dead weight, in the Metropolitan Market just now, do you know?—Imported alive into the country, and killed at Deptford they are 6½*d.* per lb. The best sheep that have been sold in Smithfield for three months were Argentine sheep; they were sold about a week ago by Mr. John Borthwick.

Frozen meat.

43,254. Is not 2*s.* 4*d.* per 8 lbs. near the mark for New Zealand meat?—That is frozen; I am talking of sheep that have been imported alive, and killed at Deptford.

43,255. But I am speaking about frozen mutton?—I should say it would be less than 2½*d.* a pound. New Zealand mutton is worth something more than River Plate mutton; that is to say, what they will allow to be classed here as River Plate mutton.

43,256. What is the general weight of a carcase of your sheep?—As to frozen mutton, I could not say.

43,257. What is the general weight of a carcase of your sheep dead, or frozen, or killed in the usual way?—It would be in the neighbourhood of 65 lbs.

43,258. 16 lbs. a quarter?—Yes.

43,259. I think you have just told us that you have not seen the sheep in the Metropolitan Market?—No, I have not been in that market.

43,260. So that you cannot speak from experience?—No, but I have been in Smithfield a great number of times.

43,261. Even with present prices you consider that you will be able, not only to increase the quality of the sheep, but to increase the quantity?—Yes.

Prospects of the British farmer.

43,262. So that if America is to be scared or frightened, what is the British farmer to do?—The British farmer has got a lot of things to do in a place like this; there are dairy farming, cheese making, poultry farming, fruit growing, and there are a lot of things that can be done in this country which the people will have to take to.

43,263. Have you carried out anything in the dairy department; in connexion with milk and butter for instance?—No. I was in charge of a dairy at one time on an estate that I managed, and it paid very well. I know it pays enormously here.

43,264. Could dairying and fruit growing be developed in your country?—Yes. There are a hundred things in our country which may be developed.

43,265. If you attack us on all sides, again I say, what is to become of the British farmer; will not the price of the land have to go down?—We do not think anything of fruit growing at the present time.

Mr. De R. J. Brett.

21 Mar. 1895.

43,266. Take the general exports of your country imported here; what is to be the British farmer's prospect?—I think it is dark.

43,267. I think Mr. Giffen put a question to you to the effect that our labourers wages are higher than with you; bearing that in mind, what position will the landlord and tenant be in in this country?—It is not encouraging to think of it at all.

43,268. How do you think they are to be helped?—I do not think they can live and pay taxes. Are you coming to that? If you would allow me to presume an opinion now, I will say that I do not think they can live and pay taxes at any rent and compete with us in growing wheat and cattle.

43,269. Do you consider that you can develop your trade in wheat and cattle so much that it will bring the British farmer to be scarcely a payer of taxes and rates?—I think so; it looks like it.

Taxes.

43,270. (*Mr. Gilmour.*) What taxes do you pay out there in the way of local taxation?—Our taxes are very light. The landed proprietors pay a direct contribution. I use the words "direct contribution" as a translation of the Spanish term. It is a direct tax on the land; but it is very low. The valuations are low and the tax is low in itself; it is five per thousand.

43,271. Do you call it a land tax?—Yes, it is a land tax, and it is only paid by proprietors.

43,272. (*Mr. Everett.*) Is it paid on the capital value?—Yes. It is four per thousand to the Government and one per thousand to the School Board.

43,273. (*Mr. Gilmour.*) What other rates are there to carry out local matters?—On the carts you have got to pay what they call a patent—it is a tax of so much.

43,274. Is it a sort of wheel tax?—Yes. For your marks on your sheep and cattle you have got to pay a patent also. Those are all the taxes with us.

43,275. I think you said that a family could cultivate 400 acres of wheat?—A family in which there were four workers.

Wheat cultivation.

43,276. Is the wheat sown broadcast?—Yes.

43,277. Then is the wheat threshed immediately after harvesting?—Yes.

43,278. Can you always depend upon good harvest weather for the necessary time?—Yes; at that season of the year you can almost to a certainty depend upon it.

Profit on wheat production.

43,279. The rate that you gave us was 15½ bushels to the acre, and 11*s.* an acre, I think you said, and you get, as I understand, half of the produce?—Yes.

43,280. You advance all these different things you have enumerated; food, I think you said, and all the implements?—Everything needed for the work.

43,281. Does that 11*s.* an acre give you a good return for your capital invested?—Yes; that gave me a return of 15 per cent., besides the advantage of having my land prepared to receive Lucerne seed.

43,282. Do these people repay you at all besides for any share of the food that you give them during the time?—Yes, they pay me for everything; it is all charged to them. Every advance I make to them I collect it from their share of the crop. If I pay a man for a month or two when they are busy sowing I charge it to their account. A certain sum per month is given to each adult that can work and plough to support himself, and that is all deducted from their half.

43,283. Have you ever calculated what is left to the farmer after everything is deducted?—He gets very good wages for his time; that is for the first year, mind you. If he goes on and fulfils his contract for the three years, his expenses are very much less after the first year in the tilling of the land, because the land once broken there is no trouble at all in tilling it.

43,284. Is the work done during the season—putting aside the harvest altogether—by the members of the man's family?—Yes.

43,285. And a man who has to employ labour, and who has not a family, in what position is he?—He will not be in nearly as good a position as the man with a family.

Mr. De R. J. Brett.

21 Mar. 1895.

43,286. He would really get nothing but his clothes and food, I suppose?—That is all.

Horse breeding.

43,287. What are you doing in the way of crossing horses in your part of Argentina?—Just where I am now there is no horse-breeding establishment, but in the province of Buenos Ayres there are quite a number. We are crossing with Clydesdales and Shires, and there are a lot of racing studs and thoroughbreds. Of course you know that Ormonde visited us there for a short time.

43,288. The crossing of the native mares down near Buenos Ayres is for street purposes chiefly, is it not?—Yes.

43,289. In the country districts you use just the native horse—I do not know what you call them—bronchos, is it?—No; criollos.

43,290. What class of horse is that?—It is a small and very handy and very hardy horse, running as a rule about 14 hands and 14 hands 2 inches high.

43,291. Are they bred on the prairie with the stallions running with them?—Yes.

43,292. Have they weight enough to do the ploughing?—No, we do not use them at all for ploughing.

43,293. Do you use oxen altogether?—We use both horses and oxen. We use horses with the gang ploughs, but for those we buy horses with a little weight in them; we buy Clydesdales and Shires for that work. These criolos are too light for that work; and they are also too light for heavy carting; there is not enough weight in them to resist the weight of the load.

43,294. So that the same remark would apply to the importation of Shires and Clydesdales as would apply to shorthorns, namely, that when times get better the pedigree trade will improve in your opinion?—I have no doubt at all about it.

Cattle disease.

43,295. (*Mr. Long.*) You referred to your cattle just now, and you told us that their health was very good; has there been to your knowledge any pleuro-pneumonia among the cattle in Argentina?—I have known of none for 25 years. Mind you, I will not say there has not been any, but I have known of none for 25 years, and there has been nothing at all general. There may have been an isolated case of an imported animal, or something of that kind, but it has been stamped out on the spot; there may have been such a case.

43,296. Are there any Government precautions which have to be taken if there is a suspicious case?—Yes.

43,297. Can you tell us what they are?—The animal is cremated, and so is everything about the place where the animal has been.

Importation of meat to England.

43,298. I understood you to say that you are perfectly content to import your animals into England subject to slaughter at the port?—Yes.

43,299. You are quite content with the profit that you make if you can get the animal to the English port and have him killed there, and distributed as dead meat?—That is it.

43,300. You were naturally unwilling to tell us what profit you would have upon those imports?—Of course, that is natural.

43,301. But you indicated that at 13*l.* to 14*l.* the profit would not be a very large one?—No, at 14*l.* the profit would not be a large one.

43,302. (*Mr. Lambert.*) What about 13*l.*—I think you said 13*l.*?—Yes, I did.

43,303. (*Mr. Long.*) As I understood, you said it was possible to do it at 13*l.*, but you contemplated 14*l.* as the price?—Yes.

43,304. If the profit is to be so very small at 13*l.* to 14*l.*, what is the object of the Argentine people in having meat sent here at such a very low price?—It is not the Argentine people who are doing it.

43,305. What is the competition that you have to meet; is it the competition of the New Zealand meat?—Yes, and the States meat also; there are live animals from the States.

Importation of live American cattle.

43,306. Surely the live animals from the States which are landed here—and I have seen a great many of them repeatedly—are not 90-stone bullocks, three years old, and of good quality?—A lot of them are.

43,307. Not the majority of them, are they?—The majority of those I saw at Deptford were. I have paid three visits to Deptford. Is it very long since you saw them? Of course it is 8 lbs. to the stone, mind you.

Mr. De R. J. Brett.

21 Mar. 1895.

43,308. I know. They land a great many at other ports besides Deptford?—I can only speak of Deptford, because I have been there. I have paid three visits to Deptford to see Argentine and American cattle. I saw American cattle there, than which there are no better breed in the world.

43,309. A good quality of meat?—Yes, and there are none better bred in England. There is a reason for it; they came here 15 years ago, and bought a couple of your best herds.

43,310. Then they were selected lots?—No, they were two or three lots that I saw of de-horned cattle as they call them.

43,311. You say a special reason for their being so good was because the Americans came here and secured good blood some years ago?—Yes, and they have been crossing ever since. They came from Maryland and Kentucky.

43,312. That is the best part of the world for them?—Yes.

43,313. After all you selected the two choicest spots?—Yes. They were sold at 18*l.* 10*s.*, and they cost 13*l.* 10*s.* where they were grown.

43,314. They made 18*l.* 10*s.* here?—Yes.

43,315. What are the cattle that are driving yours down to such an extraordinary price as 13*l.*?—There is nothing driving us down, but we can do it at that price.

Quality of American and Argentine cattle.

43,316. I imagine you are like other people, you can do it, but if you could get more money you would not be averse to taking it, would you?—Our quality is not to be compared for a moment with the quality of the States.

43,317. It is not so good?—It is not so good; it will take us 10 years to breed up to it. These were perfect cattle that I saw from Maryland and Kentucky.

43,318. And they made 18*l.* 10*s.*?—Yes.

43,319. That we have no objection to, but if you can put cattle into the market which could compete with ours in quality and condition at 13*l.*, that will be very serious?—They cannot compete in quality at all.

43,320. Or at 14*l.* it would be a disastrous blow to our trade?—They cannot compete in quality.

43,321. (*Chairman.*) I rather gathered that that was so; as I understand you, it will take 10 years to get up to the average of the Americans?—At least. There are a few isolated cases of gentlemen like Mr. David Sherman and Mr. John Fair, who have got establishments in which they have been breeding for a very long time. They can send a limited number of very good high class animals.

43,322. At the present moment your cattle at 13*l.* or 14*l.* are about on a par with the American cattle which are selling at about 18*l.*; is that it?—There is not much difference.

43,323. (*Mr. Long.*) Do you contemplate by the end of this 10-years period that your power of exporting cattle will be improved by the quality of the cattle getting to the 18*l.* standard, or that it will remain at the 14*l.* standard?—No, it will not be at the 14*l.* standard at all; I hope that we shall reach the 18*l.* and more. As a matter of fact, Argentine cattle have been sold here at 19*l.* 10*s.*, but then, one swallow does not make a summer, and that is an exceptional case.

43,324. I want to get from you whether you contemplate, with all your great experience as a breeder and raiser in Argentina, that a man will be able to breed and prepare for the market, and export a good quality of beast of fair weight, and sell him at a profit in this country at 13*l.* or 14*l.*?—Yes.

43,325. Such a beast as the Americans?—No. The price will have to go up when we get to that, because the higher we go in our class the more it will cost us. It will cost us something in the next 10 years to better our cattle.

43,326. Precisely, and therefore if you are to retain the interest you hold now for relatively the much better article which you hope to have you must improve your price?—Yes.

43,327. Therefore you do not contemplate competing with the English cattle at a price of 13*l.* or 14*l.*?—No, not at all.

43,328. That makes all the difference in the world, of course?—Yes.

43,329. (*Mr. Lambert.*) Will it pay when you have improved their quality to send them over here at 13*l.*?—Distinctly not. You must always take into consideration that we are a greater distance away than the States, and that there is a great difference in the freight. Though our passage is like taking a sea trip on a lake, except the Bay of Biscay, yet we are twice the distance away.

Profitable price of wheat.

43,330. (*Mr. Long.*) I understand you to put the price of wheat which would remunerate you at 18*s.* a quarter?—Yes.

43,331. How would it be at 16*s.*?—That would be a bad business then. I think there are a lot of people, those Italian Colonists who have settled in the country, who are committed to growing wheat, and who would have to continue, but it would be a matter of their living and leading an independent life, and working pretty well for what they would eat and wear if you took it down to 15*s.* or 16*s.*

43,332. The price of wheat in England, as you know, is not an indication of the actual price of that wheat to the grower, because as you are probably aware the English farmer consumes now, owing to the bad price, almost as much wheat as he puts into the market; do you know that there has been such a revolution of the wheat in this country?—I have heard that they were giving wheat to their animals.

43,333. Are you aware that there has been an enormous decrease in the area under cultivation in wheat in this country?—Yes. I thought, without anybody telling me, that that would be the case, because from what I know of these countries I do not think they can produce the wheat at the rate, and naturally I thought the people would not sow it.

The position of the British farmer.

43,334. I could not quite understand why you should take that most remarkably despondent view of the British farmer's position, that he can hardly live and pay his taxes in the face of this competition, because if you have to keep up the price of a bullock at 18*l.* 10*s.* we can pay our rent, rates and taxes at 18*l.* 10*s.* for a bullock; and the wheat question at 18*s.* a quarter has practically ceased to be a factor in England?—Very well. I do not say so with regard to cattle farming, dairy farming, and those things, but I do say it with regard to wheat-growing, mind you.

43,335. Your remarks only applied to wheat-growing?—Yes.

43,336. They appear to be more general?—I do not think I said anything else, and if I did happen to say otherwise it was a mistake.

43,337. You meant that to apply solely to the wheat-growing farmer?—Yes.

Effect of cost of producing Argentine wheat on prices.

43,338. (*Chairman.*) Do you consider the fact that in the Argentine Republic wheat can be grown at 18*s.* does determine at this moment the price of wheat in the market? Do you understand my question?—I am not exactly with you.

43,339. You have told us that there has been a very great increase in the cultivation of wheat in the Argentine Republic?—Yes, I estimate about 20 per cent.

43,340. And that there has been a great increase in the export of wheat?—Yes.

43,341. All within the last three or four years?—Yes.

43,342. You have told us also that wheat can be produced in your country from 18*s.* to 20*s.* per quarter?—Yes.

43,343. Do you consider that it is the great increase in the growth of wheat in your country, and the very low price at which you can produce it which have determined the price in the market here?—I think so, undoubtedly.

43,344. That is the main determining factor at this moment in the very low price of wheat, namely the very low price at which it can be produced in the Argentine Republic?—Yes.

Continuation of low prices.

43,345. Do you think it is likely to continue, or will there be other circumstances which may come, and which may tend to raise the price even in the Argentine Republic?—I think it is likely to continue.

43,346. Is it not possible that the superior profits which can be made in cattle and other things in the Argentine Republic may make a change?—The mass of the people occupied in the wheat growing are not in a position to go in for cattle farming. There is practically no cattle farming in that country with less than 1,000 head.

Mr. De R. J. Brett.
21 Mar. 1895.

43,347. Then as cultivation increases they must go on growing wheat?—Yes.

43,348. Therefore you consider the low price is likely to continue because of this increase in the Argentine Republic?—It is my opinion.

Future increase in cattle and sheep.

43,349. (*Mr. Dalton.*) Is there enough land in Argentina to enable a great increase to take place in the cattle and the sheep?—Yes.

43,350. I understood that in some districts they were already crowded upon the land?—Yes, but those are on the fine grass lands, the lands that are first taken up, lands that become refined and are equal to any of your English pasture lands, as far as fine feed is concerned. Most of those men have got outside places, but they are dilatory about their business and neglect it. You will find bad farmers all over the world, and I call a lot of them very bad farmers; and very bad farmers, not only with regard to not leaving a portion of their land to meet emergencies, but in overcrowding their lands altogether, and in being avaricious about gains.

43,351. Outside the land which is at present occupied by cattle and sheep is there a large quantity of good land capable of being used by cattle or sheep without further cultivation?—A very large supply.

43,352. (*Chairman.*) For sheep also?—Not so much.

43,353. Then you have nearly reached the limit in the production of sheep?—There is a good deal of land which is not filled up, particularly in the southern part of Buenos Ayres, and south of the province of Buenos Ayres, in the national territory, and to the west of the west of the Province of Buenos Ayres on the Pampas. Those are lands which are not suitable for sheep at present, but must be refined.

43,354. (*Mr. Dalton.*) Is there an unlimited quantity of this land, or is it limited?—I should say there must be five million acres.

43,355. Is there enough to carry double the present quantity of cattle and sheep?—More.

43,356. Treble?—Treble the quantity of cattle, not sheep—I should say double the quantity of sheep, more or less.

43,357. Double the quantity of sheep?—Perhaps; I would not like to say double the quantity of sheep at the present moment. Of course you can always put a limited number of sheep on those lands as you go on.

Immigration.

43,358. I think you said the immigration of Italian and Spanish immigrants is falling off?—Yes.

43,359. If it continues to fall off, can you continue to increase the amount of your wheat harvest?—I think not.

43,360. Therefore that may prevent your wheat harvest from increasing to any extent?—It might do so; but I think at the same time it is impossible that immigration into that country can fall off.

43,361. Why?—Because it is about the only place left with a very good climate. There are more facilities given to a man who is inclined to work in that country than in any other that I know of or ever heard of.

Labourers.

43,362. I understood that the labourer in your country was badly off as compared with the labourer in England?—That is the labourer who is working for wages.

43,363. The labourer who is working in America is better off than the labourer who is working in England?—I have heard so.

43,364. Will that not divert the immigration from your country to other countries?—I do not think it will.

43,365. Not if they have got a better chance and better wages in other countries?—I am trying to prove to you that they have not got a better chance. In none of those countries I have ever heard of has a working man who is steady and industrious, and who shows that he is inclined to work, get the same chance as in the Argentine. You know, and we all know, that to have land turned up and worked on the system I have been working on, of giving the men half the produce of their work on a certain amount of my land, may be largely extended; I am not saying that it will be, but it is capable of being so; those men would be much better, I think, in that country than in any other country I know of that they could go to now.

Mr. De R. J. Brett.
21 Mar. 1895.

43,366. At the present time emigration to your country has fallen off?—It has been improving. It had fallen off very much, but last year I think we had a balance in our favour of 40,000.

43,367. As against 200,000 some years ago?—As against a hundred and odd thousand, but that was a bogus business altogether.

43,368. (*Viscount Cobham.*) Are these Italians going elsewhere, because I think the emigration from Italy has not diminished?—Yes, they are going elsewhere, and being very badly treated. A lot of them are going elsewhere, and then coming to us after having been elsewhere. A lot are going to Brazil, and coming down to us immediately.

43,369. (*Mr. Dalton.*) These labourers who come over for four months in the year evidently do not feel disposed to stop; how do you account for that; when they go back I suppose they do not take a very good story of the country with them?—A great number of those are young unmarried men, and they do not care so much about taking up land with wheat at present prices, and with the present outlook. But although those men are earning something a year, and going backwards and forwards, and seeing how things are going on, the moment they find the turn comes they will stop.

43,370. How much could they take back with them after their four months' stay?—I do not think it would pass 20*l.*

43,371. They would pay their passage out of that?—They have to pay their passage out of that, of course.

43,372. What is the cost of the passage?—I do not know that.

Rent of land.

43,373. I think you reckoned the rent per acre as paid in this produce at about 11*s.* a year, did you not?—No, I think not.

43,374. Then what did you reckon it at per acre paid in money instead of in produce?—We are paying as much as two dollars and a half paper per acre.

Selling value of land.

43,375. Can you tell us what the capital value of the land is, and what it fetches when it is put up for sale?—That depends on circumstances altogether. It depends on the position from the coast; it depends on the distance from the railway station; it depends on the quality of the land, and whether it has got much low land on it or not; in fact there are a lot of attendant circumstances that it depends on.

43,376. Can you give us the average or the maximum and the minimum cost if you buy the land out there; I think a great many immigrants do buy good cultivated land?—16*s.* an acre.

43,377. That 16*s.* an acre would be the capital value?—Yes, but he must take the high with the low; that is as it runs; it is not selected land.

43,378. Then the rent of it would be very much less than that, would it not? What would the rent be per acre if you take it year by year on land of that kind; would it be a shilling an acre?—No, it would be more than a shilling an acre; it would be about 3*s.* an acre, I think.

43,379. Then it is only worth about five years' purchase?—That is all; they have been selling it at that. Generally speaking, they will sell small lots. A man who has got 20,000, 30,000, 50,000, or 100,000 acres of land will sell a few lots here and a few lots yonder, and so on. That is the beginning. Then when once those lots are settled, the value of the whole property is enhanced.

43,380. If you have got a large estate in really fine condition, is it not worth more than that, with its paddocks and so on?—Yes, land laid down there in paddocks with lucerne is worth 7*l.* an acre.

43,381. (*Sir Nigel Kingscote.*) But that has had money expended on it?—Yes, money, time, and patience.

43,382. (*Mr. Channing.*) 7*l.* in paper?—No, in gold, sterling.

Taxes.

43,383. (*Mr. Dalton.*) You pay in taxation 5 to 1,000 on the capital value?—Yes.

43,384. Exclusive of the wheel tax?—Yes.

43,385. If you brought that down from the capital value to the annual value, what would it be? Would you reckon that the annual value of 1,000*l.* would be 40*l.*, because, if so, you would be paying on your annual value 5*l.* a year out of 40*l.*, which would be 1*l.* out of 8*l.*, and that would be half a crown in the £?—It would be more than that; it would be 80*l.* with us.

Mr. De R. J. Brett.
21 Mar. 1895.

43,386. Then you would be paying 5*l.* on the 80*l.*, and that would be 1*s.* 3*d.* in the 1*l.*?—Yes.

43,387. Besides that you have a wheel tax?—Yes, but that is a very small tax indeed.

43,388. What is it exactly?—It is about 3*s.* per vehicle of four wheels.

43,389. Have you got good roads in Argentina?—We have got no roads at all, and they are splendid roads. That is an Irishism. You can drive where you like.

43,390. That would be one great reason why your local taxation is not so high as in other countries?—Yes. There is no such thing as mending the roads in that country.

Sheep-breeding.

43,391. (*Mr. Lambert.*) What is the breed of sheep that you have there principally?—We are crossing them now largely with Lincolns, but they were Rambouillets and Negretes, principally Rambouillets, a French breed.

43,392. Do you calculate to go on changing or crossing them, in order to suit the British markets?—Yes; we are breeding now for wool and mutton; before with the Rambouillets we were breeding for wool alone, but, as I say, we are breeding now for wool and mutton.

43,393. What would be about the average weight of Argentine sheep?—About 65 lbs. is the weight of those we purpose sending to your country; that is about 16 lbs. a quarter.

43,394. (*Mr. Little.*) What age?—From 18 months to two years.

43,395. (*Mr. Lambert.*) Do you use no artificial food at all?—None at all except the lucerne.

43,396. How much do you calculate that you would have for putting in our market sheep of 65 lbs.?—We are infringing again on private business, I am afraid.

Barley and oats growing.

43,397. Do you grow any oats or barley?—People that grow wheat never grow barley.

43,398. Do you grow any oats?—We grow some, but ours is not exactly the latitude that oats does best in. It grows very well, but it is not excellent. South of Buenos Ayres, 300 or 400 miles south of the city, we used to grow splendid oats, and they grow splendid oats there yet.

Exportation of hay.

43,399. You exported a considerable deal of hay, did you not, last year?—Yes, and there was a good deal of rubbish exported last year; some hay and a good deal of rubbish.

43,400. You do not anticipate that that will be continued, do you?—No, unless it is calamitous with your people here. If it is less than 7*l.* or 8*l.* a ton value here, we could not export it.

Interest on land investment.

43,401. What is the rate of interest a man gets for his money in Argentina?—All the capital you could take to the country could be invested to-day with absolute security at 8 per cent.

43,402. Gold?—Gold. Seven to eight per cent.; not less than seven.

43,403. Could you buy land at that price?—To give you that return, do you mean?

43,404. Yes?—I think so. You would require to work on it though; that would be buying outside land and developing it.

43,405. Is there no such thing as buying land and letting it out, except by the payment of rent in produce?—You can buy land to rent, but it is not a satisfactory basis.

43,405*a*. What is the language?—Spanish.

43,406. Do a number of people speak English?—All the English residents, of course, and their descendents speak English.

Language.

43,406*a*. (*Chairman.*) Is Spanish going to be the language of the country?—Spanish is the language of the country.

43,407. Do these Italian labourers eventually learn Spanish?—It is exactly the same as in the States. In the States they have all got to come to English, and all the people who come to our country have got to come to Spanish, which is the official language of the country.

43,408. Spanish is destined to be the language of the country?—Yes.

Mr. De R. J. Brett.
21 Mar. 1895.

43,409. All the English residents, I suppose, have to learn it?—Yes.

43,410. (*Mr. Gilmour.*) What do they teach in their schools?—Spanish. At the same time there are schools of all nationalities. We are most cosmopolitan people in that country. Of the 600,000 in the city of Buenos Ayres, 400,000 are foreigners, and you can go into no public place such as into a restaurant to have breakfast or anything of that kind, where you will not hear five languages at least spoken around you, and you may hear nine.

System of produce-sharing with colonists.

43,411. (*Mr. Channing.*) Of your half that you take of the produce, how much do you count would be ordinary rent, after allowing for interest on capital and your other outlays in regard to your land?—Out of my half, I have got to take the entire rent. I should get ten dollars a square, that is two and a half dollars an acre.

43,412. About what proportion of the gross produce would it come to?—It would be in round numbers about 12 per cent. in lieu of rent.

43,413. One of my friends who has land in the Argentine and rents it out, receives in produce a twelfth; is that a usual amount?—It all depends on the position of the place, because what they pay runs all the way from 9 per cent. to 18 per cent. Where it is a twelfth of the produce of the land that would be within, say, six or seven miles of a railway station.

43,414. (*Mr. Dalton.*) How do you ascertain that when you get paid over, do you keep accounts?—Yes.

43,415. (*Mr. Little.*) You take it all and you give half to the man?—That is what is done in my case. Those men had nothing; they came in with clean hands and a will to work and I gave them everything.

43,416. (*Mr. Channing.*) You go to all the capital outlay on the farm?—Yes.

Land laid down with lucerne.

43,417. Now about the land which, after wheat, is laid down; how soon does it come into use for pasture?—Within six months of your sowing it with lucerne.

43,418. (*Mr. Little.*) Do you sow it in the crop, or after the crop?—I have sown it in the crop, and I have sown it without the crop, but I do not approve of sowing it with the crop.

43,419. (*Chairman.*) How long does it last?—Practically for ever.

43,420. Year after year?—Yes.

43,421. (*Mr. Channing.*) How soon does it acquire the 7*l.* sterling value that you spoke of?—A year after it is sown.

43,422. As soon as that?—Yes.

43,423. (*Mr. Little.*) Does the lucerne itself stand permanently or is it succeeded by natural grasses?—It will stand permanently, but I do not say that you will have as many plants in a square yard at the end of ten years as you had at first, but you will have just as much hay.

Reduced cost of transport of grain.

43,424. (*Mr. Channing.*) Now about the bags; we notice that they form a very heavy proportion of the cost; are the railway companies and the shipping companies introducing any changes in the transport of the grain which would enable you to do away with bags?—They have been invited to do so this year, but up to the time of my coming away from there, the 18th of December, there was no special change made. They were already supplied with wagons, with which they might have made the experiment.

43,425. Do you anticipate, as a business man, that that is likely to come about?—I think it is.

43,426. How soon could that be made general do you think?—In one year; it is a matter of a siding.

43,427. That would materially modify the price of wheat which would give a profit in the Argentine?—Yes it would give them an advantage of——

43,428. Eight or ten per cent. would it not?—Of about 12 or 13 cents per 100 kilos; that is, about three cents in gold per bushel.

43,429. Suppose that is carried out, what would be the paying price for growing wheat there?—You may reduce it by the amount of advantage that they have, taking the actual paying price at present of $4·25 to $4·50 in paper on the spot.

Linseed.

43,430. Now about linseed, is that sent in the rough or is there any cleaning process?—It is all cleaned; I do not say that it would not be necessary to run it through cleaners here afterwards, but it is all cleaned in the rough.

Mr. De R. J. Brett.
21 Mar. 1895.

The currency.

43,431. You spoke of the railway charges being altered from time to time according to the premium on gold; is that applied to other articles of commerce?—No; at least there is no publication. Each man who sells will put on his own price. A man says "gold has "gone up; to-morrow I must charge so much more for "what I have to sell."

43,432. Do you find the cost of the necessaries of life goes up in proportion to the gold?—Not in proportion.

43,433. (*Mr. Everett.*) In your country I think you reckon values by dollars—that is the ordinary measure with you?—Yes.

43,434. Your dollars in ordinary use are paper dollars?—Yes.

43,435. Have they on the face of them a promise to pay?—They bear a promise to pay, but a lot of them unfortunately are promises which are broken; they are like pie-crust.

43,436. I only want to know what their face statement is?—It was a promise to pay in gold originally, but they do not promise to pay in gold now.

43,437. They do not stand upon silver—they stand upon gold?—Yes.

43,438. (*Chairman.*) The currency of the country is nominally gold?—Yes.

43,439. But it is really a depreciated paper?—Yes.

43,440. (*Mr. Everett.*) Do not your paper dollars still retain the promise to pay, only the fulfilment of it is deferred?—On the new issue there is no promise to pay in gold written on the face of it.

43,441. Do you receive coins of gold or silver in the country ordinarily?—I have seen one or two Argentines in my time.

43,442. But it is quite the exception to see coin?—It is indeed.

43,443. All the business is done with these paper dollars?—All.

43,444. (*Mr. Dalton.*) Including the payment of taxes to the Government?—Yes, but the import duties are paid in gold.

43,445. In what gold—in what coins, I mean?—You may calculate it in pounds sterling or in hard dollars.

43,446. It is at the rate of exchange of the day?—Yes; the full premium is charged there.

43,447. (*Mr. Everett.*) What is the premium to-day, within a little, do you know?—It is about 350 premium. The gold dollar is worth about 3½ paper dollars.

43,448. A dollar is 4*s.*?—Yes.

43,449. Therefore 4*s.* of our money will change into about 14*s.* of your money?—Yes.

Prices in gold and paper money.

43,450. You sell wheat here, you say, now at 18*s.* a quarter, so that if we multiply that 18*s.* by 3½, we should find that you get over 60*s.* in your paper dollars in the place of the 18*s.* here?—Yes; here.

43,451. That 18*s.* brings you 60*s.* per quarter of your paper money?—Yes, if you take it that way, but that is including freight and all expenses, of course.

43,452. (*Mr. Little.*) You do not pay the freight in paper?—No, but this gentleman takes it as being the price here.

43,453. (*Mr. Everett.*) Still even having to pay the freight in gold, you get very nearly 3*l.* a quarter for your wheat in your paper money?—In our depreciated paper currency.

43,454. And the steers that you said can be sold here at 3*l.* would bring you home something over 10*l.* in your paper money?—That price is on the spot where they are grown.

43,455. The effect of the difference between your paper money and our sterling has been, I think, not to alter the price on your side of the water, but to knock the price down on our side in our money?—Yes, it has done that to a degree.

43,456. Have your prices altered much in the last 10 years in your paper money in your own country?—They have; prices have gone up a matter of about 60 per cent.

43,457. Has the price of grain in your country gone up 60 per cent.?—The price of grain has gone down 100 per cent. in the last three years.

Mr. De R. J. Brett. 21 Mar. 1895.

43,458. Even in your money?—Yes.

43,459. You only get about half in your money for it?—I sold three years ago at 10 dollars, and I sold last year at $5 25. When I sold at $10, the premium on gold was 180, and when I sold at $5 25, the premium was 240. So it went down in two ways, and I was getting about 47 per cent., I think, of the price that I had sold at two years previously.

43,460. Although you have what they call an inflated currency, your prices have actually gone down in that, even in that, instead of going up?—Yes.

43,461. (*Mr. Dalton.*) In grain?—Yes.

43,462. In other things they have gone up, I suppose?—Yes.

43,463. (*Mr. Everett.*) They have gone up in things that are imported?—And they have gone up in cattle and sheep also.

43,464. But grain has gone down?—Yes.

43,465. That is very curious. I think your agriculture has gone ahead by leaps and bounds in the last few years?—To a marvellous extent.

The gold premium.

43,466. During that time the depreciation of your money has been increasing; as the premium has gone up your agriculture has extended more?—Yes.

43,467. (*Chairman.*) Has the depreciation gone on continually?—Yes.

43,468. I thought it was not so much now as it had been?—No; it went to 250, and it is pretty hard to get it much under that. It comes down to 225 occasionally, just to pay us a visit.

43,469. Has it not been above that?—It has been as high as 330, but that was only for a moment; it is now between 250 and 260.

43,470. How long has it been about 250?—For the last eight years it has been from 240 to 260.

43,471. Before that, for the previous two years, what was it?—It had been in the neighbourhood of from 190 to 220 for more than a year.

43,472. (*Mr. Everett.*) On the whole, during the period that your agriculture has been leaping ahead, your premium has been going up all the while?—If it has not been going up all the time it has been high all the time.

43,473. Do you think the increase of the premium hurts the producer and the grower of corn in your country?—Everyone in that country who produces more than he consumes is benefitted by it momentarily, but the country generally, I presume, at least I have always heard it said, is a loser by a depreciated currency.

43,474. You do not speak of that from your own knowledge?—No, not from my own knowledge—I know nothing about political economy.

43,475. Your country consists almost wholly of producers, I suppose?—Yes.

43,476. It is a producing country?—Yes.

43,477. As your gold premium rises they are able to lay their produce down on this side of the water for less gold, because their expenses in growing the corn do not go up as fast as the premium?—That is it.

43,478. (*Chairman.*) Still they go up, though not quite in the same proportion?—They go up, but not in the same proportion.

43,479. (*Mr. Everett.*) I understand you that the bulk of the produce in your country is not grown by people who pay wages, but that it is grown by people who work for themselves?—That is the fact; but, of course, those people buy something to clothe themselves and to live on, and the prices of those things go up also. The prices are always fluctuating, and those gentlemen have got a very happy knack of knowing immediately when the premium goes up, and they put up their articles, but they never hear of it coming down at all.

43,480. The things that they buy would be a mere bagatelle in comparison with the things that they sell?—Yes, it is true.

43,481. (*Chairman.*) It is the people who pay wages who gain most by the depreciation?—Of course, there is a lot of service in the country it is true, but then it is not necessarily agricultural. There are men who are working for ranch owners; men who are working, minding cattle, and that kind of thing. Every man who employs labour is benefited.

Mr. De R. J. Brett. 21 Mar. 1895.

43,482. Those are the people who gain most by all this depression?—Yes.

43,483. And the labourers lose?—The labourers lose a corresponding sum.

43,484. (*Mr. Everett.*) The labourers would be a very small proportion of your population; your population are mostly engaged in producing with their own hands, as I understand it?—That is in tilling the lands; but, of course, those people who are maintaining 80 millions to 90 millions of sheep, and 25 millions to 35 millions of horned cattle, and five million horses, besides goats and various other things, are very numerous. There is a lot of labour employed on that kind of work—a great deal more than the labourer employed on agriculture.

43,485. (*Mr. Dalton.*) Is that native labour?—Both native and foreign labour. The native labour is almost exclusively employed on that.

43,486. (*Mr. Everett.*) The labour even on that would bear a very small proportion to the value of the stock, I imagine; one man would see after no end of sheep or cattle in your country?—It would bear a very small proportion.

43,487. Then it appears to me that we come very much to the conclusion that the premium is really a benefit to your country, because your country is a producing country, and it is a benefit to the producing classes, because it enables them to undersell other people?

Effect of depreciated currency.

(*Chairman.*) Is that your opinion?—I think it is. Mind you, I have never gone into that subject, but it looks, on the face of it, to be so; the argument seems to run that way, and I would take it to be so. I always think that I am gaining by a depreciated currency so long as I produce more than I consume.

43,488. (*Viscount Cobham.*) Then the more you depreciate the currency the better off you will be?—Yes.

43,489. (*Chairman.*) Is that the logical conclusion; that the more a country depreciates its currency the better?—At the same time I do not believe for a moment, and I cannot believe for a moment, that it is not all the worse for the country as a country and as a whole, though individuals may be benefited by it.

43,490. Certain individuals of the country may gain very much by it?—Individuals are benefited by it, but taking the country as a whole, I cannot believe that it is not an injury to the country which has got a fluctuating and depreciated currency.

43,491. (*Mr. Everett.*) Where you have a gold debt one can quite understand that it is so as regards that debt; but as regards production, which I imagine is the life of a new country, it appears to me that you have been greatly benefited, for yours is the only country where agriculture has been going a-head by leaps and bounds?—Yes, it is true; but on the other hand, there is an almost even balance between production and consumption and supply and demand. We from that country make a sudden plunge into one side of the scale with 500,000 tons of wheat, say, and the whole thing goes flop, of course. Our own throats are cut in the operation, as well as our neighbours', because, as I tell you, our ten dollars two years ago, which was the price at which I sold my wheat then, was less than five dollars last year; I sold it actually at $5·25; but when I come to calculate out the difference of the premiums I did not get five dollars for it.

Depreciation of currency and increase of production.

43,492–3. (*Chairman.*) Then it comes to this: that the impetus given to the cultivation of wheat by the depreciation of the currency, has resulted in a great increase in the production of wheat, and that has sent down the price?—Yes.

43,494. Therefore things are finding their level, even in the Argentine Republic?—Yes.

43,495. (*Mr. Everett.*) Do I understand that the price of wheat in your paper money in the Argentine is actually lower now than it was when wheat was at a much smaller premium?—I cited the case in point in which I sold, receiving, I think it would be not more than 47 per cent. of the price that I got two years ago.

43,496. (*Mr. Little.*) It is less than 47 per cent?—Probably it is less.

43,497. (*Mr. Everett.*) It seems a remarkable fact that alongside of a depreciation of currency you have a fall

in prices instead of, as is ordinarily supposed, a rise?—Caused by ourselves; caused by over production.

43,498. Of course there was an enormous increase for a year or two?—Yes.

43,499. Is it not the fact now that with your depreciated currency you are really able to under-sell the world?—I believe it is a fact.

43,500. So do I. Alongside with a great depreciation of your money an astonishing increase of production has gone on?—Yes.

43,501. And the prices of things which you produce have actually not risen in your country, but the price of cattle, I think you said, had risen?—Yes.

43,502. What you sell here for 4*s.* turns into rather more than three times 4*s.* when you get it into your country?—I am afraid there is some slight mistake about that. We cannot call them shillings. It is three times 4*s.* in soiled paper money.

43,503. And that paper money is accepted in payment of taxes?—Yes, it is accepted in payment of taxes, but of course the taxes have not been raised, and they have not taken any notice of the premium for local taxation.

43,504. Neither has labour gone up in proportion?—No.

Mortgages.

43,505. (*Mr. Little.*) Are there such things as mortgages?—Yes.

43,506. (*Mr. Everett.*) Are they in paper or in gold? In gold, as a rule; the mortgages by English companies are all in gold.

Effect of low price of wheat on labourers.

43,507. (*Mr. Dalton.*) What has been the effect of this fall in the price of wheat on these Italian labourers who came over, and were to make their living upon the growing of the wheat; have they suffered much or have they gained?—They have not gained and they have not suffered particularly. Land is so very cheap there that where it has been yielding an average crop, they have not suffered particularly.

43,508. Still when they came over they did not expect this fall in the price of wheat, I suppose?—No.

43,509. If this fall had not taken place, they would have done very well?—Yes.

43,510. Have they done well now, or badly?—They have done better than any wage they could earn in the country.

43,511. But your wages are not high?—No.

Wages and depreciated currency.

43,512. (*Mr. Little.*) I did not quite catch what you said about the wages of these migratory labourers in harvest time; what are they paid during harvest?—It amounts to about 3*s.* a day at present rates. That is for the common men.

43,513. Does that include anything else?—They get their rations.

43,514. (*Chairman.*) Is that in gold?—Yes.

43,515. (*Mr. Little.*) Three shillings in gold?—Yes. When I say shillings I mean sterling; that is two dollars and a half in paper money.

43,516. Is it inclusive of rations?—They have rations besides.

43,517. Then they are able to save practically 21*s.* a week?—Yes.

43,518. Did you say they were about eight weeks there for the harvest?—No. They would be there from 15 to 16 weeks, between harvest and threshing, gathering in the maize, cutting lucerne, and one thing and another like that. It is about four months' hard work.

43,519. Then their aggregate earnings would only be about 15 or 16 guineas if they saved the whole?—I put it roughly that they might take back about 20*l.*, but I do not know that they take as much as that. That would be the case with the common labourers, but one man in every five would earn about 25 per cent. more than that. The skilled labourer—the stacker, and the man who can work a machine like the reaper and the binder—would earn that 25 per cent. more.

43,520. (*Chairman.*) I see that Mr. Gastrell in his report says this about labourers: "The present low "rate of wages also, 1*s.* a day in the country, is not "what the British labourer would call a 'living wage.' "Wages were formerly much higher, and once exceeded "those paid in England, but, with the depreciation of "the paper currency, they have reached a very low "level, except for certain classes of skilled labour and "for domestic servants." Do you agree with that—he is talking of permanent labourers,—men who remain in the country permanently?—That is quite true.

43,521. Then these permanent labourers only get a shilling a day, and that has been very much reduced owing to the depreciation of the paper currency?—Very much reduced from the shilling a day?

43,522. Yes?—As a rule they will get 25*s.* to 30*s.* a month now.

43,523. He is speaking of wages in English money. He says "Wages were formerly much higher, and once "exceeded those paid in England, but, with the depre- "ciation of the paper currency, they have reached a "very low level"—that is to say, a shilling a day; but the migratory labourers get 3*s.* a day you have told us?—They are working at a special time, when the days are double.

43,524. Have the wages for those men during the harvest time, or during the time they are in the country risen or fallen in English money?—They have fallen in three years a matter of about 30 per cent.

43,525. (*Mr. Everett.*) They have fallen in paper money as well as in English money?—Yes.

43,526. (*Chairman*) Mr. Gastrell goes on to say: "The material condition of the working classes in the "Argentine Republic cannot be said to be satisfactory "at the present time. The cost of living in the towns "is very dear as regards rent and imported articles "cheap as regards actual meat and necessary food; in "the country living is exceptionally cheap and bad. "Wages are low on the whole, and there is but little "demand for labour, though there is no absolute want of "demand and an excess of supply as during 1891. The "decline of the gold premium has already increased "the wages of working classes in gold some 25 per "cent.: it is hoped that the decline of the premium "will continue, thereby benefitting the working classes "both by enabling them to buy imported articles more "cheaply and by increasing the gold value of any "savings they may accumulate, and the purchasing "power of every dollar they earn." Do you agree that the depreciation of the currency has been a bad thing for the labourers, and that where it has somewhat risen again it has been a good thing for them?—To a certain extent I agree with it, but only to a certain extent. I do not know of course at what time Mr. Gastrell supposes that paper money might be at par.

43,527. Are we to conclude that although cultivators like yourselves, and those who have land and are producing, may benefit momentarily by the depreciation of the currency, yet, looking at the country as a whole, and especially as regards the labouring people, it has not benefitted by the depreciation of the currency?—It is true of the labouring classes; but you would injure a great many more in proportion by any sudden appreciation of the paper dollar than would benefit by it.

43,528. Can it be a good thing for the country as a whole that its labourers are earning less than they were before the depreciation took place?—That would all depend on circumstances, too. The labourers before, in that country, earned rather more than they ought to have been earning, I think.

43,529. They were earning what they were entitled to, I suppose?—That all depends. They earned rather more than they ought to have been earning, I think.

43,530. To that extent you would say that it has been a good thing that there should be a reduction?—Yes, I think so.

43,531. To the extent it has fallen beyond what they were entitled to it is a bad thing for them and for the country?—I can assure you that there is no man in that country who gives proof of any kind of intelligence and inclination for work who is a poor man.

43,532. But apparently the fall in the price of labour has checked immigration?—It certainly has.

43,533. And therefore it has checked the tendency to the ultimate increase of production in the country?—Because it has restricted everything all round. You will understand that a storekeeper who trusted a colonist with a certain amount when he was selling his wheat at 10 dollars must restrict the credit by 50 per cent. at least if the wheat is only worth 5 dollars.

Mr. De R. J. Brett.
21 Mar. 1895.

43,534. (*Mr. Everett.*) Then a fall in prices does not benefit your country in your experience; you are more prosperous with high prices than with low prices?—I should say so.

Land laid down with lucerne.

43,535. (*Chairman.*) You told us that this land which is laid down in lucerne is worth 7*l.* an acre; did I understand you that it took about three years before it could be laid down in lucerne?—No, it can be laid down in one year.

43,536. How much of the land of this kind in the Argentine Republic is suitable to being laid down in lucerne?—I only know of a matter of about 1,600 square leagues.

43,537. Suitable for the production of lucerne?—Yes, for feeding off.

43,538. Which does not require renewal?—It requires no renewal; it requires no irrigation. If you go into the interior provinces there is a lot of land there. I would not undertake to say what number of hundred thousands of acres at the foot of the Andes which can be irrigated and made to grow alfalfa very well.

43,539. Where the lucerne would grow it probably would not be perennial, would it?—It would need to be irrigated.

43,540. There are about 1,600 square leagues capable of being turned to that?—That you can feed off.

43,541. How much of that is now laid down in lucerne?—A very small amount.

43,542. Then there is an immense extension possible?—Yes. Of the 1,600 square leagues of land that I refer to there cannot be certainly more than 80 leagues of it under lucerne.

43,543. Gradually as the land is cultivated for wheat is it after a time laid down in lucerne or not?—You see everything is very new to us. The original owners who have been sowing wheat are laying it down, but that is only happening now.

43,544. In the case of your own tenants, or the cultivators that you speak of, and whom you make bargains with for three years, at the end of the three years do they go, and do you lay the land down yourself?—At the end of three years they go if I do not need them, but from the end of the second year we begin to lay down lucerne. It is lucerne that we have been sowing this year, not wheat.

43,545. Is that a gradual process that has been going on in your property, that the land is gradually being laid down in lucerne after having been cultivated for two or three years by these tenants?—That is the prevailing idea now.

43,546. When it is laid down in lucerne will those cultivators go?—Yes, they will go on to some other land.

43,547. And you will use the land as lucerne land?—Yes.

43,548. For feeding cattle on a great scale?—Yes.

43,549. Are you acquainted with the best lands in the United States?—No, I have never been in the United States.

Land for fattening cattle.

43,550. How many cattle can be fed upon this best lucerne land, say, per hundred acres?—Fed to fatten or fed to breed?

43,551. For fattening?—You can turn off 500 steers a year from each 400 acres.

43,552. A little more than one per acre?—Yes, a steer and a quarter.

43,553. Is that not double or three times as many as can be fattened upon any other land almost in the world?—I think it is double as many as can be fattened anywhere else.

43,554. Therefore the best land you speak of in the Argentine Republic is worth for producing purposes double the best land in other parts of the world?—Yes. We can turn off a bullock and a quarter and 7½ sheep.

43,555. (*Mr. Little.*) For each acre?—Yes.

43,556. (*Captain Owen Thomas.*) All the year round?—Yes.

43,557. (*Mr. Little.*) These are all to be fatted in the year?—Yes.

43,558. Where are they to be produced?—The sheep are turned over three times. They stay four months each time.

43,559. They are produced elsewhere, brought fully grown, and finished off?—Yes.

Mr. De R. J. Brett.
21 Mar. 1895.

43,560. (*Mr. Everett.*) And you can do three lots of them in the year?—Yes.

43,561. (*Chairman.*) Does it come to this: that it will produce a weight in cattle double what the best land elsewhere will produce?—Taking the best land in Australia, certainly.

43,562. (*Mr. Little.*) When a bullock is brought on in fairly good condition, and it is grazed on this land, how many stones of beef will it add?—20 stone.

43,563. (*Captain Owen Thomas.*) How long does it take to do that?—It will take six months.

Lucerne cropping.

43,564. (*Chairman.*) If you cut this lucerne for hay, does it produce more than one crop per year?—It produces five; a crop every four weeks.

43,565. How much on each crop?—The five crops will give you about 12 tons per acre per annum in all.

43,566. Twelve tons per acre?—From 10 to 12.

43,567. In the year?—Yes.

43,568. (*Mr. Dalton.*) All equally good?—All equally good.

43,569. (*Mr. Little.*) Is it that weight green?—No.

43,570. Dry?—Yes.

43,571. Twelve tons of hay?—10 to 12 tons per acre.

43,572. How many cuttings did you say?—Five.

43,573. (*Viscount Cobham.*) You exported some of that in 1893, did you not?—Yes; some was sold for 9*l.* here.

43,574. Did it pay?—At 9*l.* it paid well. Then a lot of fellows rushed into the market, and sent a lot of rubbish over here, thinking that in England you did not know what grass was.

43,575. (*Chairman.*) It must be most extraordinary land to produce five crops, and 12 tons to the acre?—It is; it is a very extraordinary country.

43,576. And that without the necessity of renewing the lucerne?—No occasion to touch it.

43,577. (*Mr. Whitehead.*) Without irrigation?—Without irrigation.

43,578. (*Mr. Little.*) You could not mow it constantly to remove the crop and still go on growing it, could you?—Yes.

43,579. Without any application whatever?—Without any application whatever.

Quality of soil.

43,580. (*Chairman.*) What is the extraordinary quality of this land due to—is it due to the fact that there is water at a certain depth below?—Partly.

43,581. To which the roots of the lucerne can penetrate?—The roots of the lucerne reach it at once.

43,582. What is the depth?—Twenty feet is the average depth of the water.

43,583. Over this large district there is water at that depth, and that accounts for this particular lucerne doing so well?—Yes, and the subsoil that we get there is red sand.

43,584. That makes the difference between the lucerne being a permanent crop rather than a temporary one?—Yes.

43,585. And there is all this vast extent of land you have told us of in this condition?—Yes.

43,586. Is this land, most of it, taken up?—It has all got proprietors.

43,587. It belongs to somebody, not to the State?—Not to the State. It has all got private proprietors.

43,588. In what condition is it where lucerne has not been laid down?—It is coarse land with cattle and horses on it, and some small bodies of sheep.

43,589. Producing very little?—Yes.

43,590. It is only when it has been cultivated and lucerne laid down that it is valuable?—Yes.

43,591. One would think that the cultivation of it ought to rapidly extend because the value is so great?—It will extend very rapidly now.

43,592. When was the great quality of this land discovered?—Within the last two years.

43,593. Only within the last two years?—Yes.

43,594. (*Viscount Cobham.*) Are you speaking of the 1,600 square leagues?—No, I am wrong there. I ought to retract that. There has been alfalfa on a part of that land for five or six years. I was speaking in

Mr. De R. J. Brett. 21 Mar. 1895.

general terms of its beginning. The scales are torn from the eyes of the majority of the people, and they know that land now. There were isolated cases, and I know of two gentlemen who had large areas under alfalfa.

43,595. (*Chairman.*) The original idea was about five years ago, and about two years ago the majority of the people who are owners of this land began to perceive the extraordinary good quality there was about it?—That is it.

43,596. Before the cultivation or the laying down of lucerne it did not appear to be land of any particular value?—It did not appear to be so, but I always considered that it was good for that. The first time I saw it 18 years ago—because when I examine land I always take a spade with me—I thought the soil was good and only needed to be cultivated.

43,597. But you did not know the particular value of it?—I always thought it very good land for alfalfa.

43,598. What was the general impression?—The general impression was that the land was no good.

43,599. Then about five years ago the discovery was made by some people, and two years ago the discovery became general?—Yes.

43,600. On this land of this extraordinary value you can grow lucerne as a permanent crop, giving 12 tons to the acre?—That is it.

43,601. (*Mr. Everett.*) I think you have said that you have known of some being down for 29 years?—I have been watching a piece of alfalfa for the last 29 years.

Mr. De R. J. Brett. 21 Mar. 1895.

43,602. (*Chairman.*) But you yourself have only had five years experience of it?—Eleven years' experience in my neighbourhood. Alfalfa growing.

43,603. (*Mr. Everett.*) You have seen it for 29 years, I think?—I was not speaking then of alfalfa to graze off, I was speaking of alfalfa generally, and the length of time it lasts in the land. That special spot I have known for 29 years. It belongs to a friend of mine, and I have seen it a couple of times a year for the last 29 years.

43,604. (*Mr. Little.*) Is alfalfa the same as lucerne?—It is the same plant, it is the Spanish term for it.

43,605. (*Chairman.*) This land which has been under alfalfa for 29 years what will it produce now?—It will produce just about as much, but rather of a coarser quality, as it did 29 years ago. The plants now will give you 50 stalks each plant.

43,606. Has that been cut for hay every year?—Yes, and horses tied out on it day and night, and it has been very badly treated.

43,607. On the other hand if it had been used for the feeding of cattle I presume the quality would have been maintained?—It would have been a great deal better.

The witness withdrew.

Mr. M. J. R. Dunstan.

Mr. Malcolm James Rowley Dunstan called and examined.

Mr. M. J. R. Dunstan.

43,608. (*Viscount Cobham.*) I believe you are director of Technical Education under the Nottinghamshire County Council, head of the Agricultural Department of the University College, Nottingham, and district Agricultural Analyst for the county of Notts and the county borough of Nottingham?—Yes.

Agricultural education in Nottinghamshire.

43,609. Your main work, I suppose, has been to organise the administration of the technical education grant in the county of Nottingham?—Yes, since the last return, I have had the whole grant, but up to last March I merely had such part as had been put aside for agriculture.

43,610. You are now prepared to speak to what in your opinion is the best mode of expending the money upon practical agricultural education?—Yes.

43,611. To what class of persons do you say that education should be extended?—To farmers and their sons, labourers, schoolmasters, farmers' wives, labourers' wives, and their daughters. Of course one always gets in village audiences a great number of people who have no more interest in agriculture than they have in any other subject, a number of people who take an interest in any lectures. These I have not included. I do not think it is necessary to reach them.

Subjects of instruction.

43,612. You have in the notes of your evidence given a comprehensive list of subjects of education, will you just run through those? You begin with dairying, which you divide into butter and cheese making, the management of small and large dairies, and the packing and marketing of produce?—The packing and the marketing of the produce is the point which I think we wish to pay special attention to. In dairying there is a further subject which would really come before all those that I have mentioned, that is, practically, the management of dairy stock and the getting of the greatest quantity of cream at the smallest possible cost, on which hitherto no great amount of instruction has been given—at least in our own county.

Instruction in dairying.

43,613. What has been done in Nottinghamshire to promote the dairying industry?—We have the usual travelling dairy school that conducts courses of ten days in buttermaking or twelve days in cheese-making at various centres throughout the county.

43,614. There is very little practical management of cattle involved in that?—None at all.

43,615. You buy the cream and show how it is best made into butter?—Yes.

Establishment of dairy institute.

43,616. Do you contemplate any development or alteration of that system?—Yes. By the establishment of a dairy institute, in which the counties of Leicester, Derby, and Nottingham, and the Lindsey division of Lincoln have joined, we hope to give a complete course of dairy instruction, not only with regard to butter-making and cheese-making, but with regard to the management of dairy stock generally and the management of a dairy farm of about 160 to 180 acres. We hope to go more practically into the question, and to start from the beginning, instead of, as now, starting half-way and only finishing the subject.

43,617. Do you propose to take boarders?—Yes. I have a proof of the prospectus of the institute here; but, of course, you will understand that it is at present unofficial, being merely a proof (*handing in a print*).

43,618. You have hardly begun building yet, have you?—We only began about three weeks ago.

43,619. Do you attach great importance to this proposed dairy school?—Yes, great importance.

43,620. Do you consider that a considerable portion of the grant should be extended in this direction rather than in a local distribution?—Undoubtedly. Of course, one requires a certain amount of local distribution and of peripatetic work to encourage interest in the Central Institute; but I look upon the peripatetic work as not entirely educational In the first place it is merely pioneer work.

43,621. Till the experiment is tried, you have not got much to tell us upon the management of large and small dairies as a subject of education?—No. I can merely state of course what has been tried in other places in the country. The Aylesbury Dairy Institute, I believe, has been quite successful; but they do not do it there in the complete way that we propose to do it.

Agricultural grant.

43,622. What is your agricultural grant?—The total grant is about 5,700*l.*, and we have a great many calls on it. We are a large mining population, and they come first. The amount we spend on agriculture is between 800*l.* and 900*l.* a year.

43,623. Will there be a considerable proportion of that allocated to this experimental farm, or is it to be mainly self-supporting?—We propose to give 300*l.* to the Dairy Institute.

43,624. 300*l.* out of 900*l.*?—Yes. It would mean, of course, that we shall economise in the other departments of our dairy instruction. We shall not spend so much on the travelling school as we have spent.

43,625. Will you make a charge for boarding and instructing your pupils?—Undoubtedly; but we shall have the right in view of our contribution of 300*l.* a year to send free scholars. Each county will have the right of sending a certain number of free scholars.

43,626. In the shape of scholarships?—Yes.

43,627. (*Mr. Whitehead.*) Out of what fund is the institute built?—We subscribe a capital amount of 1,000*l.*

Mr. M. J. R. Dunstan.
21 Mar. 1895.

43,628. Out of the Technical Education Grant?—Yes. We have an unexpended balance from previous years, and it is probably out of that that we are contributing this 1,000*l.*

43,629. Each county contributes in proportion to its population probably?—No, all three counties are contributing an equal sum. The other county is contributing out of the revenue. We have about 3,500*l.* I think it is for building and stocking purposes, and we have a maintenance income of about 1,050*l.* Then we hope by approaching the Board of Agriculture through the University College, Nottingham, to get our grant from that Board increased.

Effect of instruction on quality of butter.

43,630. (*Viscount Cobham.*) Have your peripatetic lecturers, do you think, done much good?—They have done some good; but I do not think the good has been at all commensurate with the expenditure. Many amateurs come to learn, the clergyman's daughter and so on, who never intend to take up dairying; but they cannot very well be refused a position as pupils in the school.

43,631. Do you think the standard of the manufacture of butter is at all raised?—Yes; more distinctly in the northern parts of the county. We have some very good instances there of a better price being obtained for the produce, and altogether of a far more satisfactory state of things.

43,632. Is there more effective competition with foreign butter?—Yes; 2*d.* and 3*d.* per lb. more has been obtained for this so-called county council butter than has been obtained for the ordinary local butter.

Horticulture.

43,633. What are you doing in the matter of horticulture?—We have established at present demonstration gardens, that is gardens to show the different management of various small fruits; and we give the usual lectures on horticulture.

43,634. How many of these gardens have you established?—We have two established at present, and we are establishing a third this month.

43,635. Are they managed by different people?—They are in connexion with a course of instruction given in what we call our district agricultural schools; and they are managed by the schoolmaster, who happens to be a fruit grower. We start a garden, and stock it with trees, and he will take the crop in return for the labour he spends on it. A certain number of demonstrations are held in the garden throughout the season, and those the local people attend free of charge.

43,636. Only the local people?—Anybody who cares to go; but of course they do not travel long distances to go.

43,637. You do not pay the fares of the more distant people, do you?—No, we do not. We hope in time to establish sufficient demonstration gardens for them to be pretty well situated throughout the whole of the county.

43,638. Have you lecturers on horticulture?—Yes.

43,639. Are they paid for the season?—We pay per lecture as a rule. Those lectures are very well attended, but they are attended by a class of people who do not make a living out of horticulture, and who take to it more as a recreation.

43,640. In other counties, I believe, there are regular horticultural instructors appointed?—We have two horticultural instructors, who travel round, but they are not paid a salary; they are paid for the work they do.

43,641. Do you think that is the best way?—I think it is. Then one can suit the work to the man, but if you establish a man and pay him a salary, you very often have to suit the man to the work you intend him to do.

Packing and marketing produce.

43,642. With regard to the subject of the packing and marketing of produce, whether dairying or horticultural or other produce; is there not a great deal to be learned by the British farmer in that department?—I think so.

43,643. (*Mr. Little.*) Do you teach him the packing by demonstration?—We intend to do so, but we have not had a fixed station, and we shall not have till this year.

Poultry keeping.

43,644. (*Viscount Cobham.*) Is poultry keeping part of a similar system?—Yes; we have there, again, a lecturer who visits centres and gives people advice on the management of their poultry.

43,645. Is a good deal of interest taken in those lectures?—Yes.

Mr. M. J. R. Dunstan.
21 Mar. 1895.

43,646. By the right sort of people?—Yes, by the farmer's wives, for a wonder. I was very much astonished to see them coming.

43,647. Can you trace any improvement yet in the breeds of poultry?—Not in the breeds, but in the method of management I think there has been an improvement. I have had some very good reports this year. It has been an exceptional winter. One or two of the farmer's wives in the north of our county were taught to set their hens rather earlier than they had been in the habit of setting them, and this year they happen to have benefited very much indeed by that.

43,648. Are you of opinion that a great deal more profit can be made by poultry-keeping than the farmer has hitherto recognised?—Yes, within certain limits.

Bee keeping.

43,649. Bee-keeping, I see, is another subject in your brief?—Yes. That is quite a minor industry, but, of course, it may be done rightly as well as wrongly.

Bacon curing.

43,650. Then you also refer to such a home industry as bacon-curing?—Yes; that would naturally affect the woman more than the man.

Lectures on general agricultural subjects.

43,651. How do you manage the education given in general agricultural subjects?—That has been done hitherto in perhaps a necessary way, but a most unsatisfactory way, by lectures. The amount of good that comes from a lecture to a mixed audience consisting of the classes I have mentioned on an agricultural subject—to people who are not in the habit of listening to a lecture, or taking notes, or remembering points, is, I think, as a rule, very small indeed.

Discussions in place of lectures.

43,652. Your experience is the same as that of other counties, from which we have had similar evidence. Has the system been given up by you?—It is being discontinued this year. We substitute for lectures informal talks or discussions if there is a wish for them. We notify a subject, and then if the farmers like to come to the village school on a certain night the matter is talked over, but a set lecture is not given.

43,653. (*Sir Nigel Kingscote.*) Do you find that the farmers will come?—I have given two of those local talks; one was very well attended indeed, and the other was fairly well attended; if it had been a lecture I should have said it was well attended.

43,654. (*Mr. Gilmour.*) Still it means employing some gentleman as a lecturer steadily going round?—Yes; it means the employing of a man who, I should take it, would be one of the resident staff at such a place as the Dairy Institute, and who would go when occasion required.

43,655. (*Viscount Cobham.*) Would your lecturer accompany a farmer to his farm, walk over it, and point out errors of management, and so forth?—Yes, he would.

43,656. Do you think that would be popular with the farmers?—Yes; where the farmers pocket is directly concerned it is popular, but I think a lecture on abstract subjects to a farmer is a waste of energy.

43,657. (*Mr. Whitehead.*) Have you had many invitations of that kind from farmers for men to go and visit their farms?—Yes, I have. I have been over some 30 to 40 farms in the county; farmers have asked me to go and see them, but I do not know what has been the result.

43,658. (*Sir Nigel Kingscote.*) Does that mean a general invitation?—There has been a general invitation, simply asking me to walk over.

43,659. (*Viscount Cobham.*) You propose, at all events for the present, to try that system still further?—Yes, I think so.

43,660. You do not see any more useful way of spending the money?—I do not see any more useful way for the present generation. I think we ought to devote the greater part of our money nowadays to the younger generation, and just do sufficient for the farmers to keep them interested in the work, and to show them that there is something in it.

Dairying.

43,661. Do you not think some dissatisfaction might be excited amongst the farmers at so large a proportion of the grant being devoted to dairying, or does that represent the value of the dairying industry throughout the county?—It does not represent what it is in Nottinghamshire; it represents what it might be. In Derbyshire it represents what it is; in Leicestershire it represents what it is; and in Lincolnshire it does not represent as much as in our county, for Lincolnshire is not a dairying county at present at all.

Mr. M. J. R. Dunstan.
21 Mar. 1895.

43,662. Is it your opinion that farmers should devote themselves more to special branches?—I think they should devote more attention to these smaller branches, especially with regard to dairying; the land is suitable.

Instruction to labourers.

43,663. Going now to the labourers, you endeavour to raise the standard of labour throughout the county, do you not, in such subjects as hedging and thatching of course?—Yes. There you have to deal with people who have even less education than the farmers, and I think lectures to them are absolutely useless, except to the better class of labourers, such as the stock men, the horse men, the shepherds, and the cattle men. Lectures to them, perhaps, on veterinary subjects are appreciated, and they do more good if too much is not put into a lecture. I think you can best interest the ordinary farm labourer in his work by showing him some particular practical work.

43,664. Do they come to these demonstrations or classes in any great numbers?—We have had very good attendances in hedging, and very fair attendances in thatching. At the horse-shoeing we have got the village smiths and their assistants. Carpentry we have not touched yet.

43,665. (*Mr. Little.*) Do you give prizes?—No, we do not.

43,666. (*Viscount Cobham.*) Do you consider that hedging and thatching, and perhaps some other of those practical matters, have fallen to a rather low ebb in Nottinghamshire?—They certainly have in our county. It is the greatest difficulty in the world to get a man who can cut a hedge properly.

43,667. Or a thatcher?—Thatching is almost done away with in a great many districts.

43,668. Then I see you propose to have rough carpentry classes?—We have not those yet, but we propose to establish them.

Cottage gardening.

43,669. (*Mr. Whitehead.*) Do you try lectures in gardening for labourers?—In the management of cottage gardens? Yes.

43,670. Have they attracted interest?—Yes, certainly.

43,671. They have in my own county taken very well?—I do not quite look upon gardening in the same way as I should look upon hedging and thatching. By the second a man earns his livelihood, by the first he simply uses his spare time profitably.

Experimental farms.

43,672. (*Viscount Cobham.*) Do you think that money may be advantageously spent upon experiments?—Very much depends upon how they are conducted.

43,673. In manuring for instance?—I think manuring experiments should be confined entirely to demonstrations of the value of the various points in the Rothamsted results. We started some manure experiments in our own county, and the results were almost entirely contradictory of the Rothamsted results in the first year, as you would almost expect. Of course the Rothamsted results are only arrived at after a very long time of careful work, and when the soil has been got into such a condition that the manures have some effect. Taking an ordinary field, I do not think it is quite possible to imagine that you can reproduce the Rothamsted results after a single year.

43,674. Do you think the experiments should be continued so as to obtain a value?—That I am very doubtful of; I would rather try and demonstrate the Rothamsted results; but unless I was perfectly certain of the experiments being good demonstrations, I should prefer to rely upon speaking on and publishing the Rothamsted principles of manuring.

43,675. Do you know the experimental plots or farms in Surrey and Sussex?—I do not know them, but I have heard of them. There is a tremendous amount of literature published on the subject of experiments; but as to the method of carrying out experiments, I have had practical experience myself, and it is not altogether satisfactory. I took about 40 farmers to Rothamsted, and they remarked when we came away, "We "expected to see good farming; we did not expect to "see that."

Methods of education.

43,676. As to the methods of education, I suppose you do not consider that you can entirely dispense with lectures?—Not entirely; for pioneer work, and for arousing a certain amount of interest in the subject, I think lectures are very valuable; but to attempt to give instruction by means of them to ordinary people is, I think, practically useless.

43,677. You think they should always be accompanied by demonstrations, or by visits to gardens, or farms, or allotments?—Yes; or the points of the lecture should be printed and given to the audience. Classes are by far the most valuable method of giving instruction.

Mr. M. J. R. Dunstan.
21 Mar. 1895.

Farm schools.

43,678. Then in your brief you speak of farm schools; what do you mean by that?—I mean somewhat of the Irish system of farm schools. A small plot of land or a farm in Ireland is attached to the village school where the schoolmaster is capable of looking after it, and it is used for demonstration purposes for the scholars. There are some 49 of those farm schools in Ireland, and they vary in extent from 5 to 10 acres.

43,679. In a few schools that is already done, I think, and the grant may be earned?—It may be earned now by cottage gardening. The West Riding County Council of Yorkshire have considered the question. The demonstration gardens that we have started will in a way supply it as regards fruit; but the question is whether their value might not be rather increased by growing something else besides small fruit.

Instruction by village schoolmasters.

43,680. How would you make the village schoolmaster a capable instructor?—I would not make him an instructor in agriculture to start with. As a rule, a village schoolmaster who has been in a village for 12 or 13 years and has not hitherto been an authority on agriculture; then he goes to the local college, and attends a course on agriculture for six or eight weeks, and then comes back as an authority to teach it. The farmers are resenting that very strongly.

43,681. How would you train him?—I think he ought not to be said to teach agriculture unless he could have a training of at least two or three years.

43,682. Not even of the most elementary kind?—I would let him teach elementary science, but I would not call it agriculture. If you call it agriculture then the farmers say, "He knows nothing about agriculture; "what is the use of letting our sons be taught by him." But an elementary schoolmaster can do a great deal in a day-school by teaching elementary science. We do not want agriculture pure and simple to be taught in our day schools; we want something taught of elementary science which shall encourage observation. I take it that the village schoolmaster, if he is properly trained, can give that, and at the same time spread information on the subject of the science of agriculture, without calling it agriculture, and so exciting the resentment of the farmers.

43,683. Do you not think an ordinary schoolmaster can excite a good deal of interest among the boys by instructing them a little upon elementary principles?—He can.

43,684. By just giving them some sort of knowledge of the principles?—Yes.

43,685. Quite apart from the practice?—Yes, just so. Of course we have absolutely no power over the day schools; it is entirely a question for the Education Department.

Supply of teachers and lecturers.

43,686. How have you selected your teachers and lecturers so far?—It has been a process of trying a man, and, if he was satisfactory, of going on with him, and if not, of trying somebody else.

43,687. I suppose there have been a good many failures?—There have been one or two, and one or two very remarkable successes.

43,688. Do you do it through the University College of Nottingham?—Yes.

43,689. Do they find you some of your teachers?—Of course they do, but, as a rule, that means us finding the teachers, because I represent the University College, and am the head of the department there. Therefore it means that if an agricultural teacher is wanted, my department have to select him; so it comes to the same, in the long run, whether the council does it or the college.

43,690. Still you get the benefit of the college being there to train competent men?—Undoubtedly. With regard to the schoolmasters we benefit very largely indeed, and, of course, through our ordinary college course we have benefited very largely.

43,691. Would you advise any county where they have got an educational centre such as that, to take full advantage of it for the supply of teachers on the various subjects?—Yes. You want to exercise a certain amount of care that you do not use a purely scientific man who will pick up a little knowledge of the practice, and then go and lecture on what he thinks is practice.

A good deal of harm has been done in that way; too much science has been taught, I think, at first.

Travelling advisers.

43,692. I see you speak of travelling advisers; who would they be?—They would be the experts at the fixed school; those experts would be looked upon in the light of travelling advisers. You would have an expert, we will say, in some department of agriculture at your fixed school, and he could travel to any farm where his services were wanted, and give such advice as was wanted. I apprehend that our manager will be asked to visit various dairies in Derbyshire and Leicestershire to report on the cheese-making, or on what improvements can be made; I should call him a travelling adviser in dairying.

43,693. You keep him distinct from the lecturers and agricultural instructors?—Yes, I should be inclined to have a different man.

43,694. Of a higher class, with a higher training?—Yes, a better class of man.

Faults in the present system.

43,695. Do you consider that there are very many faults in the present system that should be remedied?—Yes; the three which I have mentioned in my brief are the three chief ones. First of all there is attempting to instruct all the classes I have mentioned at once. For instance, we give a lecture on the laying down of permanent pasture to a mixed audience consisting of perhaps three farmers, four or five labourers, the village schoolmaster, half-a-dozen ladies, four or five boys, and the clergyman. That lecture will touch perhaps two people in the room directly, and nobody else. I maintain that you ought to have distinct work for the farmers, and for the labourers; and that the subjects which, as a rule, will touch the farmers, the labourers would not be interested in. For example, there is the purchase of goods by analysis, and manuring and the laying down of permanent pasture; they would have no interest for a labourer. Again, you have the boys in the same room, and in trying to instruct them, while you are instructing your farmers and your labourers, you have to pitch your education down to a low level. And so you cannot manage to do any good to all four classes in the room.

43,696. Do you think the object should be to raise the standard of knowledge of the rank and file, or rather to bring out the exceptional intellects among the working classes and develope them?—I should be inclined to raise the general knowledge of the rank and file, because that, I take it, would be the only way in which you could find out the better class of intellects.

Elementary instruction in day schools.

43,697. Would you pitch the standard of teaching very low at first?—Yes, I certainly should; I should begin very young. Of course the elementary science instruction which would be given in the day schools would be useful to anybody, whether he was a farmer or a labourer, or whatever he was; it would be merely general knowledge.

43,698. (*Mr. Whitehead.*) If you went down to such a low level, would you get the farmer to attend?—I would not expect him to attend.

43,699. You would not ask him to attend?—No.

43,700. Would you have separate lectures for farmers?—Yes, if I had lectures at all. I maintain that the whole of this elementary work ought to be done in the schools, so that we should have some kind of ground prepared when these lectures came on; at present we have none, and we have to begin with first principles. There is no agricultural education in the country districts.

District agricultural schools in Nottinghamshire.

43,701. (*Viscount Cobham.*) Do you suggest a graded system of instruction for the younger generation?—Yes. That ought to start in the day schools by a course of elementary science teaching. The Irish day school is, I think, a very fair example of that. That should be followed up in the continuation schools, which I think ought to be made compulsory. In our county we have what we call district agricultural schools, which of course are optional; those are practically continuation schools, which are founded for the teaching of agricultural subjects. We get a class of about 24 or 30 boys and young fellows, and they have a kind of class lecture to start with from one of the staff; then the schoolmaster follows that by a lesson on the lecture, and then they have some other instruction in mensuration, or in bookkeeping, or in some other useful subject afterwards. The classes take place generally once a week.

43,702. Who would be the teachers in the continuation schools?—The village schoolmasters. You see in the district agricultural schools the village schoolmaster would teach second hand; the expert teaches first, or gives a lecture, a class lecture as we call it—a question and answer lecture—first; then that lesson is driven home either the same night or in the same week by the class of the schoolmaster on the same subject as the lecture.

43,703. What district agricultural schools are you speaking of?—The ones we have started in Nottinghamshire.

43,704. Under this grant?—Yes; we have four started; two have just finished their second year, and two are in the first year. We have about 140 or 150 students.

43,705. They come from the locality, of course?—Yes. There we arrange to pay their travelling expenses. We hire a carrier's cart, the boys get into that, and are driven in from the various villages, and, if they attend well, 75 per cent., I think, is the qualification, their travelling expenses are refunded.

43,706. Are they boys who have left the elementary school?—Yes.

43,707. Boys about the age of 17?—16 to 19.

43,708. Have they been successful, so far?—Very successful. At one centre, Sturton, which is one of the most agricultural of our districts, we have all the students attending the second year who attended the first, and we have three or four more.

43,709. Are they examined?—Yes, at the end of the season; but the examination is optional, and they are not bound to present themselves for examination.

43,710. Are prizes given?—Yes, there are prizes given them.

43,711. Out of the fund?—Yes.

43,712. (*Sir Nigel Kingscote.*) Money prizes?—They are book prizes.

43,713. (*Mr. Gilmour.*) How is the teacher paid for that work?—We pay the schoolmaster so much for the evening's work.

43,714. Not by passes?—Certainly not.

43,715. By attendance?—No, we simply say; "You "will have to work 24 evenings, and you will be paid "at the rate of so much per evening."

43,716. (*Viscount Cobham.*) Do you get some assistance from the Education Department?—None whatever; we do not put them under the department.

43,717. (*Mr. Gilmour.*) That is really a technical class, not a continuation school?—Yes, but it is worked on continuation lines.

43,718. (*Viscount Cobham.*) Are they attended by labourers' sons or farmers' sons, or both?—We have both.

43,719. They both come together?—Yes.

43,720. No difficulty about that?—No. The instruction is so pitched as to satisfy them both; it is on general grounds.

43,721. Is there a plot of land attached to the school?—Yes, a plot of land is attached to two of those schools.

43,722. Are demonstrations given, and experiments tried?—Demonstrations are given, but no experiments have been tried at present. They have practical work, they do hedging and thatching, and all the various operations under the guidance of the instructors.

43,723. How much time do they give to these schools?—They give about two hours a week for six months of the year; and then they have to come to the demonstrations which are given beyond that.

43,724. And the instruction has been entered upon seriously, and not treated as a joke or a curiosity?—No, I think these district agricultural schools are very good examples of what might be done in districts. The difficulty of course is the expense; they are rather expensive, but if the work were left entirely to the teacher, and an agricultural school was started under the supervision of the schoolmaster, we should get very few scholars, or else it would be treated as a kind of joke.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Eighty-third Day.

Thursday, 28th March 1895.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., } *Assistant*
Alan Mackinnon, Esq., } *Secretaries.*

Mr. T. H. Hutchinson.

28 Mar. 1895.

Mr. Teasdale H. Hutchinson called and examined.

43,725. (*Viscount Cobham.*) I am afraid, as you have got to go away to-night, we can only give an inadequate time to your examination. You farm a large farm in the North Riding of Yorkshire, I believe?—Yes.

Particulars of witness' farm.

43,726–7. You have won the first prize of 75*l.*, given by the Royal Agricultural Society in 1883, for the best managed farm in Yorkshire, and also the first prize in 1891, and I think you are a well-known breeder of high-class stock?—Yes, I do breed a good many.

43,728. Including horses?—Yes.

43,729. What is the size of your farm?—600 acres.

43,730. What is the rent of it?—1,094*l.*

Reduction of rent.

43,731. That, I presume, is a reduced rental?—Yes.

43,732. Can you tell us what it was in 1880?—I could not tell you what it was then. In 1880 I farmed 250 acres, and I have added to it twice.

43,733. Has there been a material fall of rent per acre?—I should think the fall of rent would be from 15 per cent. to 16 per cent.

43,734. Does that represent the average fall in the district?—No, I should think other farms have been much more reduced than that.

43,735–6. Do you think the average reduction has been a good deal more than 15 per cent. or 16 per cent.?—I should think the average reduction would be 25 per cent. So much depends upon the farm. The good farms have not been reduced so much, but the bad lands have been very much reduced—30 per cent., I should think, many of them.

43,737. Of what district are you speaking, how would you define it?—It is the North Riding of Yorkshire, it is between Catterick and Richmond, and Bedale—in that part of the world.

43,738. (*Mr. Little.*) It is not in the Dales?—No. I should not think the Dales have been reduced so much. I do not think they have suffered so much in the Dales.

Condition agriculture

43,739. (*Viscount Cobham.*) What is the condition of agriculture in your district?—I should say it is very deplorable. The land is deteriorating, and the farmer has not got sufficient capital because his capital is going; we are losing money year by year. When the farms are let they are let at a reduction, and they go to a worse class of tenant. Men have not now got the money to invest in farms.

43,740. To what do you attribute this state of things?—It is the low price of produce. They cannot afford to do it because there is so little money made out of it, in fact there is nothing coming out of it to pay with.

43,741. You would say then that the condition of the tenant farmers is very bad?—It is very bad indeed.

43,742. And their capital is vanishing?—Yes.

43,743. Would you say that universally?—Yes, I should, universally.

43,744. Do you not know of any exceptions to that rule?—No, I do not know of any man who is making any money by farming in my district.

43,745. The result of that is, I suppose, that their expenditure has been largely restricted?—We are obliged to restrict it.

43,746. Consequently the land is falling off in condition?—The tenants have not the money to clean it, and they have not the money to spend upon it which ought to be spent upon it.

43,747. Are there many vacant farms in consequence?—I cannot say there are so very many vacant farms. They are generally taken up again.

Demand for farms.

43,748. Then there is still a good demand for farms?—Yes. There are more farmers than farms. That is the one thing that has kept the rent up.

43,749. Are the farms generally taken by men out of the district?—No; they are generally taken by the worst class of tenant; the landlords generally take any kind of tenant now.

43,750. Do they go outside the district, or are the new tenants the sons of existing tenants?—They are the sons of small farmers.

43,751. In your part of the country is there anything like the state of things in Essex, where large tracts of land have gone out of cultivation?—No, it is not so bad as that; the farms can be let as yet in a way.

Future of farming.

43,752. Do you consider that unless prices rise or cost of production falls, tenant farming can go on?—No.

43,753. Do you see any daylight in the position with regard to the rise of prices or the cost of production?—I do not see any daylight at all. I think myself that things are getting worse.

Cost of production.

43,754. Do you see any way of reducing the cost of production?—Yes.

43,755. In what direction?—You might reduce the cost of production by having rents reduced, but then I do not approve of that plan; that would be only taking money out of the landlords' pocket to serve the farmer. The rates and taxes might be equalised more, and there might be something taken off in that way. But there is nothing that can be saved in labour. The labouring man cannot afford to take less wages for his work, so we cannot save anything in labour.

Wages.

43,756. Have the labourers' wages been fairly kept up?—Yes, I do not think they are reduced at all, but there are fewer employed.

43,757. What are their wages?—The ordinary average labourer whom I employ will have 16*s.* a week, and the better men will have 18*s.*, with 30*s.* extra for harvesting.

Labourers.

43,758. Do you consider that the quality of the labour is pretty well maintained?—As far as I am concerned, mine are good labourers, I must say; and I never change them.

Mr. T. H. Hutchinson.

28 Mar. 1895.

43,759. Are they hired men?—They are hired by the week; none are in the house.

43,760. (*Mr. Little.*) They are not engaged for the year?—No, week by week.

43,761. (*Mr. Giffen.*) Is their employment continuous?—It is.

43,762. That is practically?—It is continuous; I never send a labourer away.

43,763. (*Viscount Cobham.*) Is there any land going down to grass on a large scale?—In my case there is not, because I have not put much down to grass. In the case of the poorer class of tenants, such as a man with a family, with a working son or two, and a daughter or two, they take these farms, and they contrive to work them as much as possible within themselves; and they employ a boy of 15 or 16, where formerly a man used to be employed.

43,764. You have not, I should gather, reduced the number of labourers employed on your farm much?—My labour bill is as big as ever it was.

Results of farming.

43,765. In your brief you do not go into your balance sheet; do you wish to give us any evidence as to your profits or losses in the last few years?—No, I do not think it is necessary for me to do that, I have lost.

43,766. Will you say generally that you do not see your way to a profit under present conditions?—I do not see how any man can make a profit now, as far as I know about farming.

43,767. Not even with the special method of farming that you have adopted, that is, breeding high-class stock?—If I happen to have a really good sale and sell a horse for 300*l.* or 400*l.*, that will stop a gap up; but then I do not call that legitimate farming.

Reduction of rent.

43,768. Do you consider that the fall of rent which has taken place in your district is insufficient?—It is insufficient in my case; I do not say so much for others.

Rates.

43,769. What do you say about the rates and taxes?—The rates come very heavily upon us; they press very heavily upon the land, and I think they might be more equalised.

43,770. Have you any scheme for working that out?—I have no particular scheme. In the village where I farm, I have a brother making from 1,000*l.* to 1,500*l.* a year, and I am making nothing. I am paying poor rates amounting to about 70*l.* or 80*l.* a year; and he will perhaps contribute two or three sovereigns. I do not see why my land should be taxed for me to pay those poor rates and support the people in Catterick in regard to sanitation and education and all those kind of things. The doctor gets so much more out of it than I do; he has them all on his hands and so he gets so much more out of it than I do, and why should he not pay his share of it.

43,771. Then your brother is not a farmer?—No, he is better than that, he is the doctor. He is making about 1,500*l.* a year, he is paying about 2*l.* or 3*l.*, I believe, and I am paying all this money.

Tenure.

43,772. Do you find fault with the present system of land tenure?—I think it might be improved in some way or another. I do not think that a good tenant has sufficient security yet.

Reduction of rent.

43,773. Have you known of cases in which that has been illustrated?—I know of my own case. I know that the men who farm best get the least. I think in the case of the estate that I am on, I get the least reduction of any tenant, because I farm my place well. I have farmed it well and invested a lot of money in it.

43,774. Is your land better than your neighbours?—It is better because I have made it better, I have farmed it better.

43,775. It is not naturally so then?—I have nothing to say about the land, the land is good.

43,776. Would you not admit that there would be a smaller fall of rent to be expected on good land than on bad land?—Yes, I should; but because I farm my land well, I dare not give it up in order to try to get the rent reduced, because there are plenty of men who would take it at my rent.

Compensation for improvements.

43,777. (*Mr. Chaplin.*) For a short time?—That is just the case. They would take it to get the money out of it. If I gave my farm up, I should have to leave 2,000*l.* or 3,000*l.* worth of money that I have put in the buildings on the place. Some other man would come in and pay the rent and go on for a few years and get the benefit of my tillages and my improvements.

Mr. T. H. Hutchinson.

28 Mar. 1895

43,778. Would you get no compensation for the buildings?—I do not think I should, I built them unfortunately before the Act giving compensation came into force. I think I should leave about 2,000*l.* in the buildings.

43,779. If you had to go, some man would take it for a short time for the purpose of working it out?—That is what I mean.

The Agricultural Holdings Act.

43,780. (*Viscount Cobham.*) Is the Agricultural Holdings Act made much use of?—None whatever. I have known of several cases where it has been adopted, but I never knew a tenant or landlord get much benefit from it. The only people who have benefitted from that are the arbitrators, if you get them sitting you cannot get them up again.

43,781. Do the farmers in your part of the country then prefer the custom of the country, or on private agreements?—They have to do partly; I do not think any good is done by the Act.

43,782. They are not obliged to go under the custom, of course?—If you make a claim the landlord will make a counterclaim, and then they go to arbitration, and so they waste all the money. You had better put up with what you can get.

43,783. Do you think that is the feeling that prevents them from going under the Act?—I am sure it is my feeling; I do not think I would go under it—I would not be bothered with it.

43,784. Yet I suppose in your case there could not be much of a counterclaim against you?—There would not be for dilapidations at any rate. I do not think I could get much out of what I have spent because I did it before the Act giving compensation for improvements came into force. I have acted foolishly, and I have spent a great deal more money than I ought to.

43,785. Would you not recover under any custom or agreement?—I would under the Agricultural Holdings Act. The Act is good for tillages and that is all.

43,786. (*Mr. Little.*) Do you use the word "tillages" for manures as the Lincolnshire farmer does?—Yes, bones guano and so on.

43,787. Tillage usually means the actual tilling of the land and the cultivation?—Yes, but I mean the manures.

43,788. (*Viscount Cobham.*) Do you see any effective remedies for this state of things?—It is very difficult to say what should be done; there are remedies, but then they would not be adopted.

Duty on barley.

43,789. We should be glad to hear of them though? I think one thing might be done; I think there might be a duty put on foreign barley; I do not see any great objection to that. Then I would compel the brewer when he brewed his stuff, if he brewed it from anything but malt and hops, to state what it was. I would not let him call it beer if it was not brewed from malt and hops.

43,790. Would you put a prohibitive duty on any other ingredients?—Yes. I would make it difficult for the brewer to use anything except malt and hops. My proposal would increase the consumption of barley, and it would be good for the people, because they would then get an honest stuff to drink instead of being poisoned as they are now.

43,791. Do you not use barley for feeding purposes?—Not foreign barley.

43,792. Do you not know many farmers who do?—Not very many, but there are some.

43,793. (*Mr. Everett.*) Would you contemplate a tax on all foreign barleys?—On all.

43,794. Not only on that which is used in the brewery?—I would put it on all.

43,795. (*Mr. Chaplin.*) Would you not get into a difficulty with the people who use barley for feeding; would you not make an exception in favour of crushed barley?—I think they would have a better feeling when they saw that their own good barley was making 5*s.* or 6*s.* a quarter more.

43,796. But perhaps they might grow moderate barley?—There is not any great advantage in using the foreign barley; they would get more maize and those kind of things to come and take the place of it.

43,797. (*Viscount Cobham.*) Do you grow a good malting barley yourself?—Yes, I do; very good.

43,798. Then you have not benefited by the repeal of the malt tax?—I should like the malt tax as it was before.

Malt tax.

Duty on flour.

43,799. Would you put a duty on wheat as wheat or as flour?—I would not put any duty on wheat, but I would put a duty on flour. I think farmers are very badly treated in regard to flour. The flour sent over here cheapens my wheat, which is what I have got to sell, and I have to buy a large quantity of bran, and bran is one of the most useful things used on my farm; but with the foreign flour coming over the bran is kept back and the flour only is sent, which is actually making bran here so very much dearer than it ought to be. Besides you are losing the labour of the people who make it into flour; that is shutting up the mills in my part of the country; they are nearly all closed up through this buying of foreign flour.

43,800. All the country mills?—Yes; perhaps it is owing to bad machinery, and because they cannot compete with the good machinery.

Railway rates.

43,801. As to railway rates, I see you think that they should be reduced?—I think they ought to be reduced.

43,802. But that is only a general opinion, is it?—It is only a trifle; I do not mean to say that it would make any great difference, but it would be something.

Local rates.

43,803. Do you think there should be any difference in the present system of the collection of rates?—Yes. I should like to pay all my rates to my landlord. I should like to take my farm, and pay in one sum rent, and rates, and tithe, so that I knew exactly what I was doing. Now I never know what I am doing, for they keep springing up perhaps a sanitary rate or some other rate.

43,804. You would have to leave to your landlord all the administration of the rates, I suppose?—I would vote for him in the way he wanted me; I would look to see that he had not any more to pay than necessary.

43,805. Would you give up the administration if you were relieved of the rates?—I would not give up the administration; I would vote for the rates to be kept down as much as possible because my landlord's good would be my good, and it would be no benefit to me to increase the rates.

43,806. I see you are prepared to vote against parish councillors spending money that they do not contribute themselves?—Yes, very much.

43,807. Do you consider that if you paid no rates, you should have a voice in the local administration?—I would not have the money to spend if I had not the rate to pay, but now you never know where you are. I can have 25*l.* or 30*l.* a year sprung on my rates at any time by men who have not to pay a penny of it. I think the landlord's agent is the best man to look out to see that the rates are properly levied. I do not want to shirk paying the rates, but I want to pay them in one sum—I want to include them in the rent and to know exactly what I have to pay in the year.

43,808. Like the tithe in fact?—The same way as the tithe, exactly.

43,809. (*Mr. Giffen.*) Would not the landlord make that bargain with you that he should pay all the rates?—No, not without he was forced to—he would not.

43,810. It would be simply a matter of bargain between you and the landlord?—He would not bargain for that at all—he would know better, because he would be running the risk. I want him to run the risk instead of me, but there is no compulsion over him.

43,811. And there is no compulsion on you to take the farm unless you like, is there?—None whatever.

43,812. Then it is a matter of bargain?—I need not take the farm, of course, unless I like.

43,813. (*Mr. Lambert.*) Why do you take the farm with these objectionable provisions?—There were not any of these sanitary rates and parish councils and all that nonsense when I took it.

43,814. (*Viscount Cobham.*) You want to be quit of the whole thing?—I do not want the small men who are paying a 2*s.* or 3*s.* rate to come to my district and spend a thousand or so when I should have perhaps 10*l.* of that to pay and the other men would only pay their 2*s.* or 3*s.* I do not want that.

Quitting a farm.

43,815. (*Mr. Lambert.*) Now that you have the sanitary rates, and all the other nonsense, as you term it, why do you not give up your farm?—You cannot do it as you can go out of a shop. If you have a shop you can clean the stuff out and put up the shutters, but if I leave my farm I leave a lot underneath.

Mr. T. H. Hutchinson.

28 Mar. 1895.

43,816. Then it is a very great loss to the farmer to leave his farm?—If it is in the condition that mine is in it is, but it would be a benefit to some of them to leave.

43,817. If a man is a good farmer it is a great loss for him to change from one farm to another?—Certainly it is, there is no doubt about that.

Sanitary rates.

43,818. (*Viscount Cobham.*) What sanitary rates have you to pay?—I pay about 13*l.* a year.

43,819. For Richmond?—No, for the village of Catterick.

43,820. (*Mr. Little.*) Is it an urban district, I suppose not, only a rural sanitary district?—It is a rural district.

Sale of cattle by live-weight.

43,821. (*Viscount Cobham.*) How are cattle sold in your neighbourhood?—The best beef is worth about 7*s.* 3*d.* the stone of 14 lbs.

43,822. What is the system of selling—ordinary auction sales?—Some patronise the auction sales, some send to Wakefield, and some send to Leeds market.

43,823. Do you think any better system can be adopted?—I should like them all sold by live weight.

43,824. (*Mr. Little.*) Compulsorily?—Compulsorily; they will never be sold by live weight unless it is compulsory.

43,825. (*Mr. Giffen.*) What kind of compulsion would you apply?—I would make it illegal to sell a beast without being weighed.

43,826. Would you make it punishable by fine or imprisonment?—I do not care what you do if you only make them do it that way; you can transport them if you like.

43,827. (*Mr. Gilmour.*) Do you mean that it must be sold by weight in the case of a private sale out of your own byre?—I want to sell them all by live weight.

43,828. If sold by auction, how would you ascertain that?—At a public weigh.

43,829. (*Viscount Cobham.*) Have you got machines?—Yes, but I cannot sell them by live weight.

43,830. (*Mr. Little.*) Would you apply that principle to store stock?—Yes.

43,831. To horses as well?—No, horses are not to eat. I would let horses alone.

43,832. Rams?—It would not matter so much for rams.

43,833. (*Viscount Cobham.*) Are the farmers afraid of selling by live weight?—No, the farmers are not afraid, but the men that buy the cattle are. I sold a man 20 bullocks by live weight, and when he took them to Wakefield Market he lost 30*l.* out of them. He said he could not understand how he lost 30*l.* I said: "That is quite plain; formerly, when you went to my "place and bought bullocks that weighed 60 stone "you called them 55 stone, and I had to sell them to "you at 55 stone, now I persuaded you to buy them by "live weight, and when you went to Wakefield Market "you had not the difference of that 5 stone to go to "work with."

43,834. Why do not the farmers press for a compulsory system of sale by live weight? If it is to their benefit they seem to be very apathetic?—The farmers are not the cleverest men in the world.

43,835. (*Mr. Everett.*) Do you think men would go on buying beasts of farmers and losing 30*l.* on every lot they bought?—They would not. You see from what is quoted in the papers that everybody is selling your beef at 8*s.* a stone, say, but I am only getting 7*s.* 6*d.* I want to know what it is exactly, and to have quoted correctly what I really do get for my beasts. If you had to sell by live weight you would get to know the real price better than you do now. I do not know that farmers would make very much money out of it, but it would be a much more satisfactory way of doing business. We are in the dark now, I said to my butcher the other day, you will not let me come and buy a sirloin of beef off you without weighing it, and I have a better chance of guessing its weight than you have of guessing the weight of my beast. A dealer comes to buy a beast of me, but that man is buying bullocks every day all round the country, while I am selling only about twice or

Mr. T. H. Hutchinson.
28 Mar. 1895.

three times a year. Do you think that man does not know more about his business than I do.

43,836. (*Viscount Cobham.*) Would you always sell by live weight?—Always, but I cannot get people to buy them like that.

43,837. Because they boycott you?—No.

43,838. Is it not a fact that farmers are afraid of being boycotted by the butchers?—I am not afraid of being boycotted.

43,839. Not if you insist on selling by live weight?—I am not afraid of being boycotted; I do not care.

Sale of foreign meat.

43,840. Would you prevent the selling of foreign meat as English?—I would if I could, but I could not tell you how it could be done quite. I think it is rather unfair that it should be sold as English.

The Agricultural Holdings Act.

43,841. Going to another point, in what direction would you alter the Agricultural Holdings Act?—It is a very difficult question to know how to alter it for the best. When a new tenant went on to a farm, I should like to have the whole of the place described—every field, the cropping of it, what it has been for three years back, and the state of the buildings, in fact the whole state of the farm when he enters upon the farm. Then when the tenant leaves the farm, if he has made it any worse, I think he ought to be made to pay the landlord for it; the landlord ought to receive compensation for what has deteriorated; but if the tenant has left any money in it, and improved it, I think the tenant also ought to receive payment for the improved value that he has left in the farm. The landlord should have his land back in as good a conditon as he let it, but not better without paying for it.

Compensation to landlords for deterioration.

43,842. That would necessitate a survey whenever the farm is vacated, would it not?—Yes. It would be a difficult thing to do, but if it could be done that is the right system to adopt.

43,843. I think that is in the draft Bill prepared by the Central Chamber of Agriculture, is it not?—I do not know. The great difficulty is to get at this description, but if it could be done, I say that a landlord ought to have his land given back to him in the same condition, or at least in as good a condition, as he let it, and that if the tenant has improved it and left any money in it, then the tenant ought to be able to take it away with him.

43,844. (*Mr. Lambert.*) Do you mean to take it in money?—Yes.

43,845. That he ought to be compensated?—Yes, but only for what he has done.

43,846. How is he to take it away? I want to know whether you would allow the tenant to stay in until he has exhausted the soil?—No, if he had exhausted the soil he should pay for it.

Local rates.

43,847. (*Viscount Cobham.*) I think, from your brief, you are apprehensive of county and parish councillors spending money extravagantly?—Yes, I think they do, a great many of them.

43,848. You think a good many of them are already doing so?—Yes, I think so.

43,849. The parish councils have hardly had time yet, have they?—The parish councils have not done much.

Agricultural education.

43,850. Do you think the money spent on technical education has been well applied or not?—I do not think it is in all cases; in some cases, I think, it is not. You pay a professor of agriculture, I do not know what he is, but you send him to lecture to the farmers and to tell them what they ought to do. Now if you put that man on to a 300 or 400 acre farm and let him farm it himself he would be sold up in three years, and yet he would come and preach to a man like me and tell me what I ought to do. I think that is money wasted.

43,851. Is it generally found to be a failure?—It is a failure as far as I have seen it.

43,852. Have you had a dairy school in the district?—I do not know anything at all about dairying, I have never meddled with it.

43,853. Do you think that any money could be advantageously spent in the direction of agricultural education?—I think it might in dairying; I think there is room for improvement perhaps in dairying, and technical education might answer there pretty well.

43,854-5. Do you think the farmers have nothing to learn?—I do not think they have so much to learn. They want to learn about some better prices, then I think they would produce the stuff. If they had a good market and they knew they could produce the stuff at a profit you would have plenty of stuff in the market. It looks to me as if the farmers were too clever, they send too much to the market, because, whenever I go to the market, the place is swamped and you cannot get your produce sold. If they were any cleverer and produced more they would have to give it away. The farmers know their business well enough, but they are so disheartened with bad prices. It does not pay them now, and they have not got the money to launch out.

Mr. T. H. Hutchinson.
28 Mar. 1895.

43,856. That points to developing farming in some new direction, does it not?—It is very difficult to know; it would be a very good thing if anything could be done to make it pay, but I really do not know of any direction in which you could go. People tell you that you ought not to grow wheat and all that, but it is very difficult to know what to grow in place of it.

Compensation on quitting a farm.

43,857. (*Mr. Chaplin.*) You told us just now of the great loss it would be to a man who was farming well to have to leave his farm; I suppose that would depend upon what compensation he was entitled to and upon the terms on which he held his farm; supposing, for instance, that you get full compensation for what you have spent on the buildings and any other improvements you have made you would still hold that opinion?—If I had full compensation and could have all the money I have invested in my farm I would leave it to-morrow.

43,858. And then you would leave it without loss?—Yes, if I had full compensation. If I could leave it without loss in that way I would not go on farming at all, because I am only losing money.

43,859. That is the case with a great many men who are good farmers and who have got capital left, I believe, is it not, that if they could get out of the business they would only be too glad to do so?—They certainly would.

The Agricultural Holdings Act.

43,860. What terms do you hold on—by agreement, or under the Agricultural Holdings Act, or under what circumstances?—I am under the Agricultural Holdings Act now, I think. I never had an agreement. My father and myself have been on the place for 50 years and never had an agreement. I should be guided by the rules of the estate, I think, or by the Agricultural Holdings Act—I do not know which.

43,861. What are the rules of the estate, are they less or more liberal than the Act of Parliament?—They are less liberal than the Agricultural Holdings Act.

43,862. Then you would claim under the Agricultural Holdings Act?—I think so if I thought it the best.

43,863. But the Agricultural Holdings Act, according to you, does not give sufficient compensation?—It may give sufficient, but it is so very difficult to get it; this arbitrating business is the difficulty.

43,864. It is the procedure that you object to?—It is the procedure principally.

43,865. Have you studied the recommendations of the Committee of the Central Chamber of Agriculture upon the Agricultural Holdings Act?—No, I have not.

43,866. Then it is no use asking you if they would be satisfactory?—No, I really do not know very much about them.

Scheduling the condition of farms.

43,867. Among those recommendations was one of the most prominent that you have recommended to the Commission: namely, that when a farm is taken its condition should be regularly scheduled?—I agree thoroughly with that.

Compensation to landlords for deterioration.

43,868. I understood you to say that the whole improvement ought to go to the tenant?—Yes, if it is made at the tenant's expense; but if the landlord has made any improvement the tenant should not reap the benefit of any of the landlord's money.

43,869. Is it not the case that even in any improvements that are made by the tenant something must be put down to the nature of the land itself; that is to say, that if you lay out a certain amount of money on good land the return to you would be a great deal more than the same amount of money laid out upon bad land?—Certainly.

43,870. Ought not the landlord to have some share in the improvement where the land itself is so good?—I would not deprive the landlord of anything that he had a right to.

Mr. T. H. Hutchinson.
28 Mar. 1895.

43,871. The question is whether he would have a right to that?—That I cannot say.

43,872. That you have hardly thought out perhaps?—I have hardly thought it out.

43,873. Then you say that whatever deterioration has been made in the land by the action of the tenant, the landlord ought to be paid for?—Certainly he ought.

43,874. What is to be the landlord's situation if the tenant has got nothing to pay with?—He should get the tenant off the place before he gets into that situation.

43,875. Then it comes to this, that the remedy against deterioration would really be notice to quit in sufficient time?—It would be a safeguard for the landlord not to take an inferior tenant on to his farm, would it not? That would make a landlord more cautious whom he let his farm to.

43,876. Quite so, but there are cases, I suppose, even within your own knowledge, where a tenant who has been substantial when he has entered upon a farm, has after a good many years' depression, arrived at that condition, that he would be able to pay the landlord nothing whatever for deterioration?—I do not think the landlord after he gets into that condition is doing his tenant any kindness by letting him stay on and deteriorating the land.

43,877. Is it your view that if the landlord sees his farm is being steadily deteriorated, and does not give the tenant notice that unless he improves he must go, the landlord must take the consequences?—I certainly think so, but if I was a landlord I should discharge him.

Low prices.

43,878. I understand from you that the fall of prices in your opinion is really at the bottom of the whole question of depression?—No doubt about it.

43,879. And that no real improvement can be expected unless there is to be some improvement of prices?—I think so.

Effect of the depression on the labourers.

43,880. Are the labourers beginning to be affected by the depression?—Certainly, they are affected now, because they are not getting employment, and they are being starved out of the small country villages which are becoming depopulated; not that these people dislike the country, or want to leave the country, but they are obliged to leave it—they cannot live in it—or get employment, and they are obliged to seek employment elsewhere.

43,881. I suppose it comes to this really, that for a long while the labourers have suffered the least?—Where they can get employment they have not suffered. Their wages are just as usual, and they are getting cheaper bread, cheaper clothes and cheaper food. They are not at all in a bad position if we can only go on paying them.

43,882. But in consequence of the depression labourers are losing their employment?—They are, certainly.

43,883. If the depression continues, and if the loss of employment becomes more general than it is at present, the labourers ultimately will be the people who will suffer most?—It will come to that finally; at least all will have to suffer.

Effect of the depression on cultivation.

43,884. What will be the effect upon the land itself; will there be more land going out of cultivation?—I should say all that land which was formerly let at under 1*l.* per acre will not be worth anything at all. It is not worth cultivating; I do not see how anybody can cultivate it to a profit.

43,885. That is at present prices?—If you were to make me a present of a thousand acres of bad land now I would not go and take possession to-morrow morning, if you gave it to me and forced me to till it myself.

43,886. What proportion of the district which you live in, or of the arable part of Yorkshire, is that bad land of which you are speaking?—I suppose that a very large proportion of land in Yorkshire, even in good times, was not let for more than 20*s.* or 25*s.* an acre?—Would you include the moor land?

43,887. No, I mean land under cultivation?—I should think one-third of Yorkshire is that bad land.

43,888. At least a third of it?—I think so. I have not really thought the thing out, but I should think that would nearly represent it.

43,889. Roughly speaking, you would say that one-third of the land is land of such a description that it will not pay to cultivate it at all if present prices continue?—That is what I should say.

Mr. T. H. Hutchinson.
28 Mar. 1895.

43,890. (*Mr. Little.*) What proportion of arable land have you?—About half.

Particulars of witness' farming operations.

43,891. Is the pasture all good grazing land or store land, or what would you describe it as?—I should say half the pasture was good grazing land, and the other half good store land.

43,892. For growing stock?—Yes, but it is not good enough to put fat beasts on.

43,893. Do you breed cattle and sheep largely?—I try to breed all I possibly can.

43,894. You have noted breeds of both cattle and sheep, have you not?—I once made 500*l.* of a sheep, and I have sold cattle for 500 guineas each.

43,895. Your returns would probably be considerably more than those of the average farmer then?—Yes, they would.

43,896. Very much larger?—Yes, very much larger.

43,897. But even with them you have not found of late years that you can make any great profit?—I have not been making those big profits of late years, unfortunately.

43,898. Still you have had the same character of stock?—Yes.

43,899. But the prices have fallen?—Both the price and the demand.

43,900. It is not that your farm has deteriorated, or the quality of your stock, but the price having fallen the possession of excellent stock has not enabled you to make a profit?—That is it, certainly.

Commencement of tenancies in North Riding.

43,901. At what time of the year is the entry upon farms in your district?—In February, I think.

43,902. At Candlemas?—In February a new tenant is first allowed to go on to plough; then he would enter at May-day.

43,903. Is that the 12th of May?—Some of the land you have to give up on the 6th of April, and a small portion of the grass you have to give up on the 13th of May; but a new tenant coming on would be able to come and plough in February.

43,904. That is pre-entry for cultivation, but when does the actual tenancy commence; on the 6th of April?—Yes.

Conditions of entry.

43,905. What does the incoming tenant have to pay for, or what does the outgoing tenant get in the way of cultivations?—He takes, I think, one third.

43,906. As a way-going crop?—One third of the arable land as a way-going crop.

43,907. One third of the arable land in wheat as a way-going crop?—Yes.

43,908. The spring-corn is not a way-going crop, is it?—He has one-third of the arable land, and he can sow it either with wheat, barley, or oats.

43,909. In practice does he harvest that crop himself, or does he part with it to the incomer?—He has the right, if he can agree with the incomer; he can do so, but the incomer is not forced to take it.

43,910. I said, in practice is it so?—No, not always.

43,911. You have been extending your farm, you say, from 250 acres up to 600?—Yes.

43,912. Have you when you have entered upon new farms taken the crop from your predecessor?—I went round with the other tenant, and we did it all in half-an-hour. We valued the right to everything, and I gave him a cheque and paid it down and was done with it.

43,913. Would custom there give any compensation for manures used in the production of the crops of the previous year?—Yes, he got something for bones, I think, and something for guano, according to the Agricultural Holdings Act.

43,914. We are distinguishing between custom and the Agricultural Holdings Act; did the old custom give him anything?—The old custom did not give anything.

43,915. Simply the man got paid for his way-going crop or harvested it, and I suppose he got paid for the hay and straw that was left?—I bought all the hay that was left.

Mr. T. H. Hutchinson.
28 Mar. 1895.

43,916. At consuming price?—Consuming price.

43,917. Not at sale value?—No, at consuming price; at what it would make to eat on the ground.

Sale of cattle by live-weight.

43,918. (*Sir Nigel Kingscote.*) You are very strong about making it compulsory to sell every animal, or, at all events, all fat stock, by weight; would you apply that principle beyond the markets; would you make it compulsory for any individual, myself, for instance, to sell, or for any butcher to buy by weight?—I would make them all to be sold by weight.

43,919. You would not confine it to anybody who exposed animals in the open market?—I would have them all weighed, because it would be instructive to both, and at any rate it would not do any harm.

43,920. And you want it compulsory?—Yes, because it can never be done otherwise; that is the only reason why I want it to be made compulsory.

Change in system of farming.

43,921. As regards the cultivation of your land, owing to the depressed prices of corn, have they made any change of system in the farms in your neighbourhood; have you, for instance, laid more land down to grass?—I have tried that, but I cannot say with great success. I have laid 40 or 50 acres down to grass, but I do not think it is a very profitable business. It does very well for a couple of years, but it takes a deal of keeping up, and it soon goes to waste again. It is not a very profitable job, I think. I would rather, now, let my seeds lie down for three years and then plough them up again, rather than have permanent pasture; that gives the land a rest, and it acts for two or three years.

43,922. I suppose your object would be to save labour?—That is it.

43,923. Does it do so?—I do not think so. I have saved none. I have never turned any man off.

43,924. Do you see no way to change your system of farming for economy's sake, or to meet the low prices?—No; if I had done that I should have changed my system long since. There might be some way of doing it in some places.

43,925. (*Mr. Whitehead.*) Have you done better than your neighbours?—I really could not tell you. I think I have farmed as well, but I do not know that I have made more money.

Horse-dealing and breeding.

43,926. Is that because of the horses which you breed?—I hunt a good deal, and I have got a little bit out of hunters.

43,927. Huting is not profitable, is it?—It has paid me.

43,928. Do you breed hunters?—No, I do not breed them; I buy and sell them.

43,929. Is horse-breeding profitable?—No, I used to lose money at that, but when I bought them I made money of them.

43,930. Horse dealing has been profitable to you?—I have been fortunate.

43,931. In that respect you have had an advantage over your neighbours?—It has given me ready money to lose in farming.

Cattle breeding.

43,932. I think you breed shorthorns?—Yes.

43,933. Have they been profitable?—They were once, but they are not now.

43,934. Not now?—No; there is no demand, and the price has gone down so that they do not pay very much now.

43,935. (*Sir Nigel Kingscote.*) Would you say that they hardly fetch more than market price?—Hardly that.

Agricultural education.

43,936. (*Mr. Whitehead.*) I understand that you think there is no occasion for technical education?—No, not generally; but I think something might be done in regard to dairying.

Dairying.

43,937. I was going to instance dairying?—You can do some good in dairying, perhaps, but you see if you have technical education in dairying and you taught the farmers' daughters and the farmers' wives to carry this thing out properly, the estate would have to provide new dairies and have properly fitted-out dairies and appliances to carry out this scientific dairying.

43,938. Do you think there is room for improvement in dairying which might be brought about by technical teaching?—I think technical teaching would do them no harm at any rate.

Mr. T. H. Hutchinson.
28 Mar. 1895.

43,939. Do they give technical education in dairying in your county?—No, it is not a dairying place; there is very little dairying.

43,940. Might it be introduced there with advantage?—I do not think so.

43,941. Has it been tried?—Yes, I daresay it has been tried, but you know we are a long way from a large populous centre, and there is not a market near us. I do not think much could be done by it.

43,942. Do you think there are no other things that could be tried to improve the position of the farmer?—I do not know of any; there may be, but I am not clever enough to say that I know of any.

43,943. (*Mr. Clay.*) You say you have been losing money in farming?—I have this last two or three years.

Reduction of rent.

43,944. That is at your present rent?—Yes.

43,945. If your rent had been reduced proportionately to the value of the produce you sell off the farm ——?—I should do a deal better.

43,946. How much reduction would be necessary to bring into a money-making concern?—If I was put down to about 28*s.* an acre I should not do so badly.

43,947. So it is a question of rent; you are paying too much for your land?—It is partly a question of rent.

43,948. And the principal part?—The rent is a very serious item with me.

43,949. You have, perhaps, taken the farm too dear?—I took it when times were better; it was not too dear when I took it, but the times have gone against me.

43,950. Are you not a yearly tenant?—Yes, I got a hundred a year off it last year, but I cannot get any more.

43,951. You are afraid to leave your farm?—It is in too good a condition to leave it.

43,952. Because some person would come after you who had not gone to the expense of paying for the good condition of the farm?—Yes, and who would take it over my head.

43,953. You would not like to leave the old home?—No, I should not. I have made it a very nice place.

Duty on barley and flour.

43,954. You would like to see a duty on foreign barley, you say?—Yes.

43,955. Your reason for putting it on flour, which is a very sensible reason, is that it would give us that healthy article called bran for our horses and cattle?—Yes. I use a great quantity of bran; it is a big item with me.

43,956. I suppose bran is as dear as wheat?—It is out of all proportion.

43,957. It would not interfere with the feeding of the multitude of the people if we let the raw material of wheat in?—No, not at all. I would let the raw material of wheat in. You want to feed people cheaply.

Inefficient tenants.

43,958. You say that landlords at times do not pay sufficient attention to the tenants they put upon the place?—Yes, I do.

43,959. They grasp more at the higher rent, and do not look to the position of the man they put into the property?—Yes, that is it.

43,960. So some have suffered by the deterioration of their farms through inefficient tenants, and the insufficient capital of the tenants?—Yes.

Scheduling the condition of farming.

43,961. (*Mr. Gilmour.*) You speak about the scheduling of the fields on going into a farm as being one of the most necessary and useful things to be done, so that the tenant can get a proper value on going out; do you, as a practical man, see any way of carrying that out?—Yes, I think that a proper valuer, if he had a note-book and went right round the farm, would be able to put down the condition of the buildings; he would be able to say whether they were in a dilapidated, or a middling, or a first-class condition. He would be able to say what condition they were in.

43,962. I do not mean the buildings, because that is easy?—He would have to take out the condition of every field and the state of cultivation it was in, whether clean or dirty; what the previous crop had been, and what tillages had been applied to it for two or three years, and put it in his note-book. It could

Mr. T. H. Hutchinson.

28 Mar. 1895.

be done. I grant that it is a very difficult thing to do, but I say it could be done.

43,963. Are most of your farms held annually?—Yes.

43,964. So that it might be easier done on them; but where you have to deal with leases would you see any practical way of carrying it out at the end of a 19 years' lease, when the man who valued it first has gone, and the times had altered very much?—You would have the book to go to which he would leave behind him. After the farm was gone through the book would have to be signed by both tenant and agent to show that it was a satisfactory statement of the condition that they had scheduled it in, and that note-book would be left if he were dead. That is the only way you can do it, I think.

Consumption of home-grown corn.

43,965. Then have you considered the question of compensation for home-consumed produce at all?—No, I have not. I am quite satisfied with what Sir John Lawes and those men have done. I think they know more about it than I do, and I would be guided by them.

43,966. (*Viscount Cobham.*) Have you consumed much of your own wheat?—I have consumed it all. I have not sold a peck; it was not worth selling.

43,967. Do you give it to your horses?—I give a very small portion to my cart horses, but not to my other horses. I give it principally to the cattle and sheep, but mixed with other things. I think it is not a great thing to feed cattle on.

Cattle breeding.

43,968. (*Mr. Gilmour.*) In those times when you got the biggest prices for your pedigree stock you had to pay correspondingly high prices for the animals you bought to produce them, did you not?—Certainly.

43,969. Was your profit then so very much greater than it is now that you are breeding the stock?—The profit was very much greater then, because I do not get those prices at all now. The shorthorns have so deteriorated that they are not worth more than ordinary cattle.

43,970. But in comparison you are buying in very good stock at very low prices?—Not grazing cattle you cannot.

43,971. I mean pedigree stock?—I do not buy any now; I always breed mine; but if you want them you can buy them cheap enough.

43,972. But still in proportion, at the time when the prices were higher, it paid you far better?—Yes.

43,973. Even though you had to buy at a dearer price?—Yes.

43,974. (*Mr. Long.*) I see you say in your brief: "Unless a change takes place farmers will soon be "unable to pay wages"?—Certainly.

43,975. What form do you think that inability will take?—They will not have any money to pay them with.

Reduced employment of labourers.

43,976. Will they continue to occupy their farms and dispense with their labourers?—Many small men are going on to farms who have perhaps two or three sons and daughters. They go and work those farms with their sons and daughters, and do not pay them any wages; so actually the tenant is living out of his family, and he is depriving the labourers of work. In that way no money is spent in the country, and with no labourers employed and no money spent the small shopkeepers will suffer as well, because there will be nothing for them either.

43,977. How soon do you think that next stage will arrive?—I think it is coming very fast now. It is coming on now in a great many cases. I know many farms where formerly there would be five or six strong labourers and a lot of boys and women, but which are now worked with three or four small boys that they pay 8*s.* or 9*s.* a week to, and the labourers are hungering.

43,978. You say the villages are being depopulated; are there many empty cottages?—A great many. Some of the best villages, where the land is in a good condition, have not suffered so much, but where there is bad land the cottages are empty.

43,979. So that not only have the people been driven away, but cottage property is of course deteriorating?—It is standing empty.

43,980. With regard to what you told us about land tenure, you say in your brief that there is "no induce- "ment to anybody to invest money in farming"; do you think that any serious portion of agricultural depression has been due to a failure on the part of the farmer to invest sufficient capital in the land?—That I could not say. I would not say that it would not tend to bring on the depression, because if they had invested more capital in it and farmed better the depression would even be worse, as there would be more produce to go to the market.

Mr. T. H. Hutchinson.

28 Mar. 1895.

Security of tenure and compensation for improvements.

43,981. What I rather wanted to get from you is this: whether you advanced that opinion rather with a view of securing justice for the farmer in the position in which he is now, or because you believe it has led to the farmer not farming as well as he otherwise would have done?—It is a difficult thing to say; I do not know I am sure about that.

43,982. Perhaps this will be a simpler form in which to put the question: is it not the fact that farming in England, as a rule, has resulted in a very considerable production per acre—at least equal to that of any other country?—It is more, but I think the production is capable of being made one-third more yet if the land is properly farmed.

43,983. One-third more?—Yes, if the land is properly farmed, if capital is brought into it. The idea seems to be that small holdings, and that kind of thing, will do good; my idea is that they will not do any good at all. You want to induce some large men who have capital to come into farming, and to bring their capital into it. These small farmers, who live from hand to mouth, live a most miserable life and they work harder than any labouring man; they would be much better off if they were employed as bailiffs by capitalists.

43,984. Would not that most desirable object, namely, attracting capital to the land, be better secured by an increase in price, rather than by a greater security of tenure?—Unless a man had proper security he would not like to invest, I should think.

43,985. I rather gathered from you that the failure of the land system was not due to the want of security of tenure, but the want of security for compensation?—Yes, that is so.

43,986. You indicated that the farmer only wanted better terms in order to get out, not in order to remain where he was?—I indicate now that things are so bad, and that prices are so bad, that there is no profit in farming. If I could get out now without leaving any money behind me, I would retire from farming.

43,987. That would be distinctly an injury to agriculture?—I do not know; if a better man came in it would not.

43,988. Is it likely that a better man with more capital would come in?—That I cannot say.

48,989. Do you think it is likely?—No; he might have more capital, but I do not know that he would be such a fool as to spend as much on it as I have.

Local rates.

48,990. You indicate, lower down in your brief, that you think a Bill should be introduced to prevent county councillors, and the other locally elected authorities, spending money upon local improvements; by that do you mean that the rates should be paid by each individual householder?—I mean this: that we have got a lot of county councillors, and the only good that they have done me is that they have voted now to spend about 15,000*l.* or 16,000*l.* to make themselves a comfortable house to meet in and the ratepayers and taxpayers will have to find the money to build that place with. I do not see that that will do us any good because the rooms they have got now are quite good enough rooms to meet in.

43,991. Surely the cure for that would be to elect another county council would it not?—I do not know, I am sure. There are too many elections. I do not know what you can do with them.

Compensation for improvements.

43,992. (*Mr. Lambert.*) You said that you would leave your farm to-morrow if you could get a proper sum for your improvements?—If I could get all the money out that I have invested in it I would.

43,993. What means do you suggest that the legislature should enact in order that you might get the money out?—I could not tell you. I do not know. It will take a cleverer man than I am to find it out.

Mr. T. H. Hutchinson. 28 Mar. 1895.

Arbitration.

43,994. You said just now that the arbitrators are the only people who get anything out of the Agricultural Holdings Act?—I think they are.

43,995. Have you thought out any plan whereby arbitrations might be conducted more cheaply?—I have not thought out any plan because I have never studied it. I know they are very expensive now. I have never thought out any plan whereby it could be remedied. My experience in our district is, that wherever there have been arbitrations they have generally ended in a squabble, and neither side have got much good out of them, and the money was generally spent over the arbitration. I should think the arbitrators get more money out of it than anybody else.

Wages.

43,996. (*Mr. Giffen.*) With regard to the employment of labourers, I understand that as yet there has been no fall in wages?—No.

43,997. But if they do not get employment with you, they get employment somewhere else?—They do get employment with me because I never turn a man off. I have men who have been on my place for 30 years.

43,998. There has been no reduction of wages in your district?—I have never reduced any of mine.

Reduced employment of labourers.

43,999. (*Mr. Chaplin.*) Do these men that you were speaking about to me get employment?—Some of them do not only on these good farms. It is only on two or three good farms about my place that the men are all right and get employment. The small farmers do not employ them regularly, they turn a man on and off.

44,000. Except on good farms held by men with plenty of capital, there is a great loss of employment at the present time then?—No doubt.

44,001. (*Mr. Giffen.*) What becomes of the labourers who are not employed on the farms?—They go to the towns or anywhere where they can get employment. They leave the country. I do not really know what becomes of them, but I suppose they flood the towns.

44,002. Would it not be the case that if there is such a superabundance of labour, you would be able to reduce the wages?—I have never tried to reduce mine.

44,003. (*Mr. Long.*) You say the labourers go away?—Many of them go away after a certain time, when they find they cannot get employment. It would be no use my reducing my labourers' wages, they could not live, and if they are not well fed, they will not work. It is no use not keeping my horses in condition, when I want them to work I have to feed them well, and if I want my labourers to work, I give them good wages, so that they can feed well in order to work.

44,004. (*Mr. Giffen.*) The people who go away, go I suppose because they get employment elsewhere?—I do not know. We have nothing for them when they go, and I do not think any of these men would go if they had employment in the place.

44,005. (*Mr. Everett.*) Were farmers doing fairly well in your district 20 years ago?—They did well when the Russian war was on—how many years ago is that?

Mr. T. H. Hutchinson. 28 Mar. 1895.

Farming 20 years ago.

44,006–7. That is 40 years ago?—There was a time when they did fairly well, but I cannot quite recollect what happened 20 years ago. There was a time when they did well and farming was looking up altogether, and wonderful improvements were made.

44,008. (*Mr. Everett.*) That state of things continued for a long time did it not?—It did for some time, but I do not know that it did for very long. Farming at the best is never a very lucrative sort of thing. They could live, I dare say, then. If a farmer keeps on his place and lives, he is content to do so, but he does not make very much.

44,009. The alteration in price is the great alteration that has made the difference in the farmers' condition now, as compared with his former condition, is it not?—Yes, I think so, it is the prices.

Particulars of witness' farming operations.

44,010. Have you been farming your arable land on the four-course shift until quite recently?—I recently have not farmed it under any shift. I have always kept it very clean, and I have sometimes taken two white crops. I am not tied down to anything. My landlord lets me farm as I like.

44,011. You keep all kinds of stock, I understand, pigs, sheep, cattle, and horses?—I keep shire-horses, hunters, shorthorns, Leicester sheep, middle bred pigs, game cocks, and fox terriers.

44,012. (*Mr. Little.*) All pure bred?—All pure bred.

44,013. (*Mr. Everett.*) You keep everything of the best?—I have sold fox terriers at 50 guineas each, and I have sold game cocks at 10 guineas each.

44,014. And in spite of all this the fall of prices has hit even you?—Yes, I cannot do anything at these prices.

44,015. (*Viscount Cobham.*) Are you allowed to sell hay and straw, if you wish to do so?—I am, but I never do so. We are in a country sort of place, and, with the carriage to a big town added, it would not be worth while to sell it; it would be no advantage to do so.

44,016. (*Mr. Everett.*) You would buy nearly as much as you would sell in the way of grain generally, would you not?—I buy it in cake; I buy a large quantity of cake.

44,017. (*Mr. Little.*) How far are you from Darlington?—12 miles.

44,018. But not very far from Richmond?—Five from Richmond.

44,019. (*Viscount Cobham.*) Are the opinions which you have expressed to-day generally shared by your neighbours?—That I really cannot say.

44,020. You have not discussed these matters with them?—I have never discussed the question with them at all.

The witness withdrew.

(*For Mr. Dunstan's further evidence see page* 376.)

Adjourned to to-morrow at 12 o'clock.

Eighty-fourth Day.

Friday, 29th March 1895.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., } *Assistant*
Alan Mackinnon, Esq., } *Secretaries.*

Mr. John Frederick Hall recalled and further examined.

(*For previous evidence see page* 290.)

Mr. J. F. Hall.
29 Mar. 1895.

The use of the separator.

44,021. (*Viscount Cobham.*) I think you want to reconsider an answer you gave on a previous occasion with regard to the economical use of the separator?—Yes. I was asked whether I should recommend the use of the separator in the case of a farm so small as not to number more than five or six head; and my answer was, "No, certainly not." I wish to qualify that. As a matter of the economical production of cream, I should certainly recommend it; but I had in my mind at the time of answering the question, many farms in Somersetshire that I knew of, which are managed by peasant proprietors, as you might almost term them; and I scarcely should recommend to them the use of the separator, because it requires a cleanliness and a care which have not been at all realised by that class of people in their dairy arrangements.

44,022. But managed on your principle, even with a very limited herd, it would pay to use the separator? Yes.

44,023. You give your cows artificial food all the year round, I think?—Yes.

Feeding with artificial food.

44,024. Is that done with the view of an increased production of cream, or with the view of carrying more cows upon the area of ground at your disposal?—Firstly, with the view of carrying as many cows as the land will possibly carry—that is the first object, to crowd cattle on to the land; and, secondly, because I think that such feeding as I give conduces to the best results in cream, I think it is better than grass feeding.

Effect on the quality of milk.

44,025. Do you find that the milk is of a more uniform quality with this system of feeding?—Yes; and I also find that the decorticated cotton cake makes the best grain of butter. If you are accustomed to use it, and then leave it off, even in the height of the grass season, you notice the difference.

44,026. Still I notice that in your pamphlet, very good results are shown from farms where grass feeding only is practised during the summer months?—That is true.

44,027. As good results as yours, in fact?—Yes, in quantity; but I am speaking now of quality. I could not answer the question whether the results with regard to the quality of the butter are as good from grass as they are from cotton cake. My strong impression is that a certain quantity of cotton cake always gives you a better quality than any other kind of food.

Effect on the pasture.

46,028. (*Sir Nigel Kingscote.*) The giving of this cake, I suppose, has improved the quality of the butter and the health of the cow; but do you think it also helps the pasture?—Yes, I do.

44,029. Looking round your neighbourhood—which I believe is a large dairy district—is it not?—Yes.

44,030. Since a great quantity of the milk has been sold off the farm as milk, instead of being made into butter, have you noticed any deterioration in the land?—I think where milk is sold whole, it never can be to the advantage of the land.

44,031. Therefore if the land is not helped, it must deteriorate?—Yes.

44,032. And that has been your observation?—Yes.

44,033. Do you change your pasture often; do you keep your cows in one part and then put them on to another part of the farm?—I keep them in one pasture till they have eaten it down, till it is bare; and then I move them to another.

44,034. When do you give them the cake—when they come in for the milking?—Generally.

44,035. They do not eat it in the field?—No, never in the field.

44,036. Always in the manger?—Yes.

44,037. (*Mr. Clay.*) You talk about cotton cake being the best kind of cake for making butter, as I understand?—Yes.

Artificial food for calves.

44,038. Have you not found in giving the milk to the calves that it was too rich in the oil coming from the cotton cake for the young calves?—We never give the calves new milk.

44,039. You do not bring up calves then?—Yes, I do.

44,040. Do you give them skim milk?—Yes.

44,041. Has the feeding with oil cake no effect on the skim milk?—The fat found in the skim milk after separation is a mere trace; about ·30 per cent.

44,042. But it has no damaging effect?—No, in fact the calves would do better, if it were a little richer. If the milk had a little more butter fat in it, it would be better for them. The separated milk is sometimes apt to scour them; but that we cannot help.

44,043. Are you aware whether in bringing up calves upon the sweet milk, the oil from the decorticated cotton cake does hurt young calves?—I should think that new milk from Jersey cattle fed with cake would be dangerous.

44,044. It is too rich?—Yes.

Feeding with carrots.

44,045. (*Mr. Long.*) You told us that you regarded carrots as being of especial value as food for dairy cattle; do you think that the system of dairy farming for butter making which you have brought to such a state of perfection, could be carried on in a district where carrots could be grown with special advantage, and that carrots could take the place of other food there?—Of course carrots cannot be used as the sole article of diet; but for winter food I should want nothing better. Carrots are the best of all possible roots for butter-making. Where you can get ensilage and a certain quantity of hay and carrots, you would want nothing more than a little cotton cake to make the best quality of butter and the utmost quantity of it.

44,046. (*Sir Nigel Kingscote.*) As regards carrots, do you look upon them as the most nutritive root, or is it because they do not give a taste to the milk that you use them?—It is such a sweet food for them; the milk is

Mr. J. F. Hall.
29 Mar. 1895.

untainted; they like it exceedingly; it makes a richer coloured butter; and in fact it has every quality that you require.

44,047. But it is not a very nutritive root, is it?—It is not so nutritive as parsnips.

Economical feeding of dairy cows.

44,048. (*Mr. Long.*) You told us in your answer to a question put to you by Sir Nigel Kingscote, that in your opinion—this is, I think, the general sense of your answer—the majority of farmers considerably overfeed their cattle rather than underfeed them?—Yes, in our district. Of course I cannot speak of other districts; I am only speaking of the district that I know.

44,049. But that is a typical dairy district, is it not?—Yes.

44,050. Is it not the fact that artificial feeding particularly has been carried on to a very large extent during the last few years?—I think it has.

44,051. Which involves very heavy outlay on the part of the farmer?—Yes.

44,052. And unless he can get a return in the form of increased production of a better price, owing to the better quality, it is evident that he must lose on the increased expenditure?—Yes.

44,053. And you think that economy could be exercised in the feeding of dairy cattle with equally good results, if not better?—Certainly. I think it is most necessary that instruction on that point should be given to the farmers.

Encouragement of butter-making.

44,054. How would you suggest that these alterations of the system should be brought home to the farmers—by dairy schools or by lectures?—I should like to see a general movement all round—from the agricultural societies, the technical education societies, and the State down to the individual. It seems to me so large and so important a subject that I would use all the influence I had to start the movement. As I was saying, when I finished the other day, if agricultural societies like the Royal, and the Bath, and West of England, and others, would direct attention rather to results than to maintaining the present system, it would be, in my opinion, a very great gain. At present, dairy cattle are judged as other cattle are judged; they are brought into the ring and led round, and people see them; but who can tell the real qualities of dairy cattle from such methods of judging.

44,055. (*Mr. Whitehead.*) I think both those societies did adopt that principle you spoke of, and that they have in recent years given prizes for dairy cattle separately?—I do not wish to depreciate the work that has been done, but I do say that it has no hold on the farmers. Turn over the records of the Royal Agricultural Society and see the quantity of cows that are submitted to their tests; there are perhaps a dozen or so. What does that represent? It does not represent the cheese industry, and it does not represent the butter industry; it only represents a few milkmen who have taken the thing up. Even in the case of the British Dairy Farmers' Association, with which I am connected, the work that we do in testing the cattle is important; but it is nothing as regards the nation. The ordinary farmer has not begun to realise that the individual value of his cow is the thing that is to give him the profit or the loss in the future, and that he ought to breed for butter and for butter qualities in his milk, as much as his ancestors did for beef; and he ought to follow the thing out as carefully as they did.

Jersey cows as butter makers.

44,056. (*Mr. Long.*) Would it be fair to say that in your opinion the average dairy farmer has thought a little too much of the meat qualities of his animal, and not quite enough of its milk qualities?—Certainly. Perhaps I may illustrate that. If you advocate the introduction of the Jersey cow as a butter maker, or of any small cow as a butter maker, the first thing the farmer says is, What am I to do for my beef? But if you look at the relation of the profits on beef to the profits on skim-milk and butter, you will see that the former is a negligeable quantity. I would put it in this way. Three Jerseys about equal two short-horns, the average weight of the Jersey being under 900 lbs.—about 840 lbs. Now it has been a principle always understood, that cattle eat in proportion to their live weight. Arthur Young has asserted it, and Mr. Stratton has asserted it, and many others have asserted it; and I suppose that, roughly, it represents the fact, and that in proportion to their live weight so do cattle eat. Now, if you take the cost of subsistence of three Jerseys as equal to that of two shorthorns, then three Jerseys will produce in butter and skim-milk for a series of years 15*l.* more a year than the two shorthorns.

Mr. J. F. Hall.
29 Mar. 1895.

Jersey cows and short-horns compared.

44,057. (*Mr. Everett.*) In money returns, is that?—Yes; in money return you will get for a series of years from three Jerseys 15*l.* a year more than from the two shorthorns. The only difference that I make between them is that I put down the Jersey butter as selling at 13*d.* a lb. and the shorthorn butter at 1*s.* a lb., for the reason I explained last time. Now to come to the time of death. The two shorthorns will fetch how much? They will fetch, as I reckon it, about 12*l.* more than the three Jerseys, because, of course, you must make allowance for the difference between their live weight and their dead weight. I take it by McJannett's tables, that 12*l.* will be the difference in the return, taking the shorthorn beef at 4*s.* a stone and the Jersey beef at 2*s.* 8*d.*, which is allowance enough for the difference in the quality. So that actually you have to balance the 15*l.* profit on the one side for successive years against the 12*l.* on the other side at death. That is, roughly speaking, how the matter stands. Yet the beef is by almost every dairy farmer that you meet with insisted upon as an essential point in the problem; to me it seems negligeable.

44,058. If you were speaking of the production of milk, your figures would be very different probably, but here you are taking butter?—Yes, I am taking butter and confining my evidence to butter. That is how the matter stands.

44,059. (*Mr. Long.*) Can you tell us what the average loss on your dairy is every year from barrenness and abortions?—I could not; I think it is not one per cent.

Sterility in dairy cattle.

44,060. Not one per cent.?—No, and to the best of my recollection has not been during the whole of my experience. It is well known that sterility is far more common in beef cattle than in dairy cattle; that is well understood; and that reduces the per-centage. When you keep really good dairy cattle you get less tendency to barrenness than when you keep fatting cattle. That is an exemption from risk which you profit by in keeping dairy cattle. Half the barrenness in the country, in my opinion, is due to carelessness in management.

44,061. I was going to ask you whether you attributed this very much smaller per-centage in your cattle to greater care, or to natural causes, or to death?—I think it is due to greater care and to a regular system being followed.

44,062. You say greater care now, but would not the difference between the Jersey and the shorthorn, having regard to the shorthorn's meat propensities, constitute one cause?—Yes, quite so.

44,063. That would be a natural cause which exists everywhere?—That would be a natural cause.

Uniformity in butter-making.

44,064. It has been stated very generally that one of the difficulties in the way of butter making by farmers in England, in the absence of uniformity in the butter which comes from different dairies, as compared with the butter sent from Denmark, which comes from a factory?—Yes, I know it is stated.

44,065. You appear to have overcome that difficulty?—Yes; I think when you keep one class of cattle and fed on one system all the year round as I do, and then have a competent dairymaid, you do not get variations. You will get a difference in colour between the winter butter and the summer butter; that always must be, because there is a paler colour in the winter than there is in the summer. But apart from that, the granulation of the butter is the same. Of course you should not feed with linseed cake. I see that a great many butter dairies feed with linseed cake; but nothing can be worse for the quality of the butter than that. It makes a greasy butter. When your system of feeding is the same and your cattle are of the same breed, and you have a competent dairymaid, then I think you get a uniformity of butter.

Supply of Jersey cattle.

44,066. What is the supply of these Jersey cattle in the country, suitable for this purpose of butter making; is it one which would stand an increased demand upon it, without an immediately increased price?—There are not sufficient Jerseys bred.

44,067. Not at present?—I do not think so.

44,068. I understand you to refer to English-bred Jerseys as opposed to the imported islanders?—Yes, I think they are the strongest and undoubtedly the most robust. The island cattle are certainly less strong in constitution than the English. I might say that there is one thing which we do not know yet. I have often

Mr. J. F. Hall.
29 Mar. 1895.

thought whether it would be best for the farmer to have say half a dozen Jerseys in his herd and mix the milk, or to have cross-breeds, to have, for instance, the Jersey and the Ayrshire, and the Jersey and the shorthorn crossed, I do not know which would be best, and I do not think anybody in England can tell me, because we have made no experiments about butter. Butter has never been taken up as a thing by itself and treated as an object of study entirely distinct from the cheese industry and the whole milk business.

Cross breeds as butter makers.

Butter production and foreign competition.

44,069. No doubt the production of butter affords the greatest opening at present to the English farmer in his competition with the foreigner?—I have not a doubt of it. There is a great talk about New Zealand and the colonies, and I see it actually spoken of that New Zealand can produce butter at 8*d.* a pound. I do not think any practical man would listen to that for a moment; for it means, if you take off the freight, the charges for packing, the cost of the box, and the selling expenses in London, a return of less than 2*d.* a gallon to the farmer for his milk, and that means a return of less than 4*l.* per year for the cow. No colonist, or anyone else, can do that. There is a point here which is well worth speaking of, and I wish the Commission would allow me to read from Mr. Bear's article on "Australasian Competition in Dairy Products," which appeared in the journal of the British Dairy Farmers' Association, volume X., part 1, 1895:—"Published accounts of New Zealand dairy factory companies for "1892–93, generally showed losses or very meagre profits" that year I should say butter was 15 to 20 per cent. dearer than it is now, that is, it is my impression it was selling at that much better than it is now—"and those "of 1893–94 must inevitably be worse, unless the "farmers have been paid less for their milk than "in the earlier season. Even the factories belonging "to Messrs. Reynolds & Co., the makers of the famous "Anchor brand—probably the best butter made in "New Zealand—did not pay in 1892–93 or the preceding season. At a meeting of representatives of "the company and suppliers of milk to eleven factories "owned by Messrs. Reynolds & Co., held in August "1893, the manager said there had been a small loss "on the year's working, and although a dividend "had been declared in the preceding year, it was "on paper only and had never been realised." When that was the result of 1892–93 it is not likely that in 1894, when New Zealand butter is 8*d.* a pound, as Mr. Hudson said in his evidence before a Committee of the House of Commons this last week they are going to be formidable competitors at that price.

Milk testing.

44,070. You told us that you keep a very close watch upon your herd and test the yield of each cow?—Yes, I do.

44,071. Does that entail any large amount of extra labour?—No. The simple plan that I adopt is that every day the bulk of the milk is weighed; that is to say, when the milking is finished it is put on the machine and weighed; that is the check on the bulk. Then, once a week, morning and evening, the milk produced by each individual cow is weighed. The foreman of the house enters that in his memorandum book, and it is then entered in a large book. At the end of every six months, we add up the individual cow's yield and know what each one yields. As to the quality of the milk, which is a different matter, I have always had it tested by the churn; but I am now going to test it by chemical analysis; I have arranged with one of the leading chemists to send an assistant down three or four times a year and to test by the Babcock's tester each individual cow, so as to know the yield, in quantity as well as quality, of each.

Farm buildings.

44,072. What are the buildings that you use for your cattle? Are they covered in behind as well as on top and in front?—Yes, they are close sheds.

44,073. Are they permanently enclosed, or are they only provided with winter shutters?—They are permanently enclosed.

44,074. Stone or brick?—It is all stone.

44,075. Do you use covered yards?—No, not at all.

44,076. The ordinary open yards?—Yes.

44,077. With covered sheds?—Yes, and with cement floors; all the floors are cemented, and the mangers are all cement, so that they can be washed out perfectly clean, cement being much cheaper than brick or any other thing I can find.

Mr. F. J. Hall.
29 Mar. 1895.

Scarcity of labour.

44,078. I see in the brief of your evidence, you have suggested general evidence upon two or three heads on which I do not think you have told us anything; one of those heads is wages; is there anything that you want to say with regard to the wages in your district, as especially affecting agriculture?—There is one thing I should like to say, and that is that labour is very scarce. Wages maintain their prices, owing, I think, to the fact that there has been a perpetual emigration of labourers going on. The labourers are much fewer in number, and consequently they have kept up the price of wages. As evidence of that, I may say that since I was here last, I have put an advertisement in a Wilts journal for a labourer, and I have not had a single answer, I have put three insertions in. I see every day in the Somersetshire papers 30 to 40 farmers' advertisements for labour.

44,079. What sort of labourer was it that you wanted?—I wanted a man simply to milk.

44,080. An ordinary labourer?—An ordinary labourer who could milk as well.

44,081. (*Sir Nigel Kingscote.*) The milking is where the difficulty comes in, is it not?—They will not come to milk if they can get any other occupation.

44,082. (*Mr. Long.*) Did you advertise the wages you were going to offer?—No, I did not; I said, "good wages" that is all.

44,083. (*Viscount Cobham.*) What is the staff that you employ for your 75 cows?—Cows in milk, do you mean? I have only on that farm I am speaking of from 30 to 35 in milk now and about 30 calves; that would make about 60 head; then there are 70 pigs or something of that sort, and five or six horses. The staff that I employ consists of a working foreman, a carman, and four labourers, but two of them are lads.

44,084. (*Chairman.*) How many acres?—165 acres.

44,085. (*Viscount Cobham.*) More than one dairymaid? One dairymaid, who is the wife of the foreman.

44,086. (*Mr. Long.*) As I understand you, the wages of the labourers have been kept up?—Yes.

44,087. Do you attribute that to the fact that there has been a decrease in the supply of labour of a suitable character?—I think the wages would have fallen with us undoubtedly, but for that.

Wages.

44,088. (*Sir Nigel Kingscote.*) Is the difficulty of getting labour confined to the men required to milk, or does it apply to labour generally, because there is a very great difference between those, is there not?—It is all dairying in our district, as our district is the centre of the Cheddar cheese district; so you find that on nearly every farm the labour is connected with milk. We have very little arable land, and I do not know what to contrast our labour with.

Price of butter.

44,089. (*Mr. Long.*) I do not know how far you will consider this a fair question, and perhaps you will prefer to decline to answer it it. You made all our mouths water by describing the results of your dairy-farming during the last year or two, when you were here last; and what I should like to ask you is, whether you think the result is sufficiently satisfactory to enable you to look forward to a possible reduction in the price of the article you produce, and yet feel that you are able to carry it on and make reasonable profit?—I can answer that in the affirmative. I told you that the price I had realised last year was a little over 15*d.* a lb., and that that was realised from sales to dealers mainly, and afterwards from one or two private customers that I had. If the price was to go down a penny a lb., or even if it was to go down 2*d.* a lb., I should not give up butter making.

44,090. (*Chairman.*) What is your average price per pound?—It was 15½*d.* per pound last year.

44,091. How does that compare with the general average in the market; is your butter very superior, or not?—The difficulty of comparing it with imported butter is that after all the English butter that we make is fresh butter, and always fetches a higher price.

44,092. How does your price compare with the average price of English butter; is your butter better than most English butters or not?—I think all Jersey butter is better than other butter; so it is better in that respect.

44,093. How much better should you say—a penny a lb. or 2*d.*?—A penny a lb. I should put it at.

44,094. And that is due to your using Jerseys?—Yes; it is a larger grained butter.

Rates.

44,095. (*Mr. Long.*) I see that in your brief you also refer to the rates and taxes; have you any grievance with regard to the rates in your district; do you think they are unfairly high?—Do you mean the poor rates?

44,096. Yes; the local rates?—I think the grievance that we all feel is the unfair incidence of taxation, and that really the land has to bear so very much more than its share of the burden.

44,097. Would that particularly apply to the cost of maintaining the roads, the police and lunatics?—Yes, and to education.

44,098. Have you got many board schools in your neighbourhood?—A good many; they are rather tending to increase. One voluntary school has become a board school in the last two years in the district in which part of my land is situated.

44,099. Have you had a heavy school board rate in consequence?—It threatens, I think, to become heavier, it is not very heavy at present.

44,100. (*Mr. Lambert.*) How does the labour you employ upon your estate in dairy farming, compare with the amount employed by ordinary farmers possessing the proportion of arable land and pasture land which you occupy?—Do you mean, how does butter farming compare with cheese farming in regard to labour?

44,101. I wish rather more particularly to get at ordinary arable farming?—You see we have no pure arable farms in our neighbourhood at all.

Reduction in rents.

44,102. (*Captain Owen Thomas.*) Have you anything to say about rent? I see you have got that down in your brief?—Rents have fallen in the last 10 years by amounts varying according to the district and the quality of the land.

44,103. How much?—They vary very much in our country. There is land in the valley which is worth from 2*l.* 10*s.* to 3*l.* an acre now, and there is land on the hill which is worth from 10*s.* to 15*s.* So the variations of rent in Somersetshire are very great; but, on the whole, I should say they have fallen from 15 to 20 per cent. or perhaps more.

44,104. Are the farmers satisfied with the reductions which have been made?—I am afraid our farmers are like the farmers in most parts of the country in that respect; I am not sanguine of living to see the day when the farmer is quite satisfied with his rent.

Low price of cheese and milk.

44,105. Have they applied for a further reduction?—They are always ready to propose further reductions, and there are movements in that direction, I think. I think the tendency of rent is downwards, if that will answer your question. We are feeling this year very much the fall in cheese. Cheese is falling so much that many of our farmers are going more and more into milk, and milk has fallen so much that I think you can contract at this moment for the next six months for the delivery of all a farmer's milk at 4*d.* per gallon.

44,106. (*Mr. Everett.*) Is that 4*d.* a statute gallon of eight pints?—It is 4*d.* an Imperial gallon. Milk, as I say, is going down, and cheese is so much affected by the American importations, that the tendency of that is to go down. Many of the farmers in my immediate district have their cheese houses full now, as they cannot sell their produce.

Position of farmers.

44,107. (*Captain Owen Thomas.*) Is the ordinary tenant farmer losing money now?—I should not say that.

44,108. Is he making a profit?—He is making a living. It is very difficult to answer such a question as that which you have just put. Of course one points to the broad fact that they are not giving up their farms as a rule, that they are maintaining and paying their rents and going on; so the inference is that they are earning a living. But as to the profit, I do not think there can be much profit made after paying expenses of living by the average farmer.

Competition with the colonies.

44,109. (*Mr. Everett.*) You may not have heard, perhaps, that it has ben testified before a Committee of the House of Commons now sitting that butter from New Zealand will certainly be laid down here at 6*d.* a lb.?—I should say that such a statement as that is simply ridiculous to any practical man. It is difficult to hear such a statement with sufficient patience; because what can it mean? It is clear from the figures of the factories of New Zealand which are published and which are perfectly trustworthy—that it takes 10 quarts of milk to make a pound of butter; so how can anyone tell us, when you have freight of at least 1*d.* a pound to pay, and when you have 2*d.* more to pay for the expenses of making and packing (that is 3*d.* off each 10 quarts of milk), to say nothing of the London expenses, that the butter can be sold at 6*d.* a pound? Speaking offhand, that would reduce the ordinary produce of a cow in New Zealand to about 22*s.* 6*d.* a year, or something of that sort—at any rate between that and 30*s.* Of course if it is true it is the end of all things.

Mr. J. F. Hall. 29 Mar. 1895.

44,110. (*Mr. Lambert.*) I think Mr. Everett's question is rather directed to the fact that there is an enormous glut of butter in Australia at this moment, and that it is being hawked about at almost any price in order to get rid of it?—Yes, I understand.

44,111. (*Mr. Everett.*) Is it in Australia or in New Zealand?—In both colonies.

Colouring butter.

44,112. (*Mr. Lambert.*) Do you use any colouring for your butter?—No.

44,113. None at all?—None at all.

44,114. (*Mr. Gilmour.*) Jersey butter does not require much colouring, does it?—It will; if you feed on mangolds and on hay it will be as white as lard.

44,115. (*Mr. Lambert.*) Do you have to colour your butter at all?—Not at all.

44,116. Do the farmers in your district have to colour it to any considerable extent?—They have to colour it.

44,117. Do they colour the cheese?—That I do not know; that is one of their trade secrets.

44,118. One of the chief points of the margarine manufacture, which has been brought out before a Committee of the House of Commons is, that as long as you have the right of colouring butter the margarine manufacturer has the right of colouring margarine to imitate butter; and I was therefore asking whether colouring could be dispensed with?—I do not know whether they do or do not use colouring matter, but I should hazard the opinion that they do not in Cheddar, because Cheddar is a very pale cheese, and is not like a high-coloured cheese. As I say, I should think that they do not, but that I am not quite sure of.

Advantages of butter-making.

44,119. (*Chairman.*) The general result of your evidence is that there is a better profit to be made by farmers out of butter than out of milk or cheese?—Yes, if the butter trade is thoroughly studied and understood.

44,120. And that the market for butter is greatly neglected by the farmers?—That is so.

44,121. That they have not bred their cows sufficiently for that purpose, but that by careful attention to the breeding of cows and the feeding of them there is still a profit to be made out of butter?—Yes.

41,122. That there is a market of 12,000,000*l.* on which they can draw?—Yes. Besides the direct market for butter, there is the bye-product, skim milk, which would tend to the fattening of pigs and to the securing of some of the immense bacon business.

44,123. That is a further incidental advantage?—Yes.

44,124. Under this process, the land instead of being deteriorated, as it is by the sale of the milk as milk, would be improved?—Yes.

44,125. You yourself by following this practice have made a fair profit?—Yes.

44,126. I forget whether you stated you own your land or whether you hire it?—I own it.

Rent.

44,127. You calculate, I understand, that you have made a rent of 25*s.* an acre?—Yes.

44,128. And that you have made a substantial profit beyond?—Yes.

44,129. Is your rent above the average rent of the district?—It was what I let the farm for, prior to my taking it into my own hands.

44,130. Had you let it for some years at that price?—It had been let for more than 14 years, I forget whether it was not 18, but it was certainly more than 14.

44,131. At that rent?—No, that was the reduced rent.

44,132. What had the rent been originally?—I think the rent had been over 30*s.*—I think it had been 32*s.* 6*d.*

44,133. Then there had been a reduction to 25*s.*?—Yes.

Mr. J. F. Hall.
29 Mar. 1895.

44,134. No very great reduction?—No.

44,135. Is 25*s*, an acre about the average rent of the neighbourhood, or is it rather higher than the average rent?—As I have said, you have a scale varying from perhaps 15*s*. an acre on the high lands, to 3*l*. or 3*l*. 10*s*. in the valleys.

44,136. Then it is difficult to give an average rent?—Yes, it is.

44,137. Where is your land; is it in the valley, or in the high land?—My land runs from beyond Masbury down to Divider in the valleys; my farm land is about half way between those places. Masbury is almost the highest point in the Mendips. The land up there is close upon a thousand feet high, my farm land is about six hundred feet high, and the valley will be about one hundred feet above sea level.

44,138. How much of your land is valley land?—Only a small proportion. I have no valley land on Chilcote farm.

44,139. Should you say then that your farm as a whole is a fair average of the farms of that part of the country, or is it rather worse, because it has got more of the upper land?—The land that I farm is certainly not so good as the average.

44,140. What should you say is the rent of a fair average farm in your district?—It depends on where it is situated. In the valley I think 2*l*. 10*s*. would be rather a low average, and on the hill 15*s*. would be rather a low average.

44,141. Has the reduction of rent been less proportionately in the valleys than on the hills?—I am not prepared to answer that.

44,142. You have said that you have made a fair profit yourself?—Yes.

44,143. Have any of your neighbours taken to butter-making?—Yes, a great many of them are interested in it.

44,144. Is it gradually spreading from your centre?—Yes, to a certain extent.

44,145. Are there a great many small farms in your district?—Yes.

Co-operation.

44,146. Would it not be necessary that there should be co-operation in the making of butter in the case of small farms?—Yes. My own notion is that it will take the form eventually of the farmer chiefly concerning himself with the production of milk well and economically, and of there being some central factory, either co-operative or the property of the landowner, for the milk to come into and be bought from the farmers at a certain price according to quality.

44,147. Some such system would be necessary where the farms are small, would it not?—Yes. That would be the most economical way of doing it then.

Competition with Danish butter.

44,148. In competition with the foreigner, even with Danish butter, I suppose they would have this advantage in selling their butter, that it would be fresh butter?—Yes.

44,149. I suppose the Danish butter is not quite fresh butter?—No.

44,150. It is nearly so, but not quite?—Not quite.

44,151. And there is the advantage in English butter of its being absolutely fresh?—Yes.

44,152. Could you say what advantage that would be in money, would it be 2*d*. in the lb. or what?—I am not expert enough in the markets to know that.

44,153. At any rate it is a distinct advantage?—Yes.

Rates.

44,154. What is your union?—I am in Shepton Mallet and Wells.

44,155. What do the rates average in your union?—About 2*s*. 6*d*.

44,156. As much as that?—Yes, as much as that.

44,157. Have they risen or fallen?—The tendency is upwards.

44,158. Are you sure as compared with 10 or 15 years ago, that they are higher or lower?—That I cannot say.

44,159. (*Mr. Long.*) You will probably say that whether they have risen or fallen as compared with 10 or 15 years ago, the capacity of the individual to pay them, has at all events been considerably reduced in that time?—Yes, that is so.

Mr. J. F. Hall.
29 Mar. 1895.

44,160. (*Captain Owen Thomas.*) Do you think a system of co-operation would assist the dairy farmers in your district?—Do I understand you to mean to do away with the middle man?

Co-operation.

44,161. If possible, and to have a factory where they could send their milk?—I think as I have just said, that if the farmers would only produce the milk and if the butter making was treated as a different business from the manufacture, that would be a sound economical basis for conducting the business.

System of farming.

44,162. (*Chairman.*) I think you said just now that you had no arable land on your farm?—A fourth of it is arable.

44,163. Then in fact you grow corn of some kind or other for your own purposes—I supppose for your own feeding?—I grow vetches and green crops, both in the spring and in the autumn to supplement the grass feed, and I grow oats, beans, and roots.

44,164. Do you consume it all on your own farm, or do you sell anything?—I consume the whole of it.

44,165. Then you only buy decorticated cotton cake, and something else I think you mentioned?—A little maize meal in winter.

44,166. Then the increase of farming of this kind would not do away with a large amount of land being still in arable cultivation; there would still be a considerable amount of land in arable cultivation?—Undoubtedly.

44,167. Do you think this method could be adopted more in the eastern counties, where the land is not so suitable for pasture?—Certainly.

Dairy farming in the Eastern counties.

44,168. Even in Essex, on the heavy lands there?—Yes. I think it could be, because I do not look upon the existence of meadows and fine old pastures as essential.

44,169. They are not essential?—Not at all.

44,170. Would you cultivate the land with temporary grasses?—Yes.

44,171. You have your cattle in the sheds, I suppose?—Yes.

44,172. They would not necessarily be turned out upon pasture land?—No. And I believe it would be perfectly possible, if you had proper shedding, to turn the cows out in the street here and make butter. I think anywhere, where you can get ensilage and house-room and food, you can make butter. It was pointed out years ago in the Royal Agricultural Society's Journal, that for making cheese it was very desirable that the cow should have wide scope for roaming, and that the best quality of cheese was made where the pasturage was large and rather scanty. It is exactly the opposite with butter. I think it was Dr. Playfair who pointed out in the Royal Agricultural Society's Journal that in the case of butter you get relatively better results from stall-feeding than you do from pasture land. In connexion with that point I would just like to read this from the Board of Agriculture's Reports on Dairy Farming in 1892 (C. 7019). Speaking of Sweden they say: "When it is considered under what great dis-"advantages the production and preparation of butter "is carried on in this country, it becomes evident that "the methods adopted by the Swedish dairy farmers "must be very superior to those in use elsewhere. "The climate is so severe and the winters are so long "that the cattle have to be stall-fed, at any rate, "during the greater part of the year, and in many "parts of the country where there is no pasture, they "have to remain tied up in the sheds all the year "round, and are thus entirely deprived of exercise." When you think of that, you will see that the Eastern Counties afford at any rate a similar asylum to the butter cow. If Sweden can do it with her climate and her conditions of pasture, surely they can do it in Essex. I have been very much struck in reading that about this time in the last century, the Eastern Counties were really almost the best producers of butter. Arthur Young is constantly alluding to Suffolk as one of the largest producers of butter.

44,173. I suppose they were persuaded to give that up in order to grow corn and wheat?—Yes, and when the Durham ox was led round the country they idolised it.

44,174. For a time, and indeed for a good many years, the growth of wheat was a very profitable thing, was it not?—Yes.

Mr. J. F. Hall. 29 Mar. 1895.

44,175. And every farmer went into that?—Farmers went into that; and they altered their type of cow from a dairy cow to a beef cow; and they have been following that same line ever since.

44,176. It is an essential part of your scheme to breed the cows more for the purposes of butter than for the purposes of meat?—Yes, to specialise the cows.

44,177. Either by the use of Jerseys or of a strain of Jersey?—Yes.

System of farming.

44,178. (*Viscount Cobham.*) Can you fully employ a pair of horses on your farm?—Yes. I can use more; I generally have two teams at this time of the year ploughing, as it is rather heavy ground.

44,179. How do you manage with the horses all the year round?—I use them sometimes for estate work.

44,180. (*Chairman.*) You do not buy any cheap foreign barley for your cattle, do you?—No, but for fatting the pigs.

44,181. (*Viscount Cobham.*) Do I understand you to say that you dispense entirely with hay?—No, but I give as little as possible, about 10 to 12 lbs. a day to the cow in winter.

44,182. And you do not find that that affects the colour of the butter?—No. It is the most expensive food, I think, of all for cows.

44,183. What proportion of your grass do you turn into ensilage?—I made last year 40 to 50 tons of ensilage.

44,184. How much hay?—About 50 tons.

44,185. About half and half?—Yes; but this next year I am making arrangements to make more ensilage than ever. Every year I have a growing sense of the importance of ensilage.

44,186. (*Mr. Lambert.*) Do you make your ensilage in stacks?—Yes, it is rick ensilage.

44,187. Not in the pit?—No.

Packing butter.

44,188. (*Viscount Cobham.*) Who does the butter packing?—My dairy maid does the packing.

44,189. Is she specially trained; does she know how to pack?—I think there is no special training required.

44,190. A good many farmers do fail in the packing, do they not?—I think they do. It is not a very intricate matter in my case. The butter is sent away in large baskets and packed in lbs., being just put in clean cloths.

44,191. Does the butter go away in passenger trains?—Yes.

Water supply.

44,192. (*Mr. Gilmour.*) In your opinion, is it essential to have a very good supply of spring water for butter-making purposes?—Yes, of course. I am very glad to be reminded of that. You must have a good supply of water for butter-farming.

44,193. That might, perhaps, qualify your answer in regard to some of these other stiffer land countries where there is a great want of water?—Yes. Of course, I should look upon the want of water as a very fatal objection. I ought to have made that proviso—where water exists.

Mr. J. F. Hall. 29 Mar. 1895.

Technical education.

44,194. What do you think is the quickest way to spread a knowledge of butter-making by means of the technical education given by the county councils. I notice that in your evidence on the first day, which unfortunately I did not hear, you proposed that there should be a farm taken where pupils should go to; would that in your opinion be as useful as a well-qualified man going round and staying, say, a week or a fortnight at a farm, where the farmer desired to get that knowledge, and where he might teach the neighbours along with the farmer?—You are speaking rather of instructing the farmer through the means of the county council technical education schools, are you not?

44,195. Yes?—In the first place, I do not know whether under the Act you could send a man round to the different farms. I think that our county council would object to it, and would say that such a course of procedure did not come within the meaning of the Act. I have had some correspondence on this point with them. You can hold classes in farmhouses, and I think that would be the best way of bringing the knowledge home to the farmer directly. I should suggest that the farmer should be paid a certain sum for the use of his premises; then the classes, which would consist of from four to eight scholars, could milk the cows, weigh the milk, see the calves fed, occasionally test the quality of the milk by the Babcock tester, and, in fact, do a good deal of the work of the farm; and, in addition, keep very careful records of what they did. Then the farmer should have the butter that is made and should keep it for his own market purposes; so that the expenses would be only that of paying him for the use of his premises. That would be very much more economical, I think, than the present system which consists of buying the milk—often at a very high price, and selling the butter—often at a very low price. Moreover, as I pointed out, the present system of employing these migratory schools, turns out a lot of clever dairymaids who know nothing about the economical production of milk. Since I was here last I see that they have adopted this plan, which I was advocating last time, in Durham. The Durham County Council have selected a farmhouse where they will hold classes, and that system is to be carried out in connexion with the Durham County Council this year. I see also that in Lancashire, two years ago, they did something of the same sort. It seems to me that that plan would have the advantage—a very great one, in my mind—of bringing some of the knowledge directly home to the farmer. Then I think also that another way of helping the farmer would be, if some of the county councils saw their way to do what I suggested last time, that is, to employ some intelligent young men, some analytical chemists' assistants, and send them round to the farms to test the quality of the milk of the cows. If the county council would pay these chemists' assistants something, and would charge a fee to the farmer at the same time, I think that that would be valuable both in the case of cheese farms and in the case of butter farms.

44,196. (*Viscount Cobham.*) Do you consider it important to keep your cows very clean?—Yes, most important.

The witness withdrew.

Mr. J. K. Woodward.

Mr. John Kenelm Woodward called and examined.

Mr. J. K. Woodward.

44,197. (*Chairman.*) I believe you are a market gardener living in the neighbourhood of Evesham?—Yes.

44,198. How much land do you cultivate yourself?—About six acres now.

Area of market gardens.

44,199. What is the extent of land over which these market gardens extend?—In Evesham and the neighbourhood it would be close on to 8,000 acres.

44,200. Besides that is there a large area in South Worcestershire?—Yes, reaching a long way down to the Severn.

44,201. Is that of a much greater extent?—It would exceed the 8,000 acres by a good bit.

Crops.

44,202. What is the main cultivation in that district?—The Pershore plum is the great crop. We cultivate plum crops of all descriptions as well as asparagus and fruit bushes.

44,203. By fruit bushes do you mean currants and raspberries?—Yes, and gooseberries.

Spade cultivation.

44,204. Is it all cultivated with the spade?—Yes. All land planted with fruit trees must be.

44,205. Because you cannot plough between the trees?—Because we cannot work between the trees with horses.

44,206. It necessarily involves therefore a great deal of labour?—Yes.

Size of gardens and employment of labour.

44,207. What is the average size of the small farms?—The artizan would take about two acres to three acres; the men who employ a large quantity of labour would go up to 18 or 20 acres—20 acres is quite a large garden.

44,208. Do you mean by that that where the man cultivates wholly by his own labour, he does not hold more than two acres?—Not much more.

44,209. When he holds beyond that, he begins to employ other labour; and goes up to 18 acres?—Yes.

44,210. How many men would he employ then?—Eight or nine, I suppose.

Mr. J. K. Woodward.

29 Mar. 1895.

44,211. How many do you employ yourself on your six acres?—Two men besides myself.

44,212. Is the soil very good?—It varies very much; it is improved with the cultivation tremendously.

Increase of market gardening.

44,213. Is there room for much extension; is there much land in the neighbourhood of a similar character?—There is a great demand for market garden land all round the district. If any farm is given up, it is immediately taken up by market gardeners.

44,214. Is the system extending?—Yes, greatly.

44,215. It is gradually extending?—Yes.

44,216. Do many men rise from being labourers to being small gardeners?—They become gardeners, if they keep to their holding. We find a great many self-educated men round there; men who have in the first place commenced as artisans and have worked themselves up.

44,217. They have begun by being labourers, and then they have gradually become employers of labour?—Yes.

44,218. And taken more land?—Yes.

Rents.

44,219. What is the general rent of the land there. It is said to be very much?—Yes, very much. Where land is first taken, if it is close to a railway station its price is high; but when the land gets up in value, if you take for instance a first class market garden, then the rent becomes tremendously high.

44,220. That is to say when the fruit trees are on it?—When the fruit trees are in full bearing.

44,221. What would you say the original rent would be, before any improvement has been effected?—That would be going back a long time, because the plum trees take a long time to come into bearing.

44,222. I am referring to the good land which is now devoted to these purposes; what would its rent be?—Some of the land which is in full cropping from plum trees is as high as 16*l.* to 18*l.* an acre. (*The Witness subsequently wished to alter the figures to* "9*l.* to 11*l.*")

44,223. What would land be without any improvement, and without any fruit trees upon it?—3*l.* 10*s.*

44,224. Has the rent of land been gradually increasing, or has it been gradually diminishing?—The tendency is to increase the rent.

44,225. Then it has not suffered from depreciation of late years, in the sense at all events that the rent has not gone down?—Not when they let the farm out as market gardens, because that soon increases the rents. They will not let any farm to a market gardener at the same rent that they let it to a farmer.

44,226. Taking a market garden which is fairly well planted, is the rent now as much or less than it was a few years ago?—Quite as much.

44,227. Then there has been really no reduction?—Not at all.

Condition of the market gardening industry.

44,228. Then your district has not suffered from depression in that sense, at all events?—The market gardening industry has not suffered in the least.

44,229. Do you think the tenants or the owners have made as much as they did in the way of profit?—Yes, owners, but occupiers get bad years the same as other people.

44,230. You have not, however, suffered in other respects?—No.

44,231. On the whole, the increase of cultivation tends to show that they are doing well?—Yes.

44,232. I need hardly ask you whether the success of these gardens depends mainly upon the industry of the occupier?—It does.

44,233. He has to be continually at work on his land?—Yes. He must keep his work going, so that he can take any advantage that he is able to take of any alteration in the prices, or any change in the weather that may occur.

System of cultivation.

44,234. Are they often changing their cultivation in consequence of the fresh demands?—No. We have to break the strawberries up about every half a dozen years or so, and we would not crop with strawberries again for some little time.

44,235. What do you do in the case of asparagus and things of that kind?—They would remain for a great many years—18 or 20 years; then they would break it up and plant it again after growing other crops for, say, four or five years.

44,236. Do they grow celery?—Yes, but not to any great extent.

Mr. J. K. Woodward.

29 Mar. 1895.

Labour.

44,237. Is it the fact that the amount of actual work done by these small farmers to the land is very great?—Yes; the artizan gardener works tremendously hard at his garden. He would, in the first place, become a small holder, and he would work his holding in conjunction with other employment under a larger gardener. He would work on his own land from 3 to 4 o'clock in the morning until he went to his other work, and then would come back there in the evening.

44,238. After working as a labourer on another man's land?—In the day time, yes.

44,239. Then he would come back to his own land?—Yes; that would be because he would have no capital.

44,240. Do they find by giving a large amount of labour to the land, that they can to some extent dispense with fertilizers?—Yes, that is so.

44,241. Labour acts instead of fertilizers?—Yes, it does.

Tenure.

44,242. Do many of these men own the land themselves, or is the land mostly hired?—The larger portion is hired, but there are some few small owners.

44,243. What does the land generally sell at?—It varies very much; it quite depends upon what is on it.

44,244. According to the nature of the planting of it?—Yes, and the situation and value of the land.

44,245. Are large prices given for small holdings?—Yes; for a freehold as much as 300*l.* an acre will be given, if it is in an advantageous place.

44,246. Still the larger part is held under a tenancy?—Yes.

44,247. What is generally the nature of the tenancy?—It is an annual tenancy subject to a 12 months' notice by either party.

44,248. Are there no leases?—A few, not many; they are only of quite a short duration as a rule, but we have got some few which extend to a longer period, namely 21 years.

44,249. Are the owners as a rule unwilling to grant leases?—Yes, they do not like leases at all.

44,250. Do they generally ask a higher rental, if leases are required?—Yes, because they contend that leases keep them from disposing of the land.

44,251. (*Viscount Cobham.*) Would the gardeners prefer leases if they could get them?—They would.

44,252. (*Chairman.*) Then why will not the owners give leases?—Because leases keep them from obtaining any increase in the rent. If they wish to raise the rent in any way, they could not do so if the land was leased.

Fruit tree planting.

44,253. As a rule, has the planting of trees been done by the tenants?—Yes, as a rule. We find some instances where trees are supplied by the landlord; but we would rather be without that.

44,254. Why?—Because the landlord then claims the trees. We cannot claim for any improvement at all, if the landlord finds the trees; we plant them, but they are the absolute property of the landlord, and when you have grown them up, you cannot claim anything for them from the landlord.

44,255. Whereas, as I understand it, if the tenant has planted the trees, then on leaving he can claim?—By the custom.

44,256. By the custom, but not by the law?—That is so.

Compensation for out-going tenants.

44,257. Then there is a custom in the district by which a tenant leaving his holding does claim and obtain compensation?—It usually is that the outgoing tenant claims compensation from the incoming tenant.

44,258. At all events the outgoing tenant does get the value of the improvement?—He would to some extent.

44,259. Are there any clauses in the agreement enabling the tenant to claim compensation?—No, I never saw one.

44,260. Where the gardeners take these small holdings and plant trees, do they do so at their own risk?—Yes, entirely.

44,261. But they are protected to some extent as you say by the custom of the country?—Yes.

Mr. J. K. Woodward.
29 Mar. 1895.

44,262. (*Mr. Little.*) Is that a legal custom which would stand?—I would hardly call it a legal custom; it has been broken in several instances. A man can be dismissed from his land without any compensation at all.

44,263. It could not be enforced?—No, it could not be enforced.

44,264. And yet it has been repudiated, you say?—If you give a man 12 months' notice, he has to leave his land and leave everything that is there.

44,265. (*Mr. Channing.*) It is a custom which has grown up since this mode of farming began; it is not a custom which is of very long date is it?—I think the custom on Mr. Rudge's estate is of a great many years' standing.

Initial outlay on tree planting.

44,266. (*Chairman.*) Is the initial outlay on taking one of these gardens very heavy?—Yes; if you are going to plant it out with plum trees, it is very heavy.

44,267. What do you consider it would cost?—From 55*l.* to 60*l.* to plant an acre properly with plum trees and bushes.

44,268. Has it to be thoroughly trenched first and cleansed?—Yes, it must be absolutely clean in order to plant such long-standing crops. If it is not thoroughly clean, you will ruin your plantation, as it is impossible to keep it clean afterwards.

44,269. Then the cultivator has to wait some time for the bearing of the trees?—Yes, he has to wait seven or eight years before the trees begin to bear in any quantity. You get a few, but they are very small crops before then. But then we crop underneath.

44,270. In the case of asparagus, how long does it take?—It would take from three to four years before you would derive any advantage from asparagus.

44,271. What would it be in the case of other fruit, like strawberries?—From two to three years; that would depend upon the character of the land a good bit. Heavy lands do not bring their crops up as soon as light and loamy lands do.

44,272. Supposing the land is planted with fruit trees; during the first seven years or up to ten years the cultivator has to bear the cost of the rates, taxes, rent, and so forth, all which gradually accumulate against him?—Yes.

44,273. Subject only to his getting something out of the undergrowth?—Yes, from the croppings underneath.

Average cost of cultivation.

44,274. What should you say is the average expenditure per acre in cultivating?—The higher class market garden would cost quite 30*l.* per acre per annum, rates, manure, and labour, before there was anything at all for the holder.

44,275. Including his own labour, or the wages of the labourer?—Yes.

Wages.

44,276. Are the wages high?—Yes; they are very good indeed with us.

44,277. What do they average?—From 16*s.*, to 18*s.* a week all through the summer season. Of course in the winter time if we get such long frosts as we have had, it is very trying for them, because they are out of work entirely, as there is nothing for them to do.

Employment of women and children.

44,278. Is there employment for the women during the fruit season?—Yes; from now they will begin right up to the end of the plum-picking time.

44,279. Both the women and children?—Yes.

44,280. All through the summer?—Yes, in tying radishes and onions, and cropping the parsley and such light work.

44,281. Are women and children largely employed?—Yes.

44,282. I suppose with the good wages, and with the employment of their wives and children, the position of the labourers is a favourable one?—Yes; if they like, they can make it very favourable.

Skilled labour.

44,283. Is there any difficulty in finding labourers?—Yes, to find a good skilled hand. An agricultural labourer is not worth so much to a market gardener as a market gardener's labourer would be.

44,284. (*Mr. Lambert.*) How long would it take an ordinary agricultural labourer to get into the habits of a market gardener's labourer and acquire his skill?—If he is a man of middle age he would not be of any use to a market gardener, the market gardener would rather be without him.

Mr. J. K. Woodward.
29 Mar. 1895.

44,285. (*Chairman.*) During the picking time what wages will a labourer get?—First hands will make 5*l.* for what we call the plum harvest, which usually continues over four weeks.

44,286. Do men come to the Valley especially for the picking, or does the labour of the district suffice for it?—They do in the pea picking, but not for plum picking; a man who is not used to it would knock the trees about wonderfully.

44,287. It is better to have somebody who knows the custom of the country?—Much better.

44,288. Otherwise injury may be done to the trees?—Yes.

44,289. Now, does a custom exist on some of those estates for the free sale of tenant right?—Yes.

Free sale of tenant right.

44,290. What is the nature of it?—Simply that the outgoing tenant can ask his price, or rather make his demand, and if he can find a purchaser the landlord seldom objects. I do not know that he has ever objected if the man is a substantial man. It is contended that if a man can pay a good tenant right, that should be a sufficient security to the landlord for the payment of his rent, &c.

44,291. Does it often happen that as much as 40*l.* or 50*l.* an acre is given?—Yes, quite that.

44,292. Where the rent is perhaps 10*l.* an acre?—Yes, but they go higher than 10*l.* (*The witness subsequently wrote "these tenant rights (40l. to 50l. per acre) would not "command a higher rental than 6l. to 8l. per acre per "annum."*)

44,293. That represents, in a rough way, the value of the improvements which the market gardener has made?—Yes.

44,294. You stated just now that the custom of the country recognised the right of the outgoing man to compensation for improvements; as I understand, it takes the form of a sale by the outgoing man to the incoming man of this tenant right?—That is so.

44,295. Has it ever happened that there has been a sale by auction of the tenant right?—No.

44,296. Would that not be permitted by the landlord?—I do not think it would; he would not be able to ask the incoming tenant as to his stability if it was knocked down to a man under the hammer.

Right to will land.

44,297. Is it considered that the gardener has the right to leave his interest to his son?—It has been done; the instance I have quoted in my brief is the first instance that has ever been, I think, in Evesham, or in the district. A former instance has been brought to my knowledge, in which a tenant left his tenant right to his son, and the agent refused to accept him, and let the land to another party with no ingoing valuation to pay.

44,298. Is it recognised by law?—I think it will be; it is quite recent.

44,299. Has it been hitherto?—We never had an instance before.

44,300. On some estates it appears to be recognised in a sort of way?—Yes, it would be recognised.

44,301. All this has grown up outside the law, so to speak?—Yes.

Compensation for improvements and disturbance.

44,302. What do you consider ought to be done?—We wish for absolute security for any improvement that we have made in our holdings; also for all planting and improvements in cleaning that we have done in our holdings; and we want likewise compensation in a case of disturbance, because the landlord can and does confiscate the tenant's improvements by raising the rent to the present holder. The outgoing tenant now might have to go to an incoming tenant and say: "I want 80*l.* for my improvements, but my rent has "gone up from 6*l.* to 8*l.* per acre per annum."

44,303. Then you consider, in the first place, there should be more compensation for the improvement which has been effected; and, secondly, that there should be some compensation for disturbance?—Yes.

44,304. In the compensation for improvements would you include compensation for cleansing the land, or would that be provided for in the compensation for disturbance?—In the course of years the compensation for cleaning would be merged in the improvements. If a man held the land, after having cleaned it well, for, say, 16 or 18 years, he would be able to say that the trees were worth so much, and he would not then think so much of his cleaning.

Mr. J. K. Woodward. 29 Mar. 1895.

44,305. Supposing a man has come in as a tenant, and does find the land already sufficiently cleansed, planted, and so forth; and then, after a few years, goes out; would he be compensated?—He should be compensated for any increased value of the trees on his holding.

44,306. For the trees?—Yes.

44,307. But not in his case for the cleansing?—No, because he would not have paid for it.

44,308. Because when he came into the land it was already cleansed, you mean?—There would not be so much compensation due then.

44,309. Would there be any in that case? I put to you the case of a man going into the land and finding it already thoroughly cleaned; he goes on cultivating it himself and keeping it clean; now, when he goes out would he be entitled to any compensation for cleansing?—I should think not; I do not see how he can be.

44,310. Suppose the case of a man renting a field of 5 or 6 acres at 7*l.* an acre, and planting it with plum trees and fruit bushes; then his son succeeds him, and after a few years the rent is raised to, say, 9*l.* an acre as the trees come into full bearing; would you consider that that rise of rent would be on the tenant's improvements?—Yes, certainly; and it would be an injustice to the tenant.

44,311. Do those cases occur?—Yes.

44,312. I will put another case, namely, that of a tenant taking a field of 5 acres with foul plants upon it; he pays 120*l.* for going in, and the rent is 5*l.* an acre; he then has to clean the land to erect sheds and stables, and so forth, and then to plant the fruit trees; after a few months the rent might be raised 1*l.* an acre; do cases of that kind occur?—They have occurred.

44,313. Has that happened owing to the want of a provision in the law for compensation?—Yes. If a tenant could be compensated for his improvements, I doubt whether he would have had a rise in his rent. The tenant would then have said, "No, you can take "the land if you are going to raise my rent; because "it is a tax on my own industry."

44,314. Is this your own case, that you paid 30*s.* an acre for 106 acres up to September 1894?—That was my holding up to last September. I gave it up then.

44,315. The best portion of that holding was offered to be relet to market gardeners at 3*l.* an acre, was it not?—It was offered.

44,316. Then the agent found that he had so many applications that he raised the rent to 4*l.* an acre?—Yes.

44,317. Then the land being cleaned and in good condition he had no trouble in letting it at this additional rent, without any outlay on the part of the landlord?—That is so.

44,318. Do you consider that in regard to that land you were entitled to some payment?—I do not know that I was exactly. I was valued out under the Agricultural Holdings Act. But those men have no claim for compensation; and that to me seems to be the injustice if you take their land now, and they have no claim at all, or not so much as I had under the lower rent.

44,319. You claimed under the Agricultural Holdings Act?—Yes.

44,320. But they are not under the provisions of the Act, and going in at the advanced rent they would not be entitled relatively to the same kind of protection that you had?—That is it.

Landlord's consent to tree planting.

44,321. (*Mr. Channing.*) Was not your point this, that under the Agricultural Holdings Act they have to obtain the written consent of the landlord to carry out these improvements, of planting fruit trees, making gardens, and so on; and because they have not obtained the written consent of the landlord, therefore they do not come under the Agricultural Holdings Act; is that not the case?—Yes, that is the fact. The market gardeners do not interest themselves at all in the Agricultural Holdings Act; I do not know of one instance where they have applied to the landlord for permission to plant.

44,322. (*Chairman.*) Planting is a necessity of the condition there, and therefore if you take one of these small farms it means of necessity that it would be planted, I suppose?—Certainly.

44,323. Therefore to ask a man in such a case to give his consent as owner for the purpose of planting is altogether unnecessary?—I should think so, entirely.

Mr. J. K. Woodward. 29 Mar. 1895.

44,324. Because the very existence of the whole system of cultivation in the district, implies that the land would be planted?—Certainly; the landlord or his agent would certainly know that.

Proportion of land cultivated as market gardens.

44,325. (*Mr. Long.*) Is the whole of the cultivation based on the system of planting, or is it only followed in a portion of the country? I do not understand you to say that the whole of this district is cultivated in this form?—Eighty per cent. would be.

44,326. Eighty per cent. of all the land?—I should think so. Arable only; of course we do not include garden pasture.

44,327. Of all the land in the union?—Certainly in the union of Evesham.

44,328. Eighty per cent. of the whole of the land in the union of Evesham is cultivated as market gardens?—I should think it would be certainly 50 per cent.

44,329. What other form of agricultural industry is there?—There are instances of hops being grown.

44,330. Are there no cattle kept?—Very few indeed.

44,331. Is there no dairying or other industry of that sort?—Yes, but they lie right on the outskirts. In the neighbourhood of Evesham, certainly in that part of the union lying close to the town of Evesham, 80 per cent. would be market gardens.

44,332. (*Viscount Cobham.*) There are a few meadows down by the river, are there not?—Yes, there are a few meadows by the river.

Landlord's consent to tree planting.

44,333. (*Chairman.*) I suppose that when any man takes a small holding in the district which has not already got trees planted upon it, it would necessarily follow that he would plant it?—Certainly.

44,334. Perhaps not all at once, but by degrees?—Yes; it is universally done.

44,335. To ask under those circumstances that whenever he puts a tree into the land he should get the consent of his landlord would be almost absurd?—I think so; it is quite absurd to us.

44,336. It would be unnecessary, because he would be continually planting?—It would be quite unnecessary; we would never dream of asking the landlord.

44,337. It would be implied in the custom of the country that the land would be applied to that purpose?—If the land is let in such small quantities as two to four acres, the agent would at once understand that the holder wants it for the purpose of a market garden, and, of course, the tenant would be entitled to plant fruit trees.

44,338. Then in your opinion ought an Act to be passed to secure this tenant right on this compensation for disturbance so as to give greater protection to market gardeners in your district?—Yes; I know that is the wish of the market garden industry.

44,339. (*Mr. Channing.*) I think you have been a farmer as well as a market gardener, have you not?—Yes.

44,340. You farmed for a number of years, did you not?—Yes, for 15 years.

44,341. What sort of farm was it?—It was a mixed farm in both instances; I had one farm for seven years and another for eight years.

44,342. How long ago were you farming?—I gave up my last farm in September 1894.

44,343. How long have you been market gardening?—I commenced market gardening on a portion of the farm that I held prior to 1895. I began seven years ago.

44,344. Are you aware that a Bill, which has passed through Committee, gives this right to the tenant: that where land is let as a market garden, he is presumed to be obliged to plant these trees and he would be compensated for them?—I hoped that it was so. I saw that a Bill was to come before the House of Commons entitling him to such compensation.

44,345. As I understand you, what you want is something more than a provision of that kind. You say that in certain cases the landlords or their agents are inclined to raise the rent from time to time, in cases where they have really done nothing themselves to increase the value of the holding?—That is so. If

Mr. J. K. Woodward.
29 Mar. 1895.

they do that, they must confiscate any improvement that we have made.

44,346. Is it your opinion that the mere giving the tenants the right to plant these trees and to get compensation for them is not sufficient to check that practice?—I should contend that it is not.

44,347. That is, if the tenant had to leave his holding and only got compensation, he would lose all the interest he had in his holding?—Yes, he would, if the raising of the rent was persisted in. Raising the rent must confiscate any improvement that he has made, because he could not secure an incoming tenant at the money.

44,348. Is it your opinion that he ought to have a further compensation to cover his losses in case he were given a notice to quit and was forced to go?—Yes.

Legalisation of the Evesham custom.

44,349. So it is your opinion that this Evesham custom should be legalised?—Certainly.

44,350. In what sense should it be legalised?—If it is made absolute that the tenant shall be enabled to secure compensation, his improvements will increase in value. If a man knows that he is taking land which he is not certain of holding, he cannot get so much for the tenant right as he would if he had a good secure tenancy.

44,351. Do you think the outgoing tenant would really get more for his improvements if there were that security?—Certainly he would.

44,352. Supposing you had the custom legalised, in addition to this right of compensation for planting fruit trees that would place the tenants in a better position, would it not?—Yes.

Value of tenant right.

44,353. I do not think this question has been put to you: What are the average amounts paid for the tenant right in the case, for instance, of plum trees and fruit bushes?—If the plum trees were in good order and condition, the tenant-right would be from 80*l.* to 100*l.* an acre.

44,354. Is that a price frequently obtained?—Frequently.

44,355. How much would the tenant get in the case of asparagus?—From 45*l.* to 55*l.* an acre.

44,356. And in the case of strawberries?—From 25*l.* to 30*l.* or rather more.

44,357. In the case of rhubarb?—About the same.

44,358. Are there any other crops to which you think the right of compensation should be extended, besides those?—Yes; there are others. The growing of herbs is largely on the increase in the Evesham district: those are crops that do not mature for two or three years.

44,359. As I understand it, the custom amounts to this: that it is tacitly agreed that there is no question raised by the agents in most cases to the incoming and the outgoing tenants coming to an agreement?—That is the custom.

Transfer of tenancy.

44,360. It there any lengthy notice required, or is the tenancy transferred at short notice?—It is transferred at short notice; but, of course, the outgoing tenant is held responsible for the next 12 months' rent.

Purchase of improvements.

44,361. What is your opinion about the landlord's position; ought he to have the right to say that he will not accept an incoming tenant, and be able to buy the improvements himself?—I do not think it matters to us who has the improvements so long as we are paid for them. That is our position.

44,362. Perhaps the landlord would prefer to be able to choose the tenant?—He can choose his tenant if he will pay the price.

Cost of cleaning land.

44,363. Now you spoke of the thorough cleaning of the land which is necessary, I suppose that varies a great deal?—Yes, in planting plum trees and fruit bushes, the land must be absolutely clean, that is a very emphatic point—that it must be absolutely clean.

44,364. Taking a farm such as you have had yourself a farm on the ordinary four-course system, was it?—Yes, you would call it the four-course system.

44,365. How much would it cost on the whole?—For the market gardener to clean that holding?

44,366. Yes, to prepare an ordinary farm in fair condition for market gardening?—If he takes it in a good fair condition, it would cost him from 12*l.* to 20*l.* an acre, it must depend a great deal upon the nature of the land.

44,367. As much as that when it is in good condition?—It would, he would have to go over the whole of it with the spade, first of all.

44,368. Does he do any drainage of his own?—No, we very seldom drain on our land, the landlord would drain, I think, if we asked him to do so. The landlord finds the pipes, the tenant the labour.

Mr. J. K. Woodward.
29 Mar. 1895.

44,369. In the case of other land, where there is a good deal to grub up and that sort of thing, it requires a good deal more work done to it?—Yes, I have known cases where it has been mown with a scythe.

Rents.

44,370. In your brief you give rents of 7*l.*, 5*l.*, and 9*l.* an acre, what are about the maximum rents for these market gardens?—The rent of some of the accommodation land is tremendous, but I would hardly class that as market garden land, because I think it is taken up by men who look to the land more as a hobby than anything else. The maximum would be about 16*l.* or 18*l.* an acre.

44,371. Do you think the land is really in its quality a good deal better than other fruit land, say in Herefordshire or Kent or Cambridgeshire?—It is for plum growing. There is no country we know of anywhere which can grow the black plums like we can round Evesham on the black soil of Evesham. There are certain parts of the Evesham lands—on the gravel—which do not grow the plums to the perfection that the black soil does.

44,372. How long have the majority of these market gardens been in use as market gardens, do you suppose?—The business is so rapidly increasing that it is a very difficult question to answer. The oldest that we know of is, I can safely say, 30 years old, or more; some many more years than this.

44,373. You have told us that in your own case you were paying 30*s.* an acre for 106 acres until 1894, and you said that 80 per cent. generally of the land in the district is now under cultivation as market gardens, what proportion of the lands ten years ago was paying as low a rent as 30*s.*? Do you suppose there was much then?—No.

44,374. Very little?—Yes.

44,375. Are you in the vale of Evesham, or are you somewhere outside?—I am quite in the vale of Evesham I run down to the river.

44,376. What is the average rent of fair medium land for this purpose?—From 5*l.* to 8*l.* an acre.

44,377. That is not an extreme rent?—No, not at all.

44,378. When you get up to 9*l.* or 10*l.*, would you call that an extreme rent?—Not if everything is in proper cultivation. Plenty of the gardens belonging to Mr. Rudge are rented at 14*l.* an acre. (*The Witness subsequently wished to amend his answer as follows:*—"*Yes, I should; the higher rent* 14*l. would include value of tenant right.*")

44,379. (*Captain Owen Thomas.*) Are the rates heavy?—They are in the borough, very heavy.

Compensation for good cultivation.

44,380. (*Mr. Channing.*) Is it the case that on these estates they have not offered any agreement which would give compensation?—I have never seen any such clause in any agreement.

44,381. I think you say that the ordinary gardeners are not generally informed as to their own risk?—That is so.

44,382. Is there no printed form of agreement on these estates?—There is an agreement drawn up, and then they all sign it; there is no separate agreement.

44,383. And there is no scale of compensation in the agreement?—No.

44,384. None whatever?—No, I have never seen one.

44,385. In farming one of these holdings for a long time, I suppose, if it is really well done, it increases in value, supposing the trees are replaced on it?—Yes, quite as much as the freehold.

44,386. Do you attach importance, speaking as a farmer as well as a market gardener, to giving a tenant the right to compensation for continuous good cultivation and for the added fertility, which is going on for 20 or 30 years, for instance?—Not if he is not disturbed, because he would enjoy that himself as long as he holds it himself.

44,387. If he were quitting, should he not be compensated for the added value of the fertility of the land?—Certainly.

Railway rates.

44,388. I see you speak in your brief of the railway rates being a great difficulty which this industry has to

Mr. J. K. Woodward. 29 Mar. 1895.

contend with?—They are a great drawback to us. Our heaviest item is the carriage of the produce from us to the consumer.

44,389. How is the produce carried; does each market gardener use his own packages and send in separately?—Either that, or he sends it away to fruit salesmen, and they supply him with packages.

44,390. Is there any system of collecting fruit from the market gardeners so as to send it in bulk in two ton or four ton lots?—No, the market gardeners send it themselves, but salesmen on the spot do that a good deal.

44,391. The salesman would save on the railway rates, would he not?—Yes.

44,392. Have you made any application to the railway companies to see whether you could get small lots of 2 cwt. or 3 cwt. carried at a lesser rate?—Yes, some years ago.

44,393. What did they say?—That they would rather be without them.

44,394. (*Viscount Cobham.*) That came before the Railway Rates Committee, did it not?—Yes, I think it did.

Initial outlay on tree planting.

44,395. (*Mr. Everett.*) I think I understood you to say that where these gardeners hire agricultural land for the purpose of bringing it into a market garden, they spend 50*l.* or 60*l.* an acre on it?—If they were going to clean it and to plant it, then the cost of that labour and of the trees and everything would quite come up to that.

44,396. That, I suppose, would be quite as much as the freehold value of the land when they took it?—Yes, it would be almost.

44,397. Is it possible that they embark in an expenditure like that without making an agreement with the owner of the land as to compensation?—It is so; that is the rule around us.

44,398. Are the people possessed of common sense in your part of the country?—Yes, I think we are gifted with a fair amount of that.

44,399. Do they not try to protect themselves before embarking in an expenditure like that?—The question is that there is such a demand for the land; as soon as ever land is offered there are any quantity of applicants for the land; and the thing is to secure the land.

44,400. Would not a tenant in hiring land be willing to give a good deal more if he had a lease of 14 or 20 years say than he would if he were to hire it on that hazardous principle?—They do give more if they can secure a lease.

44,401. Does that not induce the landlords to meet them with a lease?—The landlords would rather not; they would rather be without leases.

44,402. It certainly is a very extraordinary condition of things?—Yes, but it is so nevertheless.

Compensation for improvements and disturbance.

44,403. (*Mr. Lambert.*) You say that compensation for disturbance should be paid where an owner attempted to increase the rent upon the tenant's improvements?—Yes.

44,404. Should that compensation be paid on quitting?—No, on the increase if the landlord increases the rent. I do not say that you should compel an occupier to give the land up; but if the landlord says, "I must have so much more rent," then I think the tenant should be entitled to compensation for that.

44,405. On what basis are you going to estimate such compensation?—That I would leave for somebody else to discuss.

44,406. Take this case, which I will put roughly to you. A man is giving 5*l.* an acre for his land, and the landlord comes in and raises his rent 2*l.* an acre, then your idea of compensation for disturbance—that is compensation on the tenant not quitting—would be, say, that the landlord ought to pay 50*l.*; we will suppose that the landlord pays the tenant that 50*l.*, and then says, "I will not let you have the land now for an "extra 2*l.* an acre; I will make you pay 4*l.* an acre "extra"; how are you going to meet such a case as that?—That, again, would be a case for compensation for disturbance, because that would be a further disturbance. If the tenant said, "I will accept the 50*l.* "for the 2*l.* extra per acre that you are going to raise me"; then there should be a further compensation as he would not accept the 50*l.* on the 4*l.* per acre rise.

44,407. Then you would go on having a fresh compensation for disturbance; that would hardly work out in practice, would it?—You see the landlord would be confiscating the tenant's right in his improvements if he has improved the land, and the landlord comes and says that he must have an increase of rent. No incoming tenant would pay the same amount at the higher rent as he would at the lower rent; because he would say, "No, I cannot recoup myself if I pay this "larger sum of money for it."

44,408. That is true; I do not quarrel with your principle at all; probably I should be in favour of it; but still, for all that, I want to get at your exact scheme?—I cannot say that we have formulated any scheme. The idea was that it was a matter for discussion, and that if the tenant is to receive compensation on quitting merely, the landlord can confiscate his rights by increasing his rent of the holding.

44,409. I quite see your point, but I do not see how it can be met by your plan. How much would you consider would be the amount that a tenant should receive as compensation for disturbance, presuming that he had to quit the holding from no fault of his own, but by reason of the action of the landlord?—The compensation then would amount to the tenant right.

44,410. How much would you estimate it at?—If the tenant right was from 80*l.* to 100*l.* that would be the compensation that the tenant would be entitled to.

44,411. In addition to ordinary compensation?—No, it would be the amount that one tenant could obtain from another.

44,412. Then you say that the tenant ought to have some further compensation, such as compensation for disturbance?—No, certainly not; that concludes it altogether; if he is paid the amount of the tenant right that includes everything.

44,413. Then you do not want to compensate him for leaving?—The tenant is the one we wish to protect in those cases of increase in the rent.

44,414. (*Mr. Channing.*) Would you be satisfied if, when a proposal was made to raise the rent, the tenant was entitled, without quitting the holding, to get his valuation settled?—Yes, if that was paid over; the landlord could do as he thought proper with the land then.

44,415. (*Mr. Lambert.*) Then the tenant would have to quit?—He could either quit or pay the rent that the landlord chose to fix.

44,416. So that really your compensation for disturbance means compensation for improvements?—That is it. If a tenant says, "I would rather stop here," it seems hard that he should have to pay an increase on his own improvements.

44,417. He can go if he likes, and if he goes then he gets compensation for his improvements?—Quite so.

44,418. (*Mr. Long.*) If he goes he gets the value of what he has done in cash?—That is so.

44,419. If he remains he gets the future benefit that may arise upon his own holding from what he has done, because he can earn what there is to be made out of it; do you propose that he shall be paid in addition?—I do not quite follow.

44,420. I understand you to say that a tenant who is asked to pay a higher rent, if he considers that the land has become more valuable because of his own improvements in the way of manuring and cultivation, is entitled to be paid compensation by his landlord for disturbance in his holding; but if he elects to remain, is he still to have that money?—Yes, he should be compensated against an increase of rent.

44,421. Then in that case he will remain on the holding?—Yes, but at an increased rent.

44,422. He will enjoy the opportunity of the increased fertility of the soil and the consequent increased product of the soil, and in addition the landlord is to pay him for the privilege, I suppose, of owning the land, a sum of money being the capital value of what he has done?—But the landlord would enjoy an increased rent in proportion.

44,423. Certainly; but then if the land is worth that it lets at that rent in the market, I presume. Mr. Everett asked you what your people are doing down there; I imagine the gentlemen in Evesham who have this great industry do not pay these great rents, unless they have good reason to pay them?—No; but the

Mr. J. K. Woodward.
29 Mar. 1895.

improvements I refer to have been made by the industry of the tenant.

44,424. (*Mr. Lambert.*) You say there is very severe competition for these market gardens?—There is.

Agreements.

44,425. Are the agreements in writing, or are they mostly verbal?—They are mostly in writing.

44,426. Are the holdings let as market gardens?—Yes, I should think they are; by far the larger portion would be let as market gardens.

44,427. Would it be specified in the agreement, or whatever it may be, that these holdings should be held as market gardens?—No, I doubt that; they let them so many acres of land simply, and the tenants can do what they like with it.

44,428. Supposing an Act were passed which made it imperative that the tenant should obtain a written agreement from the landlord that the land was to be held as a market garden, before any compensation could be obtained by the tenant; would that meet the Evesham case?—All the uneducated men, all the artisan class, would have to be instructed that they should make an application to the landlord to have their land as a market garden.

44,429. Would the landlord consent to that?—That I do not know.

44,430. You say he is loath to grant leases?—Yes; and, therefore, I should not like to answer that question.

44,431. Do you think it is probable he would consent, if he is so loath to grant leases?—I think from the attitude of the landlords now that they would not consent. I have never seen any clause inserted under which the tenant could claim compensation; and I think it would be rather doubtful, if the landlord thought he was likely to come to any heavy expense, whether he would grant the permission.

44,432. He would not?—I doubt it.

Legalisation of the Evesham custom.

44,433. You say you want the Evesham custom legalised, that is, that the tenant should have the free sale of his improvements?—Yes.

44,434. What do you mean by free sale—putting them up to public auction?—If absolutely necessary; then the tenant secures the top of the market.

44,435. May he not, owing to the great competition for these holdings, secure somewhat more than the market value?—I think not. We have drawn up a scheme amongst ourselves, according to which a certain acreage of land, well planted with trees and fruit bushes, is worth so much. If that is situated in a particular place, we know the value of that land, and we know what a man is making off it, practically.

44,436. If you put it up to this great competition, and there is, you say, great competition for these small holdings in order to get upon the land, would it not be perhaps the case that the incoming tenant might pay more than the real value of the improvements?—Yes, that might be the case.

44,437. Then you would be satisfied, I presume, if a fair and reasonable man came along, and valued the improvements fairly between the incoming tenant and the outgoing tenant?—Yes, if it was wanted.

44,438. (*Mr. Long.*) I only want to ask you one or two questions as to facts, and not to cross-examine you, as I have not now the time for that. You stated in your evidence in chief that the rent of these market gardens amounted to 7*l.* and 8*l.* an acre, I believe?—Yes.

Rents.

44,439. Is that the general rule with regard to market gardens all round this district of Evesham?—From 4*l.* to 8*l.* per acre would be pretty well the average.

44,440. To how many acres would that rental apply would you think? Does it represent an area of 1,000 or 2,000 acres?—Quite 1,000 acres.

44,441. (*Mr. Dalton.*) In what parishes would they be?—The parishes of St. Lawrence, All Saints, Bengeworth, Hampton, and Offenham.

44,442. (*Mr. Long.*) Surely the place must be either very small, or else a thousand acres would by no means represent 80 per cent. of your land?—I was speaking well within limits when I said a thousand acres.

44,443. I should think you must be, because you told us in your examination-in-chief that 80 per cent. of the land in the district you come here to represent was let as market gardens?—Yes.

44,444. Surely a thousand acres will not represent 80 per cent. of the land in four or five parishes, or anything approaching to 80 per cent.?—You are asking me rather an awkward question to answer. A good many of these parishes come right up to Evesham, and converge there; but it is only the land right on the black soil of Evesham which commands the highest rent.

44,445. That I can understand, but what I want to know is whether this rent which has been quoted as the rent of the market gardens applies to the whole of the market gardens in the neighbourhood of Evesham, or whether it applied only to a portion of them?—The 7*l.* or 8*l.* an acre would not apply to 8,000 acres.

44,446. It would apply to an eighth of it?—Yes.

44,447. Then the rent of the rest is what, should you say?—From 3*l.* 10*s.* to 5*l.*

44,448. Is there no market garden land let at less than 3*l.*?—Very little indeed.

44,449. (*Mr. Dalton.*) I understand that it is an advantage to the tenant to plant the fruit trees, rather than to have the fruit trees planted by the landlord?—Yes, that is so.

44,450. What is the usual custom in your district?—For the tenant to plant the trees. He usually finds the trees, and plants them himself. If the landlord plants the trees, then, when they are grown up, they belong to the landlord.

Fruit tree planting by landlords.

44,451. But the tenants have no objection to the landlord planting them, I presume?—They would sooner plant the trees themselves, a good bit.

44,452. But they would not deny that the landlord would have a perfect right to plant and improve his own property before letting it?—Certainly not; they would not prevent the landlord doing that.

44,453. And they would not think it a hardship, if he insisted upon planting the trees himself?—I know they would not prefer that plan; they prefer planting the trees themselves.

44,454. Do they rapidly increase the value of the land?—In seven or eight years they would.

44,455. The holdings get better?—Yes, materially; because we plant alternately gooseberry bushes underneath the trees, and those gooseberry trees are in full bearing in seven or eight years.

44,456. You have short terms of tenancy generally from year to year, I think you say?—That is the usual tenancy.

44,457. If a landlord was to plant those trees, you would not consider he was wrong, in seven or eight years time, when they had become very valuable, in raising the rent, if he had himself planted them?—No; because they would have materially improved his property.

44,458. That would not be renting on the tenant's improvements?—It would in a way, because I think he would be growing the trees for the landlord. Growing being more expensive than planting and deriving no benefit while growing up.

44,459. I suppose when he came in, he would give a rent for what was the then value of the land with the trees upon it, would he not, in the then condition of the trees?—Yes, of course that would be the term.

44,460. Very well; he would be having it all that time at that rent, and when it became more valuable, owing to this expenditure of money on the part of the landlord, would not the landlord be entitled to demand a higher rent?—Yes, he would; but the tenant would say: "I have been to the expense of growing it." I find now, there is an instance where the landlord is offering his land on a seven years' lease, but nobody seems anxious for the land on account of this—that in seven years the trees will go back to the landlord, the tenant having grown the trees.

44,461. The landlord having planted them?—Yes.

Free sale of improvements.

44,462. Then as regards free sale, do you think that there should be power to sell the tenant right to anyone who would take it?—Yes, certainly, if they can pay the valuation.

44,463. I suppose you would have to show that the person buying it was a substantial tenant?—I should think if he pays 60*l.* or 70*l.* that should be security enough to the landlord for, say, 6*l.* per acre per annum.

Mr. J. K. Woodward.

29 Mar. 1895.

44,464. (*Mr. Channing.*) If he were a prudent and respectable man, too?—Yes.

44,465. (*Mr. Dalton.*) Do you think that a solvent man would be likely to offer less?—The gardeners always like cash; if a gardener was inclined to sell his improvements, he would sell for nothing but cash.

44,466. (*Mr. Little.*) I think you said that, on the whole the market garden industry had not suffered from the depression of the times?—No, it has not.

44,467. But that there has been a considerable demand for the holdings, as they have fallen vacant?—That is so.

Security for expenditure of capital.

44,468. And that the tenant prefers to plant rather than to allow the landlord to plant for him?—Yes, he much prefers to plant.

44,469. Then he must rely upon the custom for giving him compensation?—Quite so.

44,470. He would not embark his capital in this planting, unless he felt pretty secure?—He does rely on the custom.

44,471. Then there must be a general feeling of security?—Yes, we are secure in a way if they would allow us to exercise the custom which prevails.

44,472. I mean that there could not be that demand for the land and that disposition to expend capital rather than have it expended for them, unless there was a general feeling of security?—Quite so; but the tenant objects to growing the trees for the landlord. I know that in ever so many cases, where the landlord has offered to find trees and plant them himself, the tenant says: "No, what I want planted, I will plant "myself."

44,473. Then he must surely, as a business man, consider that his money will be secure, after putting it there?—Yes; but you must remember that you are treating now with the artizan class, who can hardly be classed as business men, although they are hard working men.

44,474. They are tolerably shrewd about laying out money, are they not?—I think so.

44,475. The point I wish you to look at is this: there must be a general feeling in the district that they will not lose the value of their improvements?—That is so.

44,476. You have referred to exceptional incidents to show that a man may be deprived of what may fairly be called his ——?—That is so.

44,477. And what general opinion would give him?—Yes.

The Evesham custom.

44,478. I think you rather misunderstood a question of mine. I asked you whether the custom was a legal one; I meant, was it a custom which the law would enforce, and you answered me that it was, but that it had been disputed and had not been enforced, I think?—We had years ago some men noticed out of their holdings on the Rudge Estate. They were given 12 months notice and dismissed from their holdings without any compensation at all. But this was many years ago; some 14 or 16 years ago.

44,479. Do I understand you to mean that at the present time, if a tenant left, he would claim, and enforce his claim by custom?—No, he cannot.

44,480. Then it is not a legal custom?—It is not a legal custom.

44,481. But it is a practical custom which has very generally been accepted?—That is so.

44,482. But, in exceptional instances, the landlord has not recognised the custom, and has, as you would say, confiscated the tenant's improvements?—That is so.

44,483. You do not dispute that you are under the Agricultural Holdings Act, do you?—I do not think that we are included in it.

The Agricultural Holdings Act.

44,484. You are not excluded, are you?—It is not known amongst us. I do not think we are included at all under the Agricultural Holdings Act. I see Mr. Corrie Grant says not, if he is to be cited as an authority.

44,485. If it be the case, as some of the best commentators on the Act say, that these holdings are under the Agricultural Holdings Act, the tenants would be entitled to compensation if they had obtained the previous consent of the landlord to planting?—Yes, if it be that they are under the Agricultural Holdings Act.

44,486. Would it be difficult to get the consent of the landlord?—It would in many instances.

Mr. J. K. Woodward.

29 Mar. 1895.

Landlord's consent to tree planting.

44,487. Even when he is letting the land at this high price for market gardening?—Yes. You see he may be called upon to pay a large valuation, and in certain cases where the land is heavily mortgaged to begin with, it would be a hardship if he could not find an incoming tenant then.

44,488. It would be laying upon the land a possible encumbrance in future?—Yes, it might do so.

44,489. It would be?—Of course it must if he could not find an incoming tenant to take it up. Many landlords embrace the opportunity of letting the land to market gardeners; they would sooner let to market gardeners than to others.

Tenants improvements and increased rent.

44,490. You referred to your own case where you gave up a farm which was let at 30*s.* an acre, and you say in your brief that the best portion was relet as market gardens; it what sense do you use the words "best portion"?—It lies higher, and consequently farther out of the reach of the frost.

44,491. Then you mean by the "best" the land most suitable for market gardening?—Yes.

44,492. How much of that was there; what proportion would that be of the whole?—There was about 10 acres at 4*l.* and about 8 acres at 3*l.* 10*s.*

44,493. About 18 acres in all then?—Yes.

44,494. You go on to say that for this land the landlord got "an increase of 50*s.* an acre with no outlay"; but is it quite fair to say, because 18 acres out of 106 were let separately at an increased value, that 50*s.* is a real increase; might not that particular land at any time have let for more money than the average rent of the farm?—No, I should say not. The rest of the farm is let at 2*l.* an acre now.

44,495. That proves that there has been a rise in value?—That is a rise in value. I take some of that to my own credit. I took one of the fields in a most dreadful state. It was tumbled down green, and I improved it wonderfully, so that it is one of the finest fields on the farm now. But I am not entitled to any compensation there—I cannot lay claim to it.

44,496. I understand you to argue that the tenant whose rent is raised should settle up with his landlord and be paid for his improvements as a condition of paying an increased rent?—Yes; that would be to create a fresh tenancy altogether.

44,497. But you are not prepared to say upon what basis you would estimate that compensation?—No, I am not.

44,498. Suppose it were a good round sum of 60*l.* or 80*l.* an acre which was paid down to the tenant on condition that he should pay an increased rent—would that be your idea?—Yes.

44,499. Suppose the landlord pays this money down, and the calculation is made upon the increased rent; suppose the tenant then, having taken the land at the increased rent, lets its condition go down, would not the landlord then be liable to considerable loss?—He must, if the tenant lets it go down, but it would be against the tenant's own interest to do so, most emphatically.

Protection of landlord and deteriorated cultivation.

44,500. Are there not instances in all branches of agriculture where a man, against his own interest and probably not by his own choice, lets his holding deteriorate very much?—Yes, there are instances, and instances that I know of.

44,501. It would be a hardship upon a landlord, if he had paid 80*l.* an acre for an increase on the rent of 2*l.* an acre, if he only got that increase for two years?—If he only got the 2*l.* he would.

44,502. Suppose he got 4*l.*? If he only got that for two years, and then the thing began to decline, it would be hard upon him, would it not? I suppose you have known instances of market gardens going to the bad?—Yes.

44,503. Deteriorating?—I have known instances, but they are very seldom.

44,504. I imagine that strawberries or asparagus or fruit trees unpruned would very soon deteriorate?—The husbandry must be kept up, certainly. In all instances of market gardening, it is essential to keep it in the highest possible state of cultivation.

Mr. J. K. Woodward. 29 Mar. 1895.

44,505. If it were not kept up to that, the landlord might have paid for a thing that might vanish, or be very much decreased?—It might deteriorate.

44,506. That is a fair view for the landlord to take, namely, that he should not be called upon to pay a sum which might disappear?—He should certainly be protected, so that, if having paid that sum, he should be entitled to claim off the tenant, if the tenant lets it go out of cultivation.

44,507. Is it not unfortunately the case that if you have got a man who lets a thing run down, he is a man you cannot get compensation out of, because he has not got anything left?—That may be the case.

44,508. Therefore there are two sides to the question?—Certainly; there are two sides to every question.

44,509. Do I understand that you would be satisfied with the presumption of law, that in a district where market gardening prevails largely, a special rule should be made that these lands should be considered as market gardens, and that, as under the Bill of Sir Edmund Lechmere, a man should be entitled to compensation on the basis of his holding being a market garden?—Yes.

Landlord's consent to tree planting.

44,510. Where land is let at a high rate in a market gardening neighbourhood, the consent of the landlord to the planting of the trees and such things should be done away with, I understand you to say?—Yes, I do not think it is necessary.

44,511. And compensation should be given to the holder based on the value to an incoming tenant?—Quite so. There is no question at all that when an agent is letting land in small quantities to little men of the artizan class—men who usually make the market gardens—he is quite cognisant of the fact that the men intend to plant it out with asparagus and fruit trees; there is no question at all about it.

44,512. On the subject of rating, do I understand that you are in the Union of Evesham?—Yes.

44,513. Is the Union of Pershore somewhat similar in its conditions?—Yes, it is.

44,514. Is the market gardening or fruit growing as largely practised in Pershore as in Evesham?—I should not be prepared to say that; they do not grow the black plums (the choicest plums) in Pershore to the extent that we do in Evesham.

44,515. (*Mr. Whitehead.*) But they have a Pershore plum, have they not, which is very celebrated?—It is a very celebrated plum.

44,516. Equally with the black plum, is it not?—It is quite as celebrated, but it does not command the same price in the market, by a long way.

44,517. (*Mr. Little.*) What do you say are the parishes in which the system prevails?—All Saints, St. Lawrence, St. Peter's, Bengeworth, Offenham, and Great and Little Hampton, I think.

Rent.

44,518. I find from a return here, that the acreage of the Evesham Union is 47,523, and the gross estimated rental is 62,673*l.*; that is, of the lands taken alone. That would give an average value of 26*s.* That would not show that the estimated rental of 80 per cent. of the land was very high?—That is a return for the whole of the union, is it not?

44,519. Yes?—We have some parishes which I know are rated exceptionally low; they have gone practically out of cultivation and are of very little value.

44,520. Do you know the acreage of those parishes?—Not in the least.

44,521. Not any one of them?—Of course, I know the parishes.

44,522. Do you know the acreage roughly?—I will hardly say roughly, but I know the parishes very well.

44,523. You do not know the acreage?—No, I do not.

44,524. I have here another return showing the gross estimated rental of the lands in the different parishes. In All Saints' it is 1,189*l.*; in Great and Little Hampton, 2,794*l.*; in Offenham, 2,789*l.*; in St. Lawrence. 1,916*l.*; and in St. Peter's, Bengeworth, 3,398*l.*?—It is only that portion of each of those five parishes which converges on to Evesham that I am talking about.

44,525. Can you tell me whether the market gardens are assessed up to the rent?—Not up to the rent.

44,526. Then rent is not taken as a criterion of value?—It is taken as a criterion of value, but not up to it. They get a rebate of 15 per cent.

44,527. You mean that the rent is taken as a guide?—That is so.

44,528. But that is not an absolute criterion?—It is not infallible.

Mr. J. K. Woodward. 29 Mar. 1895.

44,529. Do you mean that it is always taken with a certain per-centage of deduction, or that it is only taken into account?—I think that they always take a per-centage. I believe that that is the rule of the assessment committee.

44,530. Do you mean that these lands which are rented at 18*l.* an acre are assessed at that, or within 10 or 15 per cent.?—I do. But when you say 18*l.* an acre, that would be a very small acreage; when you get to 6*l.* and 8*l.* an acre you will get a much larger acreage. (*The witness subsequently wrote:*—"*I would like to make a material alteration here, the land rented at 18l. an acre and over (some even at 3l. per chain) is of a very small area, and is let mainly to tradesmen in the town, and should, perhaps, hardly be classed as market garden land, i.e., land occupied by market gardeners, though there is frequently a good margin of profit at the year's end even on this land. The area rented at 9l. is large, and is paid by bonâ fide market gardeners—my answer is correct, but applies only to, as I said, a very small acreage.*")

44,531. Do you think that even the small piece of land which is rented at 18*l.* an acre is assessed at 18*l.* less the 15 per cent.?—Yes.

44,532. (*Mr. Whitehead.*) In the same way as ordinary arable land would be?—Yes.

44,533. (*Mr. Gilmour.*) You have had experience of both ordinary farming in that district and market gardening, I think you said?—Yes.

Market gardening and farming at Evesham.

44,534. Do you think as a practical man that, paying this high rent, with all the risks you have spoken about, a man is better paid at market gardening than he is at the ordinary farming in that district?—Yes, he gets a much better return as a market gardener, even at the higher rent, than a farmer would.

44,535. But of course that can only be to a very limited extent, because market garden land can only exist to a very limited extent?—I think it is increasing. People are finding out that different classes of land are more adapted to different crops. For instance, asparagus will not grow on sandy land. It will soon work itself out there. You would not grow asparagus there as large as your pencil, but on the heavy clay lands, although it takes a good bit longer to mature, it comes to a much better state of perfection and productiveness.

44,536. Did you take the trouble of inspecting other parts of the country where you thought you could turn your knowledge of market gardening to good account, by making a market gardening place there?—No, not beyond Evesham and the district round there.

Agricultural position.

44,537. Apart altogether from market gardening, what is the condition of the farmers in the agricultural district round about Evesham, outside the market garden area?—They are getting very badly off. The land is going rapidly out of cultivation. All the heavier land is going out of cultivation, and some of the worst grazing farms are going down very much.

44,538. But they are still bringing some rent?—Yes, they are bringing a rent.

44,539. What is about the rent?—I know one farm that varies from 30*s.* an acre to 7*s.* 6*d.* on the same holding.

44,540. Is there any farm absolutely out of cultivation or out of occupation?—No, I do not know that there is now. The owners seem determined to let land at any price rather than hold it themselves.

44,541. And they have always up to the present been able to let it to somebody at a rent?—Yes, at a rent.

Reduction of rent.

44,542. (*Mr. Whitehead.*) I think you said there had been no reduction of rent in the market garden districts?—None at all.

44,543. Would that apply to all the market garden land, or only to the best of it?—Practically to the whole of it; I do not know of any instance to the contrary.

44,544. Would that apply to both the Pershore district and the Evesham district?—Yes, you may take it as applying to Pershore and Evesham.

Profits of market garden ng.

44,545. Are the profits in market gardening generally as great as they were three years ago?—I should hardly think they have been these last three years. As soon as ever trade is at all depressed, we find depression coming into the market gardening at once. We are subject to a good bit of fluctuation in that way.

Mr. J. K. Woodward. 29 Mar. 1895.

44,546. Are there not complaints, even in your best districts, of a falling off in profits?—Yes, there have been complaints; but I notice that those men who complain do not seem to feel it very much, although they grumble a good bit.

44,547. They still go on taking land?—Yes.

44,548. Do you know that the market gardeners in Essex, Bedfordshire, and Middlesex are complaining very greatly of a falling off of profits?—Yes, I have heard it, but I think, in Kent especially in the last two years, they have been subject to frosts in the spring which have severely injured their strawberry crops, and Kent depends very much on its strawberry crops. Our strawberry crops in Evesham have been practically a failure during the last two years.

44,549. Does not your market garden system differ from others, in that you have fruit combined with vegetables?—That is it.

44,550. In the other districts I spoke of, they do not have that?—No, I do not think they do.

44,551. Would you consider that the difference in the profit is due to the fruit?—Yes, certainly. You will find that a good fruited plantation sells well in the market, but that a plantation which is not fruited, does not command anything like the same price.

Vegetable gardening.

44,552. Are there any purely vegetable market gardens in your district?—There are some.

44,553. How have they fared lately?—Not so well as the plums, but they have fared with a good margin of profit.

44,554. In spite of foreign competition?—Yes. We are very centrally situated, and we have two good systems of railways, which convey our produce to all parts of the country where one system could not get to; then we are able to disperse our fruit and vegetables at once to the large centres and to the manufacturing places.

44,555. Are you better off in that respect than the growers near London who have the advantage of the metropolitan markets?—I should contend we are, because we are freer from the foreign competition.

Foreign competition.

44,556. Does not foreign competition interfere with your asparagus?—Yes, it does; but the French grass is nothing to compare with the English grass.

44,557. Yours is of a much better quality, you mean?—Much better.

44,558. Theirs comes much earlier, does it not?—Yes, but as soon as ours comes into the market, the French is of no use.

44,559. Yours takes the place of the French?—Entirely.

44,560. Would that apply to radishes and lettuces?—Yes, but not so much as to asparagus. Our asparagus is of a finer flavour altogether.

Vegetable gardening.

44,561. With regard to the coarser vegetables, such as cabbages, and cauliflowers, are you very much interfered with in that respect by farmers proper, who have taken up growing them?—We are in some years a great deal; but only in some years. If we get a good cabbage year, then farmers will begin to plant, but when we get a bad cabbage year, then farmers will not plant at all.

44,562. Their supply is not constant or regular?—Not at all.

44,563. Do you think that in the long run it will not interfere with the market gardeners' profits?—I do not think it will.

Extension of market gardening.

44,564. Do you think that the business of market gardening, as carried on at Evesham, could be largely extended throughout the country on suitable soils?—On suitable soils I think it could.

44,565. Do you think there is a good supply of that suitable soil?—Yes, I think there is, if it is properly selected. There is a great deal in selecting the land. If you get a gravel sub-soil, I should not advise anybody to plant trees on it at all, because they would soon die away, as they will not stand the drought.

Mr. J. K. Woodward. 29 Mar. 1895.

Railway rates.

44,566. One question about railway rates, you speak of small quantities being charged excessively, would that apply to smaller lots than 2 cwt. or 3 cwt.?—Yes, and it goes to higher weights still.

44,567. That interferes with your business to a considerable extent, does it not?—Yes, it does.

44,568. Because you would do a kind of retail business I take it, if you had railway opportunities?—Certainly we could. The railway company does give us one little advantage. I think that you can send small quantities, that is to say, half a hundred weight, at half the usual parcel rate.

44,569. Railway parcel rate, you mean?—Yes. I think they do give us that advantage, I am almost sure they do in fact.

44,570. The competition of the parcel post has brought that about, I think?—Very likely.

44,571. It would be desirable that these facilities should be extended?—Certainly, it is a tax on the small producer in getting his fruit to market.

44,572. That would benefit the market gardeners, especially the fruit growers?—Yes. It would benefit us in other ways, because now we are obliged to send large lots to the salesmen, to dispose of in the market, while if we could get a low charge for sending a small quantity, we would send it direct to the men who order their own stuff from us. The charge for sending little quantities is so much now that we cannot secure orders from the large hotels in North Wales, and places like those where we might compete.

44,573. I think in Pershore or Evesham, some of the growers have opened up a business of a private character with their customers?—Yes, that is so.

44,574. And they advertise for such?—Yes, that is so.

44,575. That would be very much facilitated by the railway rates being lowered?—Yes.

Rateable value of district.

44,576. (*Mr. Dalton.*) I see that the value of the land both in the Evesham and in the Pershore Unions is very much less now, taking the whole of the unions, than it was in 1870, and that there has been a considerable fall in the value of the lands altogether?—Has there?

44,577. I will give you the figures. I am only speaking of agricultural lands including market gardens?—I know Mr. Isaac Averill when he resigned the chairmanship the other day (he had been guardian and chairman over 30 years), said the rateable value of the whole of the union had gone up even in spite of agricultural depression.

44,578. That would include houses, railways, and other properties. The rateable value of lands in the Evesham Union in 1870 was 77,000*l.*, and it had fallen to 58,000*l.* in 1894; and for Pershore Union it was 76,000*l.* in 1870, and it had fallen to 62,000*l.* in 1894; therefore the additional value which has been given to some of this land by its becoming market gardens, and being highly cultivated, does not anything like compensate for the fall in the rateable value of the remainder of the land?—No, I daresay not.

44,579. Does that not rather point to the conclusion that it is a comparatively small area which is devoted to market gardening, if the rents which you have mentioned, 3*l.* 10*s.*, 6*l.*, and 18*l.* an acre, and so on, are correct?—Of course when I speak of 18*l.* that applies to quite a limited area. I think that agricultural land has gone down more than sufficient to compensate for that allowance. If you were to turn to a neighbouring union, such as Alcester and Winchcomb, where the market garden industry is not pursued, I think you would find that the reduction would be correspondingly more.

The witness withdrew.

Mr. JOHN BOWEN JONES called and examined.

Mr. J. B. Jones. — 29 Mar. 1895.

44,580. (*Sir Nigel Kingscote.*) I think you reside at Ensdon House, Montford Bridge, Shropshire?—I do.

44,581. You are a member, and have been for some years a member, of the Council of the Royal Agricultural Society?—Yes.

Particulars of witness' farm.

44,582. You have farmed how many acres of land?—720.

44,583. As a tenant farmer?—Yes.

44,584. And have done so for how long?—Most of my life. I think I may call myself an hereditary tenant; for 30 years we will say—since I was of age.

44,585. What proportion of arable and pasture have you on your farm?—413 acres of arable and 307 of pasture.

44,586. May we ask you what is the rent?—Yes, the rent in 1873–74 was 1,175*l.*

44,587. Exclusive of tithe, I suppose?—Yes, the tithe was 109*l.* Now take a period of 10 years later, 1883–84, the rent then was 1,075*l.*, and the tithe was 97*l.*—I am giving round figures—in 1893–94 the rent was 980*l.*, and the tithe (I pay a little bit of tithe so as to save the landlord the trouble of it) 17*l.*

44,588. I suppose that in fact the landlord pays the tithe?—Yes, he did after the Act was passed.

44,589. (*Mr. Little.*) Have you worked out the percentage of deduction?—The rent and tithe is now 288*l.* less than it was in 1873–74, that is 22½ per cent. less. Now take the rates. The rates in 1873–74 were 83*l.*, including a voluntary school and church rate of 10*l.*; in 1883–84 they were 77*l.*; and in 1893–94 they were 73*l.*

Rates.

44,590. (*Sir Nigel Kingscote.*) Then the rates have rather fallen?—The rates have fallen about 10 per cent.; but they are rising again now, I think, I should add, because they are up this year.

44,591. (*Mr. Little.*) Your county rate is higher?—Yes. This is the last return I can give you.

Receipts from farming.

44,592. (*Sir Nigel Kingscote.*) Could you give us any figures showing the comparative receipts for your farm?—I have worked out, for the information of the Commission, the receipts as they would be if I was not a breeder of pedigree stock. I have bred pedigree stock, and made it a speciality since about 1877 or 1878.

44,593. That is cattle and sheep?—Hereford cattle and Shropshire sheep, for which we are justly celebrated I will say. I have worked out the figures, which will be a fair indication of the receipts on a similar class of farm in Shropshire, to show what the receipts were under each head at the prices that I really obtained then and now. My course of rotation, I should premise, is 100 acres. In 1873–74 my wheat realised a gross sum of 1,147*l.*, that is 54*s.* a quarter; these are the prices that I take from my books, not the average prices in the "Gazette;" and my barley, putting 100 acres at five quarters an acre, came to 1,112*l.* Those are the two cereal crops I have grown. In 1883–84 the wheat produced amounted to 892*l.*, as against 1,147*l.*; and barley to 950*l.*, as against 1,112*l.* In 1893–94, assuming that I was still growing wheat, but I am not, for I have dropped that pretty much, the wheat came to 425*l.*, as against 1,147*l.* in 1873–74; and the barley to 687*l.* Instead of growing wheat I have grown oats, although my land is not oat land.

44,594. Still that would be the proportion?—That would be the proportion. The decrease between 1873 and 1893 is on wheat 722*l.*, and on barley 425*l.*

44,595. (*Mr. Little.*) That is about equal to the rent of the whole of the farm?—Yes, it would be. Between 1883–84 and 1893–94, the last 10 years the decrease is 467*l.* on wheat, and 263*l.* on barley. Breeding the same number of cattle and selling them at the current market price, as I did then, and, hypothetically now (because I am breeding pedigree stock and I do not sell much beef or mutton) the cattle in 1873–74 came to 1,040*l.*; in 1883–84 to 920*l.*; and in 1893–94 to 720*l.*

44,596. Are the cattle all supposed to be produced on the land?—I breed entirely; I do not buy, or scarcely ever—of course, there are exceptions to every rule. The sheep realised in 1873–74, 1,170*l.* per annum; in 1883–84, 1,090*l.* per annum; 1893–94, 910*l.* per annum. The wool, which is the other big item connected with the income, was 262*l.* in 1873–74, 175*l.* in 1883–84, and 130*l.* in 1893–94. The totals show a decrease on income on that farm from the produce between 1873–74 and 1883–84 of 1,859*l.* a year, and between 1883–84 and 1893–94, the last 10 years, of 1,155*l.* a year.

44,597. (*Sir Nigel Kingscote.*) Under totally similar conditions; I mean as to tillage, your farm I suppose was as well cultivated in 1873 as it was in 1893?—Yes, it has always been so.

44,598. (*Mr. Little.*) These figures you have given us are based on the assumption that the business had been conducted on the same lines, and that the yield had been practically the same, are they not?—The yield is practically the same. The farm is in a good state of cultivation. Of course, seasons will make a little difference, but not so much difference with land in a high state of cultivation as with poor land. The expenditure has decreased in the way of rent, as I have told you, by 288*l.*, and by 10*l.* in the matter of rates.

Labour.

44,599. (*Sir Nigel Kingscote.*) May we ask about the labour?—The labour is practically the same as it has been all through. The labour is the thing which is beating farmers of this description more than the rent. The labour bill is about 1,000*l.* a year, and that is the same as it was formerly, but in the meanwhile improvements in the way of machinery and appliances have been going on all the time. Fifty acres of land have been laid down by myself to grass, 80 acres of arable land have been changed from the four-course system to the five-course, which involves less labour, clover being left down for two years. Then a good many of the old permanent improvements were done by the ordinary labour of the farm in the days past; they have been completed and finished, and no new undertakings have been entered into lately. Therefore, the labour has really very much increased if you look at all those circumstances, although it is nominally the same. Other improvements, such as shearing machinery, water pumping appliances, self-binders, and straw trussers, have all come in within the last 10 or 12 years, and they are all labour-saving machines.

44,600. Yet the total wages has not decreased?—The total has not decreased; if anything it is a little more; it is inclined to increase if anything.

44,601. Do you consider your labour as efficient now as it used to be?—No. The amount of work done is very much less, and that, of course, is the cause of the labour bill not going down in spite of all these appliances. The amount of work done is less, as the labourers do not work as they used to do. No doubt it is an advantage to them, but, of course, it adds to the expenses of the farm.

Wages.

44,602. What are your wages?—Nominally they are 13*s.* a week for ordinary men; 15*s.* a week for waggoners, up to 18*s.*; and 20*s.* for stockmen. I think the ordinary labourer comes out at about 16*s.*, and the other at about 18*s.* I think Mr. Little had all the figures supplied to him, and they came out somewhere about that.

44,603. Is there anything else you wish to say as regards the actual farm?—I might say, with reference to the expenditure, that I see no means of decreasing it without altering the system.

44,604. (*Mr. Little.*) Did you add up the whole of your expenditure?—I did not give you that—I have not drawn it up in full.

Income and expenditure.

44,605. Would you say there has been no corresponding reduction in expenditure, to meet the great decrease of income?—There has not. The labour and the rent are the two principal outgoing sums. The labour has not decreased at all, and the rent and the rates have only decreased 300*l.*; so that the rent is not so great a factor in preventing profits as the labour is. Of course there is some decrease in the value of manures and cakes.

44,606. (*Sir Nigel Kingscote.*) And foreign feeding stuffs?—Yes. Tradesmen's bills, however, have increased, although the labour bill is the same; because all these machines require repairing and so on. It is a great advantage to the labourer to have the same wages with the less laborious work, which is brought about by the introduction of all this machinery; and then he has the advantage of getting his food and other commodities at a cheaper rate, which you may take as an addition of 30 per cent. to his wages where the wages remain the same. The landlord appears to be

Mr. J. B. Jones. 29 Mar. 1895.

affected to the extent of 22½ per cent. in my case, and very much more in many other cases. The farmer, between the two, is left without anything at all. That is about the position we are in now.

44,607. You are a member of the Shropshire Chamber of Agriculture, are you not?—Yes, I am.

44,608. And you are on the county council?—Yes; I am.

44,609. (*Mr. Little.*) Are you not vice-chairman of the county council?—Yes; I am.

Report of the Shropshire Chamber of Agriculture.

44,610. (*Sir Nigel Kingscote.*) I think your Chamber of Agriculture took evidence, did it not, or gathered evidence, as to agricultural depression?—There was a joint committee appointed by the county council and the Chamber of Agriculture.

44,611. Were you on that committee?—Yes; I was.

44,612. Were you chairman of it?—No; I was not. But the chairman has been here before you.

44,613. (*Mr. Little.*) Mr. Lander was the chairman, was he not?—Yes.

44,614. (*Sir Nigel Kingscote.*) Do you wish to say anything upon the evidence which was laid before that joint committee?—As far as I am aware, the statements put forward in the joint report, which has been handed in to the Commission, are accurate as far as facts go as a description of the farming of the county. (*See* Appendix A. I.) Of course, the individuals who sent the replies are responsible for the replies; but I think those replies indicate a feeling that I have heard expressed in agricultural circles pretty freely.

44,615. Do you think they indicate the general feeling of the tenant farmers and of those who carry on agriculture in your county?—Yes, I think so. Of course, one or two of the statements, such as the one about land courts, would not be generally accepted; but I think the general summary of the replies indicates pretty accurately the feeling of agriculturists—of farmers and of landowners also—in the county.

Local rates.

44,616. Now as to the local rates; I gathered that your own rates have rather decreased; but do you wish to say anything upon the change in the local rates in your own district with regard to the Atcham Union?—Yes. It is a subject which is creating a good deal of interest throughout the country now, and in our county also. The feeling is that rates are becoming higher every day, but my experience tells me that they have not increased in the last 25 or 30 years. Of course, I am perfectly aware that the land is less able to bear the amount of rates if they are the same as they formerly were, than it was in years gone by; that goes without saying. When the income is reduced, the capability of the medium producing the income to bear the strain is less; and it is a fact that the proportionate burden of the rates is greater now than it was in the years gone by as compared with the capability of the land to bear it. I have a statement here with regard to the county rates, which shows pretty much that the money which was granted to local taxation by Mr. Goschen in his last Budget, I think, under the Local Government Act of 1888, is pretty much absorbed as far as the county of Salop is concerned. The whole of the money which was given us, which has not been handed over to the other authorities, that is the poor law authorities in Shropshire, is absorbed, and an extra sum of something like 18,000*l.* is required for the main roads.

44,617. (*Mr. Little.*) 18,000*l.* in addition to the old subvention?—No; 7,500*l.* in addition to the old subvention. The 18,000*l.* is the sum altogether.

44,618. (*Mr. Dalton.*) Has your general county rate for general county purposes increased?—Our general county rate was increased last year by a penny.

44,619. Are you referring to 1893–94; I see that in 1892–93 it was low?—For the year ending March 1895 it was increased by a penny, and at the same time we allocated 3,000*l.* from the technical instruction money, which is another halfpenny. That is 1½*d.* in the £ increase over the last year.

44,620. What was the rate altogether in 1894 for general county purposes?—It was 2*d.* in the year ending March 1895.

44,621. And it was 2*d.* in the year after the passing of the Local Government Act, was it not?—Yes, that is quite true.

44,622. Then it fell to a halfpenny. I suppose that was owing to the year's requirements being irregular, and because you did not know what you were about to receive. The next year it went to 2¼*d.*, and then fell in 1892–93 to 1¾*d.*?—I will read you how it ran exactly. Before the Act came into force, that is, up to 1889, the average rates in the £ for the 10 years ending March 1889, after which the Local Government Act took effect, was $3\frac{21}{40}d.$

Mr. J. B. Jones. 29 Mar. 1895.

44,623. That is for all purposes?—Yes, the old quarter session rates. The average of the rates in the £ for the six years ending March 1889, after which the Local Government Act, 1888, took effect, was $4\frac{1}{12}d.$; the average of the rates in the £ for the six years ending March 1895, that is, since the Local Government Act came in operation, was $4\frac{5}{24}d.$ So there is a slight increase in the rates, but that increase, I think, is more marked now than it was just after the passing of the Act. The reason for that is that the quarter sessions cleared up all the arrears by a halfpenny rate in 1889. I think it was in that year they had an extra halfpenny rate; and, further, many of the charges under the Local Government Act were not paid for the first year or the first two years after the passing of the Act. The main roads, for instance, did not come into the first year; the highway board sent their returns in, but they were not paid until the second year, and some portions of them not until the third year.

44,624. (*Mr. Little.*) Did you find a disposition on the part of the county council to spend the balance, or to draw upon it?—What balance?

44,625. The balance that was carried over?—The balance from the Exchequer Contribution Fund?

44,626. No, I do not mean that. The quarter sessions at the end of every year made up their accounts, showing that there was a certain balance in the treasurer's hands, which in some cases was considerable. I was asking whether your attention had been drawn to that balance, and whether there was a disposition on the part of the county council to spend it or to reduce it?—I do not think I have observed that.

44,627. (*Mr. Dalton.*) The general result has been, has it not, that the county rate has risen to the extent of one penny?—The county rate has risen; but it is only fair that I should point out at the same time that the poor law authorities have received something like 2*d.*, as, I think, I estimated it some time ago—I think our financial treasurer has brought it out to about 1¾*d.*—and the highway boards have also received something like ¾*d.* in the £.

44,628. If you deduct the gains from the losses, you have still got a gain; you have risen a penny in the county rate, but you have saved more than 2*d.* on the poor rate by the subventions, and a penny on the highway rate?—Quite so. We ought, according to that, to have reduced our rates for all purposes in the county 2*d.* in the £; but I do not say that that is the case, because the highway expenditure may have increased and the poor law expenditure may have increased in the county, although it has not in my union.

Treasury subventions.

44,629. You have had a benefit from Mr. Goschen's subventions, I suppose?—Undoubtedly; but, unfortunately, the tendency is for increased charges to come upon us. The balance that we hand over from the Exchequer contribution fund for general county purposes is 24,000*l.*; that 24,000*l.* was estimated when the Local Government Act was passed to be sufficient to defray the expenses of the main roads, and was on paper sufficient with a probable surplus remaining to be divided—I do not quite remember how, but between the quarter sessions boroughs and other authorities, I think. Instead of that 24,000*l.* being more than sufficient to pay our main roads, it is not enough, for our main roads now come to 36,000*l.*, that is 12,000*l.* more. Of course the quarter sessions had to pay something towards the main roads, so it is reduced again by that amount; but we have had to levy a general county rate for main roads, both in the borough and in the county, instead of that money being sufficient to defray the charges. There is one other circumstance I should like to draw the attention of this Commission to, because there is no doubt the land is less able, as I say, to bear these charges than it was formerly; that money has gone, and I have been trying to discover where it has disappeared to——

44,630. (*Sir Nigel Kingscote.*) Is this your 24,000*l.* you are speaking of?—This is our 24,000*l.*, which I say ought to cover our general county account, according to the intention of the Act. It has gone in roads to the extent of 7,500*l.* more than the quarter sessions paid

Mr. J. B. Jones. 29 Mar. 1895.

before—that is 1½*d.* in the £; it has gone in extra police expenses, 1,600*l.*—that is a ¼*d.* in the £; it has gone in salaries and printing and to the small boroughs, of which we have three in the county, to the extent of 2,500*l.*—that is $\frac{7}{16}$ths of a 1*d.* in the £. These figures give a total of very nearly 2*d.* in the £—really a total of $1\frac{1}{16}\frac{3}{16}d.$ If agriculture is to get anything in the way of relief from the rates, I contend that an arrangement ought to be made so that this relief should go to the land and not go partly to the general ratepayers, and be absorbed more by the towns than by the country. In our case, it is true, the large boroughs are rated to the general county purposes and to the roads; but still, although the large boroughs have not gained much on account of being rated, the small boroughs have gained to the extent of 1,000*l.* a year in our county, and consequently they have got that much more than their portion from the agricultural portion of the county.

44,631. Do you think it ought to be applied entirely to the land?—Yes; any relief from local taxation now—going on to the general question—ought to be applied as much as possible to the land.

Poor rate.

44,632. Is there much difference in the expenditure of the different unions?—No, there is not much there. Our administration has been pretty strict and pretty good, and our rates have not increased up to the present. For poor law purposes alone, our rate in the £ is now 4·8*d.*; our rate in the £, before the Local Government Act of 1888 came into force as far as the subventions to the poor law are concerned, was 6·1*d.* for poor law purposes only. In 1889 it was 6·1*d.*, in 1890 it was 4·8*d.* (there is where the grants come in), in 1891 it was 4·9*d.*, in 1892 it was 5*d.*, in 1893 it was 4·7*d.*, and in 1894 it was 4·8*d.* So, you see, there has, not been any increase in the poor rates there.

44,633. I suppose that would be one of the lowest poor rates in England, would it not?—I expect so.

44,634. (*Mr. Everett.*) It is a very famous union for its management, and has been so proverbially, has it not?—It has been managed on the same principle for 50 years, and they have not changed their chairman very often. They have till now worked on the same basis, and I hope they will continue to do so in the future.

44,635. (*Mr. Little.*) You have been chairman, have you not?—I have been chairman for 10 years, but I threw it up when this new rural council came into operation. They were good enough to ask me to go on, but I found I had not the time for it.

44,636. (*Mr. Whitehead.*) I think no outdoor relief is given in the union?—We have considered every case on its merits and restricted our outdoor relief in every way that we could with fairness to the poor. There has been strict administration there no doubt.

44,637. (*Mr. Dalton.*) You have not tied yourselves by cast-iron rules; you have examined into each case?—Certainly.

44,638. (*Sir Nigel Kingscote.*) You have not dropped out-door relief?—No.

44,639. But you have minimised it as much as possible?—Yes. I should like to put in here an extract from the general report by Mr. Little to the Royal Commission on Labour, which gives some interesting information as to the price of commodities. I have added the corresponding figures for 1892–94. On page 162 of his report Mr. Little says:—

The average prices paid at Atcham for several articles of general consumption during the four periods of eight years each between 1860 and 1891 were as follows:—

	Average Price (in Pence and Decimals).				
	1860–1867.	1868–1875.	1876–1883.	1884–1891.	1892–1894.
	d.	*d.*	*d.*	*d.*	*d.*
Flour, per stone	25·31	24·50	16·42	15·37	12·75
Mutton, per lb.	6·75	7·34	7·34	6·12	5·33
Butter	13·20	14·87	14·00	11·00	10·78
Cheese	4·13	4·27	4·12	3·20	3·88
Tea	31·63	23·00	18·25	16·06	15·33
Sugar	4·09	3·20	2·29	1·71	1·82

Mr. J. B. Jones. 29 Mar. 1895.

The comparative value of these articles consumed by one adult male per week at different periods was as follows:—

Week's consumption.	1860–1867.	1868–1875.	1876–1883.	1884–1891.	1892–1894.
	d.	*d.*	*d.*	*d.*	*d.*
Flour, 1¼ stone	31·64	30·62	20·52	19·21	15·94
Mutton, 6 lbs.	40·50	44·04	41·04	36·72	31·98
Butter, ¾ lb.	6·60	7·43	7·00	5·50	5·39
Cheese, 1 lb.	4·13	4·27	4·12	3·20	3·88
Tea, ¼ lb.	3·95	2·88	2·28	2·00	1·91
Sugar, 1 lb.	4·09	3·20	2·29	1·71	1·82
	90·91	92·44	80·25	68·34	63·92
Ratio to first period of eight years	100·	101·68	88·27	75·17	70·31
If 2*s.* be added for lodging the totals will be	24·	24·	24·	24·	24·
	114·91	116·44	104·25	92·34	87·92
Ratio to first eight years	100·	101·33	90·72	80·36	76·51

Technical education.

44,640. Now I will ask you a little about technical education; what have you done in your county as regards technical education?—The money that was allotted under the Customs and Excise Act has been used for the purpose of technical education until last year, when one half of it, 3,000*l.*, was voted away to the rates by the council.

44,641. In what way did you apply it?—We have applied it by giving instruction through dairy classes, and also through evening classes which have been formed by union committees.

44,462. What have they taught?—They can take any subject they like; in some cases they have taken up woodcarving and carpentry, for instance.

44,643. Is there any teaching for the labourers on such subjects as hedging and thatching, say?—We have tried that. I was chairman of the technical education committee at first, and I endeavoured to induce the farmers to work in that direction. We got the sanction of the Education Department to that instruction being given, as it was not on the list at first. But the attempts have been failures in each case. We have tried instruction in ploughing and hedging and ditching in four or five centres in the county and they have turned out fiascoes; the labourers do not care about them and will not attend them.

Dairy instruction.

44,644. As regards the dairy instruction, has that been successful?—The dairy instruction has been pretty successful, I think. The classes in butter-making have been fairly attended, and in the northern part of the county, where cheese instruction has been imparted, I believe, advantage has been taken of it by the farmers in the district.

44,645. Has your dairy teaching been peripatetic or have you had different centres?—Butter classes have been established in different unions—one in each union in the county each year, and in the most convenient centre for that union.

44,646. Is that going on now at all?—This year we have discontinued the butter classes; there is no demand for them. Another portion of the money is expended in lectures on practical subjects. There is one lecturer on practical veterinary subjects. I think it is called "Stock Management." His lectures are very popular. The lecturer is an able man, and he imparts his information in language intelligible to the country community. His lectures are well attended. In my own district I found that all the labourers and small farmers attended the lectures and took great interest in them. There is also a set of lectures conducted in practical gardening by a Kent man, whom Mr. Whitehead knows very well by reputation, and they are very popular. I believe he is very successful in his lectures, and has done a great deal of good. Another portion of the money is devoted to female technical instruction, which is worked under a joint committee formed of the technical instruction committee and a ladies' committee. Altogether I do not think technical education has been by any means

Mr. J. B. Jones. 29 Mar. 1895.

popular in Shropshire. I am not chairman of the committee now; I took the finance committee when we made some changes instead of the technical committee; but I am still on the committee, and I take a great deal of interest in it. Those who have been working in the matter have not been supported by the general body certainly of the farmers in Shropshire. The farmers do not like it at all. They do not believe in it. The commercial parts of the county which have their share of the money take it up much more warmly than the agricultural classes.

Condition of agriculture.

44,647. (*Mr. Little.*) You have expressed your general concurrence in the statement of facts reported by the joint committee of the county council and the Chamber of Agriculture; generally the statement was that farming was very unprofitable?—Undoubtedly it is.

44,648. May I ask—do not answer it if you do not wish—whether you have found it so in your own case?—Personally, if it had not been for the pedigree stock I should have been a very much heavier loser than I am now. The last few years, even in my class of business, there has been a great falling off, and the returns from that source have been very much less.

44,649. Have other farmers been losing money?—During the last few years I have certainly lost very heavily, and I believe that most other farmers are in a similar position, except perhaps those who employ no labour but their own, and their children's, and who consequently save a large labour bill. But if you debited the farm with what their labour is worth in other directions, they would be equally heavy losers.

44,650. They would find it equally unprofitable?—Yes.

44,651. These people slave for a very small reward, do they not?—They work very hard, and perhaps they just live out of it.

Small holdings.

44,652. Is there still a demand for those small holdings or do the young people go away?—I do not think the demand is so great, as far as I can see, as it was formerly. The small holder now I think is aware that he can find a better market for his labour from someone else than from himself.

44,653. The children of these small holders then probably gradually learn that they can do better than by stopping at home?—I should think that in the course of time they will discover that.

44,654. If they were paid wages the thing could hardly be carried on?—It could not. Small holdings are of no use, unless the occupier is in receipt of wages. A man cannot live on three acres and a cow. I heard of a remark, which is to the point, made of a person who had taken one of these small holdings in my neighbourhood a few weeks ago. A fellow labourer said; "Well, "Richard finds now that instead of the cow keeping "him in his holding, he has got to keep the cow."

Report of Shropshire Chamber of Agriculture.

44,655. The joint committee of the county council and the Chamber of Agriculture did not draw up a report expressing an opinion, they only reported facts?—They did not draw up any report except the one which has been put in, and which does not express an opinion on their part.

44,656. It sets out the facts which they collected, and the opinions on many subjects which had been expressed, but the committee as a committee did not consider the whole question and agree upon a report?—They did not. They brought this report before the council, and the council agreed that they would not discuss it, but would simply record the facts, and let them be used in any direction which was thought desirable.

44,657. You are aware, I believe, that Mr. Lander, the chairman of the committee, has been before this Commission?—Yes, I know he has been.

44,658. He expressed his own views on many subjects which arise out of that report, I do not know whether you have seen his evidence?—I have not.

44,659. Probably you know his general views on the subject of landlord and tenant?—Yes, I think I have heard him at public discussions express them.

44,660. Are you in accord with him generally?—I think on most points I am.

Appointment of arbitrators.

44,961. Are you aware that he proposes that arbitrators should be appointed for each district by some local authority, would you concur in that?—I should say the county council should appoint the arbitrators or the Board of Agriculture.

44,662. For arbitrations under the Agricultural Holdings Act?—I think if the county councils nominated the arbitrators that would be sufficient.

Mr. J. B. Jones. 29 Mar. 1895.

44,663. A certain number of them?—Yes.

44,664. You are aware that they could not nominate a member of the county council?—Yes.

44,665. That they would be limited in their nomination to those who were not members of the council?—I suppose so.

44,666. Do you not think that is rather an unfair limitation?—I do not think the limitation would prevent good men being found.

Powers of arbitrators.

44,667. Then Mr. Lander proposed to give these arbitrators very considerable powers beyond those at present arising from the Agricultural Holdings Act, he would empower these arbitrators to decide whether a tenant should be allowed to make improvements that are considered first class, would you approve of that?—With regard to first class improvements and permanent improvements, I have no objection to a tenant making them, subject to a reference under the Act instead of with the permission of the landlord. I should approve of that. The reference under the Act would be to the arbitrators.

44,668. At the conclusion?—Yes, at the conclusion.

44,669. The arbitrators under the Act would decide whether the thing was an improvement and whether it was properly made and what it was worth?—Quite so.

44,670. Mr. Lander's idea was that a tenant who wished to make an improvement should go the official arbitrator if the landlord refused his consent, and the official arbitrator should say, "You shall be permitted to make it." Would that not rather interfere with the relations of landlord and tenant?—There is a slight difference between the two propositions made by Mr. Lander and myself, it is true, but not such a very great one; because under the present law a tenant could not make a permanent improvement at all without the consent of his landlord, and under my suggestion he would make it——

44,671. At his own risk?—At his own risk; and whether it was worth anything or not would be decided by the arbitrator at the termination of the tenancy.

44,672. According to Mr. Lander's suggestion he would have no risk, because the arbitrator would have determined beforehand that he was right in doing it?—Yes, except that if it was valuless at the end of the tenancy he would get nothing for it. I will illustrate what I mean by what I did two or three years ago myself. I put up a large Dutch barn and some sheep shedding. The owner of the property I farm had just come into his property, and had his legacy duties and different things to pay, and I knew I should have to wait four or five years anyhow before I could fairly ask him; so I thought I had better do it myself. If that is worth anything I have nothing in writing, but I am satisfied I shall get it allowed at my death or at the end of my time. If a tenant was allowed to do that with a reference under the Act, he would get the proper sum and no more. Of course my landlord might have come down and said, "No, I will not have "that old shed removed at all; I will not have this "put up." He could do that under the present state of the law.

44,673. You do not see any material difference between bringing in the arbitrator while a tenancy is continuing and bringing in the arbitrator to determine the question at the end of the tenancy?—The only difference I see is this, that under the present condition of the law a tenant could not put up anything without the consent of his landlord.

Compensation for improvements made without landlord's consent.

44,674. But you propose an alteration of the law which would give the tenant at his own risk power to erect and claim compensation?—Yes, I do; and I do not think it matters much whether he refers to the arbitrator before he does it or at the expiration of his tenancy.

44,675. I am only thinking of the possible ill-feeling which might be created between landlord and tenant if a landlord refuses consent, and then the arbitrator gives it against the landlord's wish?—I think my suggestion would be an easy way——

44,676. To legalise the claim?—To legalise the claim and to settle it at the end of the tenancy.

44,677. (*Mr. Dalton.*) I suppose if it was a very expensive improvement the tenant might reasonably

Mr. J. B. Jones. 29 Mar. 1895.

wish to know whether he was to be repaid for it or not before carrying it out; if it was an expenditure of a very large sum he would like to know beforehand that it was going to be treated as a permanent improvement?—I have no very great objection to that; but I think the other would be the most agreeable and pleasant way of deciding the matter. There would be less friction about it, I think.

Substituted compensation.

44,678. (*Mr. Little.*) Then Mr. Lander objected entirely to the small amount of freedom that was left to the contracting parties, and he objected to substituted compensation by agreement?—I differ from him there. I think, if you get an equivalent to the Act, you ought not to have a cast-iron rule to go by.

Notice to quit.

44,679. Then he also objected to the permissive agreement for six months' notice to quit. Do you believe it is desirable to do away with the permissive written agreement?—No, I do not attach very great importance to that, especially in these times. Of course I think for a high state of farming a longer notice is desirable; and that notice is required under the Act without the sanction of the contracting parties, is it not?

44,680. Yes, but a written agreement may make it six months?—I think the tenant has power to insist upon a 12 months' notice if he likes, and that is sufficient.

Compensation to sitting tenants.

44,681. Another point is that Mr. Lander is an advocate of compensation to the sitting tenant. Do you think that is feasible?—It is a very difficult subject. I certainly have known cases in the past of sitting tenants not being treated as well as they ought to have been treated, in cases where reductions of rent have been refused or where permanent improvements have not been put up at their request, and they have moved off their farms. The refusal to do these things has caused them to leave their farms, and then afterwards the farms have been let to people at lower rents, and the permanent improvements have been done. I have known that in many cases in my lifetime, and on very good estates, too. So I think the tenant should to some extent be protected in that direction.

44,682. Do you see a practical way of giving compensation to the sitting tenant, and if so, how would you propose to work it?—It is very difficult to lay any rule down, except where a rise of rent takes place. You might then say: "If you are going to raise my rent on "my own improvements, I want to be paid for those "improvements."

44,683. That would not deal with the class of cases which you spoke of, where a man desired a reduction of rent and could not get it?—No, it would not.

44,684. It is extremely difficult, is it not?—It is a very difficult question.

The Agricultural Holdings Act. "Inherent capabilities of the soil."

44,685. Then Mr. Lander and a good many others have a strong objection to a phrase in the Agricultural Holdings Act which you will recognise at once when I name it: "The inherent capabilities of the soil." Do you think it is possible to value improvements without taking that into account?—No. I think there is very little land in this country or in the world which cannot be worked out. If anything in the nature of the land causes an improvement in the crops, I do not see why the tenant should claim that.

44,686. You say there is very little land that cannot be worked out; but it can only be reduced to a certain condition; no man can absolutely exhaust it, can he?—He can impoverish it very much.

44,687. Sir John Lawes' opinion is that there is a standpoint beyond which you cannot lower it?—He can impoverish it very much.

44,688. He can impoverish it, but the land which has been growing wheat for 45 years in succession has been reduced to a normal standard, and is not reduced any further by continuous corn-growing, is it?—No.

44,689. Therefore, there is a point beyond which the worst tenant cannot impoverish?—I think the "inherent capabilities of the soil" is a vague phrase, but if there are any inherent capabilities they ought to belong to the landlord.

Free sale and cultivation.

44,690. Then Mr. Lander was in favour of giving by law to a tenant complete freedom of cultivation and sale of produce?—Yes, and I am in favour of that.

44,691. By law?—Yes.

44,692. In the case of existing tenancies?—Of course existing tenancies are governed by the contracts which have been already made. I do not think you can make such a thing retrospective.

Mr. J. B. Jones. 29 Mar. 1895.

44,693. Mr. Lander distinctly stated that he wished this to apply to cases where tenants had taken farms under a restrictive agreement, without any other revision of the term?—I do not think it is fair to make a law to apply retrospectively to anything, unless the State is prepared to give compensation.

44,694. If you give this freedom of cultivation and sale of produce, how would you protect the landlord from a scourging tenant?—I should modify what I said by allowing the landlord to retain power in the last year of the tenancy to prevent the free sale of produce. He could protect himself also by insisting that the land should be left perfectly clean at the end of the tenancy.

44,695. That is a protection on paper, but would it not fail where the tenant is bankrupt or reduced to a very low limit?—The landlord would take his corn crops and his hay. He could reserve that at the last year of the tenancy; I think that is quite necessary.

44,696. Do you think he could secure himself in that way?—He could secure himself at any rate as far as the crops are concerned. As to the cleanness of the land that would be a more difficult thing, and he would have to look after that year by year, of course; but if he looked to his estate he would very soon see if the land was getting foul, and he would caution his tenant.

44,697. Then with regard to compensation for manures, Mr. Lander was in favour of a fixed scale applicable to the whole country; do you think that is practicable?—Artificial manures?

Scale of compensation for manures.

44,698. Manures under the Act, including feeding stuffs?—No; I do not think you can make one rule for the whole of the kingdom.

44,699. It would depend very much upon the nature of the stock and the application of the manure and the time?—Quite so; whether it is fed on the land, whether the dung that is made from it is carted away, and a variety of things. I think you must take every case on its own merits.

Consumption of home-grown corn.

44,700. Would you be in favour of giving some compensation for home-grown corn?—Yes, certainly.

44,701. Would you extend the classes of animals by whom that corn was consumed so as to include horses?—Yes, I do not see why they should not be included; they are mostly on the farm.

44,702. Would you take all horses?—I should take all farmers' horses; all horses legitimately working for farmers.

44,703. All horses legitimately employed on the farm?—Yes.

Technical instructio

44,704. (*Mr. Whitehead.*) Speaking of Mr. Smith's lectures on fruit culture and gardening, to what class of persons are they directed?—To the industrial population almost entirely, I believe.

44,705. Not to the farmers?—Farmers probably join the classes, but the labourers and the gardeners form the larger proportion of them.

44,706. Have they been satisfactory and well attended?—They have been very well attended, and much appreciated, I believe.

44,707. The dairy lectures have not been satisfactory, I gather?—They have not been so satisfactory as I could have wished. They have not been attended so well as the stock and horticultural lectures, and we are not continuing them this year for that reason.

44,708. Not because you have not money enough on account of the allocations to county purposes?—No.

44,709. But because of the want of interest in them?—There is no great demand for them.

Pedigree stock.

44,710. You were speaking of the pedigree stock which you breed; has there been a falling off in the prices of pedigree stock?—Very considerably; both in Herefords and in the sheep that I am interested in, Shropshire sheep.

44,711. Is that owing to the depression in agriculture in this country, or to the want of competition in foreign countries?—I think it is owing to the two causes. The foreign demand has fallen off very greatly. The English farmers generally were stimulated by hearing of the high prices made of pedigree stock, so they rushed into pedigree breeding, without having the

Mr. J. B. Jones. 29 Mar. 1895.

same high class of animal that breeders who had paid every attention for years and years to it had in their pedigree stocks. The consequence was they flooded the market with inferior pedigree animals, and the home demand for good stock was diminished by this extra supply of indifferent stock, which was taken up by men who wanted cheap things and who would have cheap things.

44,712. The reputation of English pedigree stock has fallen off in foreign countries, has it not?—It is the money in America I think that has fallen off.

44,713. Has there been much exportation that you know of to Argentina?—There is a little exportation of Shropshire sheep and Herefords. We are not popular there; they are taking the shorthorns out more, and the Lincolns.

44,714. (*Sir Nigel Kingscote.*) Do many of yours go now?—Very few.

44,715. (*Mr. Whitehead.*) Are the Lincolnshire sheep going to Argentina?—The Lincolns are going there, and I have sent about a dozen Shropshires this year.

44,716. Are the Herefords popular in America?—No; they have had their boom, and it has died away. Whether it is the money that is scarce, or the breed that is not appreciated, I cannot say. I think the condition of their financial affairs has checked the American demand for our pedigree stock very much.

44,717. You would not say that the increase in the breeding of pedigree stock in this country would be a remedy for the depression in agriculture?—I am afraid not, although it has mitigated its severity in exceptional cases in the past.

44,718. Could it be adopted as a general remedial measure?—No, I think not.

Rates.

44,719. (*Mr. Dalton.*) You spoke of paying 73*l.* a year in rates for your farm last year, I think?—Yes.

44,720. Does that include the voluntary school rate?—Yes, that includes everything.

44,721. It comes to about 1*s.* 6*d.* in the £, I think?—Yes. My rates are especially low; that is due in a great measure to the management of the poor law union in which I live.

44,722. In Shropshire as a whole they would be low generally, would they not?—I think they are fairly low. My union embraces the borough of Shrewsbury; so you see we are urban as well as rural, and notwithstanding that our rates are low.

44,723. You think that if any relief is given to ocal taxation, it should go to the agricultural land and not to the towns?—I think the agricultural land should have a fuller share than it has received at present. I quite admit that the owners of real property, whether it is of houses or of land, are paying the local taxation where personalty escapes, but I say as between houses and land that land requires more consideration than the houses.

44,724. In urban districts, as a rule, the rates are of course very much higher than in rural districts?—Yes.

44,725. And have increased to a greater extent of late years?—It is true that in urban districts the rates are higher in the £, but they are very much smaller in proportion to the income derived by the people occupying houses as compared with the income derived by those occupying farms.

44,726. Take the majority of the population in an urban or a rural district—the working classes; the rent they pay for their houses is much lower in a rural district than it is in an urban; and the urban rates are a very great burden to that class of ratepayer, are they not?—Are you referring to the labouring population?

44,727. Yes; who form a very large proportion of the population?—In the country the labouring population do not pay rates as a rule.

44,728. They practically pay no rates, and they have a very low rent; but in an urban district they would pay a high rent, and that rent would be enhanced by the fact that there were high rates paid either by the owner or by themselves?—I am afraid I can hardly answer that question from personal experience, but I expect that large sections of cottage property in the towns are free from rates under the Commuting Act.

44,729. Not free from rates. The owner pays the commutation, but he no doubt takes care that he gets it back in his rent?—He may get it back in his rent, it is true; but they do not pay rates directly.

Mr. J. B. Jones. 29 Mar. 1895.

44,730. The rates are a great burden, you will admit, to places like the East End of London, or other places similarly situated?—I quite agree that rates fall unfairly, both on urban property and on real property; but I say the unfairness is more out of proportion on land than it is on houses; because the income derived from land is so very much smaller than that derived by people—tradespeople especially—occupying houses.

44,731. Have you any remedy to suggest?—My idea is, that land should be exempted from local rates entirely as land, but let the houses be charged. Land is really the raw material from which we produce the food required for the country. The food that is imported into this country is free from all taxation; and although I am a free trader, I think it is perfectly consistent with the tenets of free trade to raise such taxes for revenue purposes.

44,732. Take your own union. Would you exempt the land altogether from contributing, say, to the highway rate?—I would to all rates. I should allow the dwelling-house to be assessed; or perhaps it may be right to levy the rates in the same way that we do the sanitary rate—on one-fourth of the value of the land.

44,733. You would admit that the expenditure of the highway rate upon the roads adds to the value of the land, and that the land would be worth, in out-of-the-way places, very little without roads?—Then the highways are equally useful for the public.

44,734. I am not saying that the public should not contribute to them too; but I understood that your proposal was to exempt the land from them?—I would exempt the land and charge the farmhouses; or I would charge the land with one-fourth, which would, perhaps, be a more easy method of making the assessment. That would lighten the burden on land to the extent of three-fourths.

44,735. (*Captain Owen Thomas.*) Are you a landowner as well as a tenant farmer?—No, I am an occupying tenant.

44,736. You do not own land?—No, I have no landed property.

Fall in prices.

44,737. To what extent have the prices of agricultural produce fallen during the last 20 years?—They have fallen very largely. In the six years ending 1875, wheat was 50*s.*, barley 39*s.*, and oats 25*s.* a quarter; in the six years ending 1893, that is about 20 years later, wheat was 31*s.* 4*d.*, barley 27*s.*, and oats 18*s.* 6*d.*; in the present year, wheat is 20*s.*, barley, 21*s.* 8*d.*, and oats 13*s.* 9*d.* The fall in the 20 years I have estimated at 60 per cent. in the case of wheat, 49 per cent. in the case of barley, and 48 per cent. in the case of oats. The fall in meat is not so large as that, but it is very considerable. We have not statistics which will enable us to get at the fall in meat in the same way as we have in the case of cereals.

Reduction of rent.

44,738. Rents, of course, have not been reduced in proportion to the fall in prices in any case that you know of, I suppose?—Of course they have not been reduced 60 per cent., and 49 per cent., and 48 per cent. in the same way that the fall in particular cereals has occurred. But I do not think you should take simply the figures I have just given. You must take the whole produce of the farm, and see how much the diminution in the entire production is, and how much is the diminution of rent in order to see what the percentage should be. I could tell you that in respect to my own farm. I think in the last 20 years my returns have fallen 1,300*l.* a year, and my rent and rates have fallen only 300*l.*

44,739. You must have been making enormous profits 20 years ago?—No. I have been making very big losses lately.

Losses from farming.

44,740. How long will you go on making losses at the same rate that you are doing now?—I cannot go on making losses at the same rate as I am doing now, or else I shall be in the Bankruptcy Court in a few years. That is one of the unfortunate phases we are going through.

44,741. Are you satisfied with the reduction you have had in your rent?—No reduction of rent will recoup me for my losses during the last few years. If the rent was all taken off I should have done no good, that is the real position we are in now. You may naturally say, Why do you go on farming under

Mr. J. B. Jones. 29 Mar. 1895.

those conditions? But sentiment comes in. If I had given up farming shortly after the period I began, I should be very much better off now than I am. But when you have been born and bred on a place, and have lived in that place all your life, which is practically in my case a freehold, absolutely as good as a freehold, except for the rent I pay, it is rather hard to tear yourself away from your old surroundings, and your position, and your business, in which you have taken a delight. There the sentiment comes in. But there is no other solution of the matter in such cases as mine; I have but to go on longer under the same circumstances to be obliged to go.

44,742. (*Sir Nigel Kingscote.*) If you had to go out now, you would have to go out at a very great loss as regards the live stock?—Yes, quite so.

Labour.

44,743. (*Captain Owen Thomas.*) So land in future will pay no rent, and naturally, by what you say, farmers cannot go on, even if they can get the land for nothing?—The only other way in which I see that an alteration can be made in such cases as mine, that is, on large farms, is by the reduction of labour, which means a change of system. Labour is hurting us more than rent; there is no doubt about that. Personally, I have got a very good lot of labourers, and we have worked harmoniously together; the old ones have died, and their children have come on, and we have all worked together very well; but it is the labour bill that is eating up the profits of the farm more than the rent, and in a greater proportion than the rent.

44,744. Is it a greater proportion than the rent?—Yes, it is, because the rent has fallen 22½ per cent. and the labour has not fallen at all. In fact, the labour has risen in the sense that I showed you, namely, that labour-saving appliances have been brought into operation, and grass land has been laid down in addition.

Mr. J. B. Jones. 29 Mar. 1895.

Remedies.

44,745. Have you any remedies to propose for this depression?—No. I do not see any royal road which is practicable by which we can relieve agriculture, except the only hope one has that the natural operation of supply and demand will increase prices. It is the low prices that are killing us, of course. I do not think it is within the range of practical politics to impose any of those drastic remedies which are sometimes recommended, such as Protection; neither do I know that that would be good for the country itself, as a whole.

Tax on flour.

44,746. (*Sir Nigel Kingscote.*) Would you like to see a tax upon flour?—I think if you begin to tax one commodity you must go all through. I do not think it is within the range of practical politics.

Cattle disease.

44,747. As regards cattle disease, do you approve generally of the steps taken by the late Privy Council and now by the Board of Agriculture to stamp out disease?—Undoubtedly; the action of the Board of Agriculture supported by the Acts of Parliament which were passed some time ago has removed the disease from the country.

44,748. And that has been a very great boon?—A great advantage to the agricultural interest generally.

Marking of foreign meat.

44,749. (*Captain Owen Thomas.*) Are you in favour of marking foreign meat?—Yes.

44,750. (*Sir Nigel Kingscote.*) You would, I presume, in some way mark all foreign produce, margarine, for instance?—Yes, everything should be sold under its true designation.

44,751. (*Captain Owen Thomas.*) Have you any particular method to suggest for marking meat?—No, I think the most practical way to settle that matter is to have the meat sold in shops specially devoted to the sale of foreign meat, and to compel vendors of foreign meat to take out a licence to sell it.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Eighty-fifth Day.

Thursday, 4th April 1895.

PRESENT:

VISCOUNT COBHAM IN THE CHAIR.

Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, ESQ., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq. } *Assistant*
ALAN MACKINNON, Esq. } *Secretaries.*

Mr. MALCOLM JAMES ROWLEY DUNSTAN re-called and further examined.

Mr. M. J. R. Dunstan. 4 April 1895.

(*For previous evidence see page* 343.)

Farm schools.

44,752. (*Viscount Cobham.*) What kind of agricultural instruction would you give in the farm schools that you contemplate?—It would be a practical instruction. I rather agree with Mr. Druce, who, I believe, has given evidence before this Commission, as to the difference between farm schools and school farms, that is, as to the advisability of the farm school, and the inadvisability of the school farm. I would contemplate in a farm school a place where the teaching of farming is the chief point, and where the pupils are taken for a period varying from six months to two years, and are taught the whole business; the farm being conducted on business principles, not as a model farm, but as a business farm.

44,753. With a particular view to dairying, or to farming generally?—With a view to general agriculture; if necessary one could specialise in dairying.

Mr. M. J. R. Dunstan. 4 April 1895.

44,754. These schools, as I understand, would be intended chiefly for farmers' sons?—Yes. I would intend them to take the boys as they come from the agricultural continuation schools. The continuation schools would feed them, and the continuation schools, in their turn, would be fed by the elementary schools. I would consider these farm schools to be what you might call the end of that system; the education beginning in the elementary schools, passing through to the continuation schools, and then finally ending in the farm schools. They would deal with the class of small farmers, and, possibly, with labourers' sons.

44,755. Would the schools be within the reach of the agricultural labourers?—Yes; there would be scholarships, I suppose.

44,756. The ages of the pupils would be between 13 and 17, I think you have told us?—Yes.

Mr. M. J. R. Dunstan.
4 April 1895.

44,757. And the same education would be given to labourers' sons and to farmers' sons?—In that respect, it would be the same for both the labourers' and the small farmers' sons. I think the most important step is certainly the first one, namely, to give the boys, before they leave the elementary schools, some elementary notions of the principles of farming. I do not say that you should make the education there at all a final one; but simply that you should give a tendency to learn further to the boys, and that you should give them an interest in their future work. That I am sure can be done through the Education Department.

Agricultural education in Ireland.

44,758. Is the Irish system very much what you have been describing, in the main?—Yes, it is in the main. It consists in establishing in country districts, schools for which agriculture is, you might say, a definite subject, a necessary subject of education. Those schools are inspected by an inspector, who inspects as to the theoretical knowledge, and as to these schools a small farm of five or six acres is attached, he also takes the boys who have satisfied him in theoretical knowledge out on to the farm, and examines them in practical knowledge; and in that way arrives at some notion of the efficiency of the schools. Of course, in this country the number of small farms is nothing like the number of small farms in Ireland; so the system would have to be modified to meet the requirements of this country; but I think a certain course in the teaching of principles, which you might call elementary science, should be a necessary subject in the rural districts. I

Training of schoolmasters.

think the schoolmaster himself should be trained at the training schools, such as that which exists at the University College, Nottingham, where all subjects apparently are taught to the man who is going to be a country schoolmaster, except the subject in which his scholars are bound to be interested, namely, agriculture; and the schoolmaster goes out from the Training College with absolutely no knowledge whatever of the principles of farming.

44,759. Would you make the University Colleges generally available for farmers' sons?—Yes, for the higher class of farmers' sons. That would be the final part of the education of boys who began in the county grammar schools. I mean the endowed schools.

Instruction at Nottingham University College.

44,760. Does the Nottingham college provide this instruction?—Yes; we have a two years' course of instruction there for farmers' sons and such like. We have about 16 students now.

44,761. Wholly devoted to theory?—They are wholly devoted to theory for seven months in the year, and the other five months of the year are spent in practice; the students have to pass the remaining five months on a farm which is approved by us, and they have to show at the end of that time a certificate that they have passed the time in practical instruction.

44,762. Under what supervision are they during the time they are on the farm?—They are under general supervision by us, and under direct supervision by the farmer.

44,763. Have you passed a good many young men through this course?—Yes. This is the third year of its institution, and the numbers have been 10, 12, and now we have 16. We have scholars from Leicestershire, from Lincolnshire, and even from Cheshire.

Extension of the Nottinghamshire system.

44,764. Do you think this system can be further developed in your county?—Yes, it certainly can; the practical part of it can be more systematically developed. I am not entirely satisfied with the practical part of it now; but I hope, by the establishment of this dairy institute, we shall have an opportunity of enabling students to do their practical work under more personal supervision, and under closer supervision, than at the present time.

Theoretical and practical instruction.

44,765. Do you think that instruction is given to as many students as are likely to offer themselves?—I think the number of students who are offering themselves for next year is considerably in advance of the numbers we have now. The other counties are making scholarships tenable at University College. But I think it is a mistake in this University College to attempt to teach practice at the same time—by "at the same time" I mean on the same days—as the theory is taught. I think it is best to keep the theory distinct from the practice.

Agricultural colleges.

44,766. Do you think that the agricultural colleges and the Universities of Oxford and Cambridge should be reserved for the land-owning class and their sons?—The Universities of Oxford and Cambridge of course would deal with the higher classes, as Cirencester and Downton would. I think such colleges as Cirencester and Downton are for the best class, that is, for the class which can afford to pay the highest fees. The next class would be that reached by the university colleges and the schools with lower fees, and the other class would be reached by these farm schools. The fees with us are about 15*l.* a year.

Mr. M. J. R. Dunstan.
4 April 1895.

Scientific lectures to farmers.

44,767. Do you think anything can be done to instruct the older farmers in the scientific principles of agriculture?—I do not. I think one can talk to them, and one can explain some of the scientific truths, or one can tell them of them; but I do not think you can attempt to instruct them.

44,768. And, as I understand, lectures both for them and for the agricultural labourer have been proved to be useless?—They are of very little good indeed.

Dairy instruction.

44,769. Have you done much to train dairymaids?—In our travelling dairy schools we have trained, I think, about 500 young women in dairying; but whether these were all dairymaids I should not be prepared to say.

44,770. Still I suppose you would anticipate some improvement from the increased knowlege of dairying in all classes?—Undoubtedly.

Training schoolmasters.

44,771. You have dealt with the village schoolmaster, I think?—Yes. Of course it is in the training of the village schoolmaster where I advocate the difference. I think that in all these training colleges there should be distinct agricultural instruction given, which should form part of the instruction of the schoolmasters; so that if necessary they could reproduce it.

44,772. Did you point out in your previous evidence what should be the course of instruction for the elementary schoolmasters?—I did not.

44,773. Then will you give us a sketch of it?—I would very much go on the lines of Mr. Jenkins' report of some years ago, in which he states that the course should extend over three years, and that it should include a certain amount of teaching by agricultural lectures. I do not think that Mr. Jenkins did state what I certainly wish should be, namely, that those schoolmasters should pass a regulation period on a farm where they could see and learn the practical work. I would not have these teachers simply teach from a mere book knowledge.

44,774. (*Mr. Channing.*) What period would you take?—The schoolmaster takes three years for his training, and I would not take less than four, or five, or six months. I would take six months, say, for this agricultural instruction, passed, perhaps, in three different periods, but passed on a farm.

44,775. Six months out of the three years?—Yes.

44,776. (*Viscount Cobham.*) Wholly preliminary to his being a village schoolmaster?—Yes, in his training college course.

44,777. That would necessitate a considerable alteration, would it not, in the training college course?—Yes, it would; but those six months I have spoken of might be passed during the vacations. I think the vacation is from six to eight weeks.

44,778. Nothing of the sort is done at present, is it?—In Ireland it is.

44,779. Only in Ireland?—Yes. Teachers there go to the farm of Glasnevin, and they spend six weeks only there. I would recommend not one period of six weeks, but three periods of six weeks.

Administration of agricultural education.

44,780. Would you hand over the whole subject of agricultural education to a central body?—I should prefer it to be organised by a central body. The localities might of course be allowed to use their own discretion in the way in which they interpret it, but I think the organisation or the suggestions should be made from a central body.

44,781. And that some sort of general control should be exercised?—Certainly.

44,782. So as to secure some measure of uniformity?—Certainly.

Instruction in grammar schools.

44,783. Have you anything further to add on this subject?—I do not think anything has been said with regard to the teaching in grammar schools such as you get in places in our county, like Newark and Mansfield, which are country towns. Although these schools are attended by a great number of farmers' sons, there is not a single part of the curriculum which appeals directly to

Mr. M. J. R. Dunstan. 4 April 1895.

them at all I would suggest that in all those grammar schools there should be, we will say, an hour a week—that would be quite enough to give a certain amount of interest in the subject—devoted to a class of boys who are probably going to make their livelihood out of the land. That is what I am trying at three schools in our county. I send a lecturer only once a week who gives a lecture on general farming to those boys—there are about 12 or 14 in each school—who are going to make a living out of the land. I do not say that they get necessarily any education by it, but it gives them an interest in their future work, and it encourages them to pass on to some higher and more systematic course of instruction.

44,784. A good deal has been done in some grammar schools in this direction, has it not, but not in your county?—Not in our county at all. The farmers themselves have complained to me that their boys learn Latin and Greek, and Mathematics, and all the various subjects of an ordinary school education; but that they learn absolutely nothing bearing on their future life or on their present life.

44,785. Have the county councils offered no part of their grant to the grammar schools?—None whatever in our county.

44,786. Then the fault may be said partly to lie with them?—Partly, but I do not think that the head masters of the schools are very anxious for it. I think the head masters of most of our grammar schools have the belief that Latin and Greek are very good things for farmers' sons, as they are for the ordinary boy. I certainly think that you could get up a great deal more interest by teaching some more technical subject to such boys as require it. We have been approached by grammar schools, to aid science teaching in those schools, but not science teaching as bearing upon agriculture.

Training of schoolmasters.

44,787. (*Mr. Gilmour.*) How would you propose to fit the present parish schoolmaster for assisting this elementary training; what would be the best plan?—I should let him attend lectures on certain subjects at the nearest centre, and then insist on him spending a certain time on one of these so-called training farms, so as to be able to pick up a knowledge of the practice.

44,788. In England, generally, are the present schoolmasters to any extent interesting themselves for teaching elementary agriculture in their schools?—In the night schools they are to a certain extent, but in the day schools they are not at all.

44,789. It is not part of the routine I know, but are the teachers fitting themselves to teach these evening technical classes?—They are fitting themselves to teach, but very few of those who are fitting themselves, I think, intend to teach.

44,790. What use, then, do they intend to make of their knowledge?—I think, if I may be allowed to say so, that a great many of the elementary schoolmasters who attend these courses attend for the purpose of getting an extra certificate; whether they make use of that certificate or not, for the purpose of teaching is an open question, but there is a desire on the part of the elementary schoolmasters to get another certificate—it does not matter what it is.

44,791. But without the time spent practically on the farm as a finish, you do not consider that his going to these classes, at a University college, say, are of very much use to the parish schoolmaster?—I do not think they are useful to him for teaching. I do not think he could teach with the authority he would be able to claim if he went through a practical course.

Nottingham Agricultural College.

44,792. I think you have said that the fee for this Agricultural College at Nottingham was 15*l.*?—Yes.

44,793. What does that cover?—It covers a course of instruction in agriculture and agricultural chemistry, veterinary science, dairy instruction, agricultural economics, farm book-keeping, drawing, chemistry, mechanics, engineering, workshop practice in wood and iron, botany, zoology, and entomology.

44,794. How about the board of the students of that class?—They lodge in the town.

44,795. That is their own look-out?—Yes, it comes to about 14*s.* or 15*s.* a week.

44,796. Do they remain with you about three years?—Two years.

44,797. (*Mr. Clay.*) I think your idea of teaching the agricultural young man is to have more of the practical than of the theoretical?—Yes.

Mr. M. J. R. Dunstan. 4 April 1895.

Theoretical and practical training.

44,798–9. Although there is not a farm actually belonging to the Cirencester college, would you think that the pupils in that college who have the liberty to go over a farm which is managed, and well managed, by Messrs. Swanwick—I think that is the name—would you think that such a farm would meet your views as a practical training ground?—As far as Cirencester is concerned it would meet my views, certainly. I think that is all that is necessary there.

44,800. It has often struck us in Scotland that wherever there is an agricultural college, there should be connected with that college a farm where the lads could go out and see practical farm work, and perhaps work upon it; would that be on the same line?—Yes, but I am not altogether in favour in University Colleges of mixing up the practical with the theoretical work in a course of instruction. I should prefer that they should either do their practical work before they come to us, or else in the vacations while they are with us, or else after they leave us. I think, if I understand you rightly, you mean to have a farm, we will say, quite close to the college, where the students would go out, perhaps in the morning and do work on the farm, and then come back to the college and hear lectures in the afternoon, and such like.

44,801. That is my idea, so that you could combine the theoretical and the practical together?—I do not know what your experience is, but I find that if boys have been at work all the morning, when they come back to lectures in the afternoon they are not, as a rule, very attentive; and that a hard morning's work usually makes boys unfit to receive theoretical instruction in the afternoon, or *vice versâ*.

44,802. You may take the theoretical work in the morning, when they are wide awake, and go to the farm in the afternoon?—I think it is the mixture of the two which is not satisfactory. I think it is better to keep them distinct, and to do the one at one time and the other at another time.

44,803. Do you think that would not be a waste of time in a person's life?—I do not think so; the same time is spent either way, and it is only a matter of detail in what order it is taken. According to one plan, you mix the theoretical and practical on the same day; but, according to my plan, you would do it at two different periods of the year.

44,804. At what period would you teach the theoretical?—We will say, take the theoretical course one year in the winter and the next year in the summer, and the practical course one year in the summer and the next year in the winter.

Instruction in Canada.

44,805. Have you had any experience on some of the Canadian farms?—I have had no experience except from reading accounts of them.

44,806. You have not been there?—I have not yet been there; I am hoping to go there some year.

44,807. Do you know that there the combination of the theoretical and the practical is very successfully carried out?—Yes.

44,808. Do you know that the boys there, many of them belonging to the poorer class, get a certain wage for the piece-work that they do?—Yes; and the same in France.

44,809. (*Viscount Cobham.*) As I gather, the main argument in favour of the system you recommend is that it would be much more easily carried out?—Yes, it would be much more easily carried out. The organisation is very difficult. I know it is done with a lower class of instruction, and I would advocate it where you would give the boys perhaps an hour a day at their books, and then let them spend the rest of the day in practical work; but in a longer course I would not recommend it.

44,810. (*Mr. Clay.*) The system in Canada has turned out very good men, who, if they had not been paid for their actual practice, would not have been able to put down the fees for their theoretical training?—I can quite see that.

44,811. That may be a great advantage for the people who are working up?—Quite so.

Instruction in Denmark.

44,812. Do you think that could be carried out here?—I am not prepared to adopt that plan. I am rather of the Danish opinion. In Denmark they never mix up the practical and the theoretical; they have tried it, but they have found that it does not work. If you have a practical farm which is worked by students, you

Mr. M. J. R. Dunstan. 4 April 1895.

are either under-manned or over-manned, they say; you have either got too many students to do the labour of the farm or else you have got too few. It is very seldom you get exactly the right number. Out of all the agricultural institutions in Denmark there is, I believe, only one where the students do the practical work.

44,813. In your experience, do you find the night schools have been doing much good?—Yes, they have in our county, certainly.

44,814. Do they combine the practical with the theoretical there?—We combine the practical work in the ordinary farming operations, such as hedging, thatching, and ditching.

44,815. Would you say there is no doubt that this technical education will bring young farming lads forward, where otherwise they would never have a chance?—I certainly think so.

44,816. (*Mr. Gilmour.*) In your experience, do you consider that these students, who come to you having had practical experience first, ultimately do better; or is it better that they should come and get theoretical instruction first, and then go and get their practical knowledge?—Undoubtedly they are better when they have the practical knowledge first.

Experimental plots for schools.

44,817. (*Mr. Channing.*) Do I understand you to say in regard to the teaching in elementary schools, that you consider a plot of land for experimental work for the boys, necessary or not?—For experimental work I do not think so, but for demonstration work I do.

44,818. Do you think that can be satisfactorily carried on?—I think it could be. They have started it, I believe, in Surrey, and I am starting it in my own county myself in connexion with these district schools. We have a plot of land there, and I give a strip to each of the scholars who has to keep it clean, and to prune the fruit trees on it, and who can grow what he likes underneath the trees.

44,819. That is, you give each boy a small allotment, as it were?—Yes, we just give him a plot and he cultivates that. He grows what he likes underneath the trees—under supervision; he is taught to prune the trees and to tend the small bush trees; and so that acts as a kind of demonstration garden to him.

44,820. You do not think that the teaching of the principles of agriculture with object lessons is sufficient then?—I should prefer some more definite object lesson added, but I do not know whether it is quite practical in the ordinary day schools to carry out such a scheme as you suggest.

44,821. Would you suggest carrying out such a scheme generally throughout the agricultural districts?—I should like to see such a scheme added certainly, but the difficulties are very great.

44,822. Do you think it could be carried out economically?—No, I do not think it could be.

44,823. It would be somewhat costly?—It would be costly certainly.

44,824. It would be if you carried it out in every agricultural village?—It would be very costly indeed then; so much would depend on the schoolmaster himself.

Instruction in rural schools.

44,825. Having regard to that, would you suggest any expansion of the scale of teaching in the code?—I would suggest that everything in the rural schools should have a bearing on farming—that the reading lessons and, as has been suggested over and over again, the pictures on the walls and everything else should have a bearing on farming.

44,826. Would you give more time to it in the whole curriculum in the elementary schools?—Yes, I would make it a necessary subject in the rural curriculum. Schoolmasters now will prefer to teach foreign geography to this elementary science, because they say they are sure of a grant in the one, and they are not in the other.

44,827. Would you enlarge the proportion of time given to agricultural subjects indirectly and directly?—Yes, I would, certainly.

44,828. I notice that you have said that you consider horticulture, and market gardening, and so on, quite suitable subjects, as well as the ordinary crops?—Quite. Of course, the Education Department have recognised that in their new Code.

44,829. About the teachers—I think you said six months out of the three years would be enough?—Three periods of six weeks, perhaps, I would modify it to.

Mr. M. J. R. Dunstan. 4 April 1895.

44,830. Would you select those according to the seasons of the year?—Yes.

Training schoolmasters.

44,831. So as to give the greatest amount of experience in the actual processes of agriculture, I suppose?—Yes, quite so.

44,832. Do you think that such a small amount as six months out of the three years would give the necessary practical experience?—I do not think it is really sufficient to give a thorough knowledge of it, but I think it is all we could expect the schoolmaster to give up out of his time. I think it is a compromise between what he should do and what we can do.

44,833. That is all you could get out of the three years?—I think it is all we could expect to get.

44,834. Taking the average schoolmaster, do you think he would be able to get out of that, the sort of instruction you contemplate?—Yes, at any rate very much better than he can at present from mere book learning.

Syllabus of Nottingham University College.

44,835. Are you laying before the Commission any syllabus of your new scheme?—This is the syllabus (*handing in syllabus*) of the University College, Nottingham, scheme. My own syllabus is out of print and is not yet reprinted, but I should be glad to lay copies before the Commission.

44,836. (*Viscount Cobham.*) I see that this deals with a good many subjects?—It deals with the whole of the subjects connected with agriculture. I will send you our scheme of county agricultural education if it is of any interest to the Commission.

44,837. I think we should like that?—That would include most of the suggestions that I have made before the Commission.

44,838. As I understand it, the syllabus you are going to put in is with reference to instruction at the farms of which you have been speaking?—Yes.

44,839. And that will be ready in time?—That will be ready in about four or five days. It has been before the Conference and I have the proof with me.

44,840. We shall be glad to have that, too?—I will send it.

44,841. (*Mr. Elton.*) I see you include in the syllabus botany; when you talk about the lectures to be given in the ordinary schools you are probably including botany in relation to agriculture?—Yes, we should include a general course.

44,842. Book-keeping also, I think you said?—Yes.

Agricultural book-keeping.

44,843. With a view to agriculture?—It would be agricultural book-keeping.

44,844. Of course that is very much required, because farmers do not keep accounts much?—That is so. They have some reasons for not keeping accounts. A farmer once said to me that he did not know that he would make any more profits if he did keep his accounts; he thought that he would be simply able to show that he had made a loss and would still make it.

44,845. As regards the teacher, learning how to keep agricultural books would be useful to him, whether he was engaged in a town or in the country?—Yes.

Training of schoolmasters.

44,846. Some of these other subjects—I only ask for information—would not be very useful to those who are going to be engaged in town schools?—I am speaking with regard to training colleges. Of course it would be optional for a man, when he joined a training college, to take agriculture or some other subject.

44,847. I thought they were all to learn it?—It might be quite optional, but, even in the case of a town schoolmaster, I think a little knowledge of agriculture would do him no harm, even if made compulsory.

44,848. Certainly not, but he has got to pay heavily for it in time; he has got to pay six months out of his three years?—Yes.

44,849. I suppose that more than half the masters in England would not be concerned with rural subjects when they came to the business of their lives?—That is rather a big proportion, I think; it is not quite half.

44,850. The town schools are more numerous than the country schools?—Yes, but there are so very many

Mr. M. J. R. Dunstan.
4 April 1895.

country schools. I should be inclined to make that an optional part of the course. I have not actually thought out that part of the subject, but it would be quite possible, I think, to work it into the scheme so that the town schoolmaster should not suffer.

44,851. I quite see that, and I thought you would say that, because it is obvious that there would have to be some provision made for that?—Quite so.

44,852. A man who had selected London for his career, and meant never to go outside the London Board Schools, would not find it of much good to him to know all about cornfield weeds?—No.

Instruction in rural schools.

44,853. Of course in the village schools a very large proportion of the scholars would never get to these subjects; they are very small children, and not many of them get into the higher standards?—They would never get into some of the subjects in which the schoolmaster had received instruction, but the schoolmaster would teach such a subject as elementary science, which would be agriculture or farming in another form; he would teach that in a day school as a compulsory subject, and he could bring much of his information to bear upon those teachings.

Training of schoolmistresses.

44,854. I think so; I think he could bring it down to the level of very small children?—Yes.

44,855. Do your remarks apply to schoolmistresses as well as to masters?—The schoolmistresses should also have agricultural training just as they have in the Belgian schools. There the schoolmistresses have a definite training; they are trained more in the womens' part of the work such as dairying and such things; I mean the women's part of the work.

Mansfield Grammar School.

44,856. You referred to the modern grammar schools and you mentioned Mansfield; you said apparently that there was no scientific instruction given in them bearing on agriculture?—That is so.

44,857. No botany, do you mean?—The connexion between botany and agriculture is never shown. There is no provision for any agricultural teaching there at all.

44,858. When I mentioned botany in connection with agriculture, of course I have in my mind chiefly the weeds?—Agricultural botany?

44,859. Yes?—There is none at all.

Newark Grammar School.

44,860–6. Newark, I suppose, is the same sort of place?—Newark again has just been re-constructed. It used to be one of the old Greek and Latin classical schools; now it has been taken over by a more go-a-head master, and he is converting it into a modern school.

Acquisition of experimental land

44,867. One of the great difficulties in your perfected scheme, of course, naturally, is the acquisition of land for experiment and demonstration?—Yes.

44,868. That difficulty was settled in Dublin by their finding the land in Glasnevin, which is close by?—Yes, and it settled itself in our county by founding this Dairy Institute Farm.

44,869. What is the case in Surrey?—It will have settled itself there at Wye.

44,870. Wye is not in Surrey?—No, but the Wye Agricultural College will do for that district.

44,871. At any rate that would be a county where there would be not much difficulty in getting land?—No difficulty, I should think.

44,872. You do not think there is a very pressing difficulty, but, of course, in any particular town you might have to go some distance outside?—Possibly.

Peripatetic teachers.

44,873. (*Mr. Channing.*) Have you seen the teaching of science by peripatetic teachers in Birmingham; are you acquainted with that?—No, I am not.

44,874. I was going to ask you whether some of the dangers which Mr. Elton has drawn your attention to would not be removed by having a more highly trained agricultural teacher who would go about from school to school?—It might well be done. The London School Board has been doing it in the same way; Mr. Gordon, I believe, has been employed by the London School Board. That method certainly would meet the case.

44,875. And perhaps in some respects would meet the difficulties of teachers who perhaps did not contemplate going in for agricultural subjects or going to agricultural districts?—Yes, it would meet their case well, and we should be inclined, if we were allowed, to do that ourselves now in the day schools.

Mr. M. J. R. Dunstan.
4 April 1895.

44,876. Are you encouraging that in your scheme now?—I should certainly encourage that peripatetic teaching, but of course our hands are tied with regard to the day schools, and we can do nothing with regard to them.

44,877. Do you think that it would work out well in practice in the elementary schools to have a teacher coming round once a week?—You would require to have a good number of teachers, because the schools are so widely scattered. I should think five teachers for our county would do the whole, or possibly fewer—possibly four teachers would work the whole county.

44,878. You would not have more than that?—It would be very much better to have more.

44,879. Would it be necessary to have a day a week for these subjects?—I should think four hours a week would be sufficient for these subjects.

Inspection.

44,880. (*Viscount Cobham.*) I forgot to ask you how you would provide for the necessary inspection and examination of the teaching?—That would be by a special inspector, just as Professor Carroll is now in Ireland; his special work is to inspect the agricultural part of the teaching.

44,881. Organised under the Central Department?—Yes; and inspected as the higher branches are inspected now.

44,882. Would the elementary schools be inspected also?—No. Our inspection at home is at present confined to higher education, and in the day schools the ordinary Government inspector takes all the subjects. For this subject I would have a man whose speciality is agriculture.

44,883. I think you are prepared to give us some evidence about Danish farming?—Yes.

44,884. You spent some time in Denmark, did you not?—Yes, I was about six or seven weeks altogether in the country.

Farming in Denmark, Sweden, and Norway.

44,885. And that time was devoted to investigating the subject of Danish farming?—Yes, I investigated the general systems of agricultural education in Denmark and in the south of Sweden and Norway, and generally the methods of farming there, as far as I could judge.

Co-operative butter-making. Description of system.

44,886. What is the system generally under which this large quantity of Danish butter is produced and exported?—Entirely co-operative. There are three systems of co-operative dairying—either the farmers themselves form the co-operation, which is of course a true co-operation, or else a limited company builds the factory, &c., or else a single individual does it. Of the three methods the only one that was really satisfactory was the co-operative principle.

44,887. Is that the system which prevails in Denmark chiefly?—Yes, it is.

44,888. And in the south of Sweden and Norway?—Yes, but not so much in Norway as in the south of Sweden.

44,889–90. Would you describe how it works?—A district is selected. The farmers round about who are cowkeepers are asked to co-operate. They meet together and arrange for the co-operation. Then a certain code of byelaws is drawn up and the capital is subscribed by the farmers themselves.

44,891. Without assistance from the State?—Yes. That is one of the most important parts, I think, of the co-operative principle, that the capital is supplied by the people directly interested in the concern.

44,892. Can you state what amount of capital is required for an average-sized district. What would an average-sized district be to begin with?—It would cover a radius of about three miles from the factory.

44,893. And what capital, roughly speaking, would be required for such a society?—About 500*l.* to 700*l.* will start the factory.

44,894. Would that capital be entirely required for the building and the equipment of the factory?—Yes, I think that is about the amount.

Mr. M. J. E. Dunstan.

4 April 1895.

44,895. Do the farmers send in their milk under strict regulations?—Yes. If the milk is sent in a dirty churn the farmer is fined. If the milk has a bad flavour he is fined again, and if there is any disease in his herd he is fined severely if he has not given notice of it.

44,896. If the milk is in any way below standard is it returned?—He is paid according to the quality.

44,897. Do they use up all the milk that is sent?—Yes, but the man only gets the money for the amount of cream or fat, as the case may be, which is contained in the milk.

44,898. The feeding of the cow is under strict regulations, is it not?—Yes, it is; certain foods are essential, and others are partially prohibited.

44,899. Do these regulations vary according to the districts?—Yes, they certainly do vary according to the districts. They vary within certain limits, but the whole tenor of them is about the same.

44,900. Can you say what that is?—As a rule, they require the use of a certain amount of the artificial food which one has in stock through the winter. I think in some factories one has to show that a pound of rape cake has been used per cow per day right through the winter, and the feeding of Kohl rabi and turnips is forbidden except under certain conditions, and if the milk is at all flavoured by them then the farmer has to lose by it.

44,901. Is rape cake the only cake allowed?—They use a certain amount of cotton cake, but rape cake is supposed to give a certain flavour to the butter. In connexion with some of the factories I visited some of the farmers who supplied the milk, and they informed me that they gave rape cake in order to flavour the butter.

44,902. Do you agree with that?—I certainly agree that in England the rape cake flavours the butter, but I do not think that is an advantage, according to my experience of rape cake.

44,903. Is there no artificial feeding during the spring and summer?—No. The three essentials, I think, for co-operative factories to be a success, are, first of all, that the farmers themselves who supply the milk should supply the capital; secondly, that the farmers who supply the milk should take back the separated milk; and, thirdly, that the milk should be paid for according to quality. I think unless you get those three conditions you are not likely to make co-operating dairying a success. I have had some experience of it myself, and we broke down at the first step, that is, the farmers did not see the necessity of the point of supplying the capital themselves, and of course if the farmers do not supply the capital themselves it becomes an outside trading concern, and you are merely trading with a capitalist.

44,904. The finding of the capital must be a considerable difficulty in any case?—It merely means a matter of about 1*l.* or 30*s.* per cow to a farmer.

44,905. It is done, at all events, by the Danish farmers, who are poor men as a rule?—Yes, it is done. The farms are of course very much smaller than ours, and the number of cattle kept are not quite so many, but undoubtedly they find the capital themselves.

44,906. The factory must be built and managed on strictly economical principles, must it not?—On the most economical principles.

44,907. (*Sir Nigel Kingscote.*) About what number of cows does each farmer keep?—They vary. I have come across farmers sending to the factory who have from one cow up to 50.

44,908. Fifty would be a large herd, would it not?—Yes, it would. I think the number varies between one and 50. The point of taking back the separated milk is an important one; that is where a good many factories which have been started in England have failed.

Use of separators.

44,909. (*Viscount Cobham.*) Is a separator of the best description always used in Denmark?—Yes. Curiously, although it is a Danish industry, and the Danes are not very good friends with the Swedes, they use almost entirely Swedish separators.

Character of dairying.

44,910. What is the character of the pasture and climate in Denmark, how does it compare with ours?—There is really no pasture in Denmark, there is no grass land in Denmark, it is entirely a system of arable dairying. I asked one of the greatest authorities in Denmark as to the character of the pasture, and Professor Segelcke compared the land of Denmark to the county of Norfolk. He was well acquainted with England and English farming, and he said Denmark to him resembled the county of Norfolk more than any other country in England.

Mr. M. J. E. Dunstan.

4 April 1895.

44,911. In point of climate?—In point of climate and of land.

44,912. There is very little dairy arable farming in Norfolk at present, I think, is there?—Very little indeed.

44,913. Do you agree with your informant that it may be introduced there?—I certainly think it might be introduced there.

Farmers' mode of life.

44,914. Did you actually live on any of these farms and see their mode of life?—I stayed at Dalum near Odense for a little time with a son of a small farmer, who was teaching at the Dalum school. He had been a farmer in his time when he was younger, and his father was still a farmer. I could see their mode of life. They do the whole work of the farm almost entirely themselves. The holdings are small, and the farmers and their families do the whole of the work.

44,915. Paying no wages?—Not a great deal of wages on the whole; but more wages of course in hay time.

44,916. I mean that they do not pay wages to their family?—No; the family simply live on the land.

44,917. Do they live comfortably?—Yes; according to continental ideas, they are very comfortable.

44,918. They seem to be fairly well to do at present?—They complained very much of the depression; but they certainly seemed very comfortably off. Of course the standard of living is not so high in Denmark as it is in England, and they are content perhaps with less.

Wages.

44,919. Have not the wages which they have to pay largely increased of late years?—Yes. These are the wages of agricultural labourers employed on the farms, according to the statistics I got in Zealand:—Young men from 15 to 30 years of age, who lived on the farms were paid from 10*l.* to 14*l.* a year, that included their food and everything. These young men generally live with the family in the farmhouses; whilst the older married men, who do not live in the house, are paid wages ranging from 10*d.* to 2*s.* per day according to the season, and are provided with food. The average size of a farm is about 30 hectares (75 acres), a farm of 60 hectares (150 acres) on good soil being reckoned large. There are, however, some farms in the best part of the country of from 600 to 1,500 acres. I saw a considerable number of farms of from 2½ to 50 acres.

44,920. I presume their profits have been somewhat cut down by the rise in wages?—Yes.

Competition with Danish butter.

44,921. Do you think there are other considerations likely to affect this great export trade?—What the Danes viewed with the greatest alarm was the increasing imports of Irish butter, they looked upon the Irish butter as their most serious competitor, I think.

44,922. Not Australian?—The Australian butter really was not being exported in very large quantities, when I was there two years ago. They looked upon the Irish butter as their chief competitor.

44,923. Do you think there is a somewhat narrow margin of profit then?—It is very narrow; if there was not a very large turn over in these factories, profits would vanish.

44,924. So that, if there is any large increase of the import of cheap butter from America, or the colonies, or Ireland, very likely the margin of profit might vanish and the trade disappear?—Yes, it is quite possible; it is so very near the border line now.

44,925. Do you think they have brought their system pretty nearly to perfection?—I think they have for their purposes, that is for export purposes.

Character of the cows.

44,926. Do you consider the cow could not be considerably improved for butter purposes?—Certainly; the animals can be improved very largely. The animals which they use in Denmark are principally related to the old Dutch breed, and are not heavy milkers or rich milkers. I think the system of feeding could be improved. I think even with the cows they have, they

Mr. M. J. R. Dunstan. 4 April 1895.

could, by an improved system of feeding—and Sir Henry Gilbert agrees with me on that point—get very much better results, especially if the milk is bought according to quality.

44,927. Are the farmers reluctant to give up a beef animal in favour of a milk animal?—I do not think you can call the Danish cow either a good beef animal or a good milking animal—that is, looking at it from the English standpoint.

44,928. Is it a compromise between the two?—It is a compromise. You never see those animals in England; they would not be kept in England.

Milk ratio.

44,929. How many gallons of milk are required to produce a lb. of butter?—From 3 to 3½ gallons.

Skim milk.

44,930. What is done with the skim milk, do they consume it themselves?—It all goes back to the farmers, and they feed their young stock with it—principally the pigs. There have been great complaints in Denmark from the medical officers of health in the various districts of the dearth of whole milk for children. That was quite an indirect effect of the butter industry, but it was the subject of very serious complaint at one time.

Quality of cultivation.

44,931. Is their land well-managed for their own purposes?—Yes, it is. They are very economical indeed in their farming. Of course all the cattle, as one sees elsewhere abroad, are tethered, and so the amount of grass that a cow consumes is what she eats.

44,932. Could you say that the condition of the land is high?—The condition of the land is fairly high. Not many artificial manures are used. The manure is principally the ordinary farm-yard manure. The farms I walked over were, as a general rule, clean, and in a good state of cultivation.

44,933. Is the land of a high quality, and well suited for this particular industry?—It varies much, from a strongish clay down to light heathy sand. Some of the places the soil is undoubtedly favourable for this kind of farming, but in others it does not seem to be.

System of cultivation.

44,934. How do they manage their crops?—They adopt the ordinary four-course shift, which they extend to six, and sometimes seven years; while the seeds promise to produce a fair plant, they leave it down; they do not plough up a crop of seeds unless they think they cannot get a good return out of it.

44,935. Do they consume most of the produce on the farm?—Yes.

44,936. Wheat?—Not a very great area of wheat is sown; it is principally barley, oats, and mangolds, and a lesser breadth besides—a very small quantity indeed—of white turnips and Kohl rabi.

44,937. They support themselves on the milking industry?—Entirely; the milking and the dairying industry is what they rely upon.

Cow-keeping.

44,938. (*Mr. Gilmour.*) How many cows do they consider to be necessary before they can start a factory and keep it going?—Not less than from 200 to 400.

44,939. Do you mean to say that they require the milk of that number, winter and summer?—Yes, to make sufficient butter to enable them to realise a decent profit.

44,940. Do the men, or the women, or both, do the milking there?—They both do the milking. The cows are very often milked in the fields.

44,941. Where do they get the sale for the pork that they raise?—In England.

44,942. Do you think they give any boiled food to their cows, or bean meal?—They give a certain quantity of bean meal, but I never saw any steamed food; of course I should not at the time I went; and I did not hear that they gave any.

44,943. (*Mr. Channing.*) Are there as many cows on the Danish farms as the land could carry, or more?—Quite as many as the land can carry.

44,944. Then it would be a benefit to the Danish children if we struck off some of the Danish butter coming into England?—Yes.

44,945. (*Mr. Everett.*) The Danish winter would be harder than ours, I suppose, would it not?—Yes, it is undoubtedly.

44,946. What do they do with their cows in the winter?—They are house-fed the whole winter.

Mr. M. J. R. Dunstan. 4 April 1895.

44,947–9. What do they keep them on in the winter?—They have a certain quantity of hay with their mangolds, and some purchased food. They pasture some of their seeds, and they cut the rest for hay and that does for the winter feed.

44,950. (*Viscount Cobham.*) They are tethered in the fields in summer only?—Yes.

44,951. As in the Channel Islands?—Yes. I believe the original reason for tethering them was the absence of hedges; but certainly it is a great economy of land. One of the farmers told me that an acre and a half, when a cow is not tethered, would not go further than an acre when she is tethered—that she tramples down and spoils at least half as much again as she eats.

Tenure.

44,952. (*Mr. Elton.*) Are the farms in Denmark that you were speaking of freehold or leasehold?—I think the smaller farms are generally leasehold.

44,953. Have they not got practical fixity of tenure there?—Yes.

44,954. They have got what amounts to a freehold, have they not?—Yes, it practically does amount to a freehold.

44,955. I think the subject was dealt with in a certain book called Consular Reports on Tenures of Land; and it came to this, that they had practically a freehold?—It comes practically to that.

Irish butter.

44,956. Will you tell me this about the Irish butter. Is there any particular reason given for the Irish butter suddenly developing the competition with Danish butter that you have heard of?—The reason that I have heard given why Irish butter has developed so largely is that it is principally owing to the efforts of the Munster Dairy School.

44,957. Do you know what class of butter they bring over; in the terms of the Cork Butter Market, is it Class 1 or Class 2, or Class 3, or Class 4?—"Firsts," they call it.

44,958. That is not the very best is it?—"Superfines," I think, is the best I saw in the Cork Butter Market last winter.

44,959. Did you not find them selling things there under fancy names which did not come into the first class?—Yes.

44,960. Then comes the first class which is very good; I think you will agree there?—Yes, it is.

44,961. And the seconds, not so good?—Yes; then you get I think very inferior qualities.

44,962. The seconds are bad, I think?—Yes, I think so.

44,963. The thirds, I think, when I was on the Commission there, was very bad, and the fourth class was used for adulterating margarine, or something of that sort?—Yes.

44,964. That was getting down to a point where it nearly cuts into the profit of the Danish butter?—I think it has done so, and they certainly think the same.

Character of soil in Denmark.

44,965. Then you told us about the soil of Denmark, the part you were in, I suppose, was the South?—I went right across Zealand and the two Islands.

44,966. Beech trees grow there and there is a chalk soil, I suppose, a tertiary soil?—Yes.

44,967. But when you get up further north you get into a worse sort of sandy soil, as you indicated?—Yes, you do—very poor soil.

44,968. Your answers would apply chiefly to the better soil in the south of the country, would they not;—I had an opportunity of going over some dairy farms in the north of the country and I did not find a great deal of difference in the conditions.

44,969. The land in the extreme north is very sandy, is it not?—Yes.

44,970. But there is no reason why there should not be good grass on it?—There is a fair growth of seeds there.

Pasture.

44,971. You said there was not much pasture; just go to the Frisian Islands, there is a very good pasture there, is there not?—I should not call it very good pasture.

44,972. Of course it is grown on the deposits from the sea?—Yes, I should call it a third class pasture.

Mr. M. J. R. Dunstan.

4 April 1895.

44,973. Would you say that it is more of a salt marsh?—Yes, I should not call it the best class of pasture for milking stock.

Farming in Sweden.

44,974. I am only bringing out your answers so that we may see what it is you saw in Denmark. As to Sweden you did not say much upon Sweden?—I did not investigate the factories in Sweden.

44,975. In the South of Sweden where it joins Denmark, I suppose, the system is much the same as the Danish?—From all I could hear it was; Malmoe was the nearest place I went to.

44,976. If you get at all up into the country you get to the hills and the forests?—Yes, but I did not investigate beyond the extreme South of Sweden.

44,977. Then you do not wish your evidence to go as far as Sweden?—No, certainly not. My knowledge of Sweden above the south part of it was a very cursory glance as I was going through up to Christiana.

44,978. In the North of Christiana there are pretty good farms are there not?—Yes.

44,979. Your answers would not apply really to Norway except some very special districts in the extreme South; because you said that in the districts you went into they require the separated milk to be returned, the feeding of the cows to be regulated, and that the factory should have a radius of about three miles, and of course that does not apply to the principle of the Norwegian system of keeping the cows on the mountains of that country?—It was simply to the Danish system that I meant those remarks to apply; the Norwegian system is of course quite different in the mountainous districts.

Farming in Norway.

44,980. You began by mentioning Norway, but we now know that in Norway the system would be quite different to that?—Yes.

44,981. Except in some very special circumstances?—That is so; it is a different country altogether.

44,982. You could get a little of that sort of dairying on the sides of one of the great arms of the sea where there was good steam communication?—Yes.

44,983. Otherwise not?—Certainly not in the interior.

44,984. I suppose Norway from a dairy agricultural point of view is rather a lost country, because you do not get butter from Norway?—There is not a great amount of Norwegian butter made. The dairy industry there is principally cheese.

44,985. They turn it into a sort of cheese?—Yes, a curious kind of cheese which they make on the mountains there.

44,986. Not exportable?—No, hardly eatable I should say.

44,987. A lot of it like chalk and the other part of it Brown Windsor soap?—Yes, with carraway seeds in it very often.

Cost of a dairy factory.

44,988. (*Viscount Cobham.*) Would a factory for 400 cows cost 700*l.*?—That would be it, I think.

44,989. Would it be built in brick or in timber?—It would be built in brick. I had an estimate the other day for the implements wanted for a 500 cow factory, and I think that it came to 287*l.* for the internal fittings.

44,990. Would that be included in the 700*l.*?—The building, I suppose, would cost about a couple of hundred pounds.

44,991. Not more?—It is simply a brick building with three or four rooms; it is not a very extensive place.

Mr. M. J. R. Dunstan.

4 April 1895.

Factory staff.

44,992. What staff is required for a factory of that size?—Three men and a woman or a boy. The factory I visited in Denmark was the property of 225 farmers, and it was a 500 cow factory. That would give you some idea of the number of cows each man possessed.

Agricultural education in Denmark.

44,993. Are the whole of the agricultural classes in Denmark educated in agriculture by the State?—There is no system really of lower agricultural education in Denmark. There is a system by means of the agricultural schools for what we may call an intermediate class, and then there is the highest class of education at the Veterinary College at Copenhagen and various places like that. But there is really no primary instruction in Denmark, and I was very much struck with that. The young farmers at one place I visited—at Dalum School—go there for six months in the year. When I was there the dairymen were there, and there were 36 of them. The winter before there had been 108 young farmers or sons of men who were farming land. They go for six months' agricultural instruction. They have absolutely no practical work at the school; they simply learn the why and the wherefore of all the processes they are in the habit of using during the rest of the year.

44,994. Chiefly with regard to dairying, I suppose?—Of course chiefly with regard to that.

44,995. Do they benefit by it, could you say?—They were the roughest class of students I think I have ever come across—a good deal rougher than our ordinary agricultural labourer. One could hardly have imagined these people sitting down to books and attending classes. But yet they came of their own accord; the majority of them paid their own fees, and they would stay there for six months in the year.

44,996. Would you consider the majority of the Danish farmers as compared with English farmers scientifically instructed in their business?—I would not exactly call it science, but they are certainly more instructed in the principles of their business. There is not a great deal of science taught. I have the programme here, but it is in Danish. They do a certain amount of chemistry, physics, drawing, writing, account keeping, gymnastics, the history of agriculture in the country, the manuring, the feeding of stock and the management of stock. That is their course of instruction. That begins on the 4th of November and goes on to the 27th of April. These were all young farmers, of ages varying from 18 up to about 26 who are actually farming during the rest of the year.

44,997. They keep themselves at this school and pay their own fees?—Yes. The fee is inclusive. The fees are very much higher for the first month than they are for the second and remaining months. They all lodge on the premises.

44,998. Are these Government schools?—This was a private school, and it had existed as a private school for some time; now the Government makes a small grant, just as our Board of Agriculture makes small grants, but very much smaller towards its maintenance, and it is almost self-supporting.

44,999. Are these schools numerous enough to be within the reach of the population?—Yes, there are several of them about. They are a very striking success.

The witness withdrew.

Mr. R. A. Anderson.

Mr. Robert Andrew Anderson called and examined.

Mr. R. A. Anderson.

The Irish Agricultural Organisation Society.

45,000. (*Viscount Cobham.*) I believe you are Organising Secretary to the Irish Agricultural Organisation Society, Limited?—Yes.

45,001. Is that an organisation which extends over the whole of Ireland?—Yes.

45,002. Would you give us a short history of it?—About six years ago Mr. Horace Plunkett, M.P., who is the Chairman of this society, took up the idea of establishing co-operative agricultural societies in Ireland. He thought that by introducing co-operative methods among farmers it would minimise the cost of production and minimise the cost of marketing their produce as well as, to a certain extent, getting rid of the middle profit in purchasing their requirements. At that time there was one co-operative dairy society established. This society had been started at Dromcollogher in the County Limerick, by some members of the English Co-operative Wholesale Society, and the General Secretary of the Co-operative Union, Mr. Gray. This society was merely planted down there and was allowed to go its own way. To all intents and purposes it was a joint stock company, that is to say, the profits of the society were divided among the shareholders in proportion to

Mr. R. A. Anderson.

4 April 1895.

Finance.

their shares. The shareholders were the farmers in the district.

45,003–4. Has it succeeded?—For two years it did very well. The trade for the first year was about 4,363*l.*, and for the second year it amounted to 8,500*l.* The share capital subscribed was 374*l.*, and in the second year they raised 600*l.* by way of loan on the security of the joint names of the committee of the society. They had 50 shareholders and they expended 973*l.* in buildings and plant. They made a profit in the first year of 223*l.*, and in the second year they made a profit of about 350*l.* At that time there was very little competition in that district. That society after working for some little time got into trouble, owing chiefly to bad management and owing to the fact that they did not adopt the system of paying for milk according to its quality. They paid one price all round and adulteration became very common. People who had been sending in good milk saw that they were not getting a better price for it and they proceeded to water their milk.

Management.

45,005. Was the management Irish?—The management was Irish. It was local, and that was another cause of failure. The manager was related to several members of the committee, and so the result was not very satisfactory. Several attempts were made by Mr. Plunkett and myself to bring the society to book. I went down several times and drew attention to the gross irregularities and bad management; and they always agreed with me but refused to do anything. It culminated in an inquiry which was asked for by some of the shareholders in the society and was held the year before last by Mr. Taylor, Q.C. He found that the whole thing had been managed disgracefully; that they had been buying nearly as much water as milk, and that they had brought the society to the verge of bankruptcy. Then the committee let the premises to a Mr. Gibson, a butter merchant, for one year—last year Mr. Gibson found that adulteration was so prevalent there that he could make no profit out of it, and he threw it up. When our Organisation Society was formed they sent me down to see if we could not reconstruct the society. This I succeeded in doing, and they have now elected a fresh committee; they have appointed an independent manager, and they have taken the concern over from Mr. Gibson again. At present everything is going on satisfactorily; they have adopted new rules and I think that the society will now do very well.

Adulteration of milk.

45,006. How did you stop the adulteration?—By paying for the milk according to its quality—that has stopped it everywhere. The next thing was that Mr. Horace Plunkett attempted to start a similar society; at least a society on rather similar lines, at Kilcooley in County Tipperary. That was in 1890.

45,007. Before you leave Dromcollogher will you tell us how much you spent upon the factory?—973*l.*

Cost of building factory.

45,008. Was that the actual cost of building and equipping the factory?—Yes. At that time the machinery was dearer than it is now, and they paid a good deal of money for sinking various wells before they got water. They spent I think, as well as I can recollect, about 70*l.* or 80*l.* in abortive attempts to find water.

45,009. Do you know how many cows belonged to the shareholders?—In the second year there were 3,000 cows supplying milk for a portion of the year; in the first year 1,450.

45,010. 3,000 cows to one factory?—Yes.

45,011. Do you think that figure of 973*l.* for the initial expenses of the factory might have been reduced?—I think it is excessive; I think it is nearly 200*l.* in excess of what it need have cost.

45,012. So that we may consider between 700*l.* and 800*l.* a sufficient capital for a co-operative farm over a district including 3,000 cows?—Yes, ample, unless there are some local circumstances that make the cost of building very expensive.

Particulars of co-operative societies.

45,013. Will you proceed to the next case?—That was in 1889. In 1890 Mr. Plunkett attempted to start a society in Tipperary at a place called Kilcooley. That did not succeed. Then he held in that year with the Lord Monteagle and myself some 50 meetings, and the outcome of those meetings was the establishment of another society at a place called Ballyhahill in the County Limerick. This was immediately followed by 16 other societies on the same lines being formed in Limerick, Cork, and Clare; so that at the end of 1891 we had 17 societies at work. That was, 16 were started in the latter part of 1890 and the early part of 1891. Those societies had a membership of about 850 farmers—that is approximately speaking we ought to take it at about 50 members to each society; we never know the exact number. They had a share capital of 5,782*l.* paid up, and a loan capital of 3,295*l.* They had expended 13,910*l.* in buildings and plant, that is after allowing depreciation at the rate of 5 per cent. on buildings, 15 per cent. on separators and 10 per cent. on other plant.

Mr. R. A. Anderson.

4 April 1895.

45,014. Are all these societies existing now?—Yes. They paid for milk that year 43,946*l.*, and they realised by sale of butter 50,382*l.* Their working expenses amounted to 4,612*l.* and they allowed off the 13,910*l.*, 648*l.* for depreciation; that would average about 10 per cent. depreciation all round. They netted a profit of 1,480*l.* in the year.

45,015. Representing a dividend of how much?—On the capital it would be about 20 per cent. or more, about 22 per cent.

45,016. (*Mr. Little.*) Is the interest on the loan included in the working expenses?—It would be included in the working expenses. The profits were divided in this way at that time. They were divided altogether among the shareholders, not in proportion to their shares, but in proportion to the milk supplied by each person. Where one of these dairies was in debt—of course very few of them started with sufficient capital to cover all their outlay, and they either got credit from the machinery contractors or raised the extra capital they required by way of a loan from a local bank—where that occurred, where they had not a sufficient capital, the profits, of course, could not be paid out in cash, and they were simply allocated to the individuals in proportion to the share they would have received in cash had the society been free of debt.

45,017. Was the milk actually paid for at the time?—The milk was paid for at the end of each month or each fortnight.

45,018. (*Viscount Cobham.*) Are these societies strictly co-operative; that is to say, are the farmers who supply the milk the sole shareholders?—I think they are co-operative in the strict sense of the word in every way. The shares are all owned by the owners of the cows, except that in a few instances some few people have shares who are not cow owners, but they have merely taken shares, not as an investment, but in order to help the thing forward as a local institution. They are entitled to five per cent. on their capital; that is the first charge on the nett profit; but the remainder of the profits become the property of the suppliers of the milk and the workers in the concern.

45,019. Was the finding of the capital a considerable preliminary difficulty?—In the first instance it was, because the people were under the impression that this dairying business was a business which could only be conducted by experts. They did not believe they could do it themselves. They did not seem to have any confidence in themselves, and it was rather a difficult task to break down that idea, and get them to invest money in a concern to be worked by themselves. In many cases they said to Mr. Plunkett and to me: "Come and "start a creamery for us, and we will send you the "milk." We explained that we did not want to do that; that we wanted them to run their creameries themselves, and to take the risk or gain of it.

Adulteration.

45,020. Do you find that adulteration still goes on?—To a very small extent indeed.

45,021. But it is always detected?—Yes, and punished.

45,022. And a deduction made?—Yes.

Skim milk.

45,023. What is done with the skim milk?—The skim milk is returned to the farmers in the proportion generally of about four-fifths, 80 per cent., of the milk sent in.

The Danish system.

45,024. I suppose Mr. Plunkett made himself acquainted with the Danish system before starting on this system which seems to be very similar to the Danish?—Yes. There is a difference between it and the Danish system. In Denmark I have always understood, in fact, I have been told by men who engage in dairying there, that the bulk of the capital was borrowed on the security of the farmers; in fact, that in some cases the whole of the capital was found in that way, each farmer guaranteeing a proportion of it equivalent to the number of cows he owned, and as

the profits were accumulated this debt was paid off and turned into shares for the benefit of the guarantors. Practically it works out to exactly the same as our system, but there was a slight difference. We could not have got the money like that.

45,025. What security did the Danish farmers give—land or stock?—They gave their personal security.

45,026. For what they were worth?—Yes.

45,027. But the Irish farmers you consider have found the money without borrowing?—Yes. Of course the payment of shares is made as easy as possible. The shares are 1*l.* shares and they are generally paid up in four or more instalments. After the dairying has been once started the instalments are very frequently paid in milk, either by way of a reduced price being paid for the milk, or by allowing a certain quantity of milk to remain until the call on the share is paid up.

45,028. Have you told us over what counties these societies extend?—Limerick, Cork, Tipperary, Waterford, Carlow, Kilkenny, and Clare.

Extent of the co-operative system.

45,029. Mostly in the south and west?—Yes. I should just like to say why we took up this form of co-operation first. It was not because we considered dairying was the easiest industry to tackle, but that we thought it was the one which was most in need of co-operation at that time, and we thought it was a good opportunity to get the farmers to take it up. Mr. Plunkett and I had many talks about it, and we thought that if we could get the farmers to succeed in this particular branch of business, which was certainly a very difficult thing to start, we would have no trouble at all in getting them to adopt other forms of co-operation afterwards; and that, as I am prepared to show, has been carried out.

45,030. (*Mr. Giffen.*) Is it salt butter that you make, or fresh butter?—It has generally 3 per cent. of salt.

45,031. (*Viscount Cobham.*) Very slightly salt?—Very slightly.

45,032. (*Sir Nigel Kingscote.*) Is it sold here as fresh?—Some of it is sold so.

45,033. (*Viscount Cobham.*) Is it exported?—It is sent to England chiefly.

45,034. Do these societies fairly well cover the counties by their operations?—They are mixed up with a number of proprietary and joint stock creameries. Of course there are different kinds of creameries, and our co-operative dairies are interspersed among them.

Extension of system.

45,035. Do you think there is much room for a further development of this system?—Yes. At the present moment we have got about 40 new societies in various stages of advance.

45,036. They are purely dairy societies are they not?—Yes, in the first instance, but they are taking up other businesses now. They are taking up the joint purchase of their members' requirements, and the sale of eggs and poultry as well for their members and also for the people living in the district who are not members—for the labourers and small occupiers.

Manufactured butter.

45,037. What do you do with your manufactured butter?—It is almost entirely sent to England for sale. About one-third of it goes to Manchester market and the remainder is divided between London and South Wales. A little of it goes to Scotland,—not very much,—and not very much is sold in Ireland.

45,038. (*Mr. Little.*) Is it sent to be sold on commission?—That was formerly the way, but now the great bulk of it is sold through the Association, it is worked by the creameries themselves.

45,039. (*Mr. Channing.*) Can you state the quantity?—The quantity of butter produced was 3,567,835 lbs. in the last season, the value being 151,852*l.*, realising an average price of 10¼*d.* nearly, per lb., the average price for 1893 being 11½*d.* There was a fall in the price of butter, therefore, of over 1¼*d.* in the year. The average price for 1892 was 11·55*d.*, just a shade over 11½*d.*, and that would represent about the price of Danish butter.

45,040. (*Viscount Cobham.*) Is that only first grade butter or does it include all butter?—That includes creamery butters of various grades, because unfortunately it is not always as good as it might be.

45,041. (*Mr. Giffen.*) In what parts of Ireland mostly did you say the factories are situate?—In Limerick, Tipperary, Cork, Clare, Kilkenny, Waterford and Carlow, chiefly in the south and south-west.

45,042. Not in Ulster?—No.

45,043. Nor in Connaught?—No. These are creameries, not butter factories. I notice that your Commission has made use of the term butter factories. We always consider that there is a great distinction between a creamery and a butter factory. A creamery we take to be a dairy, where centrifugal machinery is employed to separate the cream from the milk. A butter factory is simply a place with certain rude machinery and appliances in it where lumps of butter are bought, selected and blended, and then sold as factory butter. In fact the distinction is made in selling this butter so blended and manufactured. It is called factory butter, whereas the other is called creamery butter. The two places ought not to be confounded, because there is a very great difference in the value of the two articles.

Creameries and butter factories.

45,044. (*Viscount Cobham.*) You separate the cream and you manufacture the butter on the most economical principles?—Yes.

45,045. (*Mr. Giffen.*) And your butter is better than the other butter?—Yes, infinitely.

45,046. (*Viscount Cobham.*) But you have to grade it?—That is only where you buy lumps of butter and manufacture it on the factory plan.

45,047. Is the output of your creameries all of the best grade?—I suppose nineteen-twentieths of it would be. Occasionally, owing either to carelessness or ignorance on the part of the people employed, a churn may be spoiled, the cream may be over-ripened and develop a bad flavour, or it may be over-churned and get mixed up with a lot of curd and spoiled in that way, or it may be put on the market in a bad condition.

45,048. Have you quite got over the objection that used to be brought against Cork butter, that it was in geological strata?—Yes, quite.

Price of butter.

45,049. You consider that at all events you get as good a price as any other butter producers?—We have got the best prices given in the English market for butter sold wholesale. Everywhere where this butter has been shown it has taken the highest prizes; in fact, they gave it a special silver medal at the London show the year before last, as being the best butter in the show.

Feeding and management of cattle.

45,050. Do you follow the Danish societies by laying down regulations for the feeding and management of the cattle?—No, I am sorry to say we find it very difficult to do that. We always try to get farmers to feed more carefully, and to avoid using turnips, for instance, and it is very hard to get them to do that. Of course, you can refuse the milk, and the managers of these dairies have been given instructions not to take butter which is obviously tainted with turnips, but sometimes the turnipy flavour does not make itself felt until some little time after the milk has been milked, and sometimes it does not develop until the butter has been made.

Improvement of Irish cows.

45,051. A great deal can be done to improve the character of the Irish cows as butter producers, can it not?—Yes, I think so. I think the best way to do it is to test the samples of milk from individual cows. That is what we are always having done in districts where they make use of these new testing machines like the Babcock tester or the Leffman-Beam tester. The farmers send in samples of milk from their various cows and have them tested. Then they measure the quantity of milk produced by each cow and make an average of the quantity and of the value of the milk. Thus they can easily see which cow is the most valuable to keep for milking purposes. But I do not think it would be wise from an Irish point of view to sacrifice all the other qualities of the cow for mere milking purposes, because butter is tumbling down at present at a very alarming rate, and you very often find when a milking cow goes wrong, that at six or seven years old the farmers fatten her off and sell her, but if they went altogether in for Jersey cows or Ayrshires they could not possibly do that, because they would have nothing to sell.

Proportion of butter in milk.

45,052. How much milk goes to a pound of butter on an average?—The average is about two gallons-and-a-half where the milk is sent to a creamery and separated. The average where the butter is made at home would be three gallons, and three gallons is perhaps rather a fair average to take.

45,053. It is an extremely poor average is it not?—That I am afraid is the actual fact. I can give you the averages for the last three years. The average produce per gallon in 1892 was 6·26 ounces: the

Mr. R. A. Anderson.
4 April 1895.

average produce in 1893 was 6·19 ounces, and the average produce in 1894 was 6·33 ounces. There is a very great variation in the average produce when you take into consideration the time of the year and the length of the time that the cow has calved. I published a paper on the subject in the Journal of the British Dairy Farmers' Association, in which I gave some tables of the per-centages of the butter fat in milk. It varied from 4·37 per cent of fats in December 1892 to 2·85 in April. The lowest percentage is always to be found in Ireland about April. The average per-centage taken from the milk of the cows of the creameries from their actual returns, in April 1892, was 2·85; in April 1893, 2·82; and in April 1894, 2·95; being in each case in excess of the Somerset House standard—2·75; but still being very low.

45,054. (*Mr. Giffen.*) What is the highest?—The highest was 4·37 in December, 1892.

45,055. What was the date of your paper?—That was published in the journal of the British Dairy Farmers' Association for last year, 1894.

45,056. Do you think there will be a gradual improvement of the breed of the cows in the south and west of Ireland consequent upon the action taken by your societies?—I think the figures I have just quoted show that there is an improvement. Taking the figures for 1892 you will see that the average produce was 6·26 ounces. In that year a number of the dairies only worked in the latter portion of the year, which would tend to raise the average, because cows' milk is richer in the autumn than in the spring. I attribute the improvement altogether to the practice of paying for the milk according to its quality, which was introduced subsequently to that date. In 1894 the average had risen from 6·26 ounces to 6·33 ounces. I am excluding 1893, which was notoriously a bad year, owing to the drought. In 1893 it was only 6·19 ounces, but obviously there is a distinct gain of ·07 ounces between 1892 and 1894.

45,057. Is there much difference between one creamery and another?—Yes, there is a very great difference indeed.

45,058. What is the highest product per gallon of any creamery you know of?—Do you mean for the year or for any particular month?

45,059. I want something to compare with the average figures which you have been giving us. You have told us that 6 ounces odd is the average for the whole of the creameries?—It would be very hard for me to say which creamery gives the best average. They vary very much. Some places where you would expect to find the poorest milk you get the best return from.

45,060. I merely wish to get an idea of what is the fluctuation as between one creamery and another?—There would be a difference in some cases of, I should think, fully 20 per cent. between them as to their produce of milk.

45,061. (*Mr. Little*). What Mr. Giffen was asking you for, I think, was as to the maximum produce?—I am afraid I cannot give you that for any individual creamery. I do not happen to have the figures by me.

Sale of butter.

45,062. What would you say was the maximum of the whole lot?—The maximum annual average produce of the milk would be about seven ounces to the gallon, and the minimum would be about 5·75, but that would be very low. I think I have mentioned that the butter was sold to some extent through the federation of these co-operative dairies. That was started in 1893. The creameries themselves put down a certain amount of share capital in proportion to their trade, each creamery then was entitled to representation on the board of this federation; and from the representatives who were elected by the creameries they appointed a committee to undertake the sale of their produce. They appointed a salesman in England, and the sales went up from 45,000*l.* in 1893 to 64,000*l.* last year; and then they realised a very good price by the sale of the butter and made no bad debts at all. The federation thus makes the creameries independent of the commission agent in selling their butter, because they can consign it through their own agency at a charge of 2½ per cent. on the sale, and then if any surplus remains, that becomes the property of the creameries in proportion to the quantity of butter which each has sold through the agency.

45,063–4. You do not do it through the Cork butter market?—No, we could not sell through the Cork butter market. The price obtained through the Cork butter market was always several shillings a hundredweight lower than we could get in the open market. We look upon the Cork butter market as dead; it has killed itself.

Mr. R. A. Anderson.
4 April 1895.

Dairy conferences.

45,065. (*Viscount Cobham.*) Have you held any dairy conferences?—Yes, there have been several conferences held. They have been chiefly held in Limerick.

45,066. Have they excited much interest?—A great deal. They used to be very well attended, but latterly, as the business has been so spread over the whole country, we have not had so much time for them, but we propose to revive them again. These conferences afford a very good way of getting information from the various districts, and of getting an interchange of ideas between the people who are engaged in business.

45,067. What subjects were discussed at your preliminary conference?—Mr. Plunkett read a paper on "The best means of marketing the produce of dairy societies," and that led to the formation of this Agency Society, as the federation of producers was called. Then there was a paper read by Mr. Stokes, of Limerick, "on the joint purchasing by societies;" and that has been carried out in several instances both by the creameries and by societies established for that particular purpose. Then there was another paper "On creamery managers." which was read by the secretary of one of these co-operative dairies, and which gave several very useful hints: and there was also a paper read "On calf rearing and winter dairying," by Mr. Gibson, the butter merchant.

Improvement of Irish cattle.

45,068. I suppose there is much room for improvement in the management of cattle, especially in the winter, in Ireland?—Yes, a great deal. Cattle are very injudiciously fed and very badly fed in Ireland. It is the exception when they get anything but hay in winter.

45,069. You read a paper, I see, entitled "A Board of "Arbitration to deal with questions of overlapping"?—Yes.

Dairy conferences.

45,070. What does that mean?—We thought that was necessary, otherwise there was nothing to prevent a number of farmers, merely through spite and ignorance, putting down a creamery of their own which would interfere with one already in existence and encroach on its territory; because we think that it does not pay a farmer to send his milk more than two miles or two and a half miles twice a day into a creamery.

45,071. In addition to this conference you have had 72 meetings of farmers have you not?—Yes.

Co-operative dairies in Sweden.

45,072. On the whole do you consider that much good has already been done and that there is a good future before the societies?—The way in which they have been taken up is, I think, most encouraging. I was sent over to Sweden to get some information about the system of dairying there, and I visited about 20 dairies, some of them being co-operative and others being proprietary. I must say that I did not think they were very much in advance of our dairies. The management, however, was always more economical and they were more attentive to details, such as cleanliness, which of course is very important. In regard to small things they were far in advance of us. Then they adopt a more elaborate system of testing the milk which would be quite useless to our creamery managers, who have had no scientific training in nine cases out of ten. However, I got some information about their business which was very useful.

Rules of Irish Co-operative Societies.

45,073. Under what rules do your societies work?—They are all registered under the Industrial and Provident Societies Act and they work under rules which have been drawn up to to conform with that Act.

45,074. Are there any special rules?—Yes; the special rules provide for the object of the society and its registered office; then the shares and the manner in which they shall be paid up; then for the division of the profits. The manner in which the profits are divided is, I think, novel. Five per cent. is paid on the paid up share capital and under no circumstances can anything more be paid than five per cent.; that is a first charge on the net profit. Then there is 10 per cent. of the remaining net profit allotted to the workers in the concern. The workers generally consist of the manager, the dairymaid, an assistant dairymaid, an engine-driver (if it is worked by steam) and another assistant who is usually a boy. This 10 per cent. of net

Mr. R. A. Anderson.
4 April 1895.

profit is divided among them in proportion to the wages they earn. They do not get it in cash, but it is accumulated for them as shares in the Society, and if they either leave or get into bad health or trouble in any way they can claim this accumulated bonus.

45,075. (*Mr. Lambert.*) In cash?—In cash.

45,076. (*Viscount Cobham.*) Has that a very good effect on the quality of the work?—I think that has a very good effect indeed. There is great competition for employment in these co-operative dairies. One reason for that is because of this share in the profits. Another reason is because our organisation society supplies them with a great deal of useful advice, and wherever a man has shown himself capable of managing a dairy, or wherever a dairymaid has given satisfaction, we are always forward to recommend him or her in case either wishes to change his or her situation, as the case might be.

Staff of creameries.

45,077. What is the average staff of a creamery?—About five; but it would be six in a large dairy.

45,078. Are the managers all Irish?—Without exception.

Division of profits.

45,079. What is done with the remaining profits?—The remaining profits are divided among the suppliers of the milk in this way, that the milk supplier who is not a shareholder only gets half as much in the £ on the value of his milk as a shareholder. For instance, two men supply 100*l.* worth of milk; one is a shareholder and the other a non-shareholder; the profits of the society might admit of a dividend of 6*d.* in the £ to members; then the member would get 50*s.* dividend on his 100*l.* of milk, and the non-member would get 25*s.*, but that would not be paid in cash; it would be accumulated for him until he had paid up five shares in the society, and was made a member whether he liked it or not. We find in practice, that unless you get the people to take shares in these creameries pretty universally, unless you get every supplier actually in it as a shareholder, the co-operation will not be as successful or as thorough in the district as it ought to be.

45,080. (*Mr. Channing.*) Do you get most of the farmers to take shares?—Now they do because they have seen the working of these societies. They have seen that they have been very successful, and they are ready to follow the example of other people.

45,081. (*Viscount Cobham.*) Have you room for any more shareholders in the existing societies?—Not in the existing societies. Unless it could be done by a redistribution of capital, and that is done in many cases. They do not want to have a very large share capital; that would only over-weight them with an unnecessary charge. In many cases they have transferred the shares, or a portion of the shares, from existing shareholders to new men in order to let them in.

45,082. Do most of the people who supply you with milk and who are not members ultimately become members?—They must all become members now if they supply milk, because this dividend is accumulated for them until they have paid up a certain number of shares.

45,083. Automatically they become shareholders?—Yes. There is nothing deducted from the price they get for the milk; they get the same prices as the members get. It was rather hard to get that rule passed, because the members did not wish to give up any portion of their dividend.

45,084. All applications of profit under clause (2) are to be made by shares or payments on account of shares?—Yes. The central society also arranged to have the accounts of the local societies audited. It is very important that these accounts should be audited by an independent person. One reason for the breakdown of the Dromcollogher Society was that they appointed a local schoolmaster as auditor. In the first place that was against the law, and in the second place he manufactured a statement of accounts for them which was totally in error and did not represent the true state of affairs of the society; and we had to have their accounts ripped up by the auditor we got appointed by the Treasury when a very different state of affairs was disclosed to what the members were under the impression existed. In addition to that the dairies voluntarily send in once a month to me a statement of their working showing the number of gallons of milk received, and the number of pounds of butter produced, the working expenses for the period, which are sub-divided under different heads such as coal, oil, packages, and all sorts of wrappering that they require, salt, wages, depreciation and interest, in fact everything is allowed for. Then the milk is sub-divided again into various classes such as milk producing 4 per cent. of butter fats, milk producing 3½ per cent. and 3¼ per cent. as the case might be, according to the time of the year, with the price paid for each class of milk. I check these returns and send them back with a report to the committee as I get them in. That at once shows the committee how the working of each society compares with that of the other co-operative societies. Of course I do not tell any individual society how any other society is doing, I merely tell them how they are working as compared with the general body of the societies. That is one of the functions of our organization. By this means we are enabled to point out at once if anything is going wrong and to put a stop to it. The sending in of these details is quite voluntary, but they are very glad to have us undertake this work.

Mr. R. A. Anderson.
4 April 1895.

Book-keeping of co-operative societies.

45,085. The book-keeping is necessarily somewhat voluminous and intricate is it not?—Yes, but we have taken care of that too. Proper instruction in book-keeping is given to each manager by the organisation society and a book has been published which is sold at a nominal price to each manager which prevents him going astray in his account.

Irish Agricultural Organisation Society.

45,086. What is the Irish Agricultural Organisation Society?—The Irish Argicultural Organising Society is the propogandist body, the organising centre of agricultural co-operation in Ireland. It is a body which does not trade but which merely teaches the principle of co-operation and how it may be applied to local pursuits.

45,087. Does the Organisation Society hold meetings and push the idea throughout the country?—Yes. I have already sent up a copy of the prospectus of the Society. The President of the Society is Mr. Horace Plunkett, M.P. The Vice-President is Mr. Christoper Redington, who is the Resident Commissioner of National Education. The Committee consists of the Most Rev. Patrick O'Donnell, Bishop of Raphoe; The Lord Monteagle; Mr. Thomas Sexton, M.P.; Mr. John Redmond, M.P.; Count Arthur Moore; Mr. Digges La Touche, who is managing director of Guinness' brewery; The Rev. T. A. Finlay, Jesuit Priest, Fellow of the Royal University College, Dublin; Colonel Gerald Dease; Mr. George F. Stewart; Coroner James Byrne; Mr. W. McMurrough Kavanagh, and Mr. James Musgrave. The object of the Society, as stated in the prospectus, is "'to improve the condition of the agri-"'cultural population of Ireland by teaching the "'principles and methods of co-operation as ap-"'plicable to farming and the allied industries, to "'promote industrial organisation for any purposes "'which may appear to be beneficial, and generally to "'counsel and advise those engaged in agricultural "'pursuits.' In furtherance of these objects it is "proposed to promote and organise societies of farmers "on co-operative lines throughout Ireland by sending "speakers free of charge, who may address meetings "locally convened and otherwise explain what steps "are necessary to take. Printed information will also "be supplied gratis by the speakers, or on application "to the secretary. It shall be the function of this "Society to counsel and advise these associations as to "the best methods of production, and the most advan-"tageous means of disposing of farm produce." This Society was outlined in an article by Mr. Horace Plunkett in the "Fortnightly Review." There were a series of articles written by an anonymous correspondent who signed himself "X." Those articles attacked Ireland as a rule, and found fault with everything, but suggested no remedy, and Mr. Plunkett, in replying to them in the "Fortnightly Review," suggested co-operation as a remedy for most of the evils under which Ireland was labouring. The idea received very considerable support. There are a number of people who think as Mr. Plunkett does in the matter, and they between them subscribed a sum of over 7,000*l.* for the purpose of trying to introduce these co-operative ideas among Irish farmers. This money has been subscribed altogether voluntarily by people from philanthropic motives; some has been subscribed by Englishmen, a good deal of it in fact. The Society up to the 31st December last had cost to work 1,407*l.* The bulk of that money was spent in paying the expense of lectures and attending meetings in the country. When the Society was established there were

Mr. R. A. Anderson.
4 April 1895.

33 co-operative dairies at work, with eight branches; at the present moment there are these same 33 societies at work, and in addition to those there are 21 new dairy societies, nine agricultural co-operative societies, and one agricultural bank. Altogether there is a total of 72 societies. Besides those there are 11 dairy societies and one agricultural society in process of formation. Every day in our office we are receiving applications from farmers asking us to give them advice as to how they can best start a co-operative society for some useful purpose or other in connexion with their business.

45,088. What services you render are rendered free of charge?—Yes. The Organisation Society does not take any responsibility at all on behalf of these societies. For instance, if a local association is formed among the farmers for the purchase of their requirements they have to finance the thing and work it themselves, and the organisation does not in any way guarantee payment to the manufacturers or persons who supply such society.

45,089. Is it contemplated that this Society should be permanent?—No. It is contemplated that at the end of five years we will have covered the whole of Ireland with these co-operative organisations, and then it is suggested that these societies will elect representatives to form members of the central body to carry on this work of organisation where necessary, and also to deal with questions which individual societies at present cannot deal with; for instance, the question of railway and steamship rates (which is a very serious one for Irish farmers), and the transit of cattle and large questions like that. No individual society of farmers could deal with those questions, but the representatives of all the various agricultural societies in Ireland could, we believe.

45,090. Is it the opinion of the Association that a voluntary body like this would be valuable in conjunction with a Government Department?—We think it would be very valuable working with a Government Department of Agriculture. Many of us think that the time has hardly come for an Agricultural Department yet. We would like the farmers to be so organised and educated that they would be able to make an intelligent use of an Agricultural Department.

Agricultural co-operative societies in Ireland.

45,091. What are the various forms of agricultural societies at present organised by your society?—In the first instance, dairy societies, and in the second instance societies formed for the purchase of farmers' requirements. Then there have been in districts, where there is a large quantity of poultry and eggs produced, some efforts made to establish societies of the producers of these articles to enable them to sell their produce, and where those societies can be combined with either of the other kind of societies, we propose that it should be done. Then there are also agricultural credit societies. There is only one of those started up to the present, but I should like to explain its working to the members of the Commission. It is called an agricultural bank.

Agricultural credit banks.

The system is this:—The farmers and the labourers of the district join together, pledge thier united credit for sums of money which they borrow from, say, a local bank or from persons who believe in the system, and are willing to lend; they pay 3 per cent. for the use of this money. These people, who are willing to lend, deposit in the society whatever they can afford to deposit, and they proceed to lend to members of the society, who are persons who are subject to a very careful inquiry as to the character, temperance, industry, and so forth, before they are admitted as members; and if they satisfy the committee of the local bank that they are suitable persons to be admitted as members, then they are admitted. They are then entitled to borrow money for any purpose which will, in the opinion of the committee, either produce a profit or effect a saving to the borrower. Members, however, cannot borrow money to pay a shop debt or for any improvident purpose. They can only borrow for approved purposes. The amount which the law allows the bank to lend is 50*l.* in each case; they lend it for as long as ever the borrower requires it. He finds two securities, and he repays the money either in one sum or in instalments as may be agreed on. The reason that we think these banks are necessary is this:—The existing banks do not lend small sums as a rule to the small occupier, nor do they recognise that the small occupier has any credit which is at all bankable, to use their own expression. Then they do not watch the application of the loan, but the agricultural bank does. Every man in the community is known to his neighbour and every man is interested in the bank. He has a share in the responsibility of the bank and he will not allow this loan to be misspent in any way.

Mr. R. A. Anderson.
4 April 1895.

45,092. (*Mr. Giffen.*) In what part of Ireland is this?—That is in Doneraile in County Cork. This bank, I might say, is working very satisfactorily. They have lent now close on 100*l.* in small sums. They have lent it all on approved security and to approved persons. They have been very cautious in the way in which they have done their business. The whole thing is worked by a joint committee, consisting of the farmers and labourers of the district. The whole of the capital which they are working with has been deposited with them, or lent to them, either by themselves or by people interested in supporting the scheme. The borrowers are charged 6 per cent. on the loans.

45,093. (*Viscount Cobham.*) But they get the money at 3 per cent.?—They get it at 3 per cent.

45,094. On what security is it borrowed?—On the security of the whole members of the bank: they pledge their security.

45,095. Jointly and severally?—Yes.

45,096. By the members of the bank you mean the shareholders?—Yes; each member holds a 5*s.* share; they are required to hold shares in order to comply with the Act.*

45,097. (*Mr. Giffen.*) And they have lent about 100*l.* you say?—Yes; it has only been established a month. There are a great number of these banks in Germany. The system is known as the Raiffeisen system of banks, and the Agricultural Banks Association here have, I believe, taken the matter up; it was that association, in fact, who gave us the information about these banks in the first instance. We are decided on not starting any more of these banks until we see how the experiment works out in Doneraile.

45,098. It is quite possible that there is an opening for such banks in Ireland, although that might not be the case in England?—That is quite possible.

45,099. (*Viscount Cobham.*) In Ireland, you have got a class of local money-lenders who lend on very high rates of interest, have you not?—Yes, and we have had a great deal of that to contend with. There was a case recently tried before the Recorder of Cork, where a borrower was paying 1800 per cent. on a loan. That is almost inconceivable, but still it was a fact. It was proved that he paid 1800 per cent. to one of these gombeen men, as they are called.

45,100. (*Mr. Giffen.*) 1800 per cent. per annum?—Yes.

45,101. (*Mr. Little.*) And the farmers are, many of them, indebted to the butter salesmen are they not?—That was much more general formerly than it is at present. At one time there was hardly a farmer, who sold in the Cork Market who did not anticipate the price of his butter by borrowing enough money to pay his rent or other things in the early part of the year, for which he paid 10 per cent. The money was sometimes repaid through the stock; if a man sold stock he would then reduce his liability to the butter merchant, but whether he reduced his liability or not he paid 10 per cent. down for whatever loan he took and he got no rebate on that. He was compelled to sell the whole of his butter to that particular merchant, and he was also compelled to accept a lower price than the current market price for his butter, while there was anything due to the merchant.

45,102. (*Viscount Cobham.*) Your societies make no such advances do they?—None at all.

45,103. Is it a rule that the whole of the milk produced by your shareholders shall be brought to the creamery?—It is the exception when they do not send it.

45,104. But you have no compulsion in the matter?—There is no compulsion at all. I might mention that in the "Mark Lane Annual" for 1894, I think it is, Mr. Plunkett has written an article which gives a full history of this co-operative movement in Ireland. It is very interesting and gives all these facts about the various kinds of societies which have been established.

45,105. (*Mr. Giffen.*) The "Mark Lane Annual" for 1894?—Yes. It has been reviewed by various papers.

45,106. (*Mr. Little.*) Is that the almanac which is published in connexion with the newspaper?—Yes.

* This has since been altered, and members are not required to hold shares now.

Mr. E. A. Anderson.

4 April 1895.

45,107. (*Viscount Cobham.*) I understand you to have said that this bank has only been in operation for a month?—It has only been in actual operation for about a month.

45,108. But so far as it has gone its experience has been encouraging?—Very.

Shipment of cattle from Ireland.

45,109. In addition to those organisations that you have mentioned, are there any other ones which you think of forming?—Yes. Everywhere I have been to lately, all throughout the country, the farmers are very anxious that the question of shipping their cattle should be taken up, because they tell me that the loss on the shipping of cattle is a tremendous tax on them; some people go so far as to say that a fat beast loses a penny in the pound on its value when being shipped from Ireland to England.

45,110. (*Mr. Giffen.*) Is that from Dublin or from Belfast?—From Dublin; it is a penny a pound in meat. Other people estimate the loss on dry stock at about 10*s.* a head; sometimes more. That would amount if it was calculated on the figures for 1893 (I have not got the figures for 1894) to over a million sterling annual loss.

45,111. (*Viscount Cobham.*) Do you consider that is owing to the bad stowage?—They consider that it is entirely owing to the state of the law, as it exists at the present time. The law does not make the owner of the steamship responsible in the same way that it makes a railway company responsible. At the present moment, however, a bill is being introduced into Parliament to amend the Railway and Canal Traffic Act. It proposes that section 7 of the Act shall be applied to all contracts made for the carriage of animals by sea. If that bill were passed into law I think it would reduce the loss very considerably. There was recently a case heard in Dublin where a man named Devitt sued the Glasgow, Dublin, and Londonderry Steamship Co. for killing 11 of his cattle in the transit to Glasgow, but he did not get a farthing damages, the judges holding that the company were not responsible.

45,112. (*Mr. Giffen.*) Were they killed on account of the weather?—The weather was not bad at the time. Another point is that the railway companies in Ireland do not provide sufficient accommodation for putting the stock on to the trains. For instance, I have seen a case where there were over 250 cattle at one station, and only two railway porters to help the men to load them, and the loading was only accomplished by beating them black and blue with sticks, and as they were all fat cattle, of course it would be weeks and weeks before they recovered.

45,113. (*Viscount Cobham.*) Is it considered essential that the trade should be a live stock trade?—No, it is suggested by several people that it should be a dead meat trade. The difficulty seems to be that in the first instance the dead meat is a very much more perishable article than live cattle, and another thing is that the success of it would depend on the starting of a lot of subsidiary industries in connexion with it. Those industries, with a few exceptions, do not exist in Ireland. What we think would be a better plan would be to form local societies of cattle and stock owners, just in the same way as we formed creamery societies, and to federate those as we federated the creameries into a central body, and then to let the central body undertake to look after the shipping of those cattle on behalf of those local societies. But it would be necessary to extend our organization a great deal more before that could be done. You would have to collect your cattle over too large an area at present, the districts being too scattered, and except at very great expense you could not get together sufficiently large consignments of cattle from different parts of Ireland.

45,114. (*Mr Giffen.*) At what ports of Ireland are cattle shipped?—At Cork, Waterford, Dublin, and Belfast, but not very many from Belfast. They are largely shipped to Glasgow.

45,115. Are cattle sent to Liverpool very much?—Yes. They chiefly go to Liverpool and Glasgow. Bristol, of course, we send to, but I think not so many as to Liverpool and Glasgow.

45,116. Are they sent to London direct also?—Yes.

45,117. (*Mr. Little.*) By sea?—Yes.

45,118. (*Viscount Cobham.*) Could the offal be consumed in Ireland?—It would depend in a great measure upon the possibility of starting these other industries. Mr. Tallerman introduced a scheme some years ago about the dead meat trade, but it fell through and failed, I think, chiefly owing to the fact that it was got up by a company in which the stock owner had no share or concern at all. The farmers did not contribute anything to the capital of the undertaking and they had no voice in its management.

Mr. E. A. Anderson.

4 April 1895.

Bacon curing factories.

45,119. Have you any idea of encouraging any other organization?—Yes. We are at present getting evidence from experts as to the possibility of starting bacon curing factories. At present bacon pigs, pigs weighing about one hundred weight and a quarter, which are prime bacon pigs in Ireland, are selling for about 4*d.* per lb., sometimes at only 3½*d.* The price is so low that it does not pay the feeder of the pig to feed it. The cottagers nearly all keep pigs. They used to look upon these pigs as a sort of savings bank. They used with their savings to buy food for the pig, and fatten it, and when the pig was fat they used to expect their savings back with interest on it; but now they get no interest, and they are lucky if they get their savings back. Everywhere where I go I am always met with the request that we should start bacon curing factories for them. It is a very expensive business. Two months' credit is given to the trade in selling bacon; consequently any society that was formed for the purpose would want to have a large capital, and would have to pay cash for the pig and would have to allow two months' credit for the sale of the bacon. We are going to see if we cannot do it; we are getting information from experts about it, and we propose to issue a report shortly dealing with the matter with suggestions how it might be done.

45,120. (*Mr. Elton.*) Do you not come into contact with the system of jobbing and broking persons intervening in the sale of pigs?—Yes.

45,121. A sort of hereditary brokers of pigs which makes a great tax upon the man who fattens them?—Yes; there are two rings to be dealt with—I think we might describe them almost as rings. There is the ring of pig buyers, which tends to lower the price of pigs.

45,122. To make the thing clear to begin with, as a rule there is not a sale from the pig owner to the pig buyer, but the pig owner sells to the pig jobber, or pig broker?—Yes.

45,123. And if to the pig broker, the broker finds a jobber who sells it again?—I call them all pig buyers as distinct from bacon curers. Then there is a ring of bacon curers whose whole object is to keep up the price of bacon.

45,124. So there are three buyers?—Three, and perhaps four, buyers.

45,125. With middlemen's profits?—Yes. These people all arrange the price that is to be paid for the pigs. At all events, as a matter of fact, none of them will outbid the others in a pig market. They will not give a penny a hundredweight more for a pig than the others will.

45,126. You have to get rid of this set of people, or they will get rid of you, before you can set up your bacon curing?—We propose to have the pigs bought by live weight independent of them altogether.

Farmers' profits from dairy societies.

45,127. (*Viscount Cobham.*) Going back to your dairy societies, I suppose in the working of them you have ascertained a good deal of valuable information such as the actual return to a farmer supplying milk for instance?—Yes.

45,128. What does that work out to?—The price per gallon in 1894 was 3·53*d.* per gallon, that is rather over 3½*d.* The dairies return to the farmers about 80 per cent. of the skim milk and the butter milk. That would amount to about six per cent., or seven per cent. of the whole milk sent in. Now on the figures which I have put before the Commission to-day an average cow yields 435 gallons per annum; 435 gallons at 3·53*d.* would equal 6*l.* 8*s.* as nearly as possible. If her produce was kept at home and simply skimmed by the ordinary gravitation method and sold, as the price for home-made butter last year only averaged about 8*d.* a pound, the same cow's produce, if made at home, would only realize 4*l.* 16*s.* 8*d.* making a difference in favour of the creamery of 1*l.* 11*s.* 4*d.* Those are actual facts taken from the returns of these societies and verified by our auditor. He has made out the returns for a number of cows, showing the total weight of butter produced, the total quantity of milk produced, the total price paid for the milk, and the total price received on the sale of the butter. We know the other figures to be true.

Mr. R. A. Anderson.

4 April 1895.

Value of separated milk.

45,129. What do you value the skim milk at?—We value that at 1½*d.* to 1¾*d.* a gallon as a food.

45,130. (*Mr. Lambert.*) Would the skim milk that is got at home from the gravitation process be more valuable than the skim milk separated by the separator?—It depends upon what you turn it to; it would not be very much more valuable.

45,131. (*Mr. Giffen.*) Am I to understand that for every 100 gallons of milk sent in by the farmer to the creamery he gets back 80 gallons of separated milk?—Yes.

45,132. And that that is worth 1½*d.* to 1¾*d.* a gallon?—About that.

45,133. (*Mr. Lambert.*) Would the separated milk be worth as much as that?—Quite as much as that. Wherever it can be sold it fetches a good deal more. These co-operative dairies make it a point not to sell any separated milk, but rather to give it back to the farmers for calf and pig rearing.

45,134. Will the separated milk rear a calf by itself?—I have known cases where very good calves were reared on it, but it was the exception, and it was only where they got the milk very fresh from the separator.

45,135. Is the low value of the separated milk as a food not due partly to the poorness of the milk, because all the nutritive fats are taken out of it?—Of course, the action of the separator removes nearly every particle of fat. Separator milk ought not to contain more than ·2 of fat if it was properly separated.

45,136. Practically it would be little better than water for rearing calves, would it not?—No; you have got all the other solids, all the bone and flesh-forming constituents left in it; those are not taken out by the separator. The separator only takes the fat with a small proportion of the curd. The way that the separated milk is used by all farmers who understand the feeding of calves is this: For the first month they give the calf whole milk; after that they begin to give it separated milk mixed with whole milk, and gradually they give it nothing but separated milk. Then when the calf is about two months old they begin giving it flax seed. They buy this flax seed wholesale from the creamery; it is crushed in a little grist mill attached to the creamery and worked by the steam engine there. They give it to the calf after it has had its milk; it is merely crushed and then put into the trough after the calf has had its milk out of it. The calves have an average of about 1 cwt. for the year. The farmers buy it at about 13*s.* 6*d.* per cwt. There are about two calves reared to every three cows in Ireland, therefore you must take about 9*s.* a cow off for the cost of this flax seed for every calf raised, because you see there is two-thirds of a calf for every cow, that is two-thirds of 13*s.* 6*d.* That would reduce the profit to 1*l.* 2*s.* 4*d.* I have taken the cost of milking the cows and carting the milk into the creameries as being equal to the cost of producing the butter at home and sending it to market, but as a matter of fact the cost of milking the cows and sending the milk to the creameries is only about one-half what the making of the butter at home comes to. You have the cost of packages for instance. The packing of 145 lbs. of butter, which would be the amount produced from 435 gallons of milk at 1 lb. of butter to every three gallons—the cost of packages for that alone would be close on at 5*s.*; then you have salt, you have coal, you have labour and churning and you have a certain amount of brokerage charged on the butter when you send it to the market, the amount of the brokerage depending entirely on the market you send it to.

Farmers profits from dairy societies.

45,137. (*Viscount Cobham.*) You think, therefore, that the actual return to the farmer in supplying milk is understated?—It is understated; I know it to be more than has been stated. Another thing is that I have taken the average price of farmer's butter last year in Ireland to be 8*d.* per lb., but I do not think it was that.

45,138. Against your 11½*d.*, I think, it was?—Yes, the 10¾*d.*, which was the average for the creamery.

Comparative results from creameries and home dairies.

45,139. You have been speaking as to what are the comparative results of the creamery and home dairying as to the manufacture of butter, have you anything further to say upon it?—Of course it is easy to see why the creamery pays so much better than home-dairying. At the creamery they can produce a pound of butter from about 2½ gallons of milk instead of requiring 3 gallons of milk; then they sell that pound of butter for 10¾*d.* instead of 8*d.* If you put those two factors together it works out to this difference to which I have called the attention of the Commission. There is another thing that I have not yet mentioned. This 6*l.* 8*s.*, which is returned for each cow on the creamery system applies to all kinds of districts whether they are good, bad, or indifferent. In some of these districts where the dairies are working they are very poor indeed; others are situated in the richest parts of Ireland. Over and above that 6*l.* 8*s.*, the farmer gets on his invested capital 5 per cent., and he gets a share in the profits on the milk supply.

Mr. R. A. Anderson.

4 April 1895.

45,140. (*Mr. Little.*) You have nothing in Kerry at present?—We are starting at present eight new creameries in Kerry.

System of butter-making.

45,141. Have you any special system of butter making?—Yes. The butter is made in this way. The cream stands from 24 hours to 36 hours to ripen after it is separated; it is in some dairies refrigerated as it comes from the separator; then it stands in Schwartz's cans in a cooling trough and is kept at a certain temperature until the lactic ferment is created in the cream. When the creamery manager or dairy maid, whoever is put in charge of it, considers that the cream is ripe for churning, it is thoroughly mixed and put into the churn, and when the butter comes a small quantity—a few gallons—of very cold water is added to the churn and the churn is slowly revolved; that frees the butter from all the butter milk—the granules. Then it is taken out and lightly sprinkled with very dry fine salt. Then it is put on a butter worker and it is worked about two or three times round to incorporate the salt with the butter. It is taken off then and allowed to stand for some hours, which allows the salt to get thoroughly incorporated with the mass of butter. Then it is finally worked on the butter worker and packed in hundredweight casks, half-hundredweight casks, and half hundredweight and quarter hundredweight pyramid boxes, and what are called cools—that is a sort of tub, rather wider at the top than at the bottom; some of it is packed in pound and two pound rolls for the London market. If it is made in the hot weather we are at a disadvantage, because we have no ice, and it is very hard for us, because we must get the water cold enough to make the butter firm for working. If you cannot get the butter firm before it is worked the result is that you have an undue percentage of water in it; if on the other hand you have ice, there is nothing to prevent you working the per-centage of water down to 10 or 11 per cent. if you like, although it is not desirable, I think.

Distinction between co-operative and proprietary dairies.

45,142. (*Viscount Cobham.*) Do you dispense with the washing process?—We do not wash it at all. We do not believe in washing it, because that spoils the grain of the butter and its texture, and it spoils its flavour also. People who are judges of it say it spoils its keeping qualities. I should like to make this distinction between our co-operative dairies and the proprietary dairies a little plainer, if I might. The first creamery dairies that were started in Ireland were started on the proprietary principle; that is, a small body of individuals, owned the whole concern and worked it for their own profit. As a matter of fact, they were in very few cases successful, and at the present time there are several of them in the market which the farmers are thinking of purchasing themselves, and working as co-operative creameries. They only paid one price for the milk, and wherever they did try to buy according to the quality, the farmers were not allowed to be present at the testing of the milk, and so did not believe that they were fairly dealt with, and they were sometimes led to stop supplying the creamery because their price was reduced. Then they used to sell the separated milk, the butter-milk, back to the farmers again, and that had several bad effects. In the first instance, the farmer did not buy enough of it for his own stock; sometimes he did not buy it at all rather than pay a price for it. Then there was another thing happened. Sometimes, some of this milk was left over for a time; it was not all taken away immediately by the farmers, and rather than lose this milk, it was kept from day to day in the skim-milk tank. Fresh separated milk was added to it, and the whole mass of milk became contaminated. When the co-operative dairies were first started in the country, it was alleged that the separated milk had a very injurious effect on young stock. That charge was almost entirely due to the fact that hitherto they had only got this milk which was sold at 1*d.* a gallon, and which had very often been kept in dirty tanks, and which had turned sour before being brought

Mr. R. A. Anderson.

4 April 1895.

home. In the joint stock system which followed the proprietary system, shares were owned in some cases by the farmers, and in other cases by people who had no connexion with the farmers, but the profits were all divided in proportion to the shares. It generally happened that the management of these creameries got into the hands of half-a-dozen men with more money than their neighbours. Their object was to keep down the price of milk as low as possible, in order that they might earn a big dividend, so that it was practically the same in effect as a proprietary concern. Several of these joint stock companies have been converted into co-operative dairies, and, as I have said before, several proprietary concerns are now offered for sale to the farmers' co-operative societies, if they wish to take them up.

Fixing price of milk.

45,143. How do you fix the price of the milk you take?—The price of milk is fixed in this way; you take the quantity of butter produced and the amount that it realises when sold, you estimate the value of any quantity on hand, you deduct from that all the working expenses and then there are tables issued by our society which enable the manager to calculate the price he can pay for milk producing, we will say, 4 per cent. of butter fat, when the price of butter is at 98*s.* per cwt. and allowing a reasonable amount for working expenses, I might say, roughly speaking, that 1*d.* per pound is generally allowed for working expenses.

45,144. Is that the price you charge to the farmer?—That is the price which is charged to the farmer.

45,145. Irrespective of the market?—That would be irrespective of the market in any case.

45,146. (*Mr. Little.*) Do they know beforehand what they are going to get?—No, not in the co-operative dairies.

45,147. Do they learn it periodically?—Yes. Some dairies pay once a fortnight and others once a month. In the proprietary system they had to quote a price to the farmers in advance.

45,148. They had to contract in fact?—They had to make a contract. Last year one proprietary creamery contracted to buy the milk of the farmers at 4*d.* and that smashed them up, they could not pay it.

Treatment of creamery sewage.

45,149. (*Viscount Cobham.*) Have you got reliable scientific information with regard to the treatment of creamery sewage?—We have absolutely no information on it, and we cannot get any. I wrote to the Board of Agriculture and asked if they could get us any information as to how to deal with it, and they referred us to the Irish Local Government Board; I wrote to the Irish Local Government Board and they told us that if the creamery sewage was either used to irrigate a piece of land (which the creameries do not possess), or if it was passed over a large filter bed (which the creameries had not the money to erect) it would fulfil the necessary conditions; but that if any of the creameries discharged their sewage into any watercourse or river, they would be liable to an action at law. As a matter of fact the authorities have threatened to close up one co-operative creamery now which is discharging its sewage into a stream, although the whole drainage of a village, which is above the creamery goes into the same stream. But the authorities do not suggest any remedy at all, they simply tell us that we must not dispose of our sewage in this way.

45,150. (*Mr. Gilmour.*) Has it been proved that the fish in this stream below the creamery are killed?—I do not think there are any fish in it; there are, perhaps, a few small trout. I know several streams where sewage is run direct from the creamery into the stream, and so far from it being the case that it kills the fish I have myself seen large trout waiting for the sewage to be discharged.

45,151. From the creamery?—Yes.

45,152. Of course, ordinary sewage from a village does not injure fish?—No. There is a system which we are thinking of trying in one creamery as an experiment, it is called the Oxygen Purification System. It consists in running the sewage into several tanks and treating it there chemically in order to induce a tremendous growth of micro-organisms which will destroy all the organic matter in it. But that will be very expensive, and it will be only an experiment after all, and we do not know whether it will pay or not. Creamery sewage contains a lot of albuminous matter which is very hard to get rid of.

45,153. (*Viscount Cobham.*) Have you investigated the subject of the artificial ripening of cream?—On that subject we have hardly any information. It is known very well in Denmark and Sweden. There you can buy the milk cultures and you can introduce them into the cream and ripen the cream according to a fixed rule. In Ireland we have to ripen it by rule of thumb. We have no information on it at all.

Mr. R. A Anderson.

4 April 1895.

Artificial ripening of cream.

45,154. Have you a fixed standard for pure milk?—Whenever the milk went below 2·75 of fat the creameries as a general rule used to prosecute; they do not prosecute now because they merely pay for it according to its quality. But it is felt that this standard is an absurd one, and that no milk ought at any time to show such a small per-centage of fats. Our figures go to show that it is never below 2·85, and that is when cows have just calved, and their milk ought not to be sold, because it is not fit for use. What has been suggested from time to time is that there should be two standards adopted, one, 3 per cent. of fats from January to July, and the other, 3·25 per cent. from July to December.

Standard for pure milk.

45,155. And that that standard should be enforced?—Yes. Even that would allow people whose cows produce rich milk to water it down tremendously.

45,156. Is there any systematic instruction in cheese-making in Ireland?—A very little instruction was given in one or two cases, but it came to nothing. There are times in the year when cheese might be very profitably made, times when butter is low. Cheese maintains its price more regularly than butter does. But we do not know how to do it. We do not know anything about it, and have no way of getting the information.

Instruction in cheese-making.

45,157. Are those subjects in which you think investigation should be made by some central authority?—I think if we had information on these subjects of the treatment of the creamery sewage, and the ripening of cream, and if we had some standard established for pure milk, and some instruction in cheese-making and the preserving of the cream it would be a great help to us. The only dairy in Ireland that I know of at present which sells preserved cream, is a dairy owned by the Surrey Dairy Company. This dairy is situated in the county of Cork, not very far from Doneraile, where the agricultural bank has started. They send the cream across to Guildford in steel cans, and it comes back in little crocks and is sold in Dublin retail; after having been sent over to Guildford to be treated it comes back to be sold in Ireland again, and the people pay 4*s.* a quart for it, which is equal to 4*s.* a lb. for butter. We have no information about that; we cannot find out how it is treated. We have only one dairy instructor for 200 creameries.

Dairy instruction.

45,158–9. Is that the extent of dairy instruction at present available?—He is the only itinerant instructor. There were two ladies who were appointed who used to go about and lecture at various places, but I do not think they are employed at present, in fact I am sure they are not. This young man was employed by the Commissioners of National Education, and he is under their control. He goes out from Glasnevin and we get reports of his visits to the co-operative dairies with the notes he has made about what he considers is done wrong there. Last year he did not visit more than one third of them, although there were only 33 at work. It would be absolutely necessary that these dairies should be visited at least three times a year in order to do any good at all. I might mention about dairy instruction that this Agency Society which undertakes the sale of butter has given a good deal of instruction in butter-making. It has got an expert who is an inspector of butter in connection with the agency, and whenever it is found out that a dairy is making inferior butter this man is sent down to the dairy at the expense of the society. The dairy people are not told whether he is coming or not, but he is just sent down there so that he can at once put things to rights. I have known cases where the value of the butter has increased from 10*s.* to 15*s.* per cwt. in consequence of his visits.

45,160. Those visits were made in connection with the Agency Society?—Yes.

45,161. Does your Organization Society do any work of that sort?—We have no funds for it, but we should like to do it, immensely, if we had.

45,162. Is it within the scope of the Society?—Several times we have paid this man's expenses in going to dairies where the case was urgent.

Mr. R. A. Anderson.
4 April 1895.

Munster dairy school.

45,163. The best known dairy school in Ireland is the Munster Dairy School, I believe, is it not?—The Munster Dairy School is the most important one. They have done very good work in the country and they are trying to extend their operations. They are trying to get a grant from the Government of 8,000*l.* in order that they may acquire some additional land. The farm which they have got at present is much too small, and they have only got accommodation for 36 pupils, so that it is very hard for them to give much instruction. They have trained a number of pupils up to the present. Since the school was opened in 1880, 799 female pupils and 144 male pupils have been trained. Then they have three dairy sessions of two months each for girls and one from the 20th July to 20th December for boys; but as you remark there is not much use in a dairy session that only lasts for five months in the year. It ought, at all events, to last for a complete year to be of any use. The fees that they charge for girls are three guineas for a session, and for boys seven pounds. That includes maintenance.

45,164. Are these fees generally paid by the parents?—Yes, and sometimes they are paid by the owner of a creamery or by the committee of a creamery who have got a girl they want to have trained.

45,165. Do the farmers realise the advantages of this training?—At first they did not, but now they seem to be much more alive to it because they see it has brought about a great improvement in the making of butter. The local committee of this Munster Dairy School subscribe a certain sum of money towards the manager's salary; they give 50*l.* a year for that, and they also give about 50*l.* or 60*l.* a year in prizes.

45,166. What has the effect of the school been on the quality of Irish butter?—It has improved enormously, not only in the immediate neighbourhood but also in other places where these dairy maids have been sent. One of these dairymaids is at present employed by one of the county councils over here as dairy instructress, and she is looked upon as a great authority.

Improved quality of Irish butter.

45,167. Has the quality of Irish butter generally enormously improved of late years from this and other causes?—Yes. I think you may take it that except in two counties it has improved.

45,168. What counties are those?—Kerry and Clare. I do not think it has improved at all there. Creameries have not been generally introduced in either county. At present a number of new creameries have started, but they are only building their dairies in Kerry, and there are only two or three dairies started in County Clare.

Export of Irish butter.

45,169. Has the quantity of butter exported largely increased?—I do not think it has. Butter has been so unprofitable latterly that it would be rather decreased than increased, I think, unless the increase is due to the increased output of creamery butter. It is very hard to get any reliable information about the export of butter from Ireland. There is no record whatsoever kept at Dublin of the quantity of butter exported. There is a record kept at the other ports but not at Dublin. It is estimated by various people that the value of the butter exported is about seven millions or eight millions sterling, but I do not think it is so much.

Munster dairy school.

45,170. (*Mr. Little.*) No record is kept on this side that you know of, I presume?—I think that no record could be kept very well here, anyway nobody has been able to get it. This Munster Dairy School has another point about it which is perhaps not connected with dairies. They have got no sheep on the farm and they cannot give the boy students any information about sheep, and they have only got 126 acres of land, which is entirely inadequate. What they want the Government to do is to give them 8,000*l.* to increase the accommodation for pupils, and to give them an annual grant equivalent to the average which has been contributed by the Board of Education for the last seven years; they will then go to the boards of guardians in the County Cork and elsewhere and try and get the guardians to levy an educational rate of ½*d.* in the £. If they can get this done they will be able to get a sum from the Science and Art Department equivalent to the grant locally raised which of course will give them funds for much greater effort.

45,171. (*Viscount Cobham.*) Is there a technical education grant for Ireland as in England?—Yes.

45,172. How has that been expended?—The total amount is about 9,000*l.* I think, 5,000*l.* of which goes to the Royal Dublin Society. The Royal Dublin Society at their last meeting decided on withdrawing from the Munster Dairy School an annual grant of 50*l.* which they used to give it. These are the actual figures:—The gross expenditure of the Commissioners of National Education upon agricultural education in 1893, as per their report, was 9,692*l.* 19*s.* 8*d.*, less received per produce of farms, pupils' fees, &c., 5,182*l.* 6*s.* 2*d.*, making a total expenditure of 4,511*l.* 13*s.* 6*d.* Then there was the grant of the Royal Dublin Society for the improvement of horse breeding 5,000*l.*, making a grand total of 9,511*l.* 13*s.* 6*d.* That is all that is given to Ireland for educational purposes.

Mr. R. A. Anderson.
4 April 1895.

Expenditure on agricultural education in Ireland.

45,173. It is much more than that, is it not?—That is for agricultural purposes. In England, I believe, about 73,000*l.* is paid. Denmark pays 35,000*l.* a year, and it is only a quarter the size of Ireland, and they have raised the production of butter in Denmark from a million and a quarter in 1865 to over five millions.

45,174. Pounds sterling?—Yes.

Glasnevin model farm.

45,175. Have you anything to tell us about the Glasnevin Model Farm?—I cannot give you much information about that. I have been connected with the Munster school for some years. I have been on its committee and I knew the working of it very well as I have taken a great interest in it, but I have never had anything to do with the Glasnevin Model Farm, except knowing that pupils have been trained there—and very well trained, as far as it goes. I do not think in either place they have got sufficient land or sufficient means of giving practical instruction. We always find about the girls and men trained in the Munster Dairy School that they know the A B C of their business very well, but they have only been taught how to play at butter-making, and whenever they come into a big dairy where they have to deal with thousands of gallons of milk and hundreds of pounds of butter, they become utterly bewildered and lose their heads. So we insist on every manager and dairymaid first spending a term in one of the existing dairies, where they learn the practical part of the business, after they have learnt the theoretical part at the Munster Dairy School. We find that that is the only way in which they can get a thorough knowledge of the business.

Relation of Irish Agricultural Society to dairy societies.

45,176-8. What is the relation of the Irish Agricultural Organisation Society to the Dairy Societies?—It is purely an advisory body; it does not exercise the least control over them in any way whatever. They come to us when they are in trouble and ask for advice and assistance on every conceivable point. We are asked to give them advice on legal points connected with their rules and we give them much technical instruction as to their machinery, where to buy it, what kind of machinery to use, how to construct their creameries and how to manage their business generally. Then we get them the best information we can about markets and about the latest developments of dairying in other countries.

Number of cows to a creamery.

45,179. (*Mr. Lambert.*) How many cows are necessary to keep a creamery going?—Not less than 500.

45,180. How big an area would that embrace?—You ought to get that number of cows easily within a radius of two miles: you ought to get it within a mile and a half of the creamery.

Water supply of creameries.

45,181. Is it necessary to have a large supply of water at the creamery?—Yes.

45,182. A very large supply?—About 2,000 gallons a day; it does not follow that it need all be pure spring water, but there ought to be a large quantity of water used in keeping the place thoroughly clean and in sluicing it frequently. Then you want a large quantity of water to cool down the cream; the water has to be freshly pumped into the cooling tank where the cream is put to stand, and it has to be kept moving, because if you allow it to remain standing in the tank it gets heated, of course, in the hot weather.

Foreign competition.

45,183. To what do you attribute the price going down 1½*d.* a pound between 1893 and 1894?—To foreign competition entirely.

45,184. Entirely foreign competition?—Yes.

Co-operative sale.

45,185. Have you perfected your scheme of co-operative selling?—Yes; but that would not affect the foreign competition; it would simply reduce the cost of selling; it would not level the prices up in any way; it could not tend to put the prices up.

Mr. E. A. Anderson.

4 April 1895.

45,186. I do not know that it would give you a larger price?—It would not return for the butter a larger price, but it would return to the farmer a larger profit, because it would save the middleman's profit.

45,187. How have you arranged your co-operative selling; have you agents in London?—Yes, and in Manchester.

45,188. How are they paid?—They are paid a commission on the sales, they guaranteeing a certain percentage on the bad debts. They get 1 per cent. on the sales, and they guarantee 10 per cent. of bad debts. They get no salaries.

45,189. They are something like the ordinary commission agents, are they not?—Yes, but instead of carrying it on on their own hook, they are working for this association of farmers, and are liable to be dismissed at a month's notice if they misconduct themselves, and then they can only sell to such persons as the society approve.

45,190. Where is the committee of the Society; does it come to London?—No, it stays in Limerick.

Reputation of Irish butter.

45,191. Do you think that your Irish butter is gaining favour in the London market?—I think it is. It has got a good deal to contend with in the way it is treated by the railway companies. It arrives in a very bad condition; frequently it arrives with the packages broken, and with dust and dirt mixed up with the butter.

45,192. What kind of packages do you send it in?—To the London market it is chiefly sent in half hundredweight packages. A good quantity of it is now made up in rolls in the same way that the Brittany butter is sent off, that is, 12 two-pound rolls in a box.

45,193. Do you anticipate that the Irish butter made under the creamery system will take the place of Brittany and Danish butter?—It would be impossible to foresee whether it would or would not. We are trying to do our best in that direction.

45,194. Do you think it is edging its way in?—We would have to undersell them to do it, because that butter has got a great name in the London market.

45,195. Do the creameries in Ireland produce a uniform quality of butter?—Pretty nearly. There are, unfortunately, cases where creameries do not make the butter quite as good as they ought to, but that is entirely due to defective training or carelessness. It may in hot weather, such as we had two years ago, be due to the want of ice.

45,196. Of course, you know that the system which is pursued in France is different from your system?—I know it is.

Creamery system and factory system compared.

45,197. Would you consider that the creamery system is preferable to the factory system?—In Ireland it is certainly, because you would have to reform the conditions of Irish dairy farming altogether if you wanted to adopt the factory system, and you would have to teach every woman who makes a pound of butter in Ireland how to make it properly, you would have to build new dairies on special and proper principles, and you would have to have a system of inspection which would ensure the dairies being kept properly clean. You must recollect that the bulk of the butter which comes from Ireland is manufactured in districts where the people are untidy. I have known cases where some of the butter made in County Kerry was stored in a room where there was a patient suffering from typhus fever.

45,198. And I believe it is frequently kept where the family live?—I have seen the butter put for the cream to rise under the bed which was occupied by the whole family, where there was only one room for the family to live in, where the pig was in one corner, the cow in another, and the bed with the milk under it in another.

Working expenses of creameries.

45,199. (*Mr. Giffen.*) Referring to the table on the top of page 5 of your brief, would you tell me whether the column of working expenses includes the expenses of conveying the produce to market?—Yes, that is so.

45,200. Is that the chief element in the working expenses?—I do not think it is. It would be one of the most important expenses, but I should think that the wages would be almost the most important.

45,201. The working expenses altogether come to about 10 per cent. of the gross returns?—Yes, about that.

45,202. If the freight is the chief item, say, half of the total, that would mean that not more than 5 per cent. of the gross return is spent in freight?—About 6 per cent., I think, would cover the working expenses of a properly managed and large creamery with a sufficient supply of milk, but, of course, where you have got a small supply of milk the whole working expenses have to be spread over a smaller quantity, and consequently the proportion would be heavier.

Mr R. A. Anderson.

4 April 1895.

Freight on Irish butter.

45,203. Would that not go to show that freight is not a very serious matter for butter production in Ireland?—The freight is a pretty serious item and it is taken into consideration in the price which is paid for the butter. As a general rule the purchaser pays the freight, but that is deducted off the price and therefore it would be of course charged as working expenses inasmuch as it would be taken off the price that was realised by the sale of the butter and would reduce the net return.

45,204. Still unless it all appeared in this column it would not show the proportion of the freight to the gross return?—No. But it would be impossible to do that because the butter is sent to so many different places, and where the consignee pays the carriage on it it would be very hard indeed to make an estimate of what the total freight on the output of the creamery would be. Roughly speaking, I should think it would be about 35*s.* a ton.

45,205. How much would that be per cent. upon the gross income from the butter?—It would be about two per cent.

45,206. It is not a serious element then in the cost of the butter?—No, I do not think it could be very serious. Of course that 15,398*l.* for working expenses includes depreciation.

45,207. (*Mr. Little.*) And interest on loans?—The interest on loans and the interest on share capital would come out of this 1,992*l.*

Loss by bad treatment of butter in transit.

45,208. (*Mr. Giffen.*) Still, I was desirous to have an idea of how much the butter producers of Ireland were damnified by having expensive freights to pay for reaching the market in England?—They have very expensive freights to pay if they send small quantities of any article to England. For instance, if they want to send a single hundredweight of butter to Glasgow the rate from Limerick to Glasgow is 2*s.* 3*d.* for a single hundredweight, whereas a Glasgow shopkeeper can get in a hundredweight of butter from Copenhagen for 1*s.* 8*d.* The difference in the way that the butter is treated is rather striking. The Danish butter is sent in without any cover, except the wooden case that it is put in; it is all packed in hundredweight casks. The Irish butter is not only put in these packages but it is carefully wrapped in one and sometimes two canvas covers. In spite of that I have seen the firkins and boxes arriving in such a filthy condition that positively if you did not know the butter inside was good, you would not look at it a second time.

45,209. Still there is not much difference between 2*s.* 3*d.* per hundredweight and 1*s.* 8*d.* per hundredweight when the butter itself comes to over 100*s.*?—It is when you take into consideration the difference in the way in which the butter is treated. When, perhaps, you lose a pound or two pounds on each package by having to scrape off the top of the butter and some of the sides in order to get rid of the dirt that is driven into it by the way it is banged about on board ship, that makes a serious difference. The purchaser, at any rate, will take that into consideration, and he will not pay within 2*s.* of any price that he will pay for butter which has not been damaged in transit.

45,210. Do you include in this estimate that butter which is scraped off in the way you describe?—No, we have no means of ascertaining that.

45,211. You only include the net amount?—The net amount that is realised by the sale of it.

45,212. So that if that wastage could be prevented the return to the Irish producer would be so much more?—The value of the output would be increased by so much.

Situation of creameries.

45,213. I understand from what you say that the creameries are in the south of Ireland mainly, and not in the north?—They are in the west and the south—the south-west really. You may say they are nearly all in Munster.

45,214. Would you consider that the creameries exist in the best parts of Ireland for producing butter?

Mr. R. A. Anderson.
4 April 1895.

—Yes, I think so. I think the districts where they exist are certainly amongst the best producing districts.

Bad treatment of butter in transit.

45,215. Are they good pastoral districts?—They are. I might mention that in 1893 I was over in Manchester for six weeks looking after this Agency Society, which had been established for the sale of butter. I had to go there when it was being started and look after it. That year was very hot, and I saw butter coming in from Ireland frequently, and delivered by the railway companies in a liquid condition, so that you could have poured it out of the boxes. I have seen it coming in when the cask and the butter and the paper which went round the butter were all mixed up, so that you could not tell one from the other; you saw the staves of the firkin sticking out of a lump of half melted butter. When you went to the railway companies for compensation they told you it was the act of God. The act of God consisted in leaving this butter to rest in their yards under a broiling sun instead of delivering it.

45,216. A little ice would have prevented it?—Yes.

Co-operative purchase of manures and feeding stuffs.

45,217. (*Viscount Cobham.*) I believe you wish to add something as to the working of the other societies which you represent?—Yes. The other societies which have been formed by us were, in the first instance, generally formed for purchasing farmers' requirements. It might be interesting to the Commission to know that there are some societies established in the County Kilkenny which have been able to buy super phosphates containing 26 per cent. of soluble phosphates at 2*l.* 10*s.* per ton landed in Dublin, the carriage from Dublin to their station being 7*s.* 10*d.* per ton; they being able to buy super phosphates containing 30 per cent. at 2*l.* 15*s.*; 33 per cent. at 3*l.* 1*s.* 3*d.*, and 35 per cent. at 3*l.* 6*s.* 9*d.*, plus 7*s.* 10*d.* per ton with 2½ per cent. discount off for cash. All the local prices charged for the same article were 5*l.* to 5*l.* 15*s.* per ton; and they got no guarantee as to quality, because that was before the Fertilisers and Feeding Stuffs Act came into operation. These societies therefore have actually effected a saving of 2*l.* a ton in the first year's purchase of these articles by going to the manufacturers instead of to the local dealers. The Fertilisers and Feeding Stuffs Act was never put into operation at all until these societies were started. These societies make use of it. They get samples taken and analysed and so the poorest member of one of the societies now can have his ¼ cwt. or any quantity he buys of any fertiliser tested and examined, and then he knows what he is paying for. These societies, which consist of about 200 members in each case, the value of their purchases amounting to between 2,000*l.* and 3,000*l.*, have, it is estimated, saved close on 2,000*l.* on the purchases, which they made in a few districts in Kilkenny. This is only the first experiment we have made in agricultural co-operation. They have bought turnip manure containing 20 to 22 per cent. of soluble phosphates, 7 to 10 per cent. of insoluble phosphates and 1 per cent. of ammonia at 3*l.* 7*s.* 6*d.* per ton, the local dealer charging 5*l.* 10*s.* 6*d.* Add to the 3*l.* 7*s.* 6*d.* 7*s.* 10*d.* for carriage and you will see there is a saving effected as nearly as possible of 1*l.* 15*s.* per ton. They have bought seeds with almost the same result, they have bought machinery and effected an enormous saving on it. One society has bought a thorough bred and a shorthorn bull, it has bought two stallions, a thorough bred stallion, and a cart stallion; it has hired a large disused mill for the storage of the corn grown by the members; it has undertaken the sale of the wool grown by the farmers to the manufacturers; it has bought threshing machines for the use of the members and corn drills. There is another point I should like to bring before the Commission. There are certain forms issued by the Board of Agriculture over here giving instructions to purchasers of fertilisers and feeding stuffs, how to take samples and to have them analysed; no such forms exist in Ireland, and they have never been published by any body in that country which has been interested with the administration of the Act of Parliament, and we cannot get them there from the Queen's Printers or any one else. We represented the matter to our Local Government Board, who are the responsible body, and they told us that they had never even heard of the forms.

Sampling and analysis of manures.

45,218. Do not your local authorities concern themselves with such questions?—The local authorities never bother themselves about it, because the local authorities are very largely composed of men engaged in selling these manures whose interest it is to keep the working of that Act as much as possible in the background.

Mr. R. A. Anderson.
4 April 1895.

45,219. The provisions of such Acts of Parliament are generally explained here by the county councils, have you nothing of that sort in Ireland?—No.

45,220. (*Mr. Giffen.*) I believe you have no special agricultural department in Ireland?—We have none.

45,221. (*Mr. Little.*) Have you applied to the Board of Agriculture in England?—We applied to them and they referred us to the Local Government Board for Ireland. In the end we had to have these forms printed at our own expense, and they are forms prescribed by the Act of Parliament.

45,222. Why do you not get a question asked about it in the House?—When Mr. Plunkett goes back I suppose he will ask a question.

45,223. (*Mr. Clay.*) What did the Local Government Board in Ireland do in answer to you?—They told us they had never even heard of these forms, and that they did not issue them.

45,224. Were the high prices you have mentioned those charged by small dealers?—Yes, as a matter of fact every week I get circulars from the manufacturers giving the prices to the individual purchaser of these articles, and they average about 5*l.* Take superposphates with 25 to 27 per cent of soluble phosphates, the average price is about 5*l.* to five guineas per ton; that is the very article that these people have been able to get for 2*l.* 17*s.* 10*d.* delivered at their nearest railway station, and this 5*l.* and five guineas per ton means delivery in Dublin, so that it would have 7*s.* 10*d.* added on to it if I wanted to send it to the particular station these people want it at.

45,225. (*Mr. Gilmour.*) With reference to what you are wanting to get done at the Board of Agriculture, do you refer to the leaflets alone, or do you refer to the forms of analyses?—Both; the instructions to purchasers such as are issued by the Board of Agriculture and the forms prescribed by the Act of Parliament which are to be filled up by the local authority.

45,226. These leaflets are issued really to every person whether in Ireland or in any other place who applies for them?—I wrote to the Secretary of the Board of Agriculture, and he referred me to the Local Government Board for Ireland.

Farmers' Supply Association.

45,227. (*Mr. Clay.*) Have you anything in Ireland in the shape of Farmers' Supply Associations the same as we have in Scotland?—That is what we are seeking to form in the case of these local associations and then to federate them into a strong body.

45,228. For your information I would recommend you to examine the principles of the Farmers' Supply Association which we have in Scotland. The Association is governed directly by the landlords and the farmers, and they send out a price list every week or every month which keeps the farmer in close touch with the prices of the articles that he is using, and of every commodity that he wants on the farm, such as manures, cakes and machinery?—Such an association would be very valuable indeed. I think one of the points that would be admitted about these associations of ours is that they are a great advantage to the small occupier. The small occupier was formerly completely in the hands of the middling people in making these purchases. In buying seeds, for instance, he had to take whatever seeds were given to him; he could not ask any questions, and he had no redress if they were bad. He can now get his seeds just as his richer neighbours can get theirs. He can buy just the same as the rich man, and like the rich man he can get them comparatively speaking at a lower price.

45,229. (*Viscount Cobham.*) How did you establish these societies; was there not a considerable difficulty at first starting?—We had very great difficulties to encounter from the trade. We were threatened by all sorts of things. We were threatened to be boycotted and we were threatened with personal violence, but in spite of that we determined to carry it on. I have here a circular which is a unique thing in its way. It is a circular issued by a body of these local traders, and this is one of their resolutions. "That we invite the co-operation " of all traders in town and country districts to support " us and that every trader in this association do with- " draw orders and close accounts with any manufacturer " or producer who tenders in future to, or supplies " directly or indirectly, co-operative societies."

Mr. R. A. Anderson. 4 April 1895.

45,230. (*Mr. Clay.*) We were met in the same way in Scotland and were threatened to be boycotted by the traders, but of course we paid no attention to that and now we have become a very prosperous society, paying about four or five per cent. on the capital invested. If you like I can give you an address which you can apply to and get all the information as to our Farmers' Supply Association. I can assure you it is working most admirably?—I should like to have that address immensely; it would be a very great benefit to us to get all that information.

45,231. (*Sir Nigel Kingscote.*) You say this Association has done away very much with the middlemen in buying, but how was the butter sold? Suppose any small man had butter to sell how was he able to do it; did he take it to market, or was there what we call in this country a higgler, who went round and bought it, and was the small man very much at the mercy of the higgler as to price?—It was done in both ways. In some cases they used to take into the market their butter, or whatever it might be, and sell it there to the highest bidder, and just as in buying pigs the highest bidder did not very often exist, because these people had arranged beforehand what prices they would pay. They were all working in with each other and paid a certain price for middling butter, a certain price for indifferent butter, and a certain price for bad. In the case of eggs, the eggs are collected by people who are called in the west of Ireland "egglers." They go about with a cart and packing cases, and they pick up the eggs along the road and take them away. They barter tea or sugar or things like that for these eggs, or pay cash. These eggs are very often kept for a month or six weeks, then they are put on the market, and I believe they are classed over here as "eggs"; they are not said to be "new laid" or "fresh," but "eggs" merely. The effect of that is, of course, to run down the quality of the Irish eggs. Now we have started in connexion with these creameries a system of collecting eggs from the people who supply milk. They bring in once a day with the morning's milk the eggs, which are sent away every day fresh out of the creamery packed in proper cases and with proper straw. Some of these local egg dealers, however, use musty straw, which would spoil the best egg in the world and the freshest. The straw is carefully selected at these creameries, and we are already getting a very good name in the English market.

Marketing of eggs.

45,232. Do you get any more money for them?—Yes, much more, because we can guarantee that they are fresh.

45,233. (*Mr. Giffen.*) What sort of prices do you get?—The present prices for eggs are very low. They would range, I think, about 6*s.* 6*d.* a hundred, or something like that; but after a time, this Association for the sale of the produce intends, as the capital increases, to start retail centres over here for the sale of this produce. But you cannot do a retail and a wholesale business together; you must either do one or the other. If we attempted to do both now, the wholesale men would give up buying their supplies of us, so that we have to make use of them for a time.

45,234. The price you mention comes really to about 9*d.* a dozen?—It comes to hardly as much as that; that is for the very best of them.

Management of co-operative societies.

45,235. (*Viscount Cobham.*) Does your agricultural society keep a supervision over these co-operative societies which have been formed?—Continual supervision; but we cannot, unfortunately, dictate to them how they shall do their business; we can only advise.

Mr. R. A. Anderson. 4 April 1895.

45,236. Do you find that the management on the whole is businesslike?—Yes, I think it is, very; it is wonderfully so. There is another feature about it, which I think is even more encouraging. We have started these societies in places where the feeling was not very good between the landlord class and the tenant class, and we have always found that the formation of a society like this has taught them business habits, and that they have, in a great measure, given up this bickering which they used to go in for before. We have seen cases where the local landlord—perhaps not a very popular man at one time—has been appointed chairman of the society, and he and his neighbours are living in perfect harmony with each other, simply because the society has formed a link between them and a place of meeting where they could all come together and transact business without raising contentious matters. We have found that it has had an excellent effect in that way.

45,237. What class of people are the boards of management generally drawn from?—They are drawn altogether from among the best men, the most sensible men in the community, quite irrespective of what their means may be, or their share qualification.

45,238. Farmers and consumers?—No, altogether farmers.

45,239. (*Mr. Gilmour.*) Altogether from those who are supplying?—Altogether from those who are shareholders and connected with the shareholders.

45,240. Is a landowner chairman?—Generally, if a landowner is willing to take the post they always like to have him. I should just like to say how these societies work. Some of the supply societies, as we call them, which have been formed for purchasing farmers' requirements, buy for cash, and others for credit. Those who buy for credit give security to the manufacturer for the repayment of their accounts. The security is given in this way. The committee in that case are composed of the largest shareholders, and the most solvent farmers in the parish. Those men are put on as a committee; they give their individual and joint security to the manufacturer that the accounts shall be paid. In addition to that they collect a per-centage on the purchase money which is paid down as an insurance fund against bad debts; that is held over until the end of the year when the accounts become due, and if any man becomes a defaulter his account is paid out of this deposit that is collected and he is proceeded against by his society and expelled from the society for his default. In the selection of members of the society, great care is exercised just as in forming an agricultural bank. Another safeguard that they make use of is that supposing a man wants to buy a larger quantity of manure or seeds than they think he can pay for or wants, the committee cut his order down to proper dimensions before they sanction it.

45,241. (*Viscount Cobham.*) Are these supply societies distinct from the co-operative agricultural societies?—They are all co-operative, inasmuch as they are all worked or governed by the members, and if they make a profit that profit becomes the property of the members in proportion to their trade done with the society.

45,242. (*Mr. Gilmour.*) Are they entirely distinct from the creameries?—Yes; except that the creameries are undertaking this particular class of business, and in some cases are buying seeds and manures for their members and so forth. Most of these societies have a rule—which is a very good one in Ireland—that no religious or political matter shall be introduced at their meetings. That is absolutely necessary.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Eighty-sixth Day.

Friday, 5th April 1895.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
SIR ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., } *Assistant*
ALAN MACKINNON, Esq., } *Secretaries.*

Mr. F. L. Robinson, C.B.
5 April 1895.

Mr. FREDERIC LACY ROBINSON, C.B., called and examined.

45,243. (*Chairman.*) You are Deputy Chairman of the Board of Inland Revenue, I think?—Yes.

45,244. You are well acquainted with the subject of the Land Tax?—Yes.

45,245. And the assessments under it?—Yes.

History of the Land Tax.

45,246. Will you give us a short statement of the history of that tax, and explain how the quotas were originally established?—Yes. Whether or not the origin of the existing land tax be correctly traced to the duty called escutage or scutage which resulted from the feudal system it seems tolerably clear (*vide* Blackstone, cap. 8, Book 1) that periodical assessments of a specified sum of taxation on each county, the subsidies which preceded them, and the more ancient scutage, hydage, and tallage, were to all intents and purposes a land tax—and Blackstone appears to have been surprised at the "popular opinion" which "has "prevailed that the land tax was first introduced in the "reign of William the Third because in the year 1692 "a valuation of estates was made throughout the "United Kingdom." But there is no doubt that this so-called land tax of 1692 was in fact a property tax—in its wide sense—personal estate being as much the object of charge as landed estate, the profits and salaries of persons holding offices were also taxable so that it was also a partial income tax. The terms of the Act of 1692 show this clearly enough. They were as follows: Section 2. "That every person, body politic, and cor-"porate, &c., having any estate in ready monies, or in "any debts owing to them, or having any estate in "goods, wares, merchandise, or other chattels or "personal estate whatsoever within this realm or "without, shall yield and pay unto their Majesties four "shillings in the pound according to the true yearly "value thereof, that is to say, for every hundred pounds "of such ready money and debts and for every hundred "pounds worth of such goods, wares, &c., or other "personal estate the sum of four and twenty shillings." This assumed the true yearly value of 100*l.* to be 6*l.* The third section imposed a duty of 4*s.* in the £ upon profits and salaries of persons holding offices, &c. And the fourth section was as follows:—"And to the end a "further aid and supply for their Majesties occasions "may be raised by a charge upon all lands, tenements, "and hereditaments, with as much equality and in-"difference as is possible by an equal pound rate of "four shillings for every twenty shillings of the true "yearly value; be it enacted that all manors, messu-"ages, lands and tenements, and all quarries, mines, "&c., and all hereditaments, of what nature soever "they be, shall be charged with the sum of four "shillings for every twenty shillings of the full yearly "value." These sections prove conclusively that at the period of that Act the tax was intended to be a tax (to quote a Scotch financial expression) "on means and "substance," which was in fact the character of all the previously imposed subsidies. It was in 1697 that the land tax was imposed in its present form, namely, a fixed sum for the whole kingdom to be raised in quotas specified in the Act for counties and boroughs being places of separate jurisdiction for land tax purposes. This system was a reversion to and an extension of a plan which was adopted during the commonwealth. By the Act of 1692 (4 Will. & Mary cap. 1) was raised in England and Wales 1,922,712*l.* by a tax of 4*s.* in the £ on real estate assessed on the *bona fide* rack rental and on personal estate, 24*s.* the 100*l.* or 4*s.* in the the £ on 6*l.* the annual value thereof. Stock on land and household goods were exempted. By the Act of 1697 (9 Will. 3, cap. 10) was raised 1,484,015*l.* 1*s.* 11¾*d.* by 18*s.* per 100*l.* of personal estate or 3*s.* in the £ on 6*l.* per cent. the annual value thereof—and real estate by a £ rate the residue of the fixed sum. By this Act the proportion of tax which each district was found to have borne under the assessment made pursuant under the Act of 1692 should determine the ratio in which it was to contribute towards making up the quotas imposed by the Act of 1697. This last-named provision was introduced doubtless because there was an annual decrease in the receipts from the tax between 1692 and 1697, and it was necessary with certainty to get the amount of tax needed for the service of the year. The Acts thence forward for just 100 years were annual, and in the Act of 1797 the last of the Annual Land Tax Acts, the taxation of personal property as the object of the Act was as strongly marked as ever. In that Act after the clauses imposing upon goods, wares, merchandise, &c., and upon pensions and offices the fixed charge of 4*s.* in the £ towards raising the quotas, follow the words, "and to the end "the full and entire sums by this Act charged upon "the several counties, &c. may be fully and completely "raised and paid, be it enacted that all lands, &c. "shall be charged by a £ rate towards the said several "sums by this Act imposed." But notwithstanding this Act the taxation of personal estate to the land tax had dwindled down to a very small sum, when in 1798 Mr. Pitt introduced the Act which made the land tax on real estate perpetual but subject to redemption. The exact amounts assessed on personal property are not known. In 1799 in one division (the Tower Division, London), personal property was only charged on 227*l.* whilst lands were charged at 29,964*l.* In the year 1832–33, 5,214*l.* 8*s.* 4*d.* was the result of a tax at 1*l.* per cent. on the capital value of the personalty of Great Britain, which was, of course, absurd. The land tax on personalty was repealed in the following year 1833. It is only by way of surmise possible to come to any conclusion as to why the tax on personal estate was such a failure. The reason seems to have been that the Land Tax Act provided no adequate machinery for its assessment; this is clearly evidenced by comparing the Land Tax Acts with the Income Tax Acts of 1803 and 1806. It would, moreover, be—especially in the absence of precise instructions—a singularly difficult assessment to make, and doubtless the officials concerned shrunk from the difficult duty and the unpopularity which an attempt to enforce a strict assessment would have involved them in. In addition to this the tendency to regard the tax on personalty as a fixed

Mr. F. L. Robinson, C.B.

Mr. F. L. Robinson, C.B.

5 April 1895.

charge upon the subjects on which it was originally levied operated in the direction of a gradual transfer to realty of that portion of the tax which was originally to have been imposed on personalty. The records of the office throw but little light on the subject, although an order of the Board made in 1798 which I hand in (*see Appendix A. XXXV.*), may be taken as showing that the assessment of personal estate to land tax was not regarded with official enthusiasm. The land tax on real estate has been regarded as, in effect, a rentcharge in favour of the public, variable it is true, but still a rentcharge; and having reference to the large quantities of lands that have changed hands, and been bought and sold subject to land tax, this seems the only practical way to look at the question, more especially in view of the large amount of land tax that has been redeemed under the statutes relating to redemption of land tax. With regard to the inequalities in the assessment of land tax there can be no reasonable doubt that the original allocation of the quotas between county and county was unequal. The allocation of the old subsidies was also unequal. Mr. Davenant, one of the Commissioners of Excise (from 1683), a financial writer of authority, in or about 1700, said, "in the ancient subsidies the "north and north-western counties have all along "been favoured, and reasons for it may be easily "assigned. Worcestershire, Gloucestershire, Here-"fordshire, Shropshire, and Cheshire were subject "to incursions of the Welsh. The four northern "counties and Yorkshire seem always to be on "their guard against the inroads of the Scotch ". . . so that the private and particular charge "in their defence which lay upon those counties "more than others might be a sufficient cause to "given them ease in all public burdens." Gilbert in his treatise on the Exchequer, says "the six associated "counties, London, Middlesex, Kent, Sussex, Surrey, "and Hertford being not spoiled and pillaged in the "civil war, and more hearty to the new Parliament "Interest were taxed higher than in any other counties "in England"—presumably he means according to their real wealth. In 1692 when a new valuation was made for the purpose of raising the so-called land tax those who were favourable to the Revolution returned their estates at a higher value whilst those who were hostile to it took a pessimistic view of the value of their property, and thus as events have turned out managed to escape for all time their proper share of land tax. Davenant, writing in or about 1700, expresses the opinion that in addition to the six associated counties I have mentioned, the following, namely, Bedfordshire, Cambridgeshire, Essex, Norfolk, Suffolk, Berks, Bucks, and Oxfordshire were disproportionately rated. Speaking on the Land Tax in 1732, Sir Robert Walpole alludes to the evasion (practised in 1692) at a time when he could have been contradicted by those who were actually familiar from personal or family knowledge with these transactions. He says "those gentlemen who suffered "most" (from the weight of the land tax) "were those "whose ancestors were a sort of knights errant for the "revolution, they gloried in that happy event, they "thought themselves in honour and justice obliged to "pay their equal share for the support of so glorious a "cause in proportion to the real value of the estates "they possessed, and therefore they gave them in at "their full value." These quotations show that even before 1700 the country contributions and the parish quotas were unequal. The enormous appreciation of property in some localities, and its depreciation in others, have rendered these irregularities simply grotesque. In 1797 Hertfordshire was paying and then had fixed in perpetuity a quota of 41,508*l.* 10*s.* 9¼*d.* By the same statute on Lancashire was fixed a quota of 20,989*l.* 14*s.* 6½*d.* Thus the taxable capacity of Hertfordshire was deemed to be twice that of Lancashire. Now it may be reckoned that Lancashire is 14 or 15 times as rich as Hertfordshire. This is only one out of the numberless examples that could be given of the discrepancies existing. It must be remembered that no redistribution of the parish quotas is permissible. This was definitely decided by the Court of Queen's Bench in 1853 in the case of the Queen v. The Commissioners of Land Tax for the Tower Division. Even if originally the quotas on counties and parishes were fixed on any exact principle, which seems doubtful, it is very obvious that at the present time no principle can be deduced from the anomalies which were perpetuated for all time by the Act of 1797 which made the land tax perpetual but subject to redemption by individual tax payers. That is as regards England, I have got a short note here with regard to Scotland.

45,247. I gather that the view of your department is that the land tax is in fact a rent charge, and the only way of regarding it is that it is a rent charge which properties in different parts of the country have been subjected to, of an unequal character, but still in the nature of a rent charge rather than in the nature of a tax?—Yes, in the nature of a variable rent charge.

Mr. F. L. Robinson, C.B.

5 April 1895.

Land tax a variable rent charge.

45,248. Subject to which, the owners of property have from time immemorial bought and sold their property?—Yes.

45,249. When were the quotas last fixed?—In 1797.

Quotas fixed in 1797.

45,250. Did the Act of 1797 follow the previous Acts with regard to the distribution of the quota?—Yes.

45,251. What was the last date at which there was any change made in the quota?—I should suppose 1697; probably there was hardly any since then.

45,252. Then the unequal distribution of the quotas dates from 1697?—Yes.

45,253. And they were carried on year by year by annual Acts, until 1797, and in 1797 Mr. Pitt's Act finally fixed the quotas for all time to come?—Yes.

45,254. And since then there has been no change?—That is so.

45,255. Are these quotas fixed for counties or for parishes?—The sum mentioned in the Act of Parliament is, for counties and boroughs, or places of separate jurisdiction, as they are called, that is, places which have a separate body of Land Tax Commissioners. The large quota for the county has to be raised according to the parish quotas as fixed practically in 1692. The original assessments of 1797 are kept at the Record Office.

45,256. Does the Act of 1797 mention the quota for each county or for each parish?—For each county.

45,257. Is there a provision in the Act saying that in each county the amount shall be levied according to the quotas fixed in 1697?—That was always regarded as the law, and that law was upheld in the case of the Queen *v.* Tower Commissioners in 1853.

45,258. Have you the Act of 1797 with you?—I am afraid I have not.

45,259. Is it the Act of 1797 which provides for the appointment of Land Tax Commissioners?—Yes, following the previous Acts. As you are aware there were Commissioners appointed every time a new Parliament sat, subsequently to 1797.

Land Tax Commissioners.

45,260. Are those Commissioners appointed for each county or for each hundred?—They are appointed for each county; that is, they are named for each county, but as a matter of practice they act in the hundred in which they reside. They are really entitled to act for each county but they do not in practice.

45,261. That is, the Commissioners are appointed for the county, but they act in each separate hundred?—Yes.

45,262. How are they appointed?—They used to be named in the Act of Parliament, but that was regarded rather as cumbering the Statute Book, and so now the Act of Parliament contains a reference to the "London Gazette," in which all their names appear. The process of appointment is this: when a Land Tax Act is going to be introduced a circular is addressed to the various clerks to the Land Tax Commissioners all over the country, directing them to forward to the Public Bill Office the names of such persons as may be considered fit to act as Land Tax Commissioners for the county or the place of separate jurisdiction. I believe that as a matter of practice the members for the division do sometimes go and look at them and very often add names thereto. Last year there was a good deal of feeling on the subject, and a certain amount of interest was taken in adding names to those lists, but the Department, as a Department, knew nothing whatever of the names; they see nothing of them until they appear in the "Gazette."

Appointment of Land Tax Commissioners.

45,263. Who finally selects them?—I gather that the lists sent up to the Public Bill Office at the House of Commons are written out by the proper Clerk of Parliament, and are embodied by him in the notice sent to the "Gazette." The Department knows nothing of it.

45,264. Who sends the names up originally?—The clerks to the Commissioners.

Mr. F. L. Robinson, C.B.

5 April 1895.

45,265. The clerks to the Commissioners of the Land Tax?—Yes.

45,266. (*Mr. Channing.*) They send up the existing lists, do they not?—No, they send up new names.

45,267. (*Mr. Lambert.*) Then you can add anybody you like?—No doubt new names can be added in Parliament.

45,268. (*Mr. Little.*) That list is added to, I understand, upon suggestions from the member for the division?—Doubtless. We have no knowledge of it officially, but I know particularly that last time there was a considerable amount of interest taken in the nomination of the Land Tax Commissioners, and I have reason to believe that additions were made in that way.

45,269. (*Mr. Long.*) Is the member for a division communicated with or does it rest with him to communicate with the authorities?—He is not communicated with from our Department. He may be communicated with by the Land Tax Commissioners for the county, but of that I have no knowledge.

45,270. You say that the alterations are made by the member for the division; I want to know whether you can tell us how the member for the division is imported into the question at all; does he raise it as a matter of right on his own behalf, or does he receive any official communication which invites him to make suggestions?—He receives no official communication from the Inland Revenue Department.

45,271. May he do so from other quarters?—He may from the local commissioners or he may from people who are locally interested in the matter. He has notice, of course, like every other member, that a Bill is going to be introduced; and I suppose it is imagined that if he has any interest in the matter he will move himself, but I do not know.

45,272. (*Chairman.*) I understand the practice of including the names in an Act of Parliament has been done away with and now they are only gazetted?—Yes. The Act of Parliament now is in this form: it says such-and-such persons named in the Gazette of such-and-such a date shall be Commissioners of the Land Tax.

45,273. How often is that done?—Whenever there is a new Parliament—that is the theory—this circular is sent out.

45,274. Then do the persons named at the commencement of each Parliament continue to be the Commissioners?—For all time.

45,275. And there is no alteration during that Parliament, is that so?—There is no alteration for all time, when once on the list they are always on the list.

45,276. (*Viscount Cobham.*) Are the lists sent up through the medium of the Commissioners?—They are sent up through the clerk of the Commissioners, and as he is their medium in a way, I suppose, you may say they are sent up through the medium of the Commissioners.

45,277. It is a system of co-optation?—Yes, no doubt it is.

45,278. (*Mr. Long.*) With reference to your statement that the member of Parliament has notice of the introduction of a Bill, the only notice that a member of Parliament receives of the introduction of a Bill is, of course, the public notice that leave will be asked to introduce a particular Bill?—That was what I meant.

45,279. But there is no intimation conveyed to him at the same time that that Bill authorises him to do certain things?—No.

45,280. Take for instance the only other patronage which I know of, that a member of Parliament has hitherto enjoyed or possessed, namely, that of nominating for certain post office appointments; with reference to them, actual notice is conveyed to the member that there is a vacancy, and asking him to nominate. But certainly during my experience of 12 years as a county member I never received any intimation with regard to the Land Tax Commissioners, nor did I know that any such right existed. However, it does not seem to me that we can clear it up any further?—I can only speak for the Inland Revenue Department, and I say that no official notice is ever given to any member or to anybody but the Clerks to Commissioners from the Inland Revenue Department that a Land Tax Name Bill is going to be introduced.

45,281. Does this right of nomination still exist?—I have no doubt it does, but so far as I am aware there is not a single word in any Act of Parliament referring to it. A certain amount of interest was taken in this matter a year and a half ago, and I then had occasion to look up some of the old papers of the beginning of the century, and I found that at one time notice was actually sent to the members of Parliament. When it dropped I do not know. I should say early in the eighteen hundreds.

Mr. F. L. Robinson, C.B.

5 April 1895.

45,282. (*Mr. Channing.*) Is it not probably the case that the right has always remained unchallenged in the hands of members of Parliament, but that it has lapsed from want of use?—I have not the slightest doubt that if anybody objected to a name that appeared in the old Land Tax Bills, formerly, he could have moved an amendment to omit it the same as in other matters. There was a sort of inherent right in that sense, no doubt.

45,283. (*Chairman.*) Then I may take it, so far as your information goes, that the Land Tax Commissioners are practically appointed by the Commissioners themselves, through their clerk?—Yes.

45,284. And in some unexplained manner the members for the county have the power of adding other names if they think fit?—Yes.

45,285. (*Mr. Channing.*) And of striking them out?—Yes.

Qualification of Land Tax Commissioners.

45,286. (*Chairman.*) It is not quite clear how that is done, or through what medium those names find their way upon the list; that we may perhaps find out from somebody else. The next question I was going to ask you was, what is the qualification for these Commissioners?—No person is qualified to act as a Commissioner of Land Tax for any county in England or Wales (the counties of Merioneth, Cardigan, Carmarthen, Glamorgan, Montgomery, Pembroke, Radnor, and Monmouth excepted) or for any of the Ridings of the county of York, unless he be possessed of a freehold, copyhold, or leasehold estate of the clear yearly value of 100*l.*, or be heir apparent of a like estate of the yearly value of 300*l.*, one quota whereof is situate in the county or riding for which he is appointed Commissioner. A person may so act for the counties of Anglesea and Carnarvon if possessed to an estate of 60*l.* per annum. So that in the counties of Merioneth, Cardigan, Carmarthen, Glamorgan, Montgomery, Pembroke, Radnor, and Monmouth, there is no property qualification.

45,287. I understand from you that these Commissioners meet for each hundred?—Yes.

45,288. Do they appoint a clerk?—Yes.

45,289. Does the Inland Revenue Department communicate with them, and inform them as to the quota which they have got to raise within that hundred?—No. That is a permanent record in the hands of the Commissioners or their clerk.

Amount Land Tax quota.

45,290. Is that a quota to be raised within the hundred, or is it a quota showing what amount is to be raised in each parish?—In each parish.

45,291. I gather from what you have said that the Act of 1797 following upon previous Acts provided that at all events the amount should not be more than 4*s.* in the £?—Yes.

45,292. There is a limit?—Yes.

45,293. But in the great bulk of the counties the practical assessment is very much less is it not?—Very much less.

45,294. So that if in consequence of the reduction of the rateable value of the land within the district the amount to be levied could not be levied except by an assessment of over 4*s.* in the £; at all events only 4*s.* in the £ can be levied?—Yes, that is so.

45,295. Then, although it is in the nature of a rent-charge, and a variable one as you say, it is one which increases in the way in which it bears upon particular estates in consequence of the fall in the value of land within the parish?—No doubt.

Assessment of land tax and fall in value of land.

45,296. Have you any information showing to what extent the assessment upon certain parishes has increased in consequence of the fall in the value of the land?—I am afraid I have no exact information of that sort.

45,297. (*Mr. Everett.*) The amount collected in individual parishes does not alter with the fall in the value of the land, does it?—No.

Mr. F. L. Robinson, C.B.

5 April 1895.

45,298. It is simply redistributed?—It is simply redistributed on the unexonerated property.

45,299. (*Mr. Whitehead.*) That distribution would be quite independent of the assessment to the poor rate, would it not?—It ought in strictness to be re-assessed according to the full yearly value of the land year by year, so that if any particular property in a parish increased or decreased, the land tax on that particular property or farm should be increased or decreased accordingly, but within the limit that only the quota of that particular parish had to be raised.

45,300. As a fact that does not take place, I think?—I do not know that we can quite say that, because occasionally we do have complaints from so-and-so, who writes that for a certain number of years he has only paid 4*l.*, but suddenly he finds he has got to pay 6*l.* In those cases there has evidently been a re-assessment of the parish made.

45,301. Or rather a redistribution of the liability?—Well, a redistribution of the liability.

45,302. I know it is held in my Commission that each property is liable for a certain amount, which must be collected from that?—We regard that as an official heresy.

45,303. (*Mr. Long.*) In those parishes, if there is a heavy fall in rental, which is spread generally over the whole parish, and which would be followed by an equal fall in rateable value probably, would there be a decrease in the land tax at once?—Yes.

45,304. Would the land tax then remain the same whatever the assessment of the parish was?—Yes.

45,305. Therefore the value of the property, whether in cultivation or out of cultivation, makes no difference at all to the payment which the owner has to make?—If an owner has a property which has fallen out of cultivation or become considerably deteriorated in value, he should take care to inspect the land tax assessment, and, if he considers that his neighbours, who have a more valuable property, are paying a disproportionate amount of land tax, it would be his right and privilege to appeal to the Land Tax Commissioners on the ground that the assessment was not made and equally distributed with indifference according to the respective annual values of the property.

45,306. That is exactly what I thought to be the case, because it follows from that, that the land tax being parochial, as I understand it to be?—Yes.

45,307. The assessment being parochial?—Yes.

45,308. And the collection being parochial?—Practically parochial. I cannot say that it is altogether so, because we do unite parishes for the purpose of collection; but it is sufficiently parochial to be termed so.

45,309. If the fall in the value of property is universal over the parish, that is to say, if it is one of those parishes which differs with particular severity there would be no reduction in the land tax, because his neighbour's property would have fallen equally with his own?—That is so.

45,310. Therefore, in the cases where the agricultural depression has been most severe, where the decrease in the profits of the tenant farmer has been the greatest, and where the consequent loss to the owner has been the greatest, the land tax remains the same, although there would be a reduction in a parish where a portion of the property had decreased in value while the remainder had remained the same or increased?—Yes.

45,311. (*Viscount Cobham.*) The levy cannot go beyond 4*s.* in the £, but it is conceivable, is it not, that there may be a proportionately greater reduction of value in a parish, so that the quota is not leviable?—It is within the range of possibility.

Insufficiency of assessment.

45,312. (*Mr. Dalton.*) Are there any such cases?—As a matter of fact, I believe there are only two cases in the United Kingdom. In Cambridge town there is a parish or place called Stourbridge Fair, which I suppose at one time was a valuable property. Now an assessment of 4*s.* in the £ is insufficient to raise the quota of Stourbridge Fair. The other case is that of a small parish in Yorkshire called Great Ribston, where the whole of the land tax has been redeemed except the sum of 15*s.*, and the only property which can be found there which has not been redeemed is apparently of the value of 1*l.* 6*s.* 8*d.*, so that the rate of 4*s.* in the £ gives 5*s.* 4*d.*, and there is a loss of 19*s.* 8*d.* to the Exchequer on that parish.

45,313. (*Viscount Cobham.*) Take the case of a parish where the land tax has been 2*s.*, and the fall in value throughout the parish has been more than 50 per cent., obviously there would be less land tax raised from that parish?—No, because in that case, if the property had fallen 50 per cent., they would make a corresponding increase in the rate in the £ in order to raise the quota.

45,314. Then it would go beyond the 4*s.* in the £?—We could go up to 4*s.*, which would cover it there.

45,315. You would have to go beyond the 4*s.*?—Such a case would be possible, but I have serious doubts whether such a case exists.

45,316. (*Chairman.*) One effect of all this is that if the value of certain property in the parish has fallen considerably the result would be that those lands, the value of which had not fallen, would have to bear a yet larger proportion?—That is so.

45,317. (*Mr. Dalton.*) Unless they had redeemed?—Unless they had redeemed. I might give a town instance within 150 yards of here. I refer to a block of buildings in Victoria Street. That was, as I daresay you remember, almost a waste space at one time; and it is within the last 30 years, I suppose, that these buildings were erected. There was, I believe, a land tax on it of about 100*l.* or 120*l.*; they forgot to redeem before they built up those buildings, and felt very much aggrieved that the first year they were assessed they paid such a sum for land tax as would have redeemed the whole of the tax for all time.

Redemption of land tax.

45,318. They usually redeem, I suppose, the moment there is any chance of any rise of that kind?—If they are wide awake they do.

45,319. The majority do?—Yes.

45,320. (*Mr Little.*) Railway companies almost universally redeem before they make the railways, do they not?—Yes, the railways are the main redemptioners now.

45,321. (*Chairman.*) People redeem who intend to convert the land to building purposes?—Yes.

45,322. But apart from that there is very little object in redeeming?—At the present time, as you know, redemption fluctuates according to the price of Consols. Consols are so high at the present time that it amounts to between 33 and 34 years' purchase to redeem land tax now, Consols being at 103 or 104.

45,323. (*Mr. Little.*) You get a rebate from the price of Consols in redeeming, do you not?—You do, but it works out so. Mr. Gladstone in 1853 gave a rebate of 17½ per cent., but the price of redemption has been steadily going up ever since.

45,324. (*Mr. Dalton.*) Then the result is that the land tax gets left on the poorest property in the parish, or the least improving portion?—In a town parish that no doubt is so.

45,325. But in a rural parish, is it not the same—if any building takes place in a rural parish?—It would be so of course. I may say that the principal redemptions now are taking place in towns.

45,326. (*Chairman.*) The amount to be levied in respect of the land tax was about 2,000,000*l.*, I believe?—That was the total.

45,327. Can you say how much of that has been redeemed?—877,000*l.* I must say that that 2,000,000*l.* includes the land tax on personal estate and on offices which has come off, so that practically about 1,000,000*l.* is left.

Abolition of land tax on personalty.

45,328. (*Mr. Long.*) Might we know what you mean by the expression come off. You said this 2,000,000*l.* included land tax on personalty, but that a proportion of it had come off?—The tax on personal property was abolished in 1833, and the original quota of 2,037,000*l.* included the tax on personal property and offices, which I think was about 33,000*l.*

45,329. When you used the expression "come off" you meant that it had been abolished?—Yes.

45,330. By Act of Parliament?—Yes, in 1833.

45,331. Was any other payment substituted for it?—No.

45,332. So that to the extent of that contribution personal property has escaped and has been benefited?—Yes.

45,333. (*Mr. Little.*) And the quotas were not reduced?—I should not care to answer that question off-hand.

Mr. F. L. Robinson, C.B.
5 April 1895.

I did not expect to be asked that question, and I am not quite sure whether they were or not, but I think not.

45,334. (*Chairman.*) Perhaps you will add that later on?—Yes, if I am permitted to do so. I see the 3 Will. IV. c. 12 declared that the duty on *personal* estate was to cease. The quota as regards land was not affected.

Redemption of land tax.

45,335. Rather less than one-half has been redeemed?—Yes.

45,336. That seems to be fairly evenly spread over the whole country, but in some counties rather more and in some rather less?—Yes.

45,337. Practically it may be said roughly that it has been redeemed in about equal proportions over the whole country?—I should say so. I have had a return prepared about Essex, showing against every parish in Essex the amount redeemed in the particular parish, and I have similar figures for Surrey also if you wish to have them.

45,338. Will you put that in?—Yes. (*See* Appendix A. XXXVI.)

45,339. The land-tax appears to have fallen specially heavily upon those counties which are suffering most from depression, namely, Essex, Wiltshire, Suffolk, and Norfolk?—It does. You will observe that it was always considered that Essex, Suffolk, and Norfolk, with some few other counties, were possibly rather hardly used originally. (*See* Appendix A. XXXVII.)

45,340. (*Mr. Everett.*) I see that in one column of this return you deduct the amounts which were charged formerly in respect of offices and pensions and personal estates now repealed; they were, therefore, specified as distinct quantities, and when they were repealed they were deducted from the amounts of the liabilities of the counties?—That was my impression, but I did not like to answer Mr. Little off-hand without that return before me.

Assessment of land tax.

(*Chairman.*) How is the assessment made by the Land Tax Commissioners; do they make a separate assessment for themselves, or do they take the rating of the parish?

(*Mr. Everett.*) I can say, having been a collector for many years, that I was always ordered to collect it by a pound rate on all the properties which are not exonerated, and I am admonished every few years ——

(*The Witness.*) The instruction is to assess the respective occupiers thereof by such an equal pound rate according to such annual value as will produce as nearly as possible the sum of the quota.

(*Chairman.*) Then do they make a separate assessment themselves for the purpose?

(*Mr. Everett.*) No, we are ordered to collect it on the basis of the poor rate practically.

45,341. (*Mr. Little.*) That may be the practice, but there is nothing to that effect in the law, is there?—No, the law is that they are to make an assessment by an equal pound rate according to the annual value of the property.

45,342. You have used the expression rateable value once or twice, but that is not imported into the Land Tax Acts, is it?—No, there is no definition of annual value in the Land Tax Acts.

45,343. (*Chairman.*) In making the assessment for this Act they may, if they think fit, take the poor rate assessment?—What I have just read is the instruction to the assessors whom they appoint to make the assessment.

Appointment of land tax assessors.

45,344. Do the Commissioners appoint the assessors?—They appoint assessors for the purpose of making the assessment.

45,345. Those assessors may either make an assessment themselves, or, I suppose, they may if they think fit take the assessment for the poor law purposes?—As a matter of fact, as Mr. Everett says, very frequently the rateable value is taken. In some parishes the gross value is taken, in other parishes they simply make an assessment, and in others I am afraid they merely copy the assessment one year after the other.

Appeals against land tax assessment.

45,346. Leaving it to the owner to appeal?—Leaving it to the owner to appeal if he objects, which he does sometimes, and that upsets the whole arrangement and forces a new assessment on.

45,347. To whom is the appeal?—To the Land Tax Commissioners.

45,348. To the Commissioners from the assessors?—Yes.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,349. Inasmuch as they have to raise a specific quota for the parish, if there is any appeal, and the appeal is successful, that means a re-assessment for the whole parish?—Yes.

45,350. That is to say, the rate in the £ must be altered for the whole parish in order to get the exact amount required?—It may have to be; it may be simply a shifting of the cards, so to speak.

45,351. (*Mr. Whitehead.*) Is there a further appeal to any authority from the Land Commissioners?—No.

45,352. (*Viscount Cobham.*) Have not the law courts settled the meaning of annual value?—Not very conclusively with reference to the Land Tax Acts, though the rateable value has been held to be applicable in a tithe case.

Cost of collection of land tax.

45,353. (*Mr. Dalton.*) Are the expenses of collection added to the quota?—The Commissioners have power to award the assessor any sum out of the surplus, providing that surplus does not exceed 5*l.*

45,354. But still the costs of collection are paid by the land and not out of the Imperial revenue, I mean?—Mainly.

(*Mr. Everett.*) We get our remuneration by charging a little more than the quota; we may charge an excess of 5*l.*

45,355. (*Mr. Dalton.*) That 5*l.* is not paid by the State, but is in addition to the quota?—That is so.

Authority responsible for raising land tax.

45,356. (*Chairman.*) Then the responsibility of raising the land tax rests exclusively with the Land Tax Commissioners in each hundred?—Certainly.

45,357. And the Board of Inland Revenue have no authority to interfere with regard to it?—They have not.

45,358. Has the Board at different times endeavoured to intervene?—Yes; I can give an instance of that. In 1873 we addressed a circular, which I will read with your permission, to the various clerks of the Commissioners in the kingdom. It was dated the 31st January 1873, and runs as follows:—

"Sir,—Questions relating to land tax assessments which have been brought under the notice of this Board have, in many instances, disclosed the fact that there has been a disregard of the statutory regulations requiring an assessment for each parish to be made annually on all the lands subject to land tax according to the value of such lands at the time. It appears to be a practice among the local assessors—how far prevalent the Board have no means of knowing—to continue the same assessment from year to year without reference to any alteration in the value of the several parcels of property among which the fixed quota of tax is to be apportioned. The Board are very reluctant to interfere in this matter, having, as you are aware, no authority to do so, but in consequence of complaints which have been made to them they consider it their duty to call the attention of the Land Tax Commissioners to the subject of these assessments, leaving it to the Commissioners of each district to act as circumstances may require. I am therefore to request that you will communicate to your Commissioners the purport of this letter before the time arrives for making assessments for the year 1873–74; and, in order to save trouble, I enclose six copies, and will forward more if required."

Increase of land tax from agricultural depression.

45,359. Have you any information in your office showing to what extent in certain parts of the country, especially in Essex, Norfolk, Wiltshire, and those counties which have suffered from depression, the rate in the £ has been increased in order to pay the quota of the land tax?—I have no information on that at present.

45,360. Could you get information on that point showing to what extent the rate in the £ has been increased in order to raise the quota?—Yes. What number of years would you wish to go back to—1879? (*See* Appendix A. XXXVII.)

45,361. Take the last 15 years, starting from the commencement of the agricultural depression. We know the effect is that in consequence of the fall in the value of land the rate in the £ has necessarily been increased in many of those parishes in order to raise the quota. Could you take the eastern counties—Norfolk, Suffolk, Essex, and Lincolnshire, and also Wiltshire?—Yes I have here a list of the variations of the rates all over the kingdom, but, of course, you must understand that the value on which they are

charged differs, so that I do not know that you can deduce much from it. (*See* Appendix A. XXXVIII.)

45,362. Does that return show the rate in the £?—Yes.

45,363. Perhaps you will just give us an instance from it?—Take our tax district of Colchester. The lowest rate is in the parish of Manningtree, namely, 3½*d.* in the £; whereas the highest rate is in Felstead and nine or ten other parishes, namely 4*s.* in the £; but then I have not the slightest doubt that the value is not correctly entered in those parishes.

45,364. Are all those parishes in the same hundred?—No, they would not be in the same hundred. They would be in a different part of Essex. Manningtree is down near the sea and Felstead is up near Braintree. I will hand in the return; it is rather a curiosity in its way.

Rate in the £ for land tax.

45,365. (*Mr. Little.*) How is the rate in the £ arrived at? Is it the net sum now payable, calculated on the rateable value of the property that pays?—If a parish has, we will say, a 100*l.* quota to raise it would have to be raised, or ought to be raised, with as much equality and indifference as is possible by an equal £ rate according to the annual value of the respective properties liable. That is what ought to be done.

45,366. I am aware of that, but I am asking how do you arrive at the rate in the £ in that return? Is it calculated and sent to you?—As a matter of fact that was done at the office by taking out the quotas and by taking out the particulars entered as representing the value and dividing it.

45,367. It was taken out by comparing the value of the property charged with the net quota payable?—Yes, but the basis of the value is not shown; we do not know on what basis they have fixed these values: they are taken out just as they come up.

45,368. (*Chairman.*) I see from this return that taking the surveyor's districts, which I suppose are hundreds, are they not?—They are made up of hundreds as a rule in the country.

Incidence of land tax in different parishes.

45,369. There is a very great variation in the incidence of the tax upon the different parishes within the hundred. Take, for instance, the district of Guildford. I find that in the parish of Frimley the land tax is 1½*d.* in the £, and in the parish of Waverley it is 4*s.* in the £?—Nominally 4*s.* in the £.

45,370. In Chichester, in the Marden North parish, the land tax is 4*s.* 4½*d.* in the £, and in the same district—in the parish of Dean East—it is only 2½*d.* in the £?—That is so.

45,371. I do not know how it can be 4*s.* 4½*d.*?—It is obvious that that is not the full annual value. I think they have not taken the proper basis of annual value there.

45,372. There seems, according to this return, to be a very considerable number of parishes where it is 4*s.* in the £, that is, where it has reached its maximum?—Yes.

45,373. There is a case in Norwich, in the parish of Blickling, where it is 4*s.* in the £, and in the parish of Cromer it is a penny in the £?—Yes. Would you allow me to call attention to Cambridge. There is a parish there, the parish of Great Abington, which shows that the so-called rate of 4*s.* in the £ is to a certain extent unreliable. There is a quota there to be raised of 99*l.* It is raised nominally at the rate of 4*s.* in the £ on the value, but the annual value of the property out of which that 99*l.* is raised is 1,624*l.* so that the 4*s.* in the £ there would raise 324*l.* instead of 99*l.* It is obvious, therefore, that the 4*s.* is unreliable.

45,374. Does that take into account what has been redeemed?—Yes.

45,375. It is after taking into account what has been redeemed?—Yes.

45,376. (*Mr. Channing.*) That is remaining unredeemed in the parish?—Yes.

45,377. (*Mr. Dalton.*) Is it on the income tax valuation that it will come out at over 300*l.* a year?—Yes.

45,378. Would there be any objection to having it all done on the poor law valuation or the income tax valuation throughout the country?—None whatever, I think.

Assessment of land tax.

45,379. Do you think that it would be an improvement to have a uniform assessment?—I should think so, certainly.

45,380. (*Mr. Little.*) Is not the great difficulty that of ascertaining what are the actual lands redeemed?—There is sometimes a difficulty, because in Pitt's time there is no doubt it was thought that the whole tax would be redeemed; there is not the slightest doubt about that. The result was that the original contracts of redemption were drawn in, I may say, rather a loose fashion—"the land occupied by John Smith (or whoever it "might be), 100 acres"—without any exact definition as to the *situs* of those lands, whereas at the present time, and for many years past, they have been drawn up as accurately as a deed of conveyance.

Mr. F. L. Robinson, C.B.
5 April 1895.

Possibility of effecting changes in land tax.

45,381. (*Chairman.*) Now, looking to the redemption scheme under Mr. Pitt's Act of 1797, amended by subsequent Acts, and the extent to which it has been taken advantage of by owners of property, is it in your opinion possible now either to abolish the Act or to make any important changes in it?—I think not.

45,382. Would it not be possible to alter the maximum rate levied so as to relieve those districts which suffer specially from agricultural depression?—I am afraid that would work out with extraordinary irregularity. I take as an instance six parishes in Essex. They are in a purely agricultural part of Essex. In one of them, the parish of Foxearth, the original quota was 145*l.* Of that 65*l.* has been redeemed, leaving a remaining quota of 80*l.* In the next parish of Lyston, which is absolutely next door to it, the original quota was 104*l.*, and of that 101*l.* has been redeemed, leaving only 3*l.*

45,383. It is difficult to say what the effect of this will be unless you know to what extent the rate in the £ has been increased of late years, in consequence of the agricultural depression. Now let us suppose a case of a parish where the rate in the £ has been increased from 2*s.* in the £ to 4*s.* in the £, in consequence of the agricultural depression and the fall in the value of the land, would it not be possible to reduce the maximum rate which could be levied from 4*s.* in the £ to 2*s.*, or 2*s.* 6*d.*, or 3*s.*, so as to minimise the burden of the land tax upon those parishes which have specially suffered from agricultural depression?—I venture to think that that would work out extraordinarily unequally, taking those two parishes.

45,384. But why?—The effect on this parish of Foxearth would be that you would take what I may call a workable basis of 80*l.*, whereas in the next parish you would only have 3*l.*

45,385. That arises from the fact that a larger proportion in one parish has been redeemed than in the other?—Yes.

45,386. The people who redeemed did so at a low rate in consideration of the then assessment of the property, but since then the value of the property has been reduced in consequence of the agricultural depression and the rate in the £ has been consequently increased and that falls especially high upon those people who have not redeemed?—In this next parish of Lyston there is only 3*l.* not redeemed.

45,387. Quite so, and those people who have not redeemed would get the benefit of any such arrangement?—Yes.

45,388. Of course the benefit would be a small one because the number of people who have not redeemed is small, but in the adjoining parish where the majority have not redeemed and that majority now have to bear the increased rate in the £, would it not be fair in such cases to reduce the maximum which can be raised in respect of the tax within the district?—I venture to think that the amount of redemption is an absolute bar to any dealing in that fashion with the land tax which is unredeemed.

45,389. (*Mr. Dalton.*) But they would have redeemed when their rate was, say, 2*s.* in the £ or less?—They might now.

45,390. (*Mr. Little.*) Suppose they had redeemed in Pitt's time or when Sir Robert Walpole said that landowners were paying the full value of their land?—In Pitt's time they could have redeemed favourably.

45,391. (*Mr. Dalton.*) Take the case that they redeemed a burden which was practically 2*s.* in the £; if that burden has now risen to 4*s.* in the £ what is the hardship to those who did redeem in having the burden of those who did not redeem reduced from 4*s.* to 2*s.*?—You see redemptions are going on every year and have been going on every year. I am afraid you would raise a great crop of difficulties and complaints.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,392. Have the redemptions taken place of late years in agricultural land?—As a matter of fact I signed some yesterday where the land had changed hands.

Redemption of land tax.

45,393. (*Viscount Cobham.*) What rate of interest did the landowner get by redemption?—At the present time redemption is about 33 years' purchase. It is too high really; there is no doubt about that.

45,394. Is that net? Would it be a 3 per cent. investment practically?—Yes, it would be practically a 3 per cent. investment.

45,395. After taking expenses into calculation?—Yes. The expenses are very small.

45,396. (*Mr. Long.*) In answer to Mr. Dalton's question just now you said that you had signed some documents with regard to the redemption upon agricultural land recently, and you added "which had changed hands"?—Yes.

45,397. That is land which has been sold?—Yes.

45,398. Has there been any redemption taken upon the average agricultural land which is suffering most from depression at this moment?—I cannot say without inquiry.

45,399. Would you be prepared to say this: that redemption, as a rule, has taken place upon land where the value has increased rather than decreased?—I would rather put my answer in this way: that redemption, as a rule, takes place where land is about to be increased in value.

45,400. (*Mr. Little.*) Where it is being developed?—Yes.

45,401. (*Mr. Dalton.*) And that might be the case with these recent redemptions you have spoken to?—Yes; of course it might be.

45,402. (*Chairman.*) I suppose that when a landowner builds a valuable house upon a portion of his property, he would redeem in respect of that?—Yes.

45,403. If he did not redeem, he would have to bear the proportion on that house?—Yes. In further answer to Mr. Long, I think I may say that we have signed within the last year a certain proportion, it may be a small proportion and I have no doubt it is, of redemptions of land tax on agricultural lands.

Effect of reducing land tax.

45,404. Have you any information in your office which would show what would be the effect of reducing a maximum charge from 4*s.* to 2*s.*?—No. Without a very precise inquiry as to the basis on which every parochial assessment is made, I very much fear that nothing in the shape of a very reliable estimate can be given, because, as I think, the bases are so various that it would be impossible to answer off-hand.

Assessment of income tax.

45,405. We will now go to the subject of income tax. The Income Tax Acts direct that lands should be assessed at their value—annual value—and charged thereon at the rates of taxes enforced for the year under Schedule A. in respect of the ownership, and under Schedule B. in respect of the occupation?—Yes.

45,406. The Act of last year allowed of certain deductions, did it not?—Yes.

45,407. Is this the definition of annual value—"The "rackrent or best improved rent at which lands are "worth to be let by the year, taking one year with "another, the tenant undertaking to pay all tenants' "rates and taxes, and the landowner undertaking "repairs and to pay all landlords' charges"?—That is it.

45,408. Is the assessment made wholly independently of the local assessment for rating purposes?—It is the practice to furnish the assessors with copies of the poor rate, and those copies are entered in the income tax assessments for the purposes of check, I may say, on the returns rendered by the various occupiers.

45,409. By whom is the assessment made for income tax purposes?—The assessment is made in the first instance by local assessors appointed by the general Commissioners of Income Tax for the respective districts.

Income Tax Commissioners.

45,410. Who are the Commissioners of Income Tax appointed by?—The Commissioners of Income Tax are a selected body from the Commissioners of Land Tax.

45,411. They are selected from the Commissioners of the Land Tax?—Yes.

45,412. By whom are they selected?—They are selected by the acting general Commissioners of Income Tax for the respective divisions.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,413. And what are these Commissioners; are they Commissioners for the county or for the hundred?—They are the Commissioners for the hundred.

45,414. And these selected Commissioners meet and make an assessment to the income tax within their district?—They meet and receive from the assessors the assessments which they have made.

45,415. Whom is the assessor appointed by?—By the general Commissioners of Income Tax for the district.

Assessment of income tax.

45,416. And upon his report the Income Tax Commissioners make their assessments?—The assessments made by the assessors are subject to examination by the Crown officer, that is the Surveyor of Taxes, and are eventually submitted to the General Commissioners of Income Tax for the hundred, and are allowed by them.

45,417. Then if there is an appeal, is the appeal to the Commissioners?—Yes.

45,418. (*Mr. Everett.*) Is it not a fact that unless a charge is appealed against, the assessment does not come before the lay Commissioners?—The sheet on which the assessment is made must come before the Commissioners because they must sign it and allow it, but whether they examine the individual entries in the assessment, not being an Income Tax Commissioner, I cannot say.

45,419. My personal experience is that we are only summoned when there are appeals against the individual assessments to be heard?—The Commissioners sign and allow the assessments. I have got a form here if you like to look at it.

45,420. (*Chairman.*) Is the assessor directed by your Department to compare the local assessments?—Yes; new assessments to income tax under Schedules A. and B. on all agricultural lands are made quinquennially, the object being to obtain periodically and within a reasonable time correct charges upon the actual rents or annual values of such lands. Any changes in the rents, &c., however, which may take place within the intervening four years are dealt with by, and rectified on appeal to, the District Commissioners of Taxes. Two inhabitants of each parish (usually farmers or assistant overseers) are appointed to make these assessments. They are furnished with a book of instructions, a copy of the last poor rate, and also all forms necessary for the purpose of obtaining from the occupiers due returns of the rents or annual values of the land occupied by them respectively. The copy of the poor rate handed to the assessors gives the names of the occupiers and owners of such lands, the number of acres held by each person, and also the gross and rateable values of the lands in each occupation. The information contained in the poor rate relating to the value of such lands being based upon the actual knowledge of the overseers, who prepare the poor rate, and of the union assessment committee, who pass the rate, is necessarily of much value to the assessors of income tax in enabling them to make their assessments under Schedules A. and B. correctly. The gross value is frequently found to represent the actual rents or annual values with sufficient accuracy to be taken as the basis of the assessors' charges. The assessors prepare and deliver a form (No. 10) to each occupier of lands, which requires him to make a due return of his rent, or, being an owner-occupier, of the annual value of such lands, to give other particulars relating to the terms upon which the lands are held, and also to insert in the return the particulars of any deductions claimed by him, if any, such as land tax, &c. When these forms have been properly filled up and returned, the assessors enter up the particulars given in the forms of assessment, and then proceed to consider whether the amounts returned are satisfactory or not. If, bringing their local knowledge of the annual values of properties to bear, they regard them as satisfactory, they make their charges under Schedules A. and B. upon the sums returned; but if they consider the amounts returned insufficient or inaccurate, they may make such charges as seem to them to be fair and just, leaving the parties to appeal to the District Commissioners against them if they desire to do so.

45,421. Is this done only once in five years?—Yes.

45,422. Then in the interval if any landowner or any farmer thinks he has reason to complain he may appeal to the Commissioners?—Yes.

45,423. And they reduce the assessment in proportion to the reduced rent which has taken place?—Yes.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,424. (*Mr. Giffen.*) Is that quinquennial valuation at the same date in every county in England?—Yes.

45,425. (*Mr. Dalton.*) When is the next one?—It is either the next year or the year following. It does not take place at the same time as the London valuation takes place. I think it is next year.

Payment of assessors and collectors.

45,426. (*Capt. Owen Thomas.*) How do you pay the assessor and collector for doing that work?—He was formerly paid by poundage. Objections—theoretical objections—and I dare say they were right enough, were raised to that, and now the poundage is commuted into a fixed sum by an Act of, I think, two or three years ago.

Assessment of income tax under Finance Act, 1894.

45,427. (*Chairman.*) What change has the Act of last year made in respect of the assessment?—The Act of last year has allowed in the case of farm lands a deduction of one-eighth off Schedule A. to cover outgoings, and it has also altered the basis of suppositive income of the tenant.

45,428. We will come to that very soon, but as regards the actual assessment of the land the main thing is the reduction by one-eighth?—Yes.

Income tax and poor rate assessments compared.

45,429. Then in consequence of this the assessment for income tax purposes will much more nearly approach the assessments for local purposes in future than they have in the past—there has always been a considerable difference between the two assessments?—I take it it will be so. In certain portions of England I may say the differences between the gross or rateable value in the poor rate and the income tax assessments are very considerable; in other portions I may say they are fairly close.

45,430. How do you account for the great difference?—It is to be accounted for, I suppose, by the parochial desire to keep down the rateable value.

45,431. Why should not that desire show itself in the assessments for the income tax as well as in the assessments for poor law?—Because the income tax assessments are examined carefully by the Crown officer, and he really has means by communication with agents and so on of knowing what the rents are.

45,432. Do you think the income tax assessment more nearly approaches to the real value than the assessment for local purposes?—I think so, taken as a whole.

45,433. (*Mr. Little.*) The difference between the two bodies being that you have on the Income Tax Assessment Committee as it were the Devil's advocate?—Yes.

45,434. (*Mr. Dalton.*) Do you find that the two assessments, the income tax and the local assessment, approach more nearly to one another in this quinquennial valuation than they do in the other four years?—I should not like to answer that question without some inquiry.

45,435. Do you find the income tax assessment varies more in the fifth year than it does in the intervening years as a general rule?—I think I may say yes, because I observe that in the years after the new assessments are made there is usually a greater subsequent disturbance of amounts.

Assessment of tithe.

45,436. (*Mr. Whitehead.*) Would not the difference of practice with regard to the tithe deductions make some large difference; there are differences of practice I take it with regard to tithe?—As a general rule the tithe is regarded as assessable with the land. That was the rule in the original Income Tax Act of 1842; but in 1853 a provision was introduced which enabled the tithe recipient to make a direct return for assessment, the result being that in all those cases in dealing with the Schedule A. assessment, that is the assessment on the owner of the land, a deduction was made of the amount of the tithe to prevent there being a double assessment in respect of the tithe. I may say that that system of a direct assessment on the tithe recipient has been largely on the increase since 1853, and has I opine, received a further impetus by the Tithe Act of 1891.

Income tax and poor rate assessment compared.

45,437. (*Chairman.*) But this difference of treatment would not affect the totals of the assessment in the district for the income tax and local taxation because in both cases the tithe would be assessed?—Yes. I have not much knowledge of local assessments but I believe as a matter of fact, and I think Mr. Everett will correct me if I am wrong, for rates the tithe is in all cases assessed on the recipients.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,438. The deduction of one-eighth allowed by the Act of last year will probably bring the two assessments, the assessment for income tax and for local purposes, much more nearly together; in assessments for local purposes there has always been some deduction in respect of repairs?—It is merely a deduction for the purposes of collection, an allowance off of an eighth is made in the collection.

45,439. Not in the assessment?—No, the basis remains the same.

45,440. But then in the case of local rating there is a deduction made in the assessment in respect of the cost of repairs, is there not?—In the rateable value; but the gross value appears very frequently I may say to be identical with the property tax assessment. I have got an instance here: R——, estimated 136 acres; gross estimated rental 290*l.*; rateable value 265*l.* Then he returned 365*l.* less rates 35*l.* That is a bad case, and I will not follow it out any further. Here is another: D——, estimated extent, 110 acres; gross estimated rental 200*l.*; rateable value 185*l.*; rent or annual value returned by D—— 245*l.*; that is in excess of the gross estimated rental.

45,441. (*Mr. Dalton.*) Have you any reason to suppose that the income tax assessments are too high on the agricultural lands?—I should say not.

45,442. The owners would have every object in getting them reduced for the purpose of Schedule A., would he not?—The right of appeal rests with the occupier. He is the man who *primâ facie* is the man to appeal.

45,443. (*Chairman.*) But it is quite possible that the valuation being quinquennial, and if considerable reduction in value has taken place since the last quinquennial valuation, that a good many owners may not have appealed to the Commissioners for a reduction of their assessments?—That is so.

45,444. You think that is so?—Yes, I should say that is so, but it is impossible to say how much or to what extent.

45,445. Then the full reduction in the value of land which may have taken place in consequence of depression may not appear until the next quinquennial valuation?—No doubt, that would be so, and that of course must be taken into account.

45,446. Whereas on the other hand in the case of the local assessment for local rating purposes, the probability is that the assessment has been reduced in proportion to the real reduction in the value of the land?—Probably.

45,447. Therefore comparing the two assessments at different periods it is more likely that at the present moment, and until the next quinquennial valuation is made, the local assessments show the reduction which has taken place?—Probably.

Remission of rent and income tax assessments.

45,448. (*Mr. Dalton.*) How do you treat for the purposes of the income tax valuation cases in which the owner has remitted part of the rent?—If his remission is what I should describe as a voluntary remission—I mean if there is no alteration in the original terms of the letting, the original terms of the letting would still stand in the assessment, but we should repay the tax to the owner, and also to the occupier his proportion on the amount remitted.

45,449. (*Mr. Little.*) But the assessment would remain the same?—The assessment would remain the same.

45,450. (*Mr. Dalton.*) For however many years the remissions went on?—Unless there was an altered lease, or an altered agreement, and that, of course is one of the difficulties in drawing any exact conclusions from our figures.

Position of farmers under Schedule B.

45,451. (*Chairman.*) Will you now explain to the Commission the position of farmers under Schedule B, especially as affected by the recent Finance Act?—Perhaps you will permit me to say what has been the position of farmers in connection with Schedule B. since the income tax was introduced because there have been certain changes.

45,452. If you please?—Until 1851 the original assessment, based on the presumption that the farmers profit might be taken on the average as equal to a certain proportion of the annual value of his land, was not subject to revision on the ground that the actual profit earned in any particular year had fallen short of the assessment. But in that year it was enacted that any person occupying lands for the purposes of husbandry only, and obtaining his livelihood principally from

Mr. F. L. Robinson, C.B.
5 April 1895.

husbandry, whose profits in any year fell short of the sum on which the assessment was made, might obtain relief from duty in respect of the deficiency on due proof of the facts to the satisfaction of the district commissioners of taxes, upon appeal made to them within three months of the end of the year. The restriction of this relief to persons obtaining their livelihood principally from husbandry was removed in 1853 in the case of tenant farmers, and in 1880 in the case of owner occupiers. So that now this relief may be claimed by any person who occupies land for the purposes of husbandry only. And since 1887 it has been open to any person occupying lands for the purpose of husbandry only to elect to be assessed under the rules of Schedule D. A person exercising that option escapes altogether from Schedule B., and is assessed like a trader on the average of his actual profits for the three preceding years. And if the profits earned in the year of assessment should fall short of that average he has the same right as a trader to appeal at the end of the year for the relief sanctioned by section 133, 5 & 6 Vict. cap. 35, as amended by section 6, 28 Vict. cap. 30. Prior to 1890 there was no statutory provision for setting off losses in farming against income derived from other sources. But now under the provisions of the Customs and Inland Revenue Act, 1890, any person who sustains a loss in the occupation of lands for the purposes of husbandry only may appeal within six months of the end of the year to the district commissioners of taxes; and on proof to their satisfaction of the amount of the loss, and of the payment of income tax on the aggregate amount of his income, may obtain repayment of so much of the sum paid for income tax as would represent the tax upon income equal to the amount of loss.

45,453. Then a farmer may take his option; up to last year he might either be assessed to the income tax on one-half of his rent or he might be assessed under Schedule D.?—Yes.

Farmers assessed under Schedule B.

45,454. Whichever was most beneficial to him?—1887-88 was the date in which farmers could return to be assessed under Schedule D. I may say the numbers assessed are 1887-88, 143; 1888-89, 163; 1889-90, 136; 1890-91, 134; 1891-92, 116; 1892-93, 112; 1893-4, 552.

45,455. Then in that year they took greater advantage of that option?—Yes. I think that increased jump was owing to a circular that was issued by the Board of Agriculture.

45,456. Then the number of farmers taking advantage of that provision is not large?—No, very small.

45,457. Up till last year the great bulk of farmers must have been assessed upon half of their rental?—Yes, in England.

45,458. Provided always they did not come under the other exemptions, that is the exemptions in respect of their total income?—Yes.

45,459. (*Mr. Dalton.*) And those exemptions were very considerable?—Yes.

Exemptions under Schedule B.

45,460. (*Chairman.*) Until last year what was the provision with regard to exemptions?—The suppositive income of a farmer until last year was presumably half his rent—half his full value rather.

45,461. Then beyond that if his income did not reach a certain amount—I do not know whether it was 100*l.* or 150*l.*—he paid nothing?—150*l.*, yes.

45,462. And partial exemption up to what?—Partial exemption up to 400*l.*

45,463. Previous to last year?—Yes.

45,464. What was the effect of the provisions of last year's Act; in the first place the Act provided that farmers should only be assessed upon one-third of the rent, I think?—Yes.

Effect of Finance Act of 1894.

45,465. And secondly the limit of total exemption is raised from 150*l.* to 160*l.*?—Yes. The Finance Act provided the following new limits of exemption and abatement: where the income does not exceed 160*l.* total exemption is allowed; if it exceeds 160*l.* but does not exceed 400*l.* an abatement of 160*l.* is allowed; if it exceeds 400*l.* but does not exceed 500*l.* an abatement of 100*l.* is allowed.

45,466. (*Mr. Little.*) What is the amount of rent which a farmer must stand at now to pay income tax?—487*l.* 12*s.*

45,467. (*Chairman.*) Then the limit of total exemption now is 160*l.*?—Yes.

45,468. Therefore inasmuch as the farmer is now assessed only upon one-third of his rent, his rent must be 480*l.* before he pays anything?—Yes, 487*l.* 12*s.*

45,469. Therefore all the farmers now paying less rent than 487*l.* pay nothing?—Presuming always they have no other income.

45,470. If they have other income then they must bring that into account in order to claim the exemption?—Yes, their suppositive income is roughly a third of their value, and plus any other income which they may have—that is taken as the *prima facie* index of their liability.

45,471. Have you any return showing what effect that has had upon the receipts?—No, not at present; it is impossible to tell.

45,472. Will it make a very considerable reduction?—Yes, very considerable.

Assessments under Schedule B.

45,473. Do you know what you actually received from tenant farmers before?—I think I have given in a return. Here is a return of the gross assessments of the lands under Schedule B. in the last 20 years.

45,474. (*Viscount Cobham.*) You put in a paper showing the statement of the annual amount of income tax as paid by farmers in England and Scotland respectively under Schedule B., which shows that in England, 1889, 223,578*l.* was paid under Schedule B.?—Yes. (*See* Appendix A. XXXIX.)

45,475. The net produce after repayments to date being 191,154*l.*?—Yes.

45,476. Is that purely in respect of their occupations?—Yes.

45,477. Then at 6*d.* in the £ still we get in 1892-3 205,702*l.*, the net produce being 166,309*l.*, and beyond that you are not able to carry the comparison?—No, the accounts are still open.

45,478. Is it possible to estimate the result of the Finance Act of last year?—I am afraid not. We cannot do it really until a clear 12 months after the expiry of the year.

45,479. Some effects have been produced in 1894-95?—Yes.

45,480. There being in 1894-95, at an 8*d.* income tax, only 182,838*l.*?—Yes.

45,481. That is subject to deduction, is it not?—Yes; that is owing to the increase of the area of taxation rising to 160*l.* and the increased amount of allowance in respect of abatement.

45,482. Are there any other estimated additional deductions to be made?—No.

Land tax divisions.

45,483. (*Mr. Whitehead.*) Are not the Land Tax Commissioners' districts generally coterminous with petty sessional divisions?—No.

45,484. They are not?—No.

45,485. Not in any cases?—I should not like to say not in any cases, but they are the old county divisions or hundreds in point of fact; the old hundreds, which I believe date from King Alfred's time.

45,486. Those should be the actual districts?—Those are in point of fact the actual districts for land tax purposes.

45,487. Referring to Kent, I think as a matter of fact they are coterminous with petty sessional divisions. I know in my own case it is?—It may be, but we at the office have no knowledge, and I may say no care, for petty sessional divisions; we know nothing of them.

45,488. In Kent they are not recognised as divisions for land tax purposes?—The land tax divisions are the parishes which are included in the original assessment of 1798, and if there is any dispute as to what parish is in a particular hundred or division we refer to the old original assessments of 1798, which are kept at the Record Office.

45,489. And the quota paid by each parish in respect of land tax is always the same?—Yes.

45,490. With the exception of any redemptions that may take place?—Yes.

45,491. Is the quota the same on each particular property in the parish?—No, not necessarily.

Assessment of land tax.

45,492. As a matter of fact, it often is held to be by Land Tax Commissioners?—It has been held. As you may remember, I read a circular which we issued to the Land Tax Commission in 1873, and I will read a letter which was issued by the direction of the Land Tax Commissioners for the district of Cottesloe, which

Mr. F. L. Robinson, C.B.

5 April 1895.

is in Bedfordshire:—"28th November 1873. Dear "Sirs, I am directed to inform you that the Land Tax "Commissioners have, upon consideration, deemed it "expedient that the Land Tax assessments should be "made upon the principle adopted during the past "year. Blank form of assessment is sent herewith, "which I will thank you to complete and return "signed at the earliest convenience." That was after our circular of 1873, in which we called the attention of the Commissioners to the fact that they ought to make an annual assessment. But on the receipt of that circular we had some correspondence which induced us to send down one of our inspectors to that district, and he reported as follows:—"I beg to state "that in consequence of the Board's circular of the "31st January 1873, the assessors in this division were "instructed to make proper assessments for the year "1873–74 which was done, but when the assessments "were returned to the Commissioners it appeared "that in some parishes great alterations had been "made, and at a meeting held on the 10th November "1873—Lord Cottesloe, then Sir Thomas Freemantle, "in the chair—the Commissioners decided that the "old assessments should not be interfered with, and "the assessors were directed by circular, a copy of "which is annexed, to make the assessments upon the "principle adopted in the previous year, which was "done, and the same are continued up to 1875–76." The following is an extract from the Minutes furnished by the clerk to the Commissioners which were taken at the meeting:—"They (the Commissioners) are aware "that there may be much irregularity in the present "assessments, but no alteration can be made without "greater hardship, because the present payments have "been collected for so long a period that they are "generally deemed a fixed payment, any departure "from which would give great dissatisfaction." That was reported in 1873, but I may say that in the present year I received an intimation that in this division of Cottesloe in 1894 the Commissioners instructed the assessors to make their assessments at an equal £ rate upon the rateable value in the poor rate, but in some cases the assessors are unable to identify the particular properties charged with the land tax, and therefore are unable to follow the Commissioners' instructions. So the Commissioners intended to alter that.

45,493. Do you think it is the opinion of Commissioners, and especially their clerks, that these are held as fixed payments?—Of course I do not know the mind of the Commissioners, but I should doubt whether that general and erroneous impression prevailed.

Redemption of land tax.

45,494. How is the value of the redemption fixed?—I will read just the formula for redemption: "To find "the consideration money payable for the redemption "of 1*l.* land tax, the process is as follows: Find the "cost of such an amount of stock as will yield a divi- "dend exceeding the amount of land tax to be redeemed "by one-tenth."

45,495. (*Mr. Little.*) Is it not one-eleventh now?—One-tenth. "Begin, therefore, by increasing the 1*l.* "land tax by one-tenth, viz., to 1*l.* 2*s.* From this sum "deduct 17½ per cent." (that is, by the Act of 1853), "viz., 3*s.* 10½*d.* Thus the dividend to be yielded by "the stock purchased is reduced to 18*s.* 1½*d.* It will "be found by computation that the amount of 2¾ per "cent. stock (Consols) necessary to yield this dividend "of 18*s.* 1½*d.* is 33*l.*" So it is 33 years' purchase at the present time, with stock at 103*l.* or 104*l.*

Assessment of land tax.

45,496. (*Sir Nigel Kingscote.*) How are the returns of occupiers checked; I do not think you have said anything about that?—I partially began it. When the assessments have been completed by the assessors, they are delivered with all returns to the District Commissioners at a meeting held for this purpose, at which the surveyor of taxes attends. The returns and assessments are then handed over to the surveyor of taxes, whose duty it is to examine the returns carefully, to compare them with the assessment, and to correct any mistake which may have been made by the assessors. He is also at liberty, in accordance with the 75th section of the Act 5 & 6 Vict. c. 35., to make further charges if he considers it necessary to do so. The surveyor makes his charges, which are usually very few, after careful inquiry and comparison with the assessments on other lands and in consultation with the assessors. The District Commissioners, when the assessments have been finally completed, sign and allow them. Notices of charge are then prepared and delivered by the assessors to the several persons charged, and any person who regards his assessment as excessive may, upon giving due notice to the surveyor of taxes, appeal to the District Commissioners at a meeting held for that purpose. If dissatisfied with the decision of the District Commissioners he may, if he think fit, demand that a valuation of his lands shall be made, which valuation, when duly made and sworn to by a competent person to be named by the Commissioners, shall govern the assessment. The District Commissioners may also, if they deem it necessary, direct that a valuation be made.

Mr. F. L. Robinson, C.B.

5 April 1895.

45,497. It is done locally really?—Yes.

Payment clerks to Land Tax Commissioners.

45,498. (*Mr. Giffen.*) Are the Commissioners of the Land Tax or the clerks of the Commissioners paid for the duties which they perform?—The clerks to the Commissioners are paid a commuted sum, which commuted sum is based on the poundage which they formerly used to receive on the land tax assessments. I think it was 3*d.* in the £; I am not quite sure.

45,499. How much does it come to?—I cannot answer that question off-hand, because it is mixed up with income tax remuneration.

Cost of collecting land tax.

45,500. The cost of collecting the land tax does not appear anywhere in the tax accounts?—I think it does not. The cost of collecting the land tax has been estimated at about 4 and 4½ per cent.

45,501. And, of course, the net value of the land tax to the Government is subject to that consideration?—Not altogether, because a portion of that comes, as Mr. Everett pointed out, from the surplus on the particular individual quotas where there is a surplus. The Commissioners have power to suggest an award to the assessors which, if it is apparently reasonable, is paid out of any surplus which may be raised in any particular parish, the balance of that surplus going towards the redemption of the land tax in the parish in which it is raised.

45,502. And that surplus does not appear in your accounts as part of your gross income from the land tax?—No. A portion of the cost of collection of land tax appears as a direct charge on the Treasury, and the other portion of it is paid out of the surplus, and does not appear as a direct charge on the Treasury.

45,503. So that the income from the land tax which appears in the finance accounts is less than the amount which is raised from the taxpayer by a certain small per-centage?—Yes. In some parishes I may say the per-centage is what I may call considerable. In large urban parishes, take, for instance, the parish of Birmingham, where the whole land tax raised is a little over 500*l.*, which is raised from no less than 30,000 people, of course, the cost of collection is proportionately very heavy. I believe, as a matter of fact, that 500*l.* cost 165*l.* a year to collect.

45,504. Would it not be expedient, according to the principles of our Finance Acts, that the gross sum yielded by the tax should appear upon the one side, and the total cost of collection should appear somewhere or other upon the other side?—Yes, I think it would be very valuable.

History of land tax.

45,505. I noticed that in your statement with regard to the history of the land tax you mentioned that you consider the subsidies which preceded them would have also been a kind of land tax; but I suppose your whole description is quite general, and you did not mean to refer to subsidies in particular?—It was quite general.

45,506. Subsidies in particular may have been an assessment upon personal property for aught that you mean to tell us here?—I think, so far as the land tax as originally intended, was also a tax on personal estate, to that extent the subsidies were in a sense its progenitors.

45,507. But they were not the progenitors of that part of the tax which applies to the land?—Not exclusively.

45,508. They were the progenitors of that part of the tax which applies to personal property?—Yes, undoubtedly.

45,509. Can you give us any further information as to when this mode of making the assessments—which were found to be in 1692 close upon 2,000,000*l.*, mainly upon land—began?—I am afraid not, it is really lost in antiquity.

45,510. That is a little obscure?—Yes, very obscure.

45,511. There is distinct evidence that there was something of that kind during the Commonwealth period?—Yes.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,512. But you cannot state any previous date at which that mode of assessment seemed to exist?—No, I am afraid I cannot state it with any feeling that I am stating what is accurate.

45,513. My reason for asking the question is with reference to the point at which it began to be considered important to establish that each county in England yielded a certain lump sum, and why it was that that lump sum came to be taken as the basis of the tax, and the idea of valuation seemed to be given up?—I gather that at a certain time between 1692 and 1697 there was, what I may call, a general sort of valuation, which was found to result in a decreasing revenue, and that in order to prevent that decrease the Parliamentary authorities at that time fixed a certain contribution on each county and each town, so as to prevent an annual falling off in the tax.

45,514. Was that sufficient to prevent a falling off in the tax; was not the experience of the subsidy quite the opposite, namely, that by fixing a lump sum you found in course of time certain parts of the country decayed, and you could no longer levy a quota upon them, so that the fixing of the lump sum was fatal to the perpetuation of the revenue?—In all the earlier Acts of 1600, and thereabouts, a sum is specified to be raised, and I take it that that sum actually was raised.

45,515. (*Mr. Everett.*) A sum for the whole country or for each county?—It began by a statement of the sums for the whole country.

45,516. (*Mr. Giffen.*) Was it to save the trouble of a new valuation?—I take it that it was to save that trouble.

45,517. And to prevent certain localities exempting themselves?—Yes.

45,518. But it did not provide for the increase of income according, as certain other localities increased the valuation owing to their increasing prosperity?—Apparently not.

Determination of income under Schedule B.

45,519. Coming to the income tax at the present time, might I ask if you can tell us anything as to the origin of the presumption of law, that profits under Schedule B. were to be considered equal to a certain part of the rent?—Under the Act of 1803, Mr. Pitt's Income Tax Act, the presumption of profit to the occupier was two-thirds of his full annual value. When in 1842 Sir Robert Peel introduced the Act of 5 & 6 Vict. c. 35., he stated that he had satisfied himself that that was too high, and that it had been intended in 1816, when there was a proposition to continue the income tax, to reduce the suppositive income computation to one-half, which he in 1842 adopted as the suppositive income of the English occupier.

45,520. Then the idea really was to have something that was supposed to approximate to the income of the occupier of land from the land?—That was so.

45,521. And the two-thirds was really considered at that time, in 1803, to be a fair estimate of the proportion of that income to the rent?—Yes.

45,522. And there does not seem to have been any formal inquiry in 1842, or any other time, as to any reasons for making a change. Certain information was acted upon, but that was not made public?—That is so. There was certainly no Commission of Inquiry, or anything of that sort; but on what grounds Sir Robert Peel acted, of course, there is nothing in the official books which will disclose.

45,523. And there is nothing, I suppose, with reference to the change that was made a year or two ago; there is nothing on record to show for what reason in detail the change is made. Certain statements were made in the Budget speeches, but there is no record of any formal inquiry?—No.

Schedule B. in Ireland.

45,524. Have you considered the matter at all with reference to different kinds of farming occupations; have you considered it, for instance, with reference to the case of Ireland?—No.

45,525. In Ireland the gross amount of Schedule B. is about 10 millions sterling, is it not?—I have not got with me any figures, I am sorry to say, about Ireland. The figures in the last report, no doubt, are correct.

45,526. But the gross amount under Schedule B. in Ireland, according to your reports, is a little under 10 millions sterling, is it not—there or thereabouts?—Yes probably.

45,527. Half of that would be about five millions, and one-third of it would be about 3,300,000*l.*; and I wish to ask if the presumption of law that that is the income of the occupiers of land in Ireland can be considered a correct one at all?—That is a presumption in law that one-third of the assessed value in Ireland is the income of the occupier.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,528. And there are also close upon half a million of agricultural occupiers in Ireland?—There are, I believe.

45,529. And at 3,300,000*l.* that would give each of them an income of about 6*l.* a piece, and that is supposed to be the income of the head of a family?—The amount of income tax raised under Schedule B. in Ireland is, of course, as you know, very inconsiderable.

45,530. The lowest income of the occupiers of land in Ireland, the lowest figure at which it has been put, I believe, is a little under 20 millions sterling, so that instead of being a half or a third of the gross assessment under Schedule B. it is very nearly double the gross assessment under Schedule B., is that not so?—Yes.

45,531. Then the presumption of law as regards Ireland does not seem to be worth a great deal, applying it generally, at least?—I know we receive a very small amount under Schedule B. from Ireland. Your figures are correct doubtless.

45,532. I am merely putting it that the presumption of law in this case does not amount, for some reason or other, to very much?—Yes, that would be so.

Assessments under Schedule B. on hop lands.

45,533. Have you looked into any other cases of assessments under Schedule B. in England; for instance, the cases of hop lands in Kent—how it would turn out if the people there were assessed, not upon a certain proportion of the rental, but according to their real income?—A farmer who makes more than his presumed assessment never appeals; so, of course, we have no means of testing his assessment. It is only in the cases where there is a loss of profit that an appeal is made and accounts are produced. We have no means whatever of saying whether the presumption of law as to hop lands that they only make the one-third profit is correct or not.

45,534. (*Mr. Whitehead.*) That would depend very much upon the season, I imagine?—No doubt; I suppose so.

Assessment of farmers under Schedule D.

45,535. (*Mr. Giffen.*) Would there be any real difficulty in assessing the farmer as people under Schedule D. are generally assessed?—I think not. The objection on that side has always come from the farmers. I believe one of their champions, Mr. Clare Sewell Read, invariably has stated that a farmer did not keep accounts, and was unable to keep such an account as would satisfy the Commissioners. The Board of Agriculture have, I believe, done what they can to dispel that illusion by circulating a very useful form of account to the various farming centres, and, as I showed you, the effect of that was an increase from about 163 to 500 farmers, but, of course, that is a very small proportion.

45,536. (*Viscount Cobham.*) Considering the recent exemptions the question is hardly a practical one now, is it?—I should imagine not. Of course we do not know, as I told you a little time ago, what the effect of that exemption would be, but Schedule B., of course, is becoming smaller by degrees.

45,537. (*Mr. Giffen.*) You would have no difficulty in applying the same rules and principle to Schedule D.?—We think not.

45,538. And you could assess the occupiers of land perfectly well under Schedule D.?—We think so.

Reduction of assessments under Schedule B.

45,539. With regard to this table which has been put in showing the assessments of lands under Schedule B. at different dates, 1873, 1880, 1889, and 1894, I should like to put it to you whether it would not be a fair statement from this that in England you have had a reduction since 1879–80, which is the highest date of the three, from 48,000,000*l.* to 36,597,000*l.*, which is very nearly 25 per cent.?—Yes. (*See* Appendix XL.)

45,540. In Scotland the reduction is from 7,758,000*l.* to 6,246,000*l.*, which is about 20 per cent., I think?—Yes.

45,541. And in Wales the reduction is from 3,271,000*l.* to 3,073,000*l.*, which is very little more than 6 per cent?—Yes.

45,542. So that there is a great difference between the three parts of Great Britain as regards this gross assessment under Schedule B. Have you looked into it in detail at all as to what the difference in particular counties is?—I think the reason for the striking

Mr. F. L. Robinson, C.B.
5 April 1895.

difference as regards Wales is to be found in this fact, that the poor law valuations, on which, of course, we to an extent—a considerable extent I may say—in default of information depend for the income tax assessments are very indifferently made in Wales, and that in some cases they are as much as 20 per cent. below the rack rental. The assessments originally were not approximated as closely to the full rack rentals in Wales as was the case in England, where the poor law assessments are very much better made, the result being that the fall has not been apparently so pronounced.

45,543. Then we have not to infer from this that Wales has been less hit by the agricultural depression than England has been, or not so much as this table would appear to show?—I do not think that would be an altogether fair assumption; at least I think the matter which I have referred to should also be taken into consideration.

45,544. (*Mr. Long.*) May I ask upon that question whether you have any special knowledge with regard to the degrees of agricultural depression in different parts of the United Kingdom?—No, except so far as they appear in any shape or form with reference to the yield of the tax. I got out one or two cases in the eastern counties lately—something in the shape of a sort of computation.

45,545. (*Mr. Giffen.*) I am merely asking you to ascertain what the exact value is which is to be put upon the figures; if there is any information of that kind it can be stated?—My impression is that our figures can be taken in a broad and general sense, but I should not wish to put them on a higher standard, because in addition to that which I mentioned about the variations in the poor rate, which are a considerable guide to us, we do not, as I think Mr. Shaw Lefevre brought out, immediately get the effect shown in our accounts of permanent reductions of rent, or of temporary reductions of rent.

Duties of Land Tax Commissioners.

45,546. (*Mr. Little.*) We have heard a good deal about the appointment of Land Tax Commissioners; would you tell us what they have to do?—They have to appoint the assessors, and they have also to appoint the collectors, and they have to hear any appeals against any assessments which may be made, and if collectors do not pay over their accounts properly they have, at the instance of the surveyor of taxes, to summon them before them to insist on their paying over their collections, and they have generally the responsibilities of raising the land tax in the divisions for which they act.

45,547. (*Viscount Cobham.*) Do they appoint the clerk?—They appoint the clerk too.

45,548. (*Mr. Little.*) He is generally the clerk to the Income Tax Commissioners also?—Yes.

45,549. Then they have to nominate persons to serve on the Income Tax Commission?—Yes; when there is a vacancy on the Income Tax Commission the Board of Inland Revenue are empowered by Act of Parliament to summon a meeting of the Land Tax Commissioners for the Hundred, by notice in the "London Gazette," for the purpose of appointing Commissioners to supply vacancies among the Commissioners of Income Tax.

45,550. And they form a reserve list from which the Income Tax Commissioners choose persons to serve?—Just so.

45,551. The Land Tax Commissioners have some privileges, have they not; are they not exempted from certain duties?—They are exempted from jury service and any parochial office too; that is the only privilege that I am aware of.

Duties of assessors of income tax.

45,552. On the whole it is not an onerous duty that they discharge?—It is not onerous but it is honorary.

45,553. I should like to get on the notes a little more fully than I think we have got what the assessors of income tax have to do, and how they arrive at their estimates which they have to put in a certain column of the assessment sheet. The schedule is based, first of all, upon the poor law assessment?—Yes.

45,554. That is the foundation of the whole thing, is it not?—Yes.

45,555. Then they have returns from occupiers?—Yes.

45,556. The owners have nothing to do with those returns unless they choose to give information, have they?—No.

45,557. But, I suppose the surveyor of taxes does very generally receive from larger owners particulars as to the actual rent?—That no doubt is the fact; in order to save appeals and to save trouble the surveyor applies to the owner, who as a general rule, I may say, authorises his agent to furnish the surveyor with any particulars to enable him to make the correct assessment. It saves a great deal of trouble to everybody.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,558. Have you any information as to the number or the proportionate number of occupiers who make no returns?—No, we have none.

45,559. Every occupier is bound under a penalty of 50*l.* to make a correct return?—That is so.

45,560. But you are probably aware that a great number neglect to make it?—That is so.

45,561. You do not know what proportion?—I cannot say what proportion.

45,562. In the event of no return being made the assessor has to put a value on the property?—The assessor has to put a value on the property.

Instruction to land tax assessors for valuation of properties.

45,563. Do your present instructions to assessors give them any guide as to the way in which they should arrive at that value?—They give them general instructions, and also say in default of any other means of ascertaining the value they are to refer to the poor rate.

45,564. A few years ago there were specific instructions as to the line that they should take in endeavouring to ascertain the value, were they not?—Yes, that was so. What was called a scale used to be prepared—a scale of all recent lettings, and the comparison of them was made with the poor rate on the same lettings, and if the poor rate on the particular property was found to be below the result of the scale a proportionate addition was made so as to bring up the poor rate presumably to the amount of the recent lettings.

45,565. When these scales were constructed they showed, did they not, generally an enormous variation between actual rentals and parochial assessments?—In a good many cases they showed at those times considerable variations, no doubt.

45,566. Sometimes the value was above the rent and sometimes it was from 25 to 40 per cent. below it?—In certain parishes that doubtless was so.

45,567. If you have seen some of those scales which used to be constructed you will have seen in the same parish sometimes a very great variation?—Yes, there were undoubtedly very great variations. I may say that since the Union Assessment Act of 1861 or 1862, (I forget which year it was), I do not think the variations have been so considerable.

45,568. Were those instructions found not to work well or fairly, that they were withdrawn?—As I say the Union Assessment Act was thought to have rendered them somewhat obsolete, and since agricultural depression has set in, I think it has been pretty generally considered that the gross poor rate was certainly the highest value which they would follow.

45,569. But those instructions were still continued as late as 1885 or 1886?—I do not think there was anything about a scale there.

45,570. I have before me instructions to assessors issued 1885–86 in which the rule is, "The assessors must "inform themselves, in the first place, of the actual rent "of as many properties as they can, which have been "recently let to a tenant at rack-rent. From these "they will form a judgment whether the returns by "the several occupiers represent the full annual value "or not. If they have reason to be dissatisfied with "the returns, they must then proceed to enquire into "the circumstances attending any recent settlement "of the poor rate, and of the rule by which it was "made; and by comparing the sums rated with their "actual information, they will be enabled to ascertain "the proportions between the rate and the true annual "value. Any supposed inequality in the rate may be "discovered by comparing the known rent of several "properties of the same kind with the amount charged "thereon in the rate"?—The practice at the present time may be described thus: the assessors, when duly authorised by the district commissioners, may, if they think it essential to do so, survey any lands for the purpose of ascertaining their annual values, taking with them a properly qualified person. This provision of the Act is rarely or never resorted to. The assessors are also empowered to call for the production of the lease. I may say that generally I am assured by our

Mr. F. L. Robinson, C.B.
5 April 1895.

inspectors that that scale at the present time is practically a dead letter as regards agricultural lands.

45,571. I do not know whether that duty was transferred from the assessor to the surveyor of taxes. The surveyor of taxes, having got the assessor's value, has then to compare the assessor's value and the poor rate value, and to form his own judgment as to whether the assessment is a fair one?—Yes, and I know as a fact that in former years they very frequently had recourse to a scale of that sort. I also am told by the inspectors at the present time that practically now they never resort to that scale, because they are satisfied that the gross poor rate is, in the main, in England, a very fair index of what would be the gross annual value.

45,572. Where an owner occupies his own land and no rent is paid, you must resort to something like the poor rate assessment to check his return?—Yes.

45,573. Do you find that there is much difficulty occasioned by stupid mistakes in returns made by the occupiers?—No doubt there are a good many mistakes through their stupidity or carelessness, and in order to save trouble all round, we always authorise the surveyors to go round to certain centres to meet the assessors (and the assessors being local farmers, as a rule, know all about the rents) with the view of rectifying these things before they get into assessment, so as to prevent the necessity for a lot of unnecesary appeals.

45,574. Does it not often happen that a man who has felt very much aggrieved at his assessment finds that it is due to his own carelessness or mistake?—No doubt.

Income tax assessments and fluctuations in value of land.

45,575. Do you think that when the value of land has risen, the assessment for income tax increases with the rise, or does it lag behind?—I say that we must consider that it lags behind, because the Income Tax Act lays it down that a rack rent which is fixed by a lease within a period of seven years is binding.

45,576. And then if you have no assessment for five years, you do not get the knowledge of the fact of a rise of rent in that five years?—No.

45,577. So that in a rising market the income tax assessment will probably never attain to the full height of the rents?—Not unless there is a sufficient period when they are at a state of balance.

45,578. Similarly when rents are declining the assessment will not get corrected up to date?—The Income Tax Act provides for an appeal in the intermediate years, which is sometimes resorted to.

45,579. But still there would be the disinclination, and the laziness and the carelessness of people which would have an effect?—No doubt.

45,580. People do not appeal who could appeal?—No doubt.

45,581. Is there not reason to suppose that when rents are declining, the income tax assessment does not decline at the same rate as the actual rent?—I think that is so; it lags a little behind.

45,582. Particularly when you take into account the fact that many rents have been reduced by abatement and not reduced permanently?—Yes, that is so.

45,583. That would not be shown in the assessment?—That would not be shown.

45,584. So that as between the highest period and the lowest period the actual difference is probably much greater than the figures show?—Yes. I say the income tax figures cannot be taken as showing the decline at the period when it actually occurred.

45,585. May I put it that it very much understates the decline in value?—Yes, I should say you may, it understates it.

45,586. Then there are a number of properties, I will not say large in amount, but considerable in number, where no one has any interest in the Return at all, small properties, I mean?—Yes.

45,587. These may remain charged at the old rent, though the value may have decreased very largely?—Yes.

45,588. That is another reason for the assessment keeping up?—Yes.

Income tax assessment and mortgages.

45,589. Then where there is a mortgage upon a property the assessment could not be reduced below the interest on that mortgage if it were known, could it?—It would not be reduced below the interest on that mortgage because the mortgagor on paying the interest to the mortgagee would be entitled to recoup himself the tax on the mortgage interest.

45,590. Then the assessment might stand in Schedule A. and Schedule B. at considerably more than the present value of the property because the mortgagee would have to pay the tax upon his interest?—It might.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,591. That is another reason for supposing that the assessment may be considerably above the actual value?—Yes.

45,592. Then there are those who have a very great objection to letting down the value of their property and proclaiming that it is not worth anything; do you not think that that acts as an inducement to prevent landlords from appealing against the charge in some cases?—I should think it would in some cases.

45,593. All these things would have an effect?—Yes, I take it that a person could appeal, and notwithstanding the fact of there being a mortgage it would be competent for him to show that the value of the land was below the value of the mortgage interest.

45,594. Do you mean that he would get relief?—He would get relief.

45,595. He would not have to pay the income tax upon the mortgage interest?—In that case we should have to look to the mortgagee for any balance. I have little doubt that it would be competent for him to declare, in point of fact, that the land was mortgaged at a higher sum than its value.

45,596. Which he is not very likely to do?—Just so.

Original object of land tax.

45,597. (*Mr. Long.*) With regard to the interesting statement which you have given us at the opening of your evidence respecting the land tax, I think you stated that the original object of the tax was to levy a charge upon both real and personal property?—No doubt it was so.

45,598. Including the profits and salaries of persons holding offices?—Yes.

Abolition of land tax on personalty.

45,599. You told us later that that portion of the tax which was collected from personal property has been dropped altogether?—Yes.

45,600. Was it dropped in consequence of legislation?—Yes, by an Act of the year 1833.

45,601. (*Viscount Cobham*). Did not the Return fall to nothing before legislation?—It had come down to about 32,000*l.* or 33,00*l.* There was an Act of 1833 which abolished it finally.

45,602. You said that in the year 1832 5,000*l.* was the result of a tax at 1 per cent. on the capital value of the personalty of Great Britain?—Yes, but then in addition to that I ought to have explained that there was a land tax on offices.

45,603. Which brought it up to 33,000*l.*?—Yes, and that was abolished in the sixties.

45,604. (*Mr. Long.*) Can you tell the Commission whether that Act of Parliament was passed in consequence of any difficulties connected with the collection from personal property?—It had become such a strange state of things. These assessments were gradually falling aside altogether, and so in a fit of generosity, the Parliament, I suppose, of that time, wiped them out altogether, and the Inland Revenue Department were exceedingly glad when they did so.

45,605. In the year 1833 the proportions of real and personal property in the country were very different to what they are now, were they not?—Probably so.

45,606. Personal property was relieved from this charge, which may, I suppose, fairly be described by that favourite term of a "hereditary burden" upon personal property; was any other equivalent imposed upon personal estate?—Not that I am aware of.

45,607. Then would it be fair to say that whereas hereditary burdens have been left upon land, hereditary burdens have been taken off personalty, so far as the land tax is concerned?—It would be fair to say so, if personalty could be exactly considered as on all fours with land, in connexion with its permanent character.

45,608. I am afraid I do not quite follow that answer?—Personalty, I take it, is so moveable that I do not think in connexion with a land tax it could be regarded as standing exactly on the same footing as land.

45,609. But take that portion of personalty which you have described as the salaries of persons holding offices?—I was speaking of personalty——

45,610. Pure and simple; but that is a form of personalty?—Yes; there was what was called a land tax on offices.

Mr. F. L. Robinson, C.B.

5 April 1895.

45,611. They were exempted?—They were exempted in a more recent year; I forget what the year was.

45,612. Therefore they at all events have escaped a hereditary burden and pay nothing as an equivalent?—So far as the offices are the same as they were at that time, I have no doubt that it is so.

45,613. "So far as the offices were the same as they were," would not that remark apply equally to the land, so far as the land is the same as it was; is there not as great a distinction between the condition of the land now and as it was at that time as there is in the case of any other class of property in the country?—Perhaps I may explain my meaning better by giving an example. In the early ages of the tax the salary of an excise officer, for instance, stationed at any particular place was chargeable with land tax; if for official purposes that excise officer were altogether removed from that place owing to any circumstance, such as a new brewery or anything of that sort being established elsewhere, and he were put into the next county, there would be no charge possible upon an excise officer in the town, because no excise officer would be there——

45,614. And therefore, to that extent, salaries would escape in that district?—Yes; therefore to that extent salaries would escape there; of course, there has been an enormous increase in the number of offices since that time which have never been assessed to a land tax, and, I suppose, never would have been assessed.

45,615. I gather from what you have told us that there could be no doubt that this tax was originally intended to be a tax on means and substance?—No doubt.

45,616. Can it be fairly regarded as a tax falling upon the means and substance of the country now when it falls exclusively upon land?—No.

Effect of transfer of proceeds of land tax to local taxation account.

45,617. Has your attention been called to a suggestion which has been made to the effect that the proceeds of the land tax should be transferred from the Imperial taxation account to what is called the local taxation account?—I have heard it mentioned.

45,618. Do you think that would be any advantage to the local taxpayer taking the country all over?—I think owing to the redemptions and the anomalies consequent thereon, that it would be so unequal in the benefits it conferred that it would be a very clumsy mode and a very unequal mode of giving anything in the shape of a subsidy to local taxation.

45,619. Looking at it from a rather wider point of view than that, is it not the case that the amount of land tax paid in different counties varies considerably?—Yes.

45,620. It varies from 50,000*l.* a year in Norfolk down to very much smaller sums in some of the other counties?—It does.

45,621. The whole proceeds of the tax now go into the Imperial Exchequer?—Yes.

45,622. If they are to be transferred from the Imperial to the local exchequer, it is evident that they must be replaced by some other source of revenue?—Yes.

45,623. Would it not be the case that those counties would contribute the new revenue, not in proportion as they were relieved of the land tax, but in proportion as they were called upon to pay whatever tax might be devised?—Yes.

45,624. Therefore might it not happen that while a county like Norfolk was relieved of 50,000*l.* a year, whereas some other county, we will say the county of Wilts, might be relieved only of 10,000*l.* a year—I am putting the sums only approximately, of course—that the contribution they would be called upon to make in respect of taxation in order to make up the deficit, would be altogether out of proportion to the relief they got?—It might.

45,625. Therefore it would not be in reality a relief of local taxation?—No.

45,626. It would be a transfer merely of money from one pocket to another?—It would, I presume, be a transfer of money from one pocket to another.

Assessment of land tax.

45,627. You told us that the system of assessment varied very much, and was altogether different in different parts of the country?—Yes.

45,628. Owners have the power of objecting to the assessment, have they not?—The persons assessed have the power of objecting.

Mr. F. L. Robinson, C.B.

5 April 1895.

Power of appeal against land tax assessment.

45,629. Is any communication made to the owners by notice or in any other form which tells them how they are to make their objections, or where they are to make them or when?—A notice is stuck up on every door of every church and chapel that a land tax assessment has been made, and that appeals will be heard against it at such and such a place, and any person assessed is entitled to inspect the assessment when it is in the hands of the parochial assessor.

45,630. But I suppose it is not too much to say that there is very little accurate knowledge possessed, particularly in some of the poorer districts of the country, with regard to this assessment or the best way to appeal against it?—No doubt that is so.

45,631. Are appeals made in any large number of cases?—I could distinctly say no.

45,632. As a matter of fact they are quite an exception, are they not?—They are, I may say, exceptional.

45,633. I rather understood that from the local Land Tax Commissioners and their decision there is an appeal?—There is no appeal from them to anybody, except of course that they can be called to account by a mandamus in the High Court if they do anything wrong. There have been cases of actions brought against the Commissioners in their capacity as Land Tax Commissioners in reference to assessing property which was held not to be assessable—for instance, charity property.

Assessment of income tax.

45,634. You told us that the valuation for income tax is quinquennial. Who are the valuers who make the valuation?—The parochial assessors, who are appointed by the general Commissioners of Income Tax for the district, are the people.

45,635. The general Commissioners of Income Tax appoint them?—The general Commissioners of Income Tax in each district appoint for every tax parish one or two persons—two usually—as parochial assessors, and they are the people who make the assessment.

45,636. Do they take the rate book as their basis?—They have a copy of the rate book given to them, from which they work.

45,637. Supposing that since the making up of the rate-book there have been considerable reductions in the rent of the parish, will they take the certificate either of the owner or of his agent as the basis?—They will call on the tenant to make a return, and if the return were less than the amount assessed in the rate-book they would, of course, enter that lesser amount in the appropriate column in the assessment form.

Repayment of income tax on claims for rebate.

45,638. With regard to the claims for rebate under the income tax, I put them to you in two forms—first, in the form of a landowner who makes a temporary reduction of rent for the 12 months; and, secondly, where the rebates can be claimed under the Finance Act of 1893; now is it not the case that a person liable to income tax has to make the full payments first of all and then apply for repayment?—Yes; that is the practice.

45,639. It is actually the law, is it not; it is compulsory, is it not?—When that abatement was first granted it was what I may describe as extra legal altogether; it was a concession. It was then laid down as a portion of the arrangement that it should be by repayment. I may say that I do not think that is absolutely insisted on, though I believe that it may be described as a general rule.

45,640. You say it is not absolutely insisted upon, but suppose an owner and occupier makes a return with the necessary accounts showing that no profit has been made, and therefore makes no payment, will not the Commissioners insist upon his first of all making his payment and then consider his case for repayment afterwards?—Yes. That comes, of course, under the law. The duty as you know is payable on or near the 1st of January every year, and the appeals of course are only heard after the 5th of April; so payment in that case is made as a matter of necessity.

45,641. Therefore in the case of a small owner and occupier, a farmer who is the owner of his own land, under this rebate system would be out of his money for at least three months, and possibly six; he would make a payment in excess of what he had to make, and have to wait six months before he got his money back?—He would, if he were within the scale of liability; but the small owner, if you are really speaking of a small owner, would not be assessed at all. I am using the

Mr. F. L. Robinson, C.B.
5 April 1895.

term "small" as a relative term; I do not know what you mean, but of course if he came within the limit of liability he would have to make the payment and get it back.

45,642. You mean by limit of liability the 480*l.* odd?—Yes.

45,643. I am referring to what we know as the yeoman class who may own and occupy anything from 1,000 acres down to 300 or 400, and who presumably have some other sources of income as well?—They would pay the tax, and appeal when they are able to show that they have made no profit or a less profit than their suppositive profit, and they would get repayment.

45,644. But such a man would have to wait some considerable time before he would get his repayment?—He would have to wait.

45,645. Is there any very serious objection to having these accounts presented accompanied by affidavit and avoiding all the delay attendant upon repayment after inquiry?—I do not know there is what I should describe as a serious official objection. Of course we want to arrive at the yield of the tax every year about the 5th of April so as to satisfy the Chancellor of the Exchequer as to what the possible estimate of the yield of the particular year will be.

45,646. Then in order to gratify the Chancellor of the Exchequer, the poorer members of the agricultural community are called upon to pay money which they ought not to pay?—Hardly that. I should not like quite to put it in that way.

45,647. If it is so, if they are entitled to the rebate, and they can only get it by first of all paying the money in order that the Chancellor of the Exchequer may have a nicely squared statement and then after he has made that statement to Parliament they are enabled to get a reduction, it appears that it is done in the first place for the gratification of the Chancellor of the Exchequer and in the second place for the delusion of Parliament?—The number of repayments really is even under those conditions so small relatively in number and amount both that I do not think they would delude anybody.

45,648. (*Viscount Cobham.*) I think in the case of charitable incomes the whole of the tax has to be paid and the whole of it is returned every year?—I will not say entirely so, because where the charity is established where they have proved their case, it is allowed off the assessment—we do allow off as much as we can.

45,649. (*Mr. Long.*) As a matter of fact these payments and repayments, and claims for repayments would involve a considerable amount of correspondence going through various departments of the office I suppose?—I think they involve some, but it is only fair to say that the small agricultural individual is in no worse position—I am not justifying it on that ground—than the small fundowner who has his tax stopped at the Bank of England and has to get it back afterwards.

45,650. I am quite prepared to join lots with the small fundholder if he would like to come in too, but because he is injured that is no reason why the small agricultural holder should be injured?—No, I am not putting it in that way; I am merely wishing to shew that the small agricultural individual is not singled out for execution.

Assessment of personalty to land tax.

45,651. (*Mr. Dalton.*) The taxing of personalty to the land tax was found to be attended with very great difficulty, I understand?—Yes.

45,652. What classes of personalty were liable to be taxed? Any personalty in the district?—Everything, I think, except household goods and farm stock and debts.

45,653. Were salaries and stock-in-trade, other than those for purely local offices taxed?—So far as we can say, the salaries that were taxed to the land tax, were salaries for the holding of something that you would properly describe as an office. For instance, the chancellor of a cathedral or somebody of that sort, a man who held what might be described as an actual office, was the sort of man who was apparently taxed.

45,654. Were the incomes of professional men taxed?—No, not their incomes.

45,655. It was practically given up because of the difficulty of collecting it, and the unpopularity which any attempt to enforce a strict assessment would have involved?—That no doubt is so.

45,656. And it was replaced afterwards, was it not, practically by the income tax?—The income tax was enforced originally—I think it was in 1803.

Mr. F. L. Robinson, C.B.
5 April 1895.

45,657. Did it go on continuously from then?—It went on to 1816.

45,658. And then it stopped?—Then it stopped and it was re-imposed in 1842.

Objections to the land tax.

45,659. Would you agree that the land tax is full of irregularities, inequalities, and anomalies?—Certainly.

45,660. And is a tax which is practically out of date now?—I should certainly so describe it.

45,661. Would you consider that the more it has become out of date the more difficult it is to do away with it?—I do.

Redemption of land tax.

45,662. When do you think it could have been abolished with advantage?—I think that nothing short of a compulsory redemption at the earliest stage could have operated with anything like fairness. I do not say that would have operated with fairness, but the history of the tax in later years has become so anomalous and so involved that I really utterly fail to see how anything can be done short of some scheme of redemption to remedy the evils inherent in it.

45,663. Have you considered a plan for its redemption?—We have from time to time considered it, and we are of opinion that if Parliament could be persuaded to sanction it, a plan of redemption could be carried into effect.

45,664. Treating the landowners liberally?—I should say treating them with a considerable amount of liberality.

45,665. Then you would let them redeem it at a much lower price than at present, I suppose?—We should propose that the terms of redemption should be modified somewhat as they were in 1853.

45,666. Ought any of the land tax on personalty to have been redeemed?—No, that was not subject to redemption.

45,667. Never at any time?—No.

45,668. Therefore the difficulty of redemption did not stand in the way of that policy?—No.

45,669. Do you think that the antiquity of the tax or the fact that a large portion of it has already been redeemed is the more serious bar to doing away with it?—I think that both are a serious bar because undoubtedly an amazing quantity of land has changed hands and been bought subject to what was considered a rentcharge or something in the shape of a rentcharge; and I think the number of redemptions also, a large part of the tax being redeemed is a serious obstacle to any dealing with the tax except by a system of redemption.

Incidence of land tax on agricultural land and towns compared.

45,670. Can you say what proportion of the land tax is now charged on agricultural land?—No.

45,671. Nor how much on towns?—No.

45,672. Can you form any estimate?—I am afraid I could not.

45,673. Is the larger part on agricultural land?—I should say that the smaller part was on towns. Several towns have by this process of automatic redemption reduced the tax to a minimum, and in some it has gone altogether. There is no land tax, for instance, in Manchester, and there is no land tax in Liverpool, and the land tax in Birmingham, as I was saying just now, has got down to 500*l.*, and is in course of extinction.

45,674. Where you have the land tax in towns, is it for the most part very expensive to collect in the same way as at Birmingham, or does that difficulty not apply everywhere?—It is expensive to collect because of the very minute sums in which it is collected. I should say that probably in Birmingham more than half the sums are under 6*d.*

45,675. Do you think that same rule is pretty general in other towns where the land tax is unredeemed?—Yes. In Scotland the land tax quotas were smaller, and we know that in Glasgow it is some minute portion of a penny in some cases, but there they collect it with the rates, so that we do not hear anything of it until they pay over the whole tax.

45,676. That would be an additional reason, would it not, for allowing very liberal terms of redemption?—That would, I think, be a reason. We should be delighted at the Inland Revenue Office to get rid of the land tax altogether.

Mr. F. L. Robinson, C.B.

5 April 1895.

45,677. It is neither the one thing nor the other is it? It is neither a rent charge, as I understand, nor do you regard it as an ordinary tax; you regard it as in the nature of a rentcharge, although it may vary very much; at any rate it is not a fixed rentcharge?—It is a variable rentcharge. I hardly know what to regard it as. I regard it as so much money.

Objections to the land tax.

45,678. (*Mr. Little.*) It has been converted into a rentcharge in some cases, at all events, where it has been paid?—Yes; there are 300 to 400 cases where people had the right of buying up the land tax, and in those cases the Government collect it and pay it over to the person who redeemed, but did not exonerate.

Redemption of land tax.

45,679. (*Mr. Dalton.*) You would agree that it is a mistake in legislation to allow any tax to be redeemed, would you not?—Distinctly.

45,680. And that that was a very fatal mischief in this case?—Mr. Pitt made what we now consider a serious mistake. There is not the least doubt that he imagined that, owing to the very favourable terms which existed in 1798, everybody would redeem the tax. As a matter of fact, in the early years of the tax half a million was redeemed, but only half a million.

45,681. And the result has been that he has perpetuated a very unfair tax?—A tax has been perpetuated which gets more anomalous every year.

Uniform assessment of land tax.

45,682. Do you think anything can be done to improve it in the way of having a uniform assessment?—Of course, it would be possible to request the Commissioners to act strictly in accordance with the law, but that requisition could not be enforced in a Government department, and provided the same basis is adopted in every parish, it is really of no consequence; no hardship is done to the individual taxpayer as to whether he is taxed on 400*l.* at a shilling, or 100*l.* at 4*s.*

Uniform valuation for local and imperial purposes.

45,683. Do you think it is desirable that there should be one valuation for local and imperial purposes?—Yes, certainly.

45,684. And that the system in force in London should be applied to the rest of the country?—I think such a system would be a great advantage. They have it in Scotland.

Valuation of railways for local purposes.

45,685. We have heard from a Scotch witness about the system they have there of valuing the railways for local purposes. Do you think the Inland Revenue Department could undertake that duty?—I have no doubt we could.

45,686. And that it could fix the assessment of the railway for each parish for local purposes?—I believe the Scotch system provides a specific method of fixing the amount of contribution for each parish, by reference solely to mileage, and a per-centage on the value of the buildings. The result is that it is relatively a simple process, and does not give rise to any difficulties. If such a system existed in England, no doubt it could be carried out, but if the Inland Revenue Department were expected to estimate, as I believe is the law, what is the value of the railway in respect of the tolls that it receives in each particular parish, I do not think we could do it satisfactorily.

45,687. Somebody has to do it now in the country?—Somebody does it.

45,688. Who would have less means of doing it properly than your department would have?—That would be so no doubt. I have no knowledge of it, but I imagine it is not very consistently done, and that it does not work particularly satisfactorily.

45,689. But for that reason, although it would be a difficult task, you would probably be able to do it better than any local people?—Yes, I should say we should, for this reason, that something like a uniform system would be established.

45,690. You would also have the accounts of the companies, I suppose?—We have, of course, the accounts of the companies, and in a sense we have means of knowing what amounts of tolls are collected at each station; but I think it would be a difficult operation, whereas the Scotch system is fairly simple.

45,691. But it is a matter of great importance to get it right in England, because the value of the railways is so large, and the cost at present of getting an accurate assessment and of going to law and so on is very great?—Yes.

45,692. Do you think a central department under your office could do it?—A central department could do it, but I should consider it would be necessary that some distinct direction should be given as to the principles on which the assessment ought to be determined.

Mr. F. L. Robinson, C.B.

5 April 1895.

Remissions of rent and income tax assessments.

45,693. I understand that one reason why the income tax assessment on lands is too high is that it does not take into account the remission of rents and the temporary abatements by owners?—That is so.

45,694. On the other hand, you allow rebates in respect of those temporary remissions?—Yes.

45,695. Cannot you ascertain from the amount of rebates on the income tax what the amount of those remissions of rent are—you would not expect that you would have a rebate in every case, but you could form some idea, perhaps?—I have got something like an account here. It is a statement for the years 1891–92 and 1892–93, showing the total charge, and the amounts discharged on account of agricultural depression and loss of profits by schedule, and repaid in nine divisions of Essex, Suffolk, and Bedford, together with the relative per-centages of discharge to charge. That shows that in 1891–2, in the Witham district of Essex, we discharged 24·9 per cent., and in 1892–93 we discharged 52·6 per cent.

45,696. That would be a considerable reduction in the assessment?—Yes. Then I put in a statement showing the remissions on agricultural lands and the repayments of income tax that have been made in the last five years under Schedules A. and B. under certain specified headings. (*See* Appendix A., XLI.)

45,697. Those sums seem very small for the whole of England?—Yes. Those are repayments after the assessments have been made.

45,698. Those are cash repayments?—Yes, and the assessments also show a reduction.

45,699. (*Viscount Cobham.*) Have the occupiers to make this application for rebate?—The occupiers would make an application for rebate under Schedule B. where they make losses.

45,700. But where there are remissions?—Where there is a temporary remission the owner sends in his claim for the remission of Schedule A., and the other follows as a matter of course.

45,701. And you say that in the great majority of cases the landowners have not troubled themselves to make the application?—We have had a very considerable number of cases, but now they are more dealt with in the districts. Since Mr. Goschen's Act of 1893, which authorised the setting off of loss on one schedule against the gain on another schedule, it has fallen to be the practice that these claims are made very largely in the districts and are settled there; so they do not appear in the matter of repayments; they appear as discharges.

Insufficiency of assessment.

45,702. As regards land tax, do you consider it a fact that in many parishes there must be really more than 4*s.* in the £ in order to keep up the quota?—No, I do not, I am very sceptical on that point.

45,703. How do you account, then, for the considerable number of parishes which apparently have been paying the full 4*s.* notwithstanding the reduction in the value of land?—Because the assessments on which the 4*s.* is charged bear a very small proportion to the value of the lands.

45,704. Has the re-assessment been made?—No, in these cases they have copied the land tax assessments of past years.

45,705. Therefore more than 4*s.* on the existing assessment must have been levied in many instances?—I do not think there are such cases. The cases I have looked into—the three or four cases which I gave in evidence—show that an assessment of 1*s.* on the full value would have sufficed whereas they have made 4*s.* on a fourth of the value.

45,706. (*Mr. Dalton.*) How did that assessment get so low—was it a very ancient one?—It was a very ancient one no doubt.

45,707. But your Income Tax Valuation of lands now is not much higher than it was in 1814 taking the whole country?—The Land Tax Assessments in many cases have remained the same for a great number of years.

45,708. (*Viscount Cobham.*) Let me give you this case, reverting to a previous question. Supposing the land tax in an Essex parish is 2*s.* in the £ and the

Mr. F. L. Robinson, C.B.
5 April 1895.

assessment is 1,000*l.*, and assuming that that is a full assessment, it would pay a quota of 100*l.*; then supposing that the rental of the parish has uniformly fallen from 1,000*l.* to 400*l.* (which is not an uncommon case) then the maximum of 4*s.* in the £ upon that 400*l.* would only bring in 80*l.*?—That is so.

45,709. Is it not conceivable that that has happened in a good many instances; we have had many cases of a greater fall of rent than that?—As I say I can only find two cases in which an assessment of 4*s.* on the full yearly value is not sufficient.

45,710. Does that not point to my conclusion that a good many landowners are paying in ignorance more than they can be legally compelled to pay?—That may be so; but judging from the few cases I have looked into—and if you will permit me, I shall have much pleasure in looking into some more—I think it would be found that in no case in which there is an existing assessment of 4*s.* is the amount entered the full yearly value.

Mr. F. L. Robinson, C.B.
5 April 1895.

Effect of sub-division of property on land tax.

45,711. What happens in the case of a sub-division of property?—In nearly all those cases the land tax is either properly re-assessed in the parish or else they simply split it up according to the sub-division.

45,712. Is it re-apportioned?—Yes. There ought of course, as I say, to be an annual assessment.

45,713. I suppose it is the great sub-division of land in towns which has led to such a case as Birmingham?—Yes. I may say that in London the land tax assessments are on the whole made purely with reference to the annual value as shown in the valuation list of London.

The witness withdrew.

Adjourned to Thursday, 25th instant.

Eighty-seventh Day.

Thursday, 25th April 1895.

PRESENT :

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., } *Assistant*
ALAN MACKINNON, Esq., } *Secretaries.*

Mr. C. N Dalton, C.B.
25 Apr. 1895.

Mr. CORNELIUS NEALE DALTON, C.B. (a Member of the Commission), further examined.

Mr. C. N. Dalton, C.B.
25 Apr. 1895.

(*For previous evidence see page* 299.)

Highway rates.

45,714. (*Chairman.*) I believe you have some addition or correction to make to your evidence?—Yes. Since I gave my evidence we have completed the returns of the highway rates for England and Wales for the year 1893. They amounted in that year to 1,491,434*l.*, which is a considerable increase on the preceding year. The rate in the £ came to 6·7*d.* on the rateable value of the highway areas; that is higher than it was in the preceding three years. I will add those figures to the table that was put in. (*See* Appendix A., XXXII., Table 5.) I made a slight mistake in my answer as regards the highway rates for the earlier years of the century. I stated that the Table only gave the rates in the rural districts; that is absolutely the case as regards the years subsequent to 1868 and including that year.

45,715. (*Mr. Gilmour.*) Would you give us the number of the Answer that you refer to?—It is the answer to Question 42,422. I cannot speak with certainty of the years in the earlier part of the century; no doubt the figures for those years are mainly rural, but I think there can be little doubt that they include some urban rates.

45,716. (*Chairman.*) What are you referring to?—To the table that I put in giving figures taken from page 11 of Mr. Goschen's Report, showing the highway rates. The table is headed "The highway rates in rural districts"; they are highway rates in purely rural districts from 1868 to 1893, but in the earlier years they are not highway rates levied exclusively in rural districts. I cannot say to what extent they include rates raised in urban districts, but they certainly include some urban rates. I have also received some Tables which Mr. Giffen has got for me from the Board of Trade, showing the amount of rates and taxes paid by the railway companies in England and Wales and in Scotland and Ireland in each year, from 1871 to 1893. That has been printed and I think circulated. (*See* Appendix A., XXXII., Table 17.) It shows that the rates and taxes paid by railway companies in England and Wales rose from 799,771*l.* in 1871 to 2,289,530*l.* in 1893; that is to say, they have nearly trebled. In the same period the net receipts of the companies only rose in England and Wales from something under 22,000,000*l.* to 29,000,000*l.*, and the paid-up capital of the companies increased from 461,000,000*l.* to 800,000,000*l.* There was, therefore, a very large increase in the amount of rates and taxes paid by these companies, and I understand that those are nearly entirely rates and that the taxes form a very small portion of the amount.

45,717. (*Mr. Little.*) Do they include passenger duty?—I believe they do not include passenger duty. I understand from Mr. Giffen that there is a separate item of passenger duty in the railway returns.

Mr. Goschen's and Mr. Fowler's Returns.

45,718. I understand that Mr. Goschen's and Mr. Fowler's returns, if we may distinguish the two volumes by those names, compare the rates at different periods during the present century?—Yes.

45,719. I think you have stated that those periods were selected not arbitrarily, but because the best materials were obtainable for those years for comparison?—I think that is so.

45,720. Those periods were 1803, 1813–15, 1817?—In the table I have put in I have left out 1817.

45,721. The other periods included are 1827, 1841, and 1868?—1841 I have also left out.

45,722. The four first periods that I have named were before the introduction of the new Poor Law?—Yes.

45,723. And only two of those in Mr. Goschen's report are later than that date, namely, 1841 and 1868?—Yes.

45,724. Those periods were periods of comparatively high prices for agricultural produce?—Was that the case in all of them, 1803, for instance?

45,725. "Comparatively high" I said?—I do not know; I am afraid I cannot say; some of them clearly were.

45,726. Periods of gross maladministration of the Poor Law?—I am not sure that that was the case in 1803, which is the earliest year that is taken.

45,727. At any rate, under the old Poor Law, there was a very lax system of relief?—During the years immediately preceding the report of 1834, undoubtedly.

45,728. And wages were subsidized to a considerable extent?—Yes.

45,729. Wages were actually paid out of the rates to men working on farms?—In the few years prior to 1834; I cannot answer as to what was done in the earlier part of the century.

Comparability of rates at different periods.

45,730. A comparison of the rates in the pound at different periods depends upon the assumption that the same basis of assessment is taken?—We are compelled to take the assessments that we have. In one of those periods, I think it was 1813–15, I pointed out that Mr. Goschen mentions that he took the gross annual value for the purposes of the income tax for calculating it, and that in consequence of his taking that the rates were given at 23 per cent. lower than they really would have been if the rateable value had been taken.

45,731. I mean the comparison is only a proper comparison if the data are the same: if the assessment was made on a different principle in the earlier periods it is not fair to compare the two?—I do not think you can say that it is not fair to compare them, because if you were to lay down such a principle as that, no comparison would be possible. I think that you must take into account, so far as you can, the variations which have taken place in the systems of assessment in the different years; but if you lay down the rule that you must not compare them, you could have no comparison with any past period for the purpose of seeing whether the rates had risen or decreased.

45,732. That only means, I think, that this is the best comparison that can be made?—Yes.

45,733. But if the practice was very general to rate property at considerably less than its value previous to the Union Chargeability Act, then the rate in the pound is shown by these figures as much greater than it really was on actual value?—The years I have taken for my table have been 1803, for which the figures are taken from Marshall's Digest; and 1813–15, where the calculation was made on what I think is admittedly too high a valuation, not too low a one; and the main comparison is between those two years and the present time when we have a comparatively accurate valuation. You cannot get a perfect valuation; I suppose we shall never get that; but the valuation is probably more accurate now than it was in the earlier part of the century. But I may say with regard to those earlier years that it is quite clear, from some of the reports of the Parliamentary Committees, that the practice did prevail in many localities of charging the rates on the full rental—on the gross annual value. I am not saying for a moment that that was the universal practice; I have no doubt it varied very much in different districts. That is a practice of course which prevails nowhere now, but wherever that practice did prevail the rates appearing in this table are clearly too low for the purpose of comparison with the present time.

45,734. On the other hand, if it can be shown that previous to the new Poor Law being introduced, assessments were in many cases not more than 50 per cent. of the actual rent, and that between that period and the passing of the Union Chargeability Act, they were not more than 66 per cent. of the rent, and that they are now considerably above the rent, then a comparison of the rate in the pound is entirely fallacious?—I have not taken any of the years for my table that are in the time you mention, namely, just before the Poor Law Commissioners' report in 1834.

45,735. Do you assume that the practice of rating at less than the value had increased between 1803 and 1834?—I think it is quite clear from some of the records in 1803 that in some localities the same system prevailed which prevails as regards some of the rates in Scotland; and that is that it was the simplest and most natural way of rating at starting to take the rent: but that afterwards a more artificial system came in of making allowances and getting at what is now known as the rateable value. During the first few years that passed after that system came in, I have no doubt in many places lands were rated at considerably less than at their real value. But it is a very difficult question to ascertain the precise facts. With regard to these figures for 1803 we can only take them as they appear in Marshall's Digest. It is perfectly clear that in some counties they were taken on the rack rental; in others it is perfectly clear that they were taken on a lower estimate; but the result which the compilers of that return came to in 1803 was stated as follows in the memorandum to the return:—"Application having been "made to the several clerks of the peace requesting them "to specify the usual proportion of the rated rental to "rack rental, it appears that according to the answers "received the rated rental amounts on an average to about "three-fourths of the rack rental." I think that is on the whole a fair valuation.

45,736. That would be about the per-centage now, would it not?—Yes. That is what they said at the time in 1803 in the preliminary memorandum to the return. With regard to the figures for 1813–15, I think it is quite clear from Mr. Goschen's report that those figures are too low and not too high.

45,737. (*Mr. Giffen.*) The rates are too low?—The rates in the pound were too low, that is, the valuation taken was too high; it was the income tax valuation.

45,738. (*Mr. Little.*) We have it on the evidence of the Vice-Chairman of the Inland Revenue Department, that the income tax is largely based upon the poor rates?—At the present time.

45,739. And was then?—Did he say so?

45,740. I do not know that he did say so, but I presume that it was so?—I cannot say on what system it was done. I can only give these as the figures that then appeared in the parliamentary returns of the day.

45,741. Any defect in the poor rate valuation would probably be reflected in the income tax valuation?—I really cannot say. I do not know on what system the income tax valuation was prepared.

45,742. Really, does it not come to this, that we are comparing things which are not strictly comparable?—In 1803, I think you agreed that it was pretty comparable, for it was taken on three-fourths of the rack rental. That is a valuation which is very much like the present one. In 1813–15 the valuation taken was too high and the rates in the £ too low.

45,743. Now I should like to draw your attention to page xiv. of Mr. Fowler's Report, the preface, where the summary of all the rates and the average rates at different periods is given. In the period of 1841 the total amount was 2*s.* 7*d.* in the £, and in 1891 it was 3*s.* 8*d.*; so that the only period that we have for comparison since the introduction of the new Poor Law shows a very large increase in the amount of rates?—These are urban and rural rates. In my table I have separated the two. There is no doubt whatever that the urban rates have enormously increased since 1841.

45,744. I was desirous of pointing out this difference, that when a comparison is made with 1803 of rates of 4*s.* 5*d.* in the £, and against that are contrasted the rates of 1891 of 3*s.* 8*d.*, it is only fair also to state that in 1841, when things were more like what they are at present they were only 2*s.* 7*d.*, and now they are 3*s.* 8*d.*?—On the other hand, you have just pointed out that there is reason for supposing that in 1841 the valuation was incorrect.

45,745. (*Chairman.*) But this comparison of 1841 with the present time is in regard to the rates of the whole country?—Yes, both urban and rural.

45,746. It includes urban rates as well as rural rates?—Certainly.

45,747. It is admitted on all hands that the increase in urban rates has been enormous?—Yes, but as we have not got the rural rates for 1841, at least I believe not, I have not set them out in any table.

45,748. (*Mr. Little.*) I only want to urge that a great point has been made of the decrease in rates, and that years, such as 1803 have been spoken of and compared with 1891, and what I wish to get at is that if 1841 had been taken as the starting point an enormous increase would be shown in rural districts?—There is no evidence that the rural rates have increased as compared with 1841. I have given no evidence about urban districts, nor did my evidence go in any way to giving the total rates of England and Wales. Therefore this is a new point which does not arise on my evidence. (*See* further as to the rural rates for 1841, Questions 45,863–8.)

45,749. Would you admit that statistics as to the amount of rates before the new Poor Law came into operation have very little practical bearing on the question at issue now; what rates were in 1803 or 1815 has very little to do with

Mr. C. N. Dalton, C.B.
25 Apr. 1895.

the question of the burden of rates at the present time?—I do not think I could quite say that. I have been very careful to avoid any discussion of the question of the hereditary burden, because it is a very large question, it is a question on which there is a great deal to be said on both sides, and I do not wish to express, if I can help it, any opinion whatever on one side or the other upon it.

45,750. For practical purposes is it not better to discuss what rates have been under the amended law than what they may have been under a system of mal-administration which nearly brought the country to ruin?—That was evidently not the opinion of Mr. Goschen when he wrote his report in 1871. Mr. Fowler's report gives the result of those investigations, but the figures for which the Local Government Board are responsible of course only date from the year 1871, and those are the ones that I have no doubt are of more immediate interest at the present time than the older ones. I do not think you can leave out of account the fact that the rates were very heavy in the early part of the century.

45,751. The question we have to consider here is the pressure of rates upon land, and for that purpose surely it is better to consider what has been during recent years than what is ancient history?—I think you may learn a good deal from the ancient history. I think it is quite clear that in the time when the Poor Law Commission reported in 1834 rating was then the most serious question affecting agriculture. It is quite clear from the report that very considerable areas went out of cultivation, simply because of the rates, and I think that is of some importance to consider.

45,752. Then with the new Poor Law a fresh start was made, and changes were introduced?—Yes.

45,753. And bargains have been made during nearly two generations on the basis of that improved system of administration?—Yes, and the tables which I have given show how far the rates have fallen or risen since 1868 in considerable detail.

45,754. Now you have dealt, as you say, entirely with rural rates leaving out urban districts?—As far as I have been able.

Distinction between urban and rural districts.

45,755. The distinction in the matter of rates between urban and rural is a mere technical distinction, is it not, not a real one?—I do not think so. I think there is no doubt that a considerable amount of the expenditure out of the urban rates does improve the urban property to a greater extent than expenditure out of the rural rates improves rural property.

45,756. The word "urban," speaking of urban rates, is used entirely with reference to urban sanitary districts?—Yes.

45,757. While the popular conception of an urban district is that of a town of considerable population crowded together somewhat, the urban sanitary districts are many of them, large areas of agricultural land?—That is the case in one or two exceptional parts of the country, but certainly the majority of urban districts I think would be popularly regarded as towns.

45,758. Mr. Fowler uses continually the phrase urban ratepayers, and he includes in that all the ratepayers in urban sanitary districts; now I have taken the trouble to look into the census returns and I find that nearly 40 per cent. of all the urban sanitary districts have a population of less than 5,000 people?—That would be the number of the districts, but if you take the amount of urban rates you would certainly undoubtedly find that the great mass of that expenditure was incurred in big towns. You reckon in your calculation, of course, such a town as Birmingham or Liverpool as a unit and you would have in another place, perhaps, a very small town also taken as a unit.

45,759. I am speaking only of the per-centage of the total number; but when you have urban districts with a population of less than 200?—Are there such?

45,760. There is one at least. Then there are urban districts where there are nearly 12 acres of land for every inhabitant. It is clear that there you have not got what would be popularly supposed to be an urban population?—You have got a certain number of those small villages formed into urban districts. They were allowed to form themselves into local board districts for a very limited period after the passing of the Local Government Act of 1858. This was found to lead to abuse in the manner you describe, and the sanction of the Secretary of State was made necessary for the future, and at present urban districts can only be formed by the county council. You have a number, a comparatively small number I should have said, nothing like 40 per cent. or 50 per cent.—of very small districts—a comparatively small number. I think that a town may fairly claim to be made into an urban district when it has a population of 4,000 or 5,000, and in many cases where the population is smaller, if there are exceptional circumstances; for example where it is a watering place and the population increases at one time of the year, and so forth; or where it is growing rapidly into a town. I really think that the number of those cases that you refer to, of really rural districts which are technically urban may almost be disregarded for the purposes of any broad results as regards rural rates. The amounts of rates raised in them would be very small, and would not affect the general result to any extent. A considerable number of them have been dissolved.

Mr. C. N. Dalton, C.B.
25 Apr. 1895.

Agricultural land in rural districts.

45,761. I am not speaking of the general result I am going to particular results. It cannot be denied that there is a very large quantity of agricultural land which is included in urban districts and is subject to urban rates?—Clearly, and in some cases a large urban district includes a considerable amount of agricultural land.

45,762. But agricultural land under such circumstances is subject to rating for urban purposes?—Yes.

45,763. In which the landowner or the land occupier has only the interest of an inhabitant and not the interest to the full extent of the property?—The land occupier.

45,764. Occupier or owner, I take the two together; for the sake of simplifying the case, take the man who owns the land and farms it?—I should say if it is a large town, he undoubtedly gains very much from the propinquity of the town—not only in the present annual value of his farm but that he gains very largely indeed in the capital value.

45,765. Suppose it is only a small town?—Then probably the rates would not, as a general rule, be very high.

Rates in small urban sanitary districts.

45,766. (*Chairman.*) I suppose in many of these very small urban sanitary districts the rates are not very high?—No; as a matter of fact the very small urban districts which have been referred to were generally formed for the purpose of keeping the rates down, and preventing the parish from being thrown into a highway district. Many of them were small parishes which had a small extent of road, and finding that the Act of 1858 gave them the opportunity of setting themselves up as separate rating areas they took advantage of it for the purpose of paying less highway rates, and I should think that in many of those cases they are really paying lower rates than the surrounding parishes which are purely rural. That was the original object of their constituting themselves urban districts.

45,767. (*Mr. Little.*) I shall be able to bring you evidence of a small town with a rate of 7*s.* in the £?—No doubt.

45,768. Which becomes 4*s.* 6*d.* or rather more than that on the land which lies nearly 10 miles away from a town. We have had evidence here from a gentleman who complained that he was assessed for lighting a village, and the nearest lamp-post was three-quarters of a mile from the outside of his farm?—I have no doubt that you will find individual cases of hardship, but, speaking generally, I should say that the burden of rural rates is most severely felt by places that are at a considerable distance from any urban centre. The fact that a farm is near a town has probably prevented that farm from going down in value more than any other circumstance that you can name.

45,769. That may be the case with the large towns, but surely with small towns which have got this power of rating there must be many cases of great hardship, not only as regards the man in the position I spoke of, that is one who owns and occupies land, but there must be many other cases?—I do not for a moment deny that both in urban and in rural districts there are individual cases of great hardship.

45,770. The complaints against the increase of rates may in many cases come from those who have suffered from such rates as I have described?—It is possible. You also, of course, have in many cases in a purely rural parish very high rates where you have a school board; there is no doubt whatever about that.

School board rate.

45,771. With regard to the school board rate which you have mentioned, I understand that the principle which has been adopted in estimating the average amount has been to spread the whole amount over the entire area of the district?—In the same sentence in which Mr. Fowler gives the result of doing that he is careful to say, "This rate "is a rate which falls very unequally, some districts "being entirely free from it, while others are rated to it "very heavily. As showing how high this rate often is "in the districts in which it is raised, I may mention

Mr. C. N. Dalton, C.B. 25 Apr. 1895.

"that, according to the reports of the Education Department the average rates raised in urban and rural parishes where there are school boards outside boroughs were in England 6·7*d.* and 6·8*d.* in the £," and so forth. He is careful to give the average rate in the districts in which there are school boards, but in adding together the total amount of the rural rates, he is obliged, in order to arrive at the total, to spread them over the whole rural area.

45,772. I was not accusing him of any bad faith in this?—I mean to say at the time at which the average result was stated a very full explanation was given of it.

45,773. Certainly, but in answer to the Chairman you said that in rural districts six parishes out of seven had no school board rates?—That was so in that year, 1891.

45,774. Then if the average was 2*d.* the seventh parish, supposing they were equal, would have a rate of 14*d.*?—That would entirely depend upon the size of the parishes.

45,775. I said if they were equal?—Yes, but of course the larger parish is the more likely one to get a school board.

45,776. Then when you have got the average of the school rates, you do not disclose the extreme cases of individual hardship?—Certainly not.

45,777. Where a man, for instance, pays a school rate of 2*s.* 4*d.* in the £, it is very little encouragement to him to say that on the average the rates are only 2*d.*?—On the other hand, while you hide those extreme cases by taking an average, you also hide a very large number of cases where the school board rate is very small, and where there is no school board rate. That is always the case in taking the average.

45,778. Quite so; the origin of complaint against taxation I imagine is that some people are pressed very hardly by the present system?—I think the complaint is a very general one. I do not think it is confined to places where they have felt an increase in the rates. I think it is general throughout the country.

45,779. But it derives a considerable force from these particular examples of hardship which arise under the present system of rating?—Yes, but of course you must not take one of those extreme cases as the ordinary typical case.

45,780. But surely, if a system permits what appears to be a gross injustice, the system is wrong, even though it affects only a few individuals?—I do not know that you can say that it is a gross injustice without knowing the facts of the particular case. If a particular district chooses to incur a very large expenditure, that may be incurred with the full consent and wishes of everybody in the parish—I do not say it is—but it is quite conceivable that it is.

45,781. Supposing it is forced upon them by the Government, as in the case of a school board?—I suppose it is then considered to be a necessary expenditure.

45,782. But it falls upon a limited class of owners of property?—You can hardly say that with respect to the expenditure of a school board, because a very large proportion of course of the expenditure comes from Imperial sources.

45,783. I am not speaking of the whole cost, but I am speaking of so much as is raised by rate; if you get in a purely agricultural parish a rate of 2*s.* in the £, that is an enormous burden upon the owner and occupier of land, is it not?—If suddenly you get a new burden of anything like that amount, it is a very serious thing indeed for the owner; I should say probably at the present time more for the owner than the occupier, because I should say that the occupier would apply for relief. But I am not saying that that is not a most cruel expenditure to fall upon the owner; I think it is.

45,784. I am trying to keep the individual in view who owns and occupies his land, in order that we may not have any difficulty as to whether the rate falls upon the owner or the occupier?—Yes, I quite understand that; but that is not of course the ordinary typical case. I think myself—I say so without any hesitation—that the owners of rural lands have a great deal more to complain of in the rating question than the occupiers. I do not think there is the least doubt of it, especially in such a case as you have mentioned. If you suddenly put a permanent charge of 2*s.* in the £ upon a district, you are practically diminishing the value of the property in that district enormously.

45,785. And for a purpose——?—From which the owner derives comparatively little benefit.

45,786. Which is not particularly beneficial to the district?—I do not know about the district; to the inhabitants of that district I should presume it was. I am speaking with great hesitation upon these school board matters; I know nothing of school board administration, or the circumstances under which parishes are compelled to have a school board, nor do I know to what extent the expenditure is really caused by the Government. I think if any information is wanted upon that subject, we ought to have it from the Education Department. I am afraid of expressing any opinion upon that question I know nothing about the circumstances which lead to this expenditure. It is very large in certain places, undoubtedly.

45,787. In your evidence I see you speak of the rates which railways pay as being a charge upon personal property?—Yes.

Principle of rating of railways and land companies.

45,788. But surely it is levied upon the real property, or attached to the real property?—Of course, it entirely depends what view you take of real property. I think, myself, that the ordinary view taken of real property before the Finance Act, was, that real property was property not subject to probate duty. Undoubtedly railway shares always paid probate duty, and they were technically personalty in the same way as Mr. Giffen has pointed out certain interests in houses are.

45,789. Leaseholds?—Yes; they were always liable to pay the probate duty. They came within the description of what I think is usually termed personalty. I think anybody buying railway shares does not consider that he is buying real property.

45,790. But the property which is rated is the railway, and it is rated on the same principle as a farm; on what it would let for?—What it is worth.

45,791. Yes, what it would let for; there is no different principle applied in assessing the value of railways to that applied in assessing the value of land?—I should have said a different principle was applied in practice. Is it not so? Do they not take this into account in rating a railway; is it not practically rated on its receipts?

45,792. Surely the law has not been altered?—No.

45,793. And property is assessed on what it would let for?—Yes. I have no doubt you know more about the assessment of railways than I do. I know very little practically about it, but I have always understood that they have been driven practically to rate them on the receipts. I imagine that it is quite clear that the assessment of a farm for local purposes is not determined by the receipts or profits.

45,794. It must eventually be determined by the profits, because the rent can only arise out of the profits—We are told in many cases there are no profits.

45,795. Will you explain to me what is the difference between personalty invested in developing land and personalty invested in making a railway. A man spends 10,000*l.* in draining a marsh and he creates a rateable property; his 10,000*l.* was personalty; it has developed the land and it is rated. Another man spends 10,000*l.* in developing a railway, which is personalty when it is invested; it happens to remain personalty afterwards, but it is essentially the same thing, is it not?

45,795*a.* (*Chairman.*) Does that not depend very much upon the way in which the assessment is made upon the railway; the railway is not assessed for that district merely in respect of that bit of land, without regard to the remainder of the railway, but as a part of the whole concern? You do not take the value of that particular bit of line and the capital that has been spent upon it, but you take the whole line and the proportion that that bit of railway bears to the whole. I think that is the method, is it not?—That is the method.

45,796. (*Mr. Everett.*) You do not assess a farm on a separate field; you assess it on the whole farm?—I am not suggesting that they ought to be rated on different principles, and I do not altogether understand what exception is taken to the statement that railways, canals, gas works, waterworks, and so forth are personalty. Historically they have been regarded for the purposes of taxation other than local taxation as personalty. Does Mr. Little mean that there is no distinction between the two? There was a very great distinction between the two, in the matter of the death duties, until last year.

45,797. (*Mr. Little.*) My question was what is the difference in principle between money, that is personalty, invested in the development of land, and money, that is personalty, invested in the development of the railway? You may call one technically personalty and the other, the moment it becomes attached to the soil, you may call real property, but they are the same in nature, are they

Mr. C. N. Dalton, C.B.
5 Apr. 1895.

not?—I have not argued that they should be treated differently, or that this class of personalty should not be rated. I think that any class of personalty should be rated if you can conveniently rate it.

45,798. The argument that personalty does already bear a considerable share of local taxation, because railways and canals pay, might be extended, might it not, so as to include all the personalty which a farmer invests in farming?—I do not think that is rated, although all the personalty that a landlord expends in improving his farm is clearly rated.

45,799. But the land could yield nothing if it were not for the personalty which is employed in working it?—Certainly not.

45,800. And, therefore, just as you may say that personalty pays in the shape of railways personalty pays in the shape of farm stock?—I beg your pardon; in the case of the farm stock that is the capital employed by the occupier on the farm. I have not suggested for a moment that that ought to be separately rated, but no doubt the farm would be valueless without it.

45,801. (*Chairman.*) As a matter of fact the farmer's stock is not rated?—I think it would make little difference if it was rated. I think I pointed out last time that if it was rated, a lower rent would probably be paid for the land.

45,802. (*Mr. Little.*) I only want to clear up this difficulty about the investment of personalty in railway and canal shares, and I want you to admit that if personalty is paying rates in the shape of railways then it is paying rates in the shape of farmers' capital?—I admit this, that if you rated the farmers' capital the general result would be practically that it would make very little difference; you would get no additional source of revenue to local taxation by doing it, because the rent would fall. I think there can be practically no doubt about that.

45,803. (*Chairman.*) To carry the analogy further, we do not know whether the railway is rated upon its stock. I presume the railway is only rated upon its land and plant invested in the land; I do not think it is rated on its rolling stock?—I think not.

45,804. That would bear the same analogy to the farm; the farm is rated upon the land, and the improvement effected upon the land, but not upon the farmers' stock?—Yes.

45,805. (*Mr. Everett.*) How would you get the rent if the farmer's stock were not employed to make the land productive; where would the rent come from?—I think you ought to rate any kind of personalty which you can conveniently rate locally; but I tried to prove that there are some classes of personalty that you cannot rate locally, and I think Mr. Little would admit that.

45,806. (*Mr. Little.*) I am not arguing for the rating of personalty, but I am arguing that if you contend that railway property is taxed as personalty you must admit that the farmer's capital is rated as personalty?—I fully admit that if the farmer's capital were rated directly it would not make, speaking broadly, any great difference. It would have this effect, no doubt, that a man who had a very valuable stock would probably have to pay more rates than a man who had a less valuable stock. I suppose some stocks, especially those of an exceptional character, might have to pay very largely. I do not suggest it should be done, but I do not feel quite sure that they are actually taken into account in the rent of a particular farm. I think, speaking broadly, there would be little difference in the result, but I should imagine that some farms do not require the same amount of stock as others, and that the rent does not depend upon the value of the stock employed on the farm. For instance, you may have racehorses, or any particular stock of that kind, and I think the man who owned that would have to pay very heavily if you rated him on his stock.

45,807. I am not contending for the rating of personalty; I only want to get an admission that if personalty is rated in the case of railways it is rated in the case of farm stock?—Farm stock does not directly pay it. The shareholder of a railway, before he receives a penny, has the rates deducted from the receipts of his company.

45,808. His profit is affected by the amount of the rates?—His profit is affected, and the money is taken from him before it reaches him. I could not say that in every case a farmer whatever his stock was, whether it was valuable or whether it was comparatively valueless, actually was rated on that stock. I think that would be too broad a proposition to be able to be defended.

45,809. (*Mr. Chaplin.*) Indirectly I understand you to admit, in answer to Mr. Little, that the farmer's stock is rated; do I understand you correctly?—No, I have not said that.

Mr. C. N. Dalton, C.B.
25 Apr. 1895.

45,810. In so much that but for his stock and his personalty the land would produce nothing; do you not admit that?—What I would say is this: I would quite admit that the land would produce nothing unless some stock was put upon it; but the land may produce no more by putting a very valuable class of stock than it would produce if you put a comparatively valueless stock upon it; and I do not think you can absolutely say that the particular stock which a farmer employs pays rates.

45,811. No, but indirectly it is rated, inasmuch as it is the application of this stock, or this personalty, or whatever you call it, which makes the land capable of being rated at all; it makes it valuable, and therefore capable of being rated; you admit I understand that, so far, the farmer's personalty is indirectly rated?—I should hardly consider it quite a correct phrase to say that it was rated. I quite admit that there is no useful object to be gained by rating it, and that taking the agricultural interest as a whole nothing at all would be gained by it, but I think as between different individuals they would pay differently from what they do now.

45,812. But whether the phrase be correct or not, is that not the indirect effect?—I should have said not.

45,813. Then how can you explain the fact that unless it were for the application of this personalty, the land would be valueless and not be rated at all?—It would not be valueless but for the application of that particular personalty.

45,814. Or not equally valuable?—It would require some personalty undoubtedly to be applied to it to make it valuable.

45,815. Then that "some personalty" would be indirectly rated?—Yes.

45,816. (*Chairman.*) Is there any difference in this respect between the stock on a farm and a stock in a shop?—I think that you must say that the stock in the shop is rated, if you admit the principle that some personalty is rated in each farm. Some stock has got to be used for the purposes of the farm, and if for that reason you consider that some personalty of the farmer is rated, you must admit that some personalty is rated in every shop, because an empty shop would be valueless.

Incidence of rates on land.

45,817. (*Mr. Giffen.*) Is that not an incorrect mode of putting it altogether, because the incidence that is laid upon farms, for instance, is upon the rent, not upon the farmer at all; he is not concerned with the rates really?—If the rate rises during his tenancy of course to that extent he loses.

45,818. That is because he has a beneficial interest as if he was the owner?—Yes.

45,819. But taking it that he is paying a rack rent, he is not concerned with the amount of rates at all, is he?—The rates may go up or down, you see, during his tenancy.

45,820. (*Chairman.*) Is not the rate ultimately paid by the landowner out of the rent?—I think the greater part of it is probably taken into account in most cases.

45,821. (*Mr. Little.*) Again I want to go to the man who owns and occupies the land; it must come from him. (*Mr. Giffen.*) But it comes from him in his capacity as owner and not in his capacity as occupier. (*Mr. Little.*) It comes out of the produce, does it not?—I do not think my opinion on the question of what share of the rate is paid by the owner or occupier is worth any more than that of any other member of the Commission, and I have really never been able to satisfy myself what either share precisely is.

45,822. A point has been made of the fact that personalty has been rated in the case of railways, and what I want to get an admission of, is, that if it is rated in the case of railways and because profits are diminished by the increase of rates, so it is rated in the case of farm stock. (*Mr. Giffen.*) Might I interpose to put it to this extent—the profit of the farmer is not diminished in any respect by the rate. (*Chairman.*) When you speak of personalty being rated in railways, you mean that in the ordinary acceptation of the term railway counts as personalty?—And has always counted so, and has also been so taxed. It always had to pay the probate duty, and it was legally personalty. It does not go to the heir; it goes to the next of kin. It undoubtedly has been regarded in this country as personalty and therefore I spoke of it as such.

45,823. (*Mr. Little*). Yes, but it is rated as attached to a realty and as developing the value of realty?—Of course the railways are not the only classes of property we have

Mr. C. N. Dalton, C.B.
25 Apr. 1895.

been speaking of. You would say the same, I suppose, with regard to gas mains passing through a town; it is difficult to say they are developing the value of the street, but they have to pay.

Local valuations and income tax valuations compared.

45,824. There is only one other question that I want to put to you; you have furnished us with some information comparing assessments and income tax at different periods in the rateable value and the value for income tax purposes; it was pointed out that the one was for union counties, and the other for counties proper?—Yes.

45,825. Is that not a possible source of considerable error?—In the Tables that have been put in of course it was desirable to compare the income tax valuation with the local valuation; but the income tax valuation can only be given for geographical counties, and the local valuation can only be given, without an enormous amount of trouble, for the union counties. It is not suggested for a moment that the two tables are in each case absolutely comparable, but they afford some check upon one another. As regards the total undoubtedly I think they do show what is the difference between the income tax valuation and the local valuation. Of course some of these counties are more comparable with one another than others. The great object of putting the Income Tax Return in was this: that it shows in what year land reached its maximum value. We have no means of comparing the local assessment of land in 1880, with that at the present time, and it was thought desirable if possible to show what had been the actual fall in the value of land; and to do that you were obliged to take as well as the year 1870 the year 1880, in which year according to the income tax valuations land rose to its maximum value. It has fallen very rapidly since. I think it was very desirable to have the figures for that year and to have them also county by county.

45,826. I am not finding fault with the return; I am only desirous of getting on the notes this fact, that there is a very considerable difference between the areas of administrative counties and union counties. I have a memorandum here which shows that the union county of Berkshire, for which the rateable value is given, is 24 per cent. in excess of the county proper; and that in Huntingdonshire only 74 per cent. of the ancient county is included in the union county?—There are very great differences in many cases between the union counties and the geographical counties, and I think when I put that table in I drew attention to the fact that they were different areas.

45,827. I think if you refer to the evidence you will find that the difference was said to be inconsiderable; if you get a difference of 25 per cent. in area, and in Rutland ——?—That is, of course, a very small county.

45,828. You have in the union county of Rutland 28 per cent. of the total quantity not in the county at all?—Yes, that might happen in such a small county as that, but what would be the next largest per-centage of difference? Have you got the next largest per-centage to that of Rutland? Rutland, of course, is a most exceptional county.

45,829. I have only taken out those three counties. I only want to get that on the notes as a possible source of error in comparing the rateable value with the income tax assessment in counties. I quite admit that taking the whole together the return is valuable, but for counties it must be taken with that consideration?—Yes, the figures of the income tax valuation are for geographical counties, and those of the local assessments are for union counties.

45,830. (*Mr. Giffen.*) With regard to some of the questions which Mr. Little has put to you respecting the earlier figures, I should like to put this to you—that they seem to apply more to the interpretation of the figures than to the propriety of your giving them in the returns which you have put before us; would that not be the case?—Yes, the reason we put them in was that there have been only two official inquiries into the incidence of local taxation, the earliest by Mr. Goschen, which went very fully into all questions connected with local taxation from the beginning of the century up to the then present time; the later one by Mr. Fowler following, so far as the local taxation of England and Wales was concerned, the same lines as that of Mr. Goschen.

45,831. And it is the duty of investigators to put all the facts which they find that seem to be material at all for the interpretation of those interested?—I think so.

45,832. Then, would it not be the case that if it is suggested that the valuation at the earlier dates was too low so as to throw up the rates, that would merely put you on an inquiry as to how much the valuation was too low?—Certainly.

45,833. That is, if you have any materials for finding out?—Certainly.

45,834. And the question would immediately arise whether there is any reason to believe that however much you might rectify the valuation of 1803, say, in comparison with 1868, you would still find that there was a great reduction of rates between the two periods, although it might not be from 3*s.* 4½*d.* to 1*s.* 6*d.*, a very great reduction?—Certainly; but I think, taking the figures of 1803 as a whole it is pretty clear from the note which I read out, and which was appended to the return published in 1803, that the valuation was a fair valuation taking the country as a whole. I quite admit that in certain counties where the rackrental was taken the rate in the £ given in this table will be too low, and that in cases where they had too small a valuation the contrary would be the case. But taking it for the whole country I think the note appended to the return is very strong corroborative evidence of the fact that the 4*s.* 5½*d.*, which is the average rate for the whole of England and Wales in 1803, was what we should consider a fair average rate now. It is stated on the authority of the compilers of that return that on the whole, the valuation came out at three-fourths of the rackrental.

Mr. C. N. Dalton, C.B.
25 Apr. 1895.

45,835. I am putting the question partly with reference to Mr. Little's use of the phrase "entirely fallacious," so as to bring out the fact that it is merely a case for putting you upon an inquiry as to how far the figure is capable of rectification?—Certainly.

45,836. And that the figure is not put forward in any absolute manner, but merely for the information of all concerned?—Certainly.

Comparability of rates at different periods.

45,837. Then with reference to the suggestion that it is not of much value to go back to those dates, is it not the case that although we seem to be separated now by a very long interval from the period before the thirties, yet, when these figures were first put together in 1869 and 1870, we were separated by a comparatively short interval then?—Yes.

45,838. And it was quite natural that the compilers of those figures should go back to earlier periods which were not so distant then as they seem to us now?—Certainly that is so.

45,839. I am looking to your Table 3 of the expenses of relief of the poor; it would appear from that, that down to 1827 (which was just before the new Poor Law) the rate per £ of the expenses of relief of the poor was close upon 2*s.* 6*d.*?—Yes.

Effect of Poor Law on the rates.

45,840. The effect of the new Poor Law undoubtedly was to reduce that rate, and there has been no subsequent increase of that rate since then; and, in fact, there has been a certain amount of reduction in the expenses of the relief of the poor; is not that the general effect of the figures?—There has been a reduction in the expenses of the relief of the poor in many localities; but, of course, taking the gross expenses of relief for the whole country, they have very considerably increased and are higher at the present time than they ever have been before.

45,841. But not the rate in the £?—Clearly not the rate in the £. Owing to the rise in the rateable value, and to other circumstances, including the subventions, the rate in the £ has been very considerably less.

45,842. Therefore the general effect of the Table, as far as burdens of that nature which existed before 1841 were concerned, is that the burden upon the property which bore them then, has been rather diminished than increased even as far as the rate in the £ is concerned?—Yes, certainly, as far as the rate in the £ is concerned.

45,843. (*Mr. Whitehead.*) When you were giving evidence before, I asked you a question upon your statement that church rates were raised formerly, not only for the maintenance of the churches but for the actual building?—Yes.

Church rates.

45,844. I think you have some additional evidence on that head which it would be interesting to put upon the notes?—I have looked up the Church Building Acts, and I find that a power was given to borrow on the security of the church rate for the building of churches, for the enlargement of churches, and for the repair of churches. I think it is tolerably clear that the sums that were borrowed on the security of the church rate were mainly borrowed for one or other of those purposes. Of course the church rate was also liable for the current repairs of churches.

45,845. (*Mr. Everett.*) What is the date of that legislation; do you carry that in your mind?—The powers I have referred to were given by the Church Building Acts of 1818 and 1819.

Mr. C. N. Dalton, C.B.
25 Apr. 1895.

45,846. (*Mr. Whitehead.*) Were the church rates liable for the building of churches up to the date of their repeal; can you say that?—I think the debts were incurred almost up to the passing of the Church Rate Abolition Act, 1868. There is one debt, I understand, which is not even now repaid. There were up to the last few years several debts outstanding. I think it is clear therefore that the borrowing on the security of the church rate went on almost up to 1868.

Rating of personalty.

45,847. (*Mr. Everett.*) Taking your evidence generally, I think the result of it comes to this, that the original intention of the law was to rate personalty just the same as realty—to rate all value; but owing to administrative difficulties personalty to a considerable extent has escaped out of its liability?—I think when the Act of Elizabeth was passed it was probably not passed with the direct intention of rating personalty: it intended that every man should contribute according to his ability; and no doubt there was no great amount of personalty then in the country. It was not till a very long period after that Act that as far as we can tell the question as to the liability of personalty to contribute to the poor rate began to be raised for the first time in the law courts. The section of that Act of Elizabeth was never amended and so you have not got any direct declaration of the intention of Parliament upon the subject since the reign of Elizabeth till about 1834. I think there is no doubt however that in the latter part of the last century that Act was interpreted certainly by the later decisions as intending that personalty should be rated in certain cases.

45,848. And such legislation as has taken place since then has gone in the direction of exempting personalty?—Clearly; except so far, I may say, as that legislation has taken the form of giving Parliamentary grants.

45,849. Would you yourself see any objection to making personalty contribute a larger share than it does now by means of an income tax?—I would rather not give any opinion upon that subject; I think that is a question for Parliament for the time being. If any such proposal were adopted, I think it is quite clear that the money would have to be collected centrally and distributed locally as Parliament might determine. There would be considerable difficulty of course in any distribution; there always is; but I suppose the main difficulty would be in imposing an extra income tax.

45,850. (*Mr. Channing.*) You do not believe in a locally collected income tax then?—I think it has been proved by experience both in England and in Scotland to be quite impracticable.

Compounding in rural districts.

45,851. All the questions that I wanted to ask you have been asked already, but I should like to ask this one further question: Can you give us any information as to the amount of compounding in the rural districts; or are you not prepared with any figures upon that?—I think there is no Parliamentary return upon the subject, but I will see whether we have any information in the statistical department. We may have it for certain particular areas, I am not sure that we did not some years back get some information from a limited number of areas, but I do not think what we have would be of any value for the purpose of showing what the compounding is for the whole of England and Wales.

45,852. Did you take selected unions?—We sent a circular to boards of guardians asking for information as to the extent to which in parishes in their unions the owners were assessed instead of the occupiers under section 4 of the Poor Rate Assessment Act, 1869, or paid rates instead of the occupiers under section 3 of that Act. But the information received was exceedingly imperfect, and certainly we have no information on the subject which will cover the whole of England and Wales. In many rural unions we were informed that there was no compounding under either of the sections.

45,853. In unions where there are urban districts and rural districts, are you aware that in some cases there is a difference of assessment owing to the prevalence of compounding in the urban district and not in the rural districts?—The contributions to the common fund are based, of course, on the rateable value, and do not take into account compounding. That is no doubt a cause of hardship to poor districts which contain a large amount of property which is compounded for, because it necessitates a larger rate in the £ to raise the contributions in a poor parish containing much of this property than is required in a richer one containing little of it. That is the case both in London and in the country.

45,854. In those cases where there is a difference in the area of the compounding in the same union there might be a hardship arising to agricultural land, might there not?—I should have thought that it would be the other way, and that the areas in which the higher rate was required to be levied would be those in which there would be a good deal of this property that is compounded for. I think I may have misunderstood your question. Of course if you have a rural parish in which there is a great deal of property compounded for, but which also contains agricultural land, you would have a higher rate to pay in that parish than you would in a similar parish where the property was not compounded for. The parish which contains the greater part of the small properties would be the parish that would suffer, and of course sometimes that would be an urban parish.

Mr. C. N. Dalton, C.B.
25 Apr. 1895.

Rural rates at different periods.

45,855. (*Chairman.*) You have dealt in your evidence in the main almost wholly with the rural rates, excluding the subject of urban rates?—Yes, as far as it was possible to do so.

45,856. Your attention was called to Mr. Fowler's return, page xiv, in which he gives the average rates throughout England for the year 1841 at 2*s.* 7*d.*, whereas for 1868 the figure is stated to be 3*s.* 4*d.*?—Yes.

45,857. Those were rates for the whole of England, including urban rates, were they not?—That is so.

45,858. And therefore showed an increase?—Yes. Perhaps I may add that the great development of urban expenditure has taken place since the year 1841, that is within the last 50 years.

45,859. You have no return showing the rural rates for 1841 exclusively, have you?—I think not.

45,860. I think you have not been able to get the aggregate of rural rates for the year 1841?—That is so.

45,861. The only year for which you have been able to get them is the year 1868?—1868 was the latest year in Mr. Goschen's return.

45,862. Looking at the rural rates only, the reduction from 1868 to 1891 has been from 2*s.* 7*d.* in the £ to 2*s.* 2½*d.*?—Yes, that is so.

45,863. In the year 1826–27 for which you have given the rural rates, they were 3*s.* 8*d.* in the £, in 1868, 2*s.* 7*d.*, and in 1890–91, 2*s.* 2*d.*; therefore one may assume that if you had the figures for 1841, they would show a reduction in the case of the rural rates and not a rise?—I should correct a former statement I made. We have on page 74 of Mr. Goschen's report the poor and county rate only for each county in England and Wales for 1841.

45,864. For which years?—For 1841. The poor and county rate came to 2*s.* in the £; but you would have to add to that the highway rate and the church rate, which would bring the average rural rate up no doubt to a considerably higher sum. The highway rate at the present time is 6½*d.*, and in the year 1874 it was nearly 7*d.* You would, therefore, have to add to that 2*s.* in 1841 something like 6*d.* in the £, and that would bring the average rural rate to 2*s.* 6*d.* without reckoning the church rate. We have not got for 1841 clearly the whole of the rural rates; we have in this table a portion of them, namely, the poor and county rate, and they come together, as I say, to 2*s.* in the £.

45,865. Then in all probability in 1841 the aggregate of rural rates was 2*s.* 6*d.*, or slightly over that?—I should say so, as far as I can judge.

45,866. Whereas in 1891 it was 2*s.* 2*d.*?—That is so.

45,867. Showing a reduction?—Yes.

45,868. Whereas if you take the rates for the whole of the country, which includes the urban rates as well as the rural rates, the figures show an increase of from 2*s.* 7*d.* in 1841 to 3*s.* 4*d.* in 1868, and something still higher in 1891?—Yes.

45,869. Have you got the figure for 1891?—For the whole country?

45,870. Yes?—The rate in the £ for that year of all rates, urban and rural combined, was 3*s.* 7·9*d.*—3*s.* 8*d.*, practically.

45,871. If, therefore, the rural rates have fallen in the interval from 1841 to 1891 from 2*s.* 6*d.* or 2*s.* 7*d.* to 2*s.* 2½*d.*, and the aggregate rates of the whole country have increased in the interval, it follows as a necessary consequence that the urban rates have increased in a still greater proportion?—Certainly, they have undoubtedly done so.

45,872. Is there any other point you wish to bring out?—I think there is nothing.

Mr. M. C. Thomson. — 25 Apr. 1895.

Mr. MATTHEW CHARLES THOMSON called and examined.

45,873. (*Chairman.*) I believe you are a station owner in Queensland?—Yes.

45,874. And that you have been there for 32 years?—Yes.

45,875. Were you sent to England last August by the Central Queensland Meat Export Company to report on the markets for Australian meats?—Yes.

Stock-raising in Queensland.

45,876. I believe you have had great experience in the growing of cattle and sheep in Australia and in New Zealand?—Not in New Zealand, but in Australia; I have been in New Zealand, but I was not engaged in squatting pursuits there, I went there as a visitor.

45,877. Can you state the number of stock in Australia, and the cost of production?—Do you mean in the whole island of Australia?

45,878. Yes?—About 100,000,000 of sheep, and 12,000,000 of cattle. That does not include New Zealand; there are 20,000,000 of sheep in New Zealand besides.

45,879. Is there a considerable depression at the present time in the values of stock there?—Yes, in the values of stock and station properties there is a very serious depression.

45,880. What is that due to?—It is due to the want of a market for the surplus stock. We have a very large amount of stock there, and a very small population, and so we cannot consume our surplus, and the difficulty is to find an outlet for it. We have brought it here for some time past in a frozen state, and now we are also bringing it here in a live state; but we have to compete against America, and the Argentine Republic, and we are handicapped by the greater distance; altogether we are having rather a bad time.

45,881. Has there been in your opinion an over production in the sense that there has been a great increase?—Yes.

45,882. Without a corresponding increase in the price?—Without a corresponding increase in the population to use it.

45,883. And with a reduction in price would you say?—With a consequent very serious reduction in price.

45,884. In your opinion are the Colonies able to supply a largely increased quantity to this country?—Yes; the carrying capabilities of Australia are not yet developed to their full extent, or anything near it.

45,885. You say that you meet here with competition from the Argentine Republic, and from America?—Yes, and from European countries as well.

45,886. Cannot you at present compete fully with those?—We are trying to, but at the present moment the New Zealand and Australian mutton, which is being brought home here in a frozen state, is not covering the expenses of sending it here.

45,887. It is not?—No.

Price of English and Australian meat compared.

45,888. Then the transaction is not a good one at present?—No, it is a very bad one at the present moment, but sometimes it rises and falls in a very marked way; for instance, take beef; when I came to England about last October or November, beef was very low in price, namely, 2½*d.* a pound by the carcase, and it went up in three months to 5*d.* a pound, which makes all the difference between landing it here at a loss, and landing it here at a very handsome profit.

45,889. Are you speaking now of the price of Australian beef?—Yes.

45,890. Is that less than the price of English fed beef?—Yes, that is a great deal less.

45,891. What is the difference?—The difference in the wholesale price, I should say, is about 2*d.* a pound, or more than that; English beef would be about 7*d.*, and Australian, 5*d.*, so that there would be 2*d.* a pound difference when it was at the top price, and there would be 4½*d.* a pound difference when it was at the lower price.

45,892. What was this great rise due to?—It was due to the rapid rise of meat in America, and to a short supply.

45,893. Then we may gather from that that if there is an excessive supply, the price falls in a still greater proportion, so to speak?—Yes. If the American competition was to cease altogether we would get a very good price for it always, but they are fighting for this market; they have had it for so many years, and will continue to fight for it, and we are going to fight for it too. It is a matter of who is going to survive longest.

45,894. At what price do you consider it does pay to send from Australia?—Do you mean frozen meat?

Price at which Australian meat can be exported.

45,895. You were speaking just now of whole carcases?—In a frozen state; but cattle and sheep are now coming home alive.

45,896. (*Viscount Cobham.*) Chilled is it not, strictly speaking?—No, it is frozen hard. It will pay to bring beef here and sell it at 4*d.* a pound.

45,897. (*Mr. Channing.*) Here?—Yes; landed here in a frozen state.

45,898. (*Mr. Chaplin.*) And mutton?—There are different qualities of mutton, as, of course, there are different qualities of beef, but merino mutton could be landed here and sold for about 3*d.* a pound.

45,899. (*Mr. Everett.*) At rather less than beef then?—Yes, and cross-bred sheep at about 4*d.* a pound.

45,900. (*Chairman.*) Is that in both cases about 3*d.* a pound less than the value of English?—Yes. In mutton there is a very great deal of difference. English mutton, I see, has gone up to 9*d.* a pound wholesale and New Zealand mutton is selling at 2½*d.*

Export of live cattle from Australia.

45,901. (*Mr. Chaplin.*) What other form do you send the meat in?—It comes home alive; small quantities are being sent home alive—the business has just commenced. I saw the first ship load in Sydney myself. When I left Australia in August there was a ship there with 20 head of cattle on board of her in the harbour in Sydney, and I got to London before the cattle were killed, so I saw them before they left Australia, and I saw them also before they were killed in England, and I was able to judge of the condition of them. They landed here in just as good condition as they left Australia although they were over 60 days at sea.

45,902. At what price do they pay?—I have evidence about that which we got at the Society of Arts from Mr. Dangar of Australia. He sent home some cattle lately and he got 21*l.* a head for them.

45,903. (*Viscount Cobham.*) Did that pay him?—Yes, it cost him 13*l.* to send them here, and it left him 8*l.*, and 8*l.* is 4*l.* more than he would have got if he had sold the cattle in Sydney.

45,904. (*Mr. Giffen.*) The shipments are not always successful, are they?—They have been up to the present time except that they have had rather a high per-centage of deaths.

45,905. (*Mr. Channing.*) What is the per-centage?—The per-centage has been very high; I cannot exactly say what it is in all the shipments.

45,906. (*Mr. Giffen.*) I heard of a case some little time ago, in March I think, of a shipment of 140 cattle from Queensland, 40 of which died on the way before they got to the Suez Canal, the remainder being disposed of at Dunkirk as they were afraid to bring them on to London?—They were bound for Dunkirk when they started from Australia.

45,907. It was a most unsuccessful shipment altogether, was it not?—Yes.

45,908. You are aware of the case?—Yes, I am aware of all the cases. I have inspected several of the boats myself, and seen the cattle landed. On broad lines, although there may be exceptional cases when it does not come off all right, the business can be done.

45,909. I believe that 40 of these cattle died of pleuro?—I do not believe that; I do not believe they started with pleuro.

45,910. (*Mr. Chaplin.*) Can you tell us at what price per lb. they would pay?—To land live cattle here, do you mean?

45,911. Yes?—These cattle fetch about 5*d.* to 5½*d.* a lb. in England by dressed weight and the whole animal at that rate mounted up to 21*l.* I am now quoting Mr. Dangar's figures which he gave us; I have no practical experience of sending any live cattle myself because I have never done it. He told us that that was the outcome of it for him, He sent 27 head of cattle I think, he lost two and after paying for insurance, for freight and charges of all kinds, he got 8*l.* a head for the cattle that left Sydney, and if he had sold the cattle in Sydney he would only have got 4*l.* a head for them.

Mr. M. C. Thomson.
25 Apr. 1895.

45,912. At what price per lb. is the lowest that would pay; can you tell us that?—It depends upon the freight and the charges. I could not give you a good answer to that because it is a matter of bargain how many head go in a ship. If you send a ship off with 20 or 30 head of cattle you probably pay more for it than if you charter a ship and send 500 head of cattle in her.

45,913. You mean that the freights for live cattle vary more than the freights for frozen meat?—Certainly.

45,914. (*Mr. Channing.*) Is the profit greater on the frozen meat?—No, I could not say it is.

45,915. (*Chairman.*) Then when the cattle are sent alive do they sell at a relatively lower price than English cattle?—Yes.

45,916. What is the difference then—it is not so great, I suppose, as in the case of the frozen meat?—No.

45,917. What is the difference then?—I cannot tell you that.

45,918. But still it sells at substantially less?—Yes, the price is substantially less because it is not of the quality of English meat.

45,919. Not of that quality?—No; there is no meat in the world as good as English grown meat.

Price of Australian and English meat compared.

45,920. You were saying just now that English mutton at the present moment is selling for 9*d.* a lb. and the New Zealand mutton for 2½*d.*, is that so?—Yes.

45,921. That shows there is an enormous difference?—An enormous difference which is very difficult to account for.

45,922. (*Mr. Clay.*) Where does the English mutton sell at 9*d.* per lb. just now?—It was selling at Smithfield about a week or 10 days ago at 9*d.* wholesale.

45,923. It is only selling just now according to the papers at 5*s.* the 8 lbs., that is 7½*d.*?—I make it 8½*d.*

45,924. (*Chairman.*) Is there much of the Australian and New Zealand meat which is sold as English meat?—I believe there is a good deal of it goes into consumption as English meat; in fact, I know there is.

45,925. (*Mr. Clay.*) I beg to correct you. I think you used the expression of live weight once, but in the London market we always deal with the dead weight, and confining ourselves to dead weight, 5*s.* the 8 lbs. is 7½*d.* and not 8½*d.*; 9*d.* is 72 pennies or 6*s.*?—I took it from a circular that I saw printed, which was to go to Australia; it is not of my own knowledge so I will correct that if you will allow me.*

45,926. (*Chairman.*) Still at the present moment we may take it that the New Zealand mutton is selling relatively at a very much lower price than the English mutton?—Yes.

45,927. New Zealand mutton you said was averaging only 2½*d.* the pound?—Some kinds of it; the very best of it is bringing a little more, but 2½*d.* is about the average of it now.

45,928. At that rate it is very unremunerative I suppose?—Yes.

45,929. I think you said that it must be 3*d.* a pound to pay?—That was for Australian mutton; New Zealand mutton must be about 4*d.* a pound in order to pay.

45,930. Then is there a difference of about a penny in pound between Australian and New Zealand?—Yes.

45,931. The Australians have an inferior quality?—Yes; not so suitable for this market because the Australian sheep are principally small merino sheep, and you do not like those sheep here. The New Zealand sheep are more like English sheep, and they are grown in much the same way in New Zealand as they are in England; that is, they get winter artificial feeding, Australian sheep get no artificial feeding whatever, neither do the cattle there.

45,932. Then the facts you produce tend to show that the price of Australian and New Zealand meet may fall at the same time while the price of English meat is rising?—That is so. That has been the case lately; English meat has risen and New Zealand meat has fallen.

45,933. Therefore they would seem to supply different customers so to speak?—Yes. The fact is, I think, that the people in London are so rich, as a class, that they can afford to buy English meat, and they will have it, it does not matter what the price is; they will have their own meat.

Mr. M. C. Thomson.
25 Apr. 1895.

45,934. And so if the supply is at all deficient the price rises in proportion?—Yes.

45,935. Whereas the reverse may happen in the case of the inferior meat from Australia and New Zealand?—Yes.

45,936. If these supplies are somewhat in excess of the demand the price falls?—Yes.

45,937. Though the price of English meat may be rising at the same time?—Precisely; that is exactly the position.

45,938. That would rather tend to show that there is not that acute competition between the two which one might expect?—No.

45,939. And they supply different classes of people?—That is it, they have different classes of customers.

45,940. Is there much prospect of the quality being improved in Australia?—Yes, we are working in that direction constantly.

45,941. (*Viscount Cobham.*) But you never will have artificial feeding in winter in Australia, I suppose?—No.

45,942. The improvement will be effected by the improvement of the breed?—Yes.

45,943. And by the diminution of the merino blood?—Yes, by crossing the merinoes with the heavy sheep.

Wheat growing in Queensland.

45,944. (*Chairman.*) Now, going on to wheat, is the wheat-growing area of Australia considerable?—Yes; the wheat-growing area of Queensland alone is 80,000 square miles.

45,945. How much of that is now cultivated?—About 33,000 acres, according to the last return.

45,946. A fraction of that?—Yes. We have over 50,000,000 of acres of wheat-growing land in Queensland alone—of the very finest quality of land that you could imagine.

45,947. What is the average production per acre?—Up to the present time it is about 20 bushels per acre, but it has gone up to 40 bushels.

45,948. (*Mr. Channing.*) Is that on exceptionally good land or on average land?—All this wheat land is exceptionally good. Most of it is open down all ready for the plough.

45,949. (*Viscount Cobham.*) For how many years would it carry that sort of crop?—I cannot tell you; there has never been any manure used on it; they have not been very many years trying it.

45,950. (*Chairman.*) Does it depend on artesian wells for the supply of water?—Yes. We have a large area of country there, 80 odd thousand square miles, which was practically almost valueless because it was badly watered. It was a drought-stricken district; and, strange to say, this very drought-stricken district is the place where artesian water is found.

45,951. (*Mr. Giffen.*) Is the wheat land in the drought-stricken district?—Yes. It was called drought-stricken because the water supply was so bad for stock that it was very soon dried up. The stock very seldom suffered from want of grass in this country; they suffered from want of water, but now water is supplied by artesian wells, and this country is the most valuable country we have.

45,952. (*Chairman.*) Does the water rise to the surface in these wells?—Yes.

45,953. Does it rise above the surface?—It comes up at a tremendous pressure, as high as 200 lbs. per square inch, and at a temperature of 170 degrees heat in some cases.

45,954. (*Mr. Giffen.*) Is the supply sufficient to enable you to describe the country now as "well watered"?—Yes, decidedly; it is better watered than any other part of it.

45,955. (*Chairman.*) Is land being taken up in this district now?—Yes, it is all taken up already, but it is taken up by the pioneer squatter, as he is called out there, that is, the man who takes 1,000 square miles of it up and pays a small rental for it, and just runs sheep over it, and uses the natural grasses.

45,956. Is the cultivation of wheat increasing rapidly in that district or not?—No, it is not, because there is no market for it.

45,957. The prices are low?—Yes, that also is affected by the stiff competition of foreign countries.

* The witness subsequently wrote as follows:—The confusion *re* prices in my evidence is due to the fact that there are two markets in London for sale of meat. The Metropolitan Meat Market at Islington deals only with live stock, and the prices quoted mean price per lb. of meat with offal, skin, &c. given in, which is worth roughly about 2*d.* per lb. extra as compared with the dead weight prices at Smithfield. I now say that the price of English is 7½*d.*

Mr. M. C. Thomson.

25 Apr. 1895.

45,958. In the case of those large grazing farms that you speak of, can land be taken from them for the purpose of arable cultivation?—You can do what you like with them. This is land taken from the pioneer-squatter, and it is the second class of occupation, as it were. First there is the man who takes up a huge tract, but he has in his lease a clause which enables the Government to take it from him when there is a demand for closer settlement.

45,959. That is what I was referring to; those first settlers take a very large extent of land?—Yes.

45,960. Then under the terms of the legislation of that country the Government can take the land from him?—Yes, half of it.

45,961. And lease it or sell it?—Cut it up into these "selections." These 20,000 acre selections are held by the man who comes in after the pioneer.

45,962. Do those persons get a lease for 30 years?—Yes.

45,963. At the end of that time the land reverts to the Government, I suppose?—I presume so; or they would get a renewal of the lease. I daresay they would be very easily dealt with and kindly treated, because we want population out in that country. We have 600,000 square miles of territory, and only about 400,000 people on it.

45,964. Then I believe there is a smaller class of "grazing homesteads" of about 2,560 acres?—Yes. They would be nearer the coast, nearer the railways, and nearer the centres of the settlements. Probably a man with 2,560 acres, for which he pays three farthings per acre per annum rent, would go in for dairying or breeding fancy stock, sheep, or horses, or cattle.

Australian and Argentine cattle compared.

45,965. (*Viscount Cobham.*) Where do you expect to find the most formidable competition in the immediate future in regard to meat?—In the Argentine, I should say. I have just come home from America; the company that sent me home sent me through America to report on the rival that we had in America, and the proper way to deal with the meat products, as they are dealt with in America, and I have reported to Australia on these subjects.

45,966. Have you seen the evidence we had from Argentina, from Mr. Brett, for instance?—Yes, I read his evidence.

45,967. Do you agree generally with the views he expressed?—I have not been to Argentina, I was only in the United States.

45,968. I mean as to his comparison between Argentine meat and Australian meat, for instance?—Yes. We have a better class of cattle in Australia than they have in the Argentine, judging from the ones I have seen sent home here, that is judging from the live cattle that I have seen at Deptford.

45,969. You think Queensland has a rather better class of cattle?—Yes.

45,970. And of sheep?—And of sheep. I have brought a photograph here of Queensland fat cattle if you would like to look at it (*handing in a photograph*). That is a photograph of the cattle that took the prize at the Brisbane Show yard last year.

Freightage.

45,971. (*Chairman.*) What was the freight per lb. from Australia in the early part of the business?—In the early part of the frozen business the freight was 2½*d.* per lb.

45,972. And what is it reduced to now?—It is down to 1*d.*, and sometimes even less.

Disposal of surplus meat in Australia.

45,973. (*Viscount Cobham.*) What is done with your surplus product in meat if you cannot send it away?—We tin a good deal of it, and we boil a great deal of it. A great many sheep are boiled annually, and cattle as well, just wrecked up for the sake of the hides and tallow.

45,974. And the meat is practically wasted?—It is absolutely wasted. I have the returns with me of some cattle that were boiled down in the gulf of Carpentaria, that is in the northern part of Queensland. These returns show that 13,000 bullocks and 5,000 cows were boiled down there in one season. The average of tallow for the bullocks was 212 lbs., and for the cows 180 lbs.

45,975. Is it exported in that shape?—It comes home here and is sold as tallow and hides. It would cost the price of the hide for boiling expenses, and the men who owned the bullocks would get, I should say, not more than 30*s.* a head for them.

45,976. Still it does get sent off?—It gets rid of it. It must go. One of two things must happen, either the cattle must be got rid of by boiling, or in some other way; or we must stop breeding, that is, stop our business. But it is a pity to see such good cattle wasted; it is a wasteful way of getting rid of them.

Mr. M. C. Thomson.

25 Apr. 1895.

Diseases of animals in Australia.

45,977. Are you troubled with any disease in Australia?—Yes, but nothing to speak of. There are diseases there, but, as a rule, it is a very healthy country for all kinds of stock.

45,978. Have you pleuro?—Yes, but it is confined mostly to the coast districts. Pleuro is a disease which seems to affect cattle in a swampy country rather in the coast lands in Australia, for instance; the pleuro is sometimes there; but inland where I was, 200 miles inland, I never saw much pleuro.

Loss of cattle in transit from Australia.

45,979. (*Sir Nigel Kingscote.*) You told us that you saw a cargo of cattle put on board ship in Australia, and that you saw them again after they landed here?—Yes.

45,980. May I ask you whether there was any loss from deaths in coming over?—Two, I think, out of 20.

45,981. What were the ages of those beasts?—They were from four years old to eight years old, I should say.

45,982. From four years to eight years?—Yes; I do not think any of them were under four years old, and I do not think any of them were over eight.

45,983. Do you keep beasts in Australia till they are eight years old before you sell them fat?—They have been doing it.

45,984. You will not continue that long?—A beast does not begin to put on fat till he gets a certain age, and if we have to boil all our cattle we must keep them till they put on enough fat.

45,985. To keep a beast there costs very little?—Very little.

Production of cattle and sheep in Australia.

45,986. Are they likely to go on producing a large quantity of cattle and sheep?—Yes.

45,987. And of a better quality?—Yes.

45,988. You are not imparting any fresh blood into Australia now are you—you have stopped that for some time, have you not?—Yes the thing has got the other way round now; you are bringing home blood from Australia. As far as horses go the best horse we had is coming to England.

45,989. You say that you are now getting artesian wells, I suppose that is merely in order to water the cattle?—And sheep—at present.

45,990. Supposing there came a drought, the same as you suffered from before, those wells would not grow the grass?—No.

45,991. Do you think you would be able to keep the same number of stock or rather a larger number on account of being able to water them?—Yes. We keep a larger number owing to the artesian wells—because these wells cause creeks to run; for instance some of them make water run for 25 miles.

45,992. What I want to ask you is will you be able to keep them not only by the help of these artesian wells but on account of more grass growing or anything of that sort in consequence of irrigation?—No. I should not say the artesian wells would have any effect upon the grass growing because they have not gone into that yet; they do not irrigate with it; but the artesian wells will give access to a country that was otherwise quite inaccessible but where there was plenty of grass and no water.

Improvement of mutton in Australia.

45,993. You are trying to improve the mutton in Australia; I understand that the merino mutton is considered very poor and thought very lightly of?—It is not considered to be very good here, but it is considered to be very good in Australia. We all eat merino mutton ourselves there and prefer it.

45,994. But still not being of the same value as it was, you want to get out of the merino so as to get more flesh on them?—Yes, we want to breed as much for the carcase as for the wool. We want to breed for the carcase and the wool combined.

45,995. I take it that you have been speaking almost entirely of Australia and not of New Zealand?—More of Australia than of New Zealand.

Growth of barley and oats in Australia.

45,996. You have told us about the wheat growing; do you grow either barley or oats much in Australia?—In the southern parts of it, yes, some barley and oats are grown no doubt; but I am not a practical farmer and I do not know much about farming. I only know there is an enormous wheat area and the wheat grows very well, but I do not know the cost of growing.

Mr. M. C. Thomson.
25 Apr. 1895.

45,997. You do not know anything about the other two, that is about oats or barley?—No.

Fruit-farming in Queensland.

45,998. Do you know anything about the fruit farming—apples or pears, for instance?—We have tropical fruits in Queensland, where I come from, and we do not grow English fruits. We grow oranges, lemons, pineapples, grapes, mangoes, and fruits of that sort.

45,999. Is that an increasing product?—Yes, but like other things there is no market for it; it increases up to the point where the local consumption ceases.

46,000. Have you vines in your part?—Yes, we grow very good vines.

46,001. (*Mr. Giffen.*) In Queensland?—Yes.

46,002. Do you make wine in Queensland?—Yes, at a place called Roma.

46,003. (*Sir Nigel Kingscote.*) But you cannot tell us anything about the orchard part, that is, about the apples and the pears?—Apples and pears do not grow there. In Tasmania and the southern parts of Victoria they grow apples and pears and other English fruits. You must remember that Australia is 2,000 odd miles from one end to the other.

46,004. (*Mr. Whitehead.*) Surely in Australia there is a great move being made for exporting such fruit at apples and pears to this country?—Yes, from the southern part of it.

46,005. But only in the southern part?—Yes, there are no apples and pears in Queensland.

46,006. But a great many are imported into this country?—Yes, from Tasmania. Tasmania is a great apple-growing country.

46,007. And from Australia?—From Australia as well—from Melbourne, for instance.

Export of poultry from Australia.

46,008. With regard to poultry, are you not exporting poultry to a considerable extent?—I do not know.

46,009. That is a fact, I believe?—I believe it is since I left Australia.

Equipment of Australian cattle ships.

46,010. Now with regard to the ships that your cattle come over in, are they well qualified for the service?—As far as I know, yes, but they are not so well fitted as the ships which do the Atlantic trip.

46,011. Is that the cause of the death of so many?—The cause of the death of so many, in my opinion, is that the cattle are not quiet enough when they start; they are terrified, and it is very difficult to get them on board ship. Twenty-six head of cattle left Rockhampton in a ship called the "Buteshire" lately, and it took some hours to get them on board ship; each beast had to be slung. When I was in Boston, in the United States, last October, I saw 380 head of cattle walk out of the train in the morning, and walk across a wharf and walk into a ship in two hours.

46,012. Yours are not accustomed to that yet?—No, they are wild, compared with the American cattle.

46,013. Will the ship's service be improved, do you think?—I have no doubt of it.

46,014. So that there may not be such great mortality in the future?—No, the mortality compared with the mortality coming across the United States is very marked. Of 4,700 head of cattle which came over in one line of ships from the United States—the Hall Line of Steamers—in 12 months only nine head were lost.

46,015. Of course, the distance is very much smaller?—Yes, but even so, it is a very small average; it is one in 500, or something of that sort, and we lose something like 10 per cent. of ours, I should say.

Improvement of Queensland cattle.

46,016. Are you importing pedigree stock to improve your breed?—We have been, and I do not think there is any necessity to import any more pedigree stock. We have excellent cattle there.

46,017. But it does not seem to be up to the English standard?—No.

46,018. That is judging by the difference in the prices you have given us?—I think that the English country and the English grasses are better than any grasses anywhere else, as well as the breeding of the cattle; that too is better than anywhere else.

46,019. But it is the fault of the feeding rather than of the breeding, would you say?—I do not say that; I think both the breeding and the feeding are better in England than in any other country.

Mr. M. C. Thomson.
25 Apr. 1895.

46,020. Are you satisfied yourself that there is a marked difference between the qualities of the respective meats, that is your meat and English meat; have you seen them together in the market?—Yes; I think that our meat is not as good as the best English meat.

46,021. It is not altogether a question of sentiment?—No.

46,022. (*Viscount Cobham.*) It is all English bred in Australia, is it not?—Yes. We imported stock from here and we bred them out there, but then they get knocked about coming home in the ships if they come home alive.

46,023. Are they mostly short horns?—Yes.

46,024. (*Mr. Whitehead.*) And some are Herefords, I see, according to the photograph?—Yes, we have all the breeds, the same as you have in this country. We have men who believe that one breed is better than any other, and they cross them and breed all sorts of cattle. I have always been a shorthorn breeder; I believe they are the best.

Prices of meat in America.

46,025. You have said in your evidence that America was your greatest competitor?—Yes, it is.

46,026. When you were in America the other day, had the rise in the prices of meat taken place?—No.

46,027. Was there any indication of it?—No; it was a very severe winter, and they had very heavy losses through the blizzards this last winter.

46,028. Is that the reason of the rise?—I think so. I heard that they lost two or three million head of cattle by severity of weather alone.

46,029. Then it is not likely to be a permanent rise?—I doubt it.

Export of lamb from Australia.

46,030. Do you send any lambs over?—Yes.

46,031. In a frozen state?—Yes. I think there are something like 200,000 lambs coming over from New Zealand and Australia to England. They are either afloat or will be afloat very shortly.

46,032. What time would be the season for them?—You can get lambs all the year round there.

46,033. I rather gathered that from being able to obtain lamb in England?—We have no particular season for shearing or lambing there; we shear all the year round and lamb all the year round; the climate is such that there is no winter.

46,034. What is the relative price of English and Australian lambs, can you tell us?—The English lamb is very much dearer than the merino frozen lamb.

Difficulty of selling frozen meat.

46,035. Very much?—Yes. The difficulty of selling frozen meat in this country is that the people do not understand how to thaw it properly. But a new patent has been discovered here by Mr. Nelson, and the thawing is now done here in the same way as the freezing is done at the other end. The meat at the other end is frozen by being attacked by cold air. The heat is all taken out of the meat, and then decomposition ceases; that is the effect of freezing the meat. When it comes home here the process is reversed, and the meat is attacked by hot dry air. In the one case it is cold dry air, and in the other case it is hot dry air. The air must be dry, because otherwise the damp condenses on the surface of the cold animal, and it drips and gets flabby, unsightly, and unsaleable. Now we have chambers fitted up where the moisture is extracted from the air, and where the meat can be hung in thoroughly dry air so that there can be no dripping and no condensation. When it is hung in these chambers some time it gets thawed perfectly, and the meat looks exactly the same as if it had never been frozen at all.

Process of thawing frozen meat.

46,036. (*Viscount Cobham.*) What is the temperature of these chambers?—The meat goes in at a temperature of say 25 degrees, or 20, perhaps. It must not be done too rapidly. The temperature here at present is 40 degrees to begin with; they leave it hanging in 40 degrees for some hours, and it is gradually raised to 60 degrees. It takes as long to thaw it as it does to freeze it. It takes four days to freeze a hind quarter of beef and four days to thaw it, and it takes two days to freeze a sheep right through, and it take two days to thaw it—it is just undoing the process of freezing.

46,037. (*Mr. Whitehead.*) Where are those chambers?—In London.

46,038. Not at the ports?—No, in Lambeth.

46,039. (*Mr. Dalton.*) What is the cost of thawing?—The cost of thawing is one farthing a pound for beef and a fifth of a penny a pound for mutton. It brings more in

Mr. M. C. Thomson.
25 Apr. 1895.

the market when it is thawed than it does in a frozen hard state.

46,040. (*Mr. Everett.*) Do you mean that it weighs more?—It brings more money; it sells better.

Cost of freezing meat.

46,041. (*Mr. Channing.*) What is the cost of freezing?—It is a consolidated rate for freezing, killing, shipping, insurance, and everything. We take at the other end of the world the live animal from the man who owns it and delivers it to the works, and we charge a consolidated rate which is now down to about 2*d.* per lb. That covers the cost of killing it in the yards, freezing it, bagging it, sending it home in a ship, insuring it, delivering it, and holding it at this end for 30 days.

46,042. (*Mr. Giffen.*) That is per lb. of carcase, not per lb. of live animal?—Per lb. of carcase, dead weight. After it is killed and hung up it is weighed. We do everything else with it, and charge a man 2*d.* a pound for doing the work; that covers the commission on sales at this end.

46,043. Is that the same for beef and mutton?—Yes, practically.

46,044. But it does not cover the thawing at this end, does it?—No. We cannot do very much thawing at this end because there are not the appliances for it. If all the meat that is frozen in Australasia had to be thawed when it got to London we should require an establishment at this end as big as all the Australasian freezing works put together. What we are able to do now is a drop in the bucket compared with the amount of stuff that comes home. So that it cannot be done in that way yet, but people who wish to have their meat thawed can have it done if there is room.

Export of tinned meat from Australia.

46,045. (*Mr. Whitehead.*) Do you send any meat in tins?—Yes.

46,046. To any large extent?—Yes. Last July, the last month before I left the works in Rockhampton, we put a million pounds of meat in tins in a month.

46,047. Is that consigned to this country as well as the other meat?—It comes to this country, and it also goes to France, to India, and to China; in fact, it goes all over the world.

46,048. What kind of sale does it meet with in this country, is it profitable?—Not much. Fresh meat is so very cheap in this country now that there is not much room for tinned meat. It takes 3 lbs. of fresh meat to make a pound of tinned meat; that is to say, a beast weighing, say, 600 lbs. dressed weight would only give you 200 lbs. of tinned meat; the bones have to come out, and then you have to boil the meat, cook it.

46,049. So that that part of the trade is not likely to be very much extended?—I cannot say that; I think that it ought to be extended, because I think we ought, in Australia, to be able to compete with the Americans in sending tinned meat home when the value of the raw material in Australia is about one-fifth what it is in America. The reason why we do not do it is, that we do not understand our business; we are not educated up to nearly the standard the Americans are, and we do not understand how to do it as well as they do.

46,050. Then you do not send it of such good quality, in fact?—Our tinned meat is actually made out of better raw material, but it is not so well put up.

46,051. Do you can any fruits to send to this country?—Yes, I think so; but I am not aware of it personally.

Co-operation amongst farmers in Australia.

46,052. You do, I believe, as a fact. Does the system of co-operation exist at all in Australia?—In what way?

46,053. Farmers combining to make factories?—Yes, in the case of the factory I was in charge of the shareholders were pastoralists.

46,054. Do they combine together to send quantities of produce by the railways, for instance?—No.

46,055. They do in America, as you are aware?—Yes.

46,056. Would it not be advantageous to the Australians also if they did that?—I doubt it; but I do not know.

46,057. I think you said your railway system is not extended by any means sufficiently in that country?—We have got very first-class railway extensions in Queensland.

46,058. I am speaking of Australia generally?—Even taking Australia generally, it is wonderful the amount of railways we have got for the population of the country.

46,059. I think you said in the early part of your evidence that there was a want of communication?—I did not mention anything at all about the railways. I think Australia is wonderfully well-developed as far as the railways are concerned, and also as far as concerns telegraphs and the roads, and everything else of that kind.

Mr. M. C. Thomson.
25 Apr. 1895.

46,060. In answer to Sir Nigel Kingscote you said that you did not irrigate the land at all?—Not where I live.

Irrigation in Australia.

46,061. I think that in parts of Australia there is considerable irrigation?—Yes; there are some Americans who have got large grants of land from the Government who have settled down on the Murray River at a place called Mildura. I have not been there, and all I know of it is that everything that is done there is done by irrigation.

46,062. Why could that not be applied to Queensland in times of drought, as was pointed out by Sir Nigel Kingscote?—We are all busy doing something else. We want about two millions of people over there.

46,063. But it can be done?—Yes, there is no reason why it could not be done.

46,064. As to the temperature of the water that comes out of these artesian wells, I suppose the water has to undergo some process of cooling?—It cools in the open air.

46,065. That would be rather an objection to irrigation, would it not; it must be cooled, of course, before it is used for irrigation?—It could run away for a few miles and cool. I do not think that would be an objection.

Loss of cattle in transit from Australia.

46,066. (*Mr. Giffen.*) With regard to that shipment, which I spoke about, of live cattle, when 40 out of 140 died very soon after being put on board, I suppose that was exceptional instance?—It was an exceptionally bad case; the "Bothnia" was the worst case of death that has occurred yet.

46,067. What did the cattle die of?—I think it was the knocking about that they got in putting them on board the ship, and the terror and the fright they were in.

46,068. They died very soon after they were put on board, did they not?—A great many of them. I think they were put on board in Sydney, and that a great many of them died at Melbourne.

46,069. You think that that instance is not at all fatal to the prospects of there being a large trade in live cattle?—No; these are the difficulties that are always attending a new thing. There is always a lot of trouble to get it started. But they will surmount all these difficulties. The broad fact remains, that cattle have come home, and if the same conditions are carried out with other cattle they will come home too.

Irrigation in Australia.

46,070. With regard to these artesian wells, have you got them in other parts of Australia as well as in Queensland?—Yes, we have them in New South Wales. They have them also in New Zealand.

46,071. In what part of New Zealand?—In the North Island, all over it in fact, at Canterbury and Napier, and between the two.

46,072. And they are very extensively useful?—Yes.

46,073. And their use is to provide water for the cattle, and not to irrigate the land?—That is all at present.

Wheat growing in Australia.

46,074. Then, as I understand you, the land in Queensland, which you spoke of as being suitable for the cultivation of wheat does not suffer from drought to an extent which would prevent that cultivation going on?—No. That is not my own opinion—my own opinion about it is not worth anything; that is the opinion of the American expert whom the Queensland Government brought over to tell us what our country was made for.

46,075. That is a country which is quite suitable for the settlement of Europeans, is it?—Yes, quite.

Advantages offered to Australia.

46,076. Is the Queensland Government taking any steps to bring settlers to that country?—Only by offering them very easy terms of settlement.

46,077. They do not assist the passages of emigrants in any way?—No, but they can go there and get land at half-a-crown an acre, with five years to pay it in—6*d.* per acre per annum, and then it is freehold.

46,078. Any quantity of it?—A million acres in one district at 2*s.* 6*d.* per acre payable in five years, where the staple crops at present grown are wheat, oranges, potatoes, grapes, and maize.

46,079. They are not bound to do anything for it except make these payments?—Yes, of 6*d.* per annum for five years and then it become freehold, but you must live on it all the time.

46,080. Are they bound to cultivate any part of it?—Yes, there are regular conditions; they must do something;

Mr. M. C. Thomson.

25 Apr. 1895.

they cannot go and sit down there and put up a tent and get it as a freehold in five years.

46,081. How many acres can any person get, what is the maximum: it is like the Homestead Law of America, is it not?—They can have up to 160 acres.

46,082. That is the American Homestead Law?—These are the half-a-crown places—"Agricultural farms," as they are called, up to 160 acres can be had at 2*s.* 6*d.* per acre, payable in five years at the rate of 6*d.* per acre per annum with personal residence. Then there are "Agricultural farms" up to 1,280 acres at 15*s.* per acre payable in five years, or a 30 years' lease at from 3*d.* upwards per acre per annum. The residence there may be personal or by agent; you can have an agent there. Then "by unconditional selection" you can have land at from 20*s.* per acre payable in 20 annual instalments of 1*s.* per acre. Then "by grazing farm selection" up to 20,000 acres you can have a 30 years' lease at from ¾*d.* upwards per acre per annum according to quality. "By purchase by auction" where you can buy right out, the upset price of "agricultural land" is from 20*s.* per acre, and the upset price of "grazing land" is from 10*s.* per acre, the payments to be spread over three years without interest in the case of "agricultural land," and with 5 per cent. added in the case of the "grazing land" when instalments are paid later than six months from the date of sale. Every facility is given by the Queensland Government for people to go out to Queensland.

46,083. (*Viscount Cobham.*) Is emigration assisted?—No, it is not. Politics came in the way; our labour members are getting numerous, and they stopped that. Practically their influence was so strong in the House that they stopped any money being gathered from them, as they say, to bring people out to compete with them.

46,084. That is the case all over Australia, is it not?—Yes, pretty well; but Queensland is a wonderfully rich country. There are only 400,000 people in Queensland, and we turned out last year, I think, very nearly 9,000,000*l.* of exports.

46,085. (*Mr. Clay.*) In talking about Queensland you are confining your observations to a part of Australia only?—Yes.

46,086. What proportion?—Six hundred thousand square miles out of three millions; that is about a fifth of it.

Condition of squatters in Australia.

46,087. Have the men who have invested in land there become prosperous?—No; some of the men who invested in places like Sydney and Melbourne in the early days have become very prosperous, but I take it that you mean men who have bought land at 10*s.* an acre and put stock on it.

46,088. I mean the general squatters?—They have not been prosperous; they were up to a certain point, but now they are going down, because wool is falling very rapidly and there is no outlet for our surplus stock. The difficulty of getting rid of our surplus stock and the low price of wool have depreciated the value of sheep and cattle properties.

46,089. Have the land agencies closed upon them?—Yes, where they thought they could get the money out that they had lent. They squeezed up the men who could pay, and the ones who are too deeply in they are leaving just to work away—just to manage for the mortgagees in fact.

46,090. They are neither more nor less——?—Than bailiffs on their own places. That is the position they are in. Take my own case. I have a place with 10,000 head of cattle, and 10 years ago I could have got as much money for 2,500 head as I now would get for 10,000.

46,091. (*Mr. Giffen.*) How much would you get now?—About 10,000*l.*, and for 2,500 head of cattle 10 years ago I would have got 10,000*l.*

46,092. (*Mr. Whitehead.*) May I ask what you did with them at that time; how would you get rid of them; what was the sale for them?—The local market, that is for Australian consumption.

46,093. Home consumption?—Yes.

46,094. (*Mr. Clay.*) What has become of the home consumption now?—The production of the raw material has outpaced it altogether; the increase of population is nothing like the increase of stock.

46,095. (*Viscount Cobham.*) The increase of population from immigration has been restricted?—Yes.

46,096 (*Mr. Clay.*) As a whole original squatters are in a very poor way?—Yes, taking it all round they are in a very poor way.

46,097. And the fact of the matter is that they have lost all their capital?—Yes, broadly that is about it.

Mr. M. C. Thomson.

25 Apr. 1895.

46,098. Now, regarding the laws in Queensland are there any new regulations to the effect that a man cannot hold more than a certain number of acres?—A man cannot take up more than one of these selections in the same district, that is to say, no man can go and take up 20,000 acres, and then take up a new block of 20,000 acres alongside, and go on taking land round about; he must be content with 20,000 acres, or if he wants to get any more he must go to another district. That is what you mean, I presume?

Settlement laws in Queensland.

46,099. Yes; do you know that in New Zealand they have curtailed a man's acreage a good deal?—Not to my own knowledge.

46,100. Do you know that in Queensland and in other parts of Australia they will not give a man as much land as hitherto he has been entitled to have?—As I say you cannot have it except in different districts. They want to try and dot people all over Queensland, and so they will not let a man take 20,000 acres here and 20,000 acres alongside his own boundary. He must go somewhere else.

46,101. So you are not so free in that country as here?—You cannot take up any here.

46,102. You can get any amount you want to buy?—Yes, so you can there; buying is a different thing.

46,103. But not to farm it?—You can buy up the whole concern I should think at 10*s.* an acre, and the Government would be very glad to let you have it.

46,104. But still you cannot farm more than a certain quantity of the land?—You can do what you like with what you buy.

46,105. But not as a tenant?—Not as a Government tenant—a "selector" we call him.

46,106. Have you any experience in other parts of Australia—down by New South Wales and down by Adelaide, for example?—No, only as a visitor; I never lived there.

Drought in Australia.

46,107. I suppose they are very much troubled with drought there?—I do not think the droughts in any part of the island of Australia have been sufficient to check the increase taken as a whole.

46,108. Is it not the case that down there they cannot market the cattle for want of water in driving it?—In individual cases that may be so. I have driven cattle over a large part of Queensland and I never knew a road yet that I could not get along with stock on. But I do not say that that difficulty does not exist in other parts of Australia. What I do say is that there never has been a drought yet that has stopped the increase. In good seasons the increase is very enormous, but in every season there is an increase. You must remember that the drought is a partial thing. You may have a drought in Queensland, and New South Wales may be in a very flourishing condition. You never have a drought all over the place at the same time.

46,109. I am not asking you about the question of increase or decrease. What I said was: if there are these droughts they interfere with the driving to the cattle market?—Yes, it is so in some districts.

46,110. Is it not a very serious matter?—It is serious while it lasts, but it does not last very long.

46,111. They cannot drive the cattle more than 12 or 15 miles?—Not so much; 50 miles a week is a fair thing.

46,112. If they do not fall in with a "water hole," as they call it, a stream, they are apt to lose the whole of their cattle?—Yes; but these difficulties are being obviated by the bores which have been made. I have got a map of Queensland here showing that there are 200 of them, and I dare say there are many of them in New South Wales, but I do not know the figures there. The Government, in order to keep these main arteries open, have gone to the expense of putting down these bores in order to supply the water for watering your stock. You pay so much per head as you go on.

46,113. Perhaps you are not so well acquainted with the southern part as with the northern part of Australia?—No, I am not.

Effect of "Protection" in Australia.

46,114. I think you rather favour Protection?—Yes.

46,115. How do you propose to work it?—Charge a duty upon foreign cattle and sheep that come in here

46,116. You know you have Protection very hard in Victoria State, have you not?—Yes.

Mr. M. C. Thomson. 25 Apr. 1895.

46,117. How does it work there; has it made them more prosperous?—No, it has had the opposite effect, in my opinion, and, of course, I only give you my own opinion.

46,118. If Protection is going to be disastrous for them in your country, why go in for Protection?—New South Wales is a Free Trade country alongside of them.

46,119. But is that any more prosperous than Victoria?—Yes.

46,120. So it shows that a Free Trade country is the best?—Apparently; that is, as far as Australia is concerned. New South Wales is much larger than Victoria, has greater national resources, 50,000,000 sheep against 13,000,000, for instance, Queensland is protectionist and, I think, is in a better financial position than either of them.

46,121. (*Mr. Giffen.*) Neither one nor the other is very Protectionist in effect, is it?—Victoria is a Protectionist country, as she will not allow cattle to come from New South Wales across her border without paying a duty.

46,122. I am speaking more particularly of manufacturers. There are a great many duties upon manufactured articles, but they have not a Protective effect, because they have got no manufacturers in Victoria to speak of?—No, not to speak of.

Decrease of sheep in Queensland.

46,123. (*Viscount Cobham.*) I see that your Registrar General states that the heavy diminution in the numbers of your sheep in Queensland as between 1893 and 1894 was partly caused by losses by drought; that is hardly consistent with what you have been saying?—It was partly caused by losses by drought, but, as I have said, droughts notwithstanding, the increase of sheep and stock generally in Australia goes on—all over the island I mean. Sometimes it is checked in one part of the country but not in another. Taking the whole island the increase goes on, droughts notwithstanding.

46,124. I see there has been a fall of three million in the number of your sheep?—Is that in New South Wales.

46,125. In Queensland alone?—In what year.

46,126. The number of sheep at the end of 1893 was 18,697,000, and as compared with 1892 those figures shew a decrease of 3,000,000 in the number of sheep?—Possibly a great many of them have been boiled down, I think they have boiled a million sheep in Queensland.

46,127. He goes on to state the two causes which have conjointly operated to bring them about, namely, first the losses by drought and secondly a desire to understate rather than to exaggerate the number owned by each proprietor; that looks as if your provision of water as yet is very inadequate, and that you are liable to suffer very heavily from drought?—I may tell you that a large proportion of these artesian wells have been sunk since 1893.

46,128. Perhaps in consequence of the great drought then?—Yes, it was the great drought that forced them into the expenditure.

46,129. (*Mr. Dalton.*) In what condition did your live cattle land in England?—In first rate condition, as good as when they left Australia.

46,130. How do you account for the mortality?—I account for it principally because I think the cattle are not quiet enough when shipped to begin with; they are slung up by ropes and all that sort of thing.

46,131. You do not think the voyage injures them at all?—I should not think so; I do not think it does.

Number of squatters.

46,132. Is the number of these squatters that you have got diminishing or increasing now?—I do not think they are diminishing or increasing. There is no room for increasing because the land is all taken up pretty well, but the original squatters are having their runs invaded or taken up by these smaller men under the "Grazing Farm" regulations.

Mr. M. C. Thomson. 25 Apr. 1895.

46,133. Is there any large demand for the number of sheep farms that you mentioned and of which you gave us the prices?—No, I do not think there is very much demand.

Demand for sheep farms.

46,134. You do not have much immigration then?—No, we have very few people there.

46,135. Is the immigration increasing or falling off?—It is increasing; the population of the colony generally is steadily increasing.

Immigration.

46,136. By reason of immigration or by natural increase?—By both.

46,137. Is there much likelihood of the number of sheep and cattle increasing to any great extent?—No; I do not think they will unless there is a better outlet for the cattle and sheep. There is no encouragement to increase our stock when we cannot get rid of the stock that we have, but there is room for increasing if the increase is encouraged.

Number of sheep and cattle.

46,138. (*Mr. Everett.*) I gather from your evidence that the fall in the price of agricultural produce has been a great calamity to the farmers of Australia?—Yes.

Effect of low prices.

46,139. There was a great agricultural prosperity, I think, in Australia till 20 years or 15 years ago?—Yes.

46,140. And the fall in prices is the main cause of the difference to-day?—Yes.

46,141. Have you paid any attention to the connection between the level of prices and the supply of the standard by which prices are measured?—No.

46,142. So far as you have travelled about, I think you have found agriculture depressed in all the countries you have visited at the present time?—Yes.

46,143. Have you happened to travel in a country where the standard is silver instead of gold?—I have been in India twice.

46,144. Did you hear of complaints of agriculture there?—It was a long time ago, 20 years ago.

46,145. Have you been to the Argentine?—I have not been there, but I have been in China, in Japan, and in India.

The sugar industry in Queensland.

46,146. (*Viscount Cobham.*) Is the sugar industry as much depressed as the agricultural industry?—No, the sugar industry is very flourishing at present in Queensland.

46,147. It is limited to a very small area, is it not?—About 5,000 square miles is the area of the sugar land; it is on the Queensland coast north of Rockhampton.

46,148. It is not likely to encroach upon the agricultural land, is it?—It is agricultural land, but it is also sugar land; I mean it would grow other things, but it is especially good for sugar.

46,149. (*Mr. Giffen.*) Is there any bounty upon the production of sugar?—No.

46,150. (*Mr. Whitehead.*) Do they grow sugar beet?—No.

46,151. Cane?—Cane; the sugar requires a good deal of rain, and there is a very heavy rainfall on the coast. I have a map here showing the rainfall on the coast; the rainfall is heaviest where the sugar is.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Index to Evidence.

INDEX TO EVIDENCE.

MR. W. H. LANDER, Chairman of the Joint Committee of the Shropshire County Council and the Chamber of Agriculture.

Agreements substituted, 33,662–5. Agricultural Holdings Act, the, 33,347–75, 33,436–44; compensation for consumption of home-grown wheat, 33,576–86; compensation for improvements, 33,538–48; freedom of cultivation, 33,555–75; notice of claims, 33,530–4; penal clauses, 33,549–54, 33,587–91; scale of compensation, 33,524–9; scheduling the condition of farms, 33,489–92; substituted agreements, 33,513–23. Allotments, 33,472–7. Arbitrators, official, 33,651–61, 33,674–5. Assessments reduced, 33,287–9. Beer, 33,380–1. Bimetallism, 33,390–2. Cattle disease, 33,487–8; sale by live weight, 33,484–6. Claims, compensation for, outside the Act, 33,666–9; landlords', 33,670–3. Co-operation for sale of produce, 33,455. Cultivation, change in, 33,711–5; freedom of, 33,637–42. Dairy factories, 33,447–62. Depression in Shropshire; distress, law of, 33,496–9. Farm buildings, 33,319–20. Farmers' capital, 33,612–5; immigrant, Scotch, 33,478–83. Farming, results of, 33,700. Farms, competition for, 33,643–50; condition of, 33,352; demand for, 33,328; in hand, 33,329; size of, 33,295; that have withstood depression, 33,347–51, 33,626–9. Foreign meat, marking of, 33,616–7, 33,679–81. Fruit farming, 33,326. Game, 33,355–62, 33,618. Grass, land laid down to, 33,276–86. Holdings, small, 33,297–310. Improvements, compensation for, 33,630–6. Labour, reduced, 33,716–20. Labourers, unemployed, 33,344–6. Land courts, 33,376–9. Management, 33,694–9. Marketing, 33,325. Prices low, 33,625, 33,703–4. Protection, 33,382–9. Railways, light, 33,403–7, 33,500–7. Rates, local, 33,408–35; railway and canal, 33,327, 33,608–11. Rents, 33,682–4; average, 33,311–3; fixing of, 33,600–4, 33,620–4, 33,690–3; reduction of, 33,260–72, 33,314, 33,393–402, 33,493–5, 33,592–9, 33,685–9; on a sliding scale, 33,721. Report of Committee of Shropshire County Council, 33,290–4, 33,508–12, 33,705–10. Taxation and local rates, 33,363–73. Technical instruction, 33,353–4. Tenure, 33,296, 33,321–4, 33,605–7, 33,676. Wages, 33,332–43. Wheat growing, 33,273–5.

MR. WESTLEY RICHARDS (Gentleman Farmer), Oakham, Rutland.

Agricultural Holdings Act, 33,818–29. Block tests, 33,841–51. Bullocks, system of fattening, 33,854–68. Cattle-weighing machines, 33,798–817, 33,869–80. Farmers' accounts, 33,724–52. Landowners and practical farming, 33,852–3. Profits on a co-operative farm, 33,830; on his own farm, 33,830. Receipts and payments on his own farm, 33,753–78. Sale by live weight, 33,789–97. Stock, system of buying in, 33,779–88.

MR. ARTHUR ARNOLD, President of the Free Land League.

Agricultural land, mortgages on, 33,963–6. Agriculture, operation of the suggested legislation on, 33,925. Allotments, number of, 34,105–9; and Small Holdings Act, 33,955–62. Charges on land, imposition of, 34,136–40; common rights, 33,930–2; copyholds, compulsory enfranchisement of, 34,032–41; and customary tenure, 33,903–10; cultivation of land on arge and small holdings compared, 34,074–85. Disabilities of glebe owners and public bodies, 34,090–1. Doomsday Book, Modern, 34,063–71, 34,110–117. Encumbrances of small owners, 34,086–8. Enfranchisement of copyholds, compulsory, 34,032–41; leasehold, 33,933–7. Entail, abolition of settlement and, 34,04–53; law of, 33,898–900. Effect of depression (1.) upon landowners, 41,189–91; (2.) upon the Pelly estate, 41,192–5; (3.) upon a large estate, 41,196–7; (4.) upon a small estate, 41,198–9; (5.) upon large farmers, 41,200–5; (6.) upon small farmers, 41,206–7; (7.) upon labourers, 41,208–12. Estates, management of, 41,240–7; vacant, 41,383. Fall in prices, 41,251–3. Farms, letting of, 41,384–6. Foreign competition, 41,268. Fruit culture, 41,314–7. Income tax, 41,406. Labour, 41,269–71; reduced, 41,265–7. Labourers, 41,379–80; cottages, 41,381–2. Land out of cultivation, 41,218–26, 41,326–32; tax, 41,275–82, 41,400–5. Law of distress, 41,296. Letting of farms, 41,384–6. Light railways, 41,390–1. Management of estates, 41,240–7. Notice of claim, 41,291–3, 41,356–60. Official referees, 41,294–5, 41,361–2. Prices, fall in, 41,251–3. Railway rates, 41,303–4. Rates, 41,272–4, 41,305–10, 41,392–9, 41,407–45. Reduced labour, 41,265–7; rental on the Pelly estate, 41,320–5. Reductions of rent, 41,446–57. Restrictions, 41,2977–302, 41,363–74. Rural depopulation, 41,248–50. Small holdings, 41,387–9. Technical instruction, 41,311–12. Tenancy changes of, 41,230. Tenure, 41,287–8. Tithe, 41,333–4. Wages, 41,213–7, 41,335–8.

Mr. JOSEPH CRESCENS REYNOLDS, tenant farmer, Paxford, Camden, Gloucestershire.

Acreage of land under market gardens, 41,480–9. Agricultural Holdings Act, compensation under the, 41,803–13. Allotments, 41,545–8, 41,785. Bad seasons, 41,596–601. Compensation, for disturbance, 41,663–79, 41,730; for home-grown corn consumed, 41,831–5; leaseholders and, 41,679–91; under the Agricultural Holdings Act, 41,803–13. Competition of farmers and market gardeners, 41,864–8; foreign, and market gardening, 41,860–3; in milk, 41,651–2. Condition of farmers in Cotswold district, 41,516; of labourers, 41,564–81, 41,749–51; of sheep farmers, 41,602. Corn rents, 41,610–18, 41,632–7. Cultivation, deterioration in, 41,551; and sale of produce, restrictions on, 41,814–22. Dairy factories, 41,710–13. Deterioration of cultivation, 41,551. Depression on landowners, effect of, 41,882–5, 41,894–8. Effect of depression on landowners, 41,882–5, 41,894–8. Evesham district, soil in, 41,858–9; tenant right system, 41,736–42. Farmers' club, north Cotswold, 41,876–9; in the Cotswold district, condition of, 41,516; losses of capital, 41,823–30; on quitting their farms, 41,692–700. Foreign competition and market gardening, 41,860–3; in milk, 41,651–2. Fruit farming, 41,853–7; farm, Lord Sudeley's, 48,844–52. Judicial rents, 41,701–7, 41,731–5, 41,770–7; and Land Courts, 41,715–29. Labourers, condition of, 41,749–51, 41,564–81; wages, 41,582–95, 41,786–802. Land courts, 41,655–62, 41,752–77, 41,761–7, 41,838–43; and judicial rents, 41,715–29. Land out of cultivation, 41,540–4, 41,880–1; under market gardens, acreage of, 41,480–89. Laying of land down to grass, 41,552–2. Leaseholders and compensation for disturbance, 41,680–91; leases and yearly tenancies, 41,768–9. Light railways and waterways, 41,714. Local rates, 41,603–10. Losses of landlords and tenants compared, 41,756–60. Malt tax, 41,836–7. Market gardens, 41,743–8, 41,783–4; and competition of farmers, 41,864–8; profitableness of, 41,490–4; rent of, 41,505–7; tenant right of, 41,495–504, 41,508–15. North Cotswold Farmers' Club, 41,876–9. Particulars of witness' farms, 41,459. Railway rates, 41,638–50, 41,653. Rating of land, 41,708–9. Reduction of rents, 41,469–79, 41,537–8, 41,654, 41,886–93; and reduction of assessments to income tax compared, 41,618–31. Rent of farms, 41,517–36. Results of farming, 41,560–3. Sheep farmers, condition of, 41,602. Temporary pastures, 41,869–75. Tithe, 41,755; rentcharge in his district, 41,778–82. Unoccupied farms, 41,549–50. Wages of labourers, 41,786–802.

Mr. GEORGE ADAMS, farmer, Berkshire.

Agricultural depression, effect of, 42,006–8. Holdings Act, counter claims under, 42,131–45. Allotments, 42,026–9; (Minster Lovell), 42,055–64. Barley, fall in price of, 41,929–37. Burdens on land, 41,946–8. Buscot estate, 42,047–54. Butter factories, 42,033–46. Changes of tenancy, 42,016–9. Clearing of water courses, 42,097. Commercial gambling, 41,985–90. Condition of labourers, 42,009–11. Counter claims under Agricultural Holdings Act, 42,131–45. County rate, 41,968–73, 42,087. Dairy produce, fall in price of, 41,928–37. Early closing, 41,997–8. Effects of agricultural depression, 42,006–8; depression on landlords, 42,020–2. Fall in price of barley, 41,929–37; of dairy produce, 41,928; of sheep, 41,939–43. Farm, particulars of witness', 41,900–22. Farming, witness' experience of, 42,098–107. Highway rate, 41,956–62. Import duty on flour and meat, 41,999–42,005. Labourers, condition of, 42,009–11; cottages, 42,108–11; payment of, 41,991–6, 42,030–2; quality of, 42,113–5; wages, 42,012–15, 42,112. Land out of cultivation, 41,949–55. Low prices, 41,923–7. Maintenance of main roads, 42,088–96. Market gardening and fruit, 42,023–5. Marking of foreign meat, 41,944–5. Milk, railway rates on, 41,974–83. Minster Lovell allotments, 42,055–64. Payment of labourers, 41,991–6, 42,030–2. Premiums of incoming tenants, 42,146–53. Quality of labour, 42,113–5. Railway rates on milk, 41,974–83; on sheep, 41,984. Rateable values of property in witness' union, 42,080–5; rates on witness' farm, 42,070–9. Reductions of rent and assessments to local rates, 42,065–9. Sheep, fall in price of, 41,939–43; railway rates on, 41,984. Tenant right, 42,116–30. Use of wheat as fodder, 41,938. Wages and earnings, 42,155–61; of labourers, 42,012–5. Wheel tax, 41,963–7.

Mr. JOHN FREDERICK HALL, landowner, Sharcombe, Somersetshire.

Adulterated butter, 42,925. Advantages of butter making, 44,119–26. Artificial food for calves, 44,038–44; feeding with, 44,024; effect of, on quality of milk, 44,025–7; effect on pasture, 44,028–37. Butter

Index to Evidence.

making, advantages of, 44,119–26; encouragement of, 44,054–5; uniformity in, 44,064–5; and cheese making, quality of milk for, 42,246–51, 42,266–70; colouring, 44,112–8; compared with milk and cheese, 42,271–2; dairying and the economical production of milk, 42,167; dairies, particulars of, 42,168–7; farm, produce of witness', 42,172–4; inspection of, by county council inspectors, 42,297–9; making industry, importance of the, 42,291–5; packing, 44,188–91; price of, 44,089–94; production and foreign competition, 44,069; ratios, 42,174–6, 42,237, 42,288–90; yield of cows, 42,178, 42,237. Chicago, result of butter tests at, 1893, 42,287. Comment on Mr. C. S. Read's and Mr. Bear's evidence, 42,245. Competition with colonies, 44,109–11; with Danish butter, 44,148–53. Co-operation 44,146–7, 44,160–1. Cost of producing Jersey and other milk compared, 42,272. Cows, cost of winter food for, 42,216; economical feeding of dairy, 44,048–53; Jersey, 42,171; Jersey as butter makers, 44,056–9; Jersey and shorthorns compared, 44,057–9; milk and butter, yield of, 42,226–36; prejudice against dairy, 42,286; summer and winter food for, 42,214–6; superiority of Jerseys as butter, 42,251, 42,265, 42,287; use of Jerseys abroad, 42,287. Cross breeds as butter makers, 44,068. Dairy cattle at shows, improvement of tests of, 42,299. Farming in the eastern counties, 44,168–77. Economical feeding of dairy stock, 42,218–26. Effect of age on cows' milk, 42,274–85; on pasture of feeding with artificial food, 44,028–37; on the quality of milk, 44,025–7. Ensilage, 42,204–13. Farm buildings, 44,072–70. Farmers, position of, 44,107–8. Farming, system of, 44,162–7, 44,178–87. Feeding of dairy stock, 42,204; with artificial food, 44,024; with carrots, 44,045–7. Importance of the butter-making industry, 42,291–5; of economical production of milk for butter making, 42,286. Improvement of tests of dairy cattle at shows, 42,299. Low price of cheese and milk, 44,105–6. Marketing produce, 42,198–203. Milk testing, 44,070–1. Position of farmers, 44,107–8. Profit and loss account, 42,178–97. Rates, 44,095–101, 44,154–60. Rent, 45,127–45: reduction in, 44,102–4. Scalding system, 42,262–4. Scarcity of labour, 44,078–87. Separators, 42,257–61; use of, 44,021–3. Skim milk, 42,176–8. Sterility in dairy cattle, 44,060–63. Supply of Jersey cattle, 44,066–8. Technical education, 42,295–7, 44,194–6. Uniformity in butter making, 44,064–5. Wages, 44,088. Water supply, 44,192–3.

MR. CORNELIUS NEALE DALTON, C.B., a Member of the Royal Commission on Agriculture.

Abolition of Church rate, effect of, 42,625. Agricultural land in rural districts, 45,761–5. Amesbury Union, rates in, 42,567–75, 42,631–46. Amount of property assessed for local purposes, 1870, 42,499–501. Areas, effect of an extension of Poor Law, 42,685–6. Assessments, income tax, reduction of, 1870–71 and 1893–94 compared, 42,516–34; increased, of railways and other property, relief of rural rates by, 42,479–85, 42,535–52, 42,588–94; effect of, 42,670–4; of railways, parochial, in 1813–15 and 1826–27, 42,352; to income tax and to local rates, compared, 42,486–98; variations in, 42,553–66, 42,668–9. Beer and spirit duties, expenditure on technical education from residue of, 42,468–9. Buildings and railways, rateable value of, in 1870 and 1894, compared, 42,507–15. Church rates, 42,327–31, 45,844–6; effect of abolition of, 42,625–8. Comparability of rates at different periods, 45,730–54, 45,837–9, 45,855–72. Compounding in rural districts, 45,851–4. Consols, difficulty of taxing, 42,615. Councils, parish, 42,705. County rate, 42,395–405; expenditure included in, 42,406–8, 42,409–11. Decrease of pauperism, 42,377; of rural rates, cause of, 42,446–9. Difficulty in bringing returns up to date, 42,639–43, 42,647–55. Distinction between urban and rural districts, 45,755–60. Education, grants in aid, and object of, 42,456–60. Fowler's, Mr., report on local taxation, 42,310, 45,718–29. Garstang, rural rates in, 42,576–8. Goschen's, Mr., report on local taxation, 42,307–9, 45,718–29. Grants in aid, and object of grants in aid, of education, 42,456–60. Hatfield, rural rates in, 42,579–84. Highway rate, 42,412–28, 42,656–60, 45,714–7. Incidence of rates on land, 45,817–23. Income tax, and local rates, assessments to, compared, 42,486–98, 45,824–35; assessments, reduction of, 42,516–34; impracticability of levying a local, 42,616. Increase in State subventions, 42,454–5. Land, agricultural in rural districts, 45,761–5. Companies and railway companies, principle of rating, 45,787–816; effect of rating, at 75 per cent. reduction, 42,691–7; incidence of rates on, 45,817–23; rateable value of, in 1870 and 1884, 42,501–6; Langport, rural rates in, 42,585. Local income tax, impracticability of levying a, 42,616. Local taxation, Mr. Fowler's report on, 42,310–11, 45,718–29; Mr. Goschen's report on, 42,307–9, 45,718–29; relative position of land and other property as contributors to, 42,595–6. Local valuations and income tax valuations compared, 45,824–36. London, expenditure on poor relief in, 42,380–5. Nationalisation of the poor rate, 42,617, 42,675. 42,682–4. Object of grants in aid of education, 42,456–60. Parochial assessments in 1813–15 and 1826–27, 42,352. Parish councils, 42,705. Pauperism, decrease of, 42,377. Personalty, effect on rural districts of rating or taxing of, 42,600–4; history of the rating of, in England and Scotland, 42,597–9; the rating of, 42,621–2, 42,698–704, 45,847–50. Poor Law, effect of, on the rates, 45,840–3; areas, effect of an extension of, 42,685–6. Poor rate, nationalisation of the, 42,617, 42,675, 42,682–4; rates in the £ of the, 42,386–94; select committee of 1817 on the, 42,336–42; and of 1834, 42,343–8. Poor relief, 1818–20, 42,349–51; as a county charge, 42,676–81; expenditure on, in London, 42,380–5; in rural unions in 1868 and 1893, 42,355–76, 42,378–9. Property assessed for local purposes 1870, amount of, 42,499–501. Railways and land companies, principle of rating, 45,787–816; and other properties, increase in assessments of, 42,535–52, 42,588–94; effect of assessments of railways on local rates, 42,670–4; rateable value, in 1870 and 1894, of buildings and, 42,507–15; variations in assessments of, 42,553–66, 42,668–9. Rate, county, 42,395–405; expenditure included in, 42,406–8; variations in, 42,409–11; highway, 42,412–28, 42,656–60, 45,714–16; select committee of 1817 and of 1834 on, 42,336–42, 42,343–8. Rateable value of buildings and railways in 1870 and in 1894, 42,507–15; of land in 1870 and 1894, 42,502–6. Rates, at different periods, comparability of, 42,311–26, 42,332–5, 45,730–54, 45,837–9; causes of decrease in rural, 42,446–9; church, 42,327–31, 45,844–6; effect of Poor Law on the, 45,840–3; effect of State subventions in the, 42,450–3, 42,470–8; fall of rural, 42,353–4; in Amesbury, 42,567–75; in 1894, 42,644–6; in rural unions, 42,629–30; in small urban sanitary districts, 45,766–70; in the £ of poor rate, and rate per acre, 42,386–94, 42,687–90; on the land, incidence of 45,817–23; relief of rural, by increased assessments of railways and other property, 42,479–85; rural sanitary, 42,435–45; school-board, 42,429–34, 45,771–86; State subventions in reduction of, 42,461–7, 42,661–7. Rating, of farmers' stock-in-trade and its effect on rent, 42,618–20; of land at 75 per cent. reduction, effect of, 42,691–7; of personalty, 42,621–2, 42,698–704, 45,847–50; effect of, on rural districts, 42,611–14; in England and Scotland, history of, 42,597–9; of ships, 42,623–4. Relative position of land and other property as contributors to local taxation, 42,595–6. Relief, poor, as a county charge, 42,676–81; in 1818–20, 42,349–51. Rent, effect of rating farmers' stock-in-trade on, 42,618–20. Returns, difficulty of bringing up to date, 42,639–43, 42,647–55. Rural districts, compounding in, 45,851–4; distinction between urban and, 45,755–60. Rural rates (Amesbury), 42,567–75, 42,631–8; (Garstang), 42,576–8; (Hatfield), 42,579–84; (Langport), 42,585–6; (Whitchurch), 42,586–7; at different periods, 45,855–72; fall in, 42,353–4; relief of, by increased assessments of railways and other property, 42,479–85. Sanitary districts, rates in small urban, 45,766–70; rates, rural, 42,435. School board rates, 42,429–34, 45,771–86. Ships, rating of, 42,623–4. Spirit and beer duties, expenditure on technical education from residue of, 42,468–9. State subventions, in reduction of rates, effect of, 42,450–3, 42,461–7; increase in, 42,454–5; in London and other districts compared, 42,661–7; in rural and urban districts compared, 42,470–8. Tax (income), assessments to local rates compared with, 42,486–98, 45,824–36; impracticability of levying a local, 42,616; reduction of assessments, 1870–71, and 1893–4, 42,516–34 Taxation, Mr. Fowler's report on local, 42,310, 45,718–29; Mr. Goschen's report on local, 42,307–9, 45,718–29; of personalty, effect on rural districts of, 42,600–14; relative position of land and other property as contributors to local, 42,595–6. Technical education, expenditure on, from residue of beer and spirit duties, 42,468–9. Urban and rural districts, distinction between, 45,755–60. Whitchurch, rural rates in, 42,586–7.

MR. DE RINZY JAMES BRETT, Landowner, Argentine Republic, Santa Fé.

Alfalfa growing, 43,602–7. Alluvial soil, 43,166–9. American and Argentine cattle, quality of, 43,316–29. American cattle, importation of live, 43,306–15. Area suitable to cereals, 43,058–9. Argentina, colonists in, 42,949–50; in competition, 43,502–4; immigration to, 43,215–21. Barley and oats growing, 43,397–8. British farmer, prospects of, 43,262–9. Cattle, breeding, 43,173–6; disease, 43,197–200, 43,295–7; future increase in sheep and, 43,349–57; improved breed of, 43,160–1; sheep and horse breeding, 43,156–9. Climate, 43,144–55. Colonists in Argentina, 42,949–50. Comparison with New Zealand meat, 43,135–5. Continuation of low prices, 43,345–8. Cost of cartage, 43,022–8; of wheat production, 43,018–20. Cultivation of maize, 42,993–4. Currency, the, 43,091–103, 43,431–49; effect of depreciated, 43,487–91; depreciation of, and increase of production, 43,492–504. Depreciated currency, effect of, 43,487–91; and wages, 43,512–533. Depreciation of currency and increase of production, 43,492–504. Development of wheat production, and of sheep and cattle, probable, 43,241–50. Droughts, 43,226–7, 43,236–40. Effect, of cost of producing Argentine wheat on prices, 43,338–44; of low price of wheat, 43,060–7; on labourers, 43,507–11. Employment of women and children, 42,980–7. Export of flour, 42,995, 43,108–9; of hay, 43,399–400; of live cattle, 43,044–5; of wool, 43,179–86. Extension of railways, 43,034–9, 43,170–2. Extent of virgin soil, 43,029–33. Fertility of the soil, 43,136–7. Freights, charges, 43,228; limited, 43,229–31. Frozen meat, 43,077–81, 43,254–61; price of, 43,086–90, 43,130–3. Future increase in cattle and sheep, 43,349–57. Gold premium, the, 43,466–87; and railway rates, 43,117–20; premium on, and prices of commodities, 43,201–7; and paper money prices in, 43,450–65. Hire of implements, &c., on credit, 42,996–8. Horse breeding, 43,287–94. Hours of labour, 43,104–7. Immigration, 43,358–61; to Argentina, 43,215–21. Importation of breeding stock from England, 43,187–95; of cattle, sheep, and horses, 43,165; of labourers for harvest, 43,004–17; of meat to England, 43,298–305; of live American cattle, 43,306–15. Improved breed of cattle, 43,160–1. Increase, of land under cultivation, 43,055–7; in cattle, sheep, and horses, 43,075; of wheat cultivation, 42,943. Interest on land investment, 43,401–6. Labourers, 42,999–003, 43,362–72; wages, 43,208–14, 43,222–3. Land for fattening cattle, 43,550–63. Laid down for lucerne, 43,417–23, 43,138–42, 43,535–9. Language, 43,406*a*–10. Linseed, 43,430; cultivation, 43,196. Low prices, continuation of, 43,345–8; of wheat, 43,060–7. Lucerne cropping, 43,564–79. Maize cultivation, 42,993–4. Mortgages, 43,505–6. Nature of soil, 42,971. Particulars of witness' farming, 42,939–42. Position of the British farmer, 43,334–7. Premium on gold and prices of commodities, 43,201–7. Price of cattle, 43,068–71, 43,082–5; of frozen meat, 43,086–90, 43,130–2. Prices in gold and paper money, 43,450–65. Probable development of wheat production and of sheep and cattle, 43,241–50. Produce per acre, 42,990–1. Production of wheat, 43,224. Profit on wheat production, 43,279–86. Profitable price of wheat, 43,230–3. Prospects of the British farmer, 43,262–9. Quality of, beef and mutton, 43,127–9; mutton, 43,162–3; sheep, 43,251; soil, 43,580–600. Railway rates, 43,110–16; and the gold premium, 43,117–20. Dividends, 43,121–6. Rearing of stock, 43,046–51. Reduced cost of transport of grain, 43,424. Reduction in cost of wheat producing, 43,040–2. Rent of land, 43,373–4. Sale of land, 42,992. Selling value of land, 43,375–82. Sheep breeding, 43,177–8, 43,391–6. Size of farms, 42,988. System, of cultivation, 42,968–70; of produce sharing with colonists, 42,952–67, 43,232–5, 43,411–6. Taxes, 43,270–5. Tenure, 42,972–8. Veterinary examination of cattle, 43,072–4. Wages and depreciated currency, 43,512–33. Wheat, cultivation, 43,276–8; increase in, 42,943–51; production, cost of, 43,018–20.

MR. MALCOLM JAMES ROWLEY DUNSTAN, Director of Technical Education, Nottingham County Council; Head of Agricultural Department, University College, Nottingham; and Agricultural Analyst for the county of Nottingham.

Acquisition of experimental land, 44,867–72. Advisers travelling, 43,692–4. Agricultural, book-keeping, 44,842–5; colleges, 44,766; college, Nottingham, 44,792–6; education, administration of, 44,780–2; education, in Denmark, 44,993–9; in Ireland, 44,758; in Nottinghamshire, 43,609–11; grant, 43,622–9. Bacon curing, 43,650. Bee keeping, 43,649. Butter, Irish, 44,956–64. Character, of the cows, 44,926–8; of dairying, 44,910–13; of soil in Denmark, 44,965–70. Competition with Danish butter, 44,921–5. Co-operative butter making, description of system, 44,886–908. Cost of a dairy factory, 44,988–91. Cottage gardening, 43,669–71. Cow keeping, 44,938–51. Dairy factory, cost of a, 44,988–91; institute establishment of, 43,616–21. Dairying, 43,661–2; instruction in, 43,613–5, 44,769–70. Discussions in place of lectures, 43,652–60. District agricultural schools in Nottinghamshire, 43,701–24. Effect of instruction on quality of butter, 43,630–2. Elementary instruction in day schools, 43,697–700. Extension of the Nottinghamshire system of instruction, 44,764. Experimental, farms, 43,672–5; plots for schools, 44,817–24. Factory staff, 44,992. Farm schools, 43,678, 44,752–7. Farmer's mode of life, 44,914–8. Farming in Denmark, Sweden, and Norway, 44,885; in Sweden, 44,974–9; in Norway, 44,980–7. Faults in the present system of education, 43,695–6. Horticulture, 43,633–41. Instruction, in Canada, 44,805–11; in dairying, 43,613–5; in Denmark, 44,812–6; effect of on quality of butter, 43,630–2; elementary, in day schools, 43,607–700; in grammor schools, 44,783–6; to labourers, 43,663–8; at Nottingham University College, 44,760–3; in rural schools, 44,825–9, 44,853; theoretical and practical, 44,765; by village schoolmasters, 43,680–5. Inspection, 44,880–4. Irish butter, 44,956–64. Lectures on general agricultural subjects, 43,651. Mansfield Grammar School, 44,856–64. Methods of education, 43,676–7. Milk ratio, 44,929. Newark Grammar School, 44,865–6. Nottingham University College, instruction at, 44,760–3; syllabus of, 44,835–41. Packing and marketing produce, 43,642–3. Pasture, 44,971–3. Peripatetic teachers, 44,874–9. Poultry keeping, 43,644–8. Quality of cultivation, 44,931–3. Scientific lectures to farmers, 44,767–8. Separators, use of, 44,909–13. Skim milk, 44,930. Subjects of instruction, 44,612. Supply of teachers and lecturers, 43,686–91. Syllabus of Nottingham University College, 44,835–41. System of cultivation, 44,934–7. Tenure, 44,952–5. Theoretical and practical training, 44,798–804. Training of schoolmasters, 44,758–9, 44,771–9, 44,787–91, 44,830–4, 44,846–52; mistresses, 44,854–5. Travelling advisers, 43,692–4. Use of separators, 44,909. Wages, 44,919–20.

MR. T. H. HUTCHINSON, Farmer, North Riding of Yorkshire.

Agricultural education, 43,850–6, 43,936. Holdings Act, 43,780–8, 43,841, 43,860–6. Agriculture, condition of, 43,739–47. Arbitration, 43,995. Barley, duty on, 43,789–97; and flour, duty on, 43,954–7. Cattle breeding, 43,932–5, 43,968–75. Change in system of farming, 43,921–5. Commencement of tenancies in North Riding, 43,901–4. Compensation for improvements, 43,777–9, 43,992–3; and security of tenure, 43,980–9; to landlords for deterioration, 43,841–6, 43,868–77; on quitting a farm, 43,857–9. Condition of agriculture, 43,739–47; of entry, 43,905–17. Consumption of home-grown corn, 43,965–7. Cost of production, 43,754–5. Dairying, 43,937–43. Demand for farms, 43,748–51. Duty on barley, 43,789–97; on barley and flour, 43,954–7; on flour, 43,799–800. Effect of the depression on the labourers, 43,880–3; on cultivation, 43,884–9. Farming, future of, 43,752–3; results of, 43,765–7; 20 years ago, 44,006–9. Foreign meat, sale of, 43,840. Horse dealing and breeding, 43,926–31. Inefficient tenants, 43,958–60. Labourers, 43,758–64; reduced employment of, 43,976–9 reduction of employment, 43,999–44,004. Local rates, 43,803–14, 43,807–9, 43,990–1. Low prices, 43,878–9. Malt tax, 43,798. Particulars of witness' farm, 43,726–38; farming operations, 43,891–900, 44,010–20. Quitting a farm, 43,815–7. Rates, 43,769–71; railway, 43,801–2; sanitary, 43,818–20. Reduced employment of labourers, 43,976–9. Rent, reduction of, 43,731–8, 43,768, 43,733–6, 43,944–53. Sale of cattle by live weight, 43,821–39, 43,918–20. Security of tenure and compensation for improvements, 43,980–9. Scheduling the condition of farms, 43,867; farming, 43,961–4. Tenure, 43,772. Wages, 43,756–7, 43,996–8.

Index to Evidence.

MR. JOHN KENELM WOODWARD, Market Gardener, Evesham.

Agricultural Holdings Act, 44,484–6; position, 44,537–41. Agreements, 44,425–32. Area of market gardens, 44,199–201. Average cost of cultivation, 44,274–5. Compensation for good cultivation, 44,380–7; for improvement and disturbance, 44,302–19, 44,403–23; for outgoing tenants, 44,257–65. Condition of the market-garden industry, 44,228–33. Cost of cleaning land, 44,363–9; of cultivation, average, 44,274–5. Crops, 44,202–4. Cultivation, spade, 44,204–6. Employment of women and children, 44,278–82. Evesham, custom, the, 44,478–3; legalisation of the, 44,349–52, 44,433–8; market gardening and farming at, 534. Extension of market gardening, 44,564–5. Foreign competition, 44,556–60. Free sale, of tenant right, 44,290–6; of improvements, 44,462–7. Fruit tree planting, 44,253–6; by landlords, 44,451–61. Increase of market gardening, 44,213–18. Initial outlay on tree planting, 44,266–73, 44,395–402. Labour, 44,237–41; skilled, 44,283–9. Landlord's consent to tree planting, 44,321–4, 44,333–48, 44,487–9, 44,510–7. Market gardens, area of, 44,199–201; extension of, 44,564–5. Gardening and farming at Evesham, 44,534–6. Gardening industry, condition of the, 44,228–33; increase of, 44,213–8; profits of, 44,545–51; proportion of land cultivated as, 44,325–32. Proportion of land cultivated as market gardens, 44,325–32. Protection of landlord and deteriorated cultivation, 44,500–9. Purchase of improvements, 44,361–2. Railway rates, 44,388–94, 44,566–75. Rateable value of district, 44,576–9. Rent, reduction of, 44,542–4. Rents, 44,219–27, 44,370–9, 44,439–50, 44,518–33. Right to will land, 44,297–301. Security for expenditure of capital, 44,468–77. Size of gardens and employment of labour, 44,207–12. System of cultivation, 44,234–6. Tenant right, value of, 44,353–9. Tenants' improvements and increased rent, 44,490–9. Tenure, 44,242–52. Transfer of tenancy, 44,360. Value of tenant right, 44,353–9. Vegetable gardens, 44,552–5, 44,561–3. Wages, 44,276–7.

MR. JOHN BOWEN JONES, Member of Council of the Royal Agricultural Society, Montford Bridge, Shropshire.

Agricultural Holdings Act, 44,685. Agriculture, condition of, 44,647–51. Arbitrators, appointment of, 44,661–6; powers of, 44,667–73. Cattle disease, 44,747–8. Compensation for improvements made without landlord's consent, 44,674–7; for manures, scale of, 44,698–9; to sitting tenants, 44,681–4; substituted, 44,678. Condition of agriculture, 44,647–51. Consumption of home-grown corn, 44,700–3. Dairy instruction, 44,644–6. Fall in prices, 44,737. Free sale and cultivation, 44,690–7. Income and expenditure, 44,605–9. Inherent capabilities of the soil, 44,685–9. Labour, 44,599–601, 44,743–5. Local rates, 44,616–28. Losses from farming, 44,740–2. Marking of foreign meat, 44,749–51. Notice to quit, 44,679–80. Particulars of witness's farm, 44,582–9. Pedigree stock, 44,710–18. Poor rate, 44,632–9. Rates, 44,590–1, 44,719–36. Receipts from farming, 44,592–8. Reduction of rent, 44,738–9. Report of Shropshire Chamber of Agriculture, 44,610–15, 44,655–66. Scale of compensation for manures, 44,698–9. Small holdings, 44,652–4. Substituted compensation, 44,678. Tax on flour, 44,746. Technical instruction, 44,640–3, 44,704–9. Treasury subventions, 44,629–31. Wages, 44,602–4.

MR. ROBERT ANDREW ANDERSON, Organising Secretary to the Irish Agricultural Organisation Society, Limited.

Adulteration, 45,020–2; of milk, 45,006–7. Agricultural co-operative societies in Ireland, 45,091. Credit banks, 45,091–108. Education in Ireland, expenditure on, 45,172–3. Artificial ripening of cream, 45,153. Bacon curing factories, 45,119–26. Bookkeeping of co-operative societies, 45,085. Butter, bad treatment of, in transit, 45,215–6; exports of Irish, 45,169; freight on Irish, 45,202–7; making, system of, 45,141; manufactured, 45,037–42; price of, 45,049; proportion of, in milk, 45,052–61; reputation of Irish, 45,191–6; sale of, 45,062–4; improved quality of Irish, 45,167–8. Cattle, feeding and management of, 45,050; shipment of, from Ireland, 45,109–18. Cheesemaking, instruction in, 45,156–7. Comparative results from creameries and home dairies, 45,139–40. Co-operative, dairies in Sweden, 45,072; particulars of, 45,013–9; purchase of manures and feeding stuffs, 45,217; sale, 45,185–90; societies, rules of Irish, 45,073–6; system, extent of the, 45,029–34. Cost of building a factory, 45,008–12. Creameries and butter factories, 45,043–8; situation of, 45,213–4; staff of, 45,077–8; system and factory system compared, 45,197–8; working expenses of, 45,199–201. Dairy, conferences, 45,065–7, 45,070–1; instruction, 45,158–62. Danish system, the, 45,024–8. Distinction between co-operative and proprietary dairies, 45,142. Division of profits, 45,079–84. Extension of system, 45,035–6. Farmers' profits from dairy societies, 45,127–8, 45,137–8; supply association, 45,227–31. Feeding and management of cattle, 45,050. Finance, 45,003–4. Fixing price of milk, 45,143–8. Foreign competition, 45,183–4. Glasnevin model farm, 45,175. Irish Agricultural Organisation Society, 45,000–2, 45,086–90; finance, 45,003–4; management, 45,005; society, relation of, to dairy societies, 45,176–8. Irish cattle, improvement of, 45,068–9; cows, improvement of, 45,051. Loss by bad treatment of butter in transit, 45,208. Management of co-operative societies, 45,235–42. Marketing of eggs, 45,231–4. Munster Dairy, 45,163–6, 45,170–1. Number of cows to a creamery, 45,179–80. Sampling and analysis of manures, 45,217–26. Skim milk, 45,203. Standard for pure milk, 45,154–5. Treatment of creamery sewage, 45,149–52. Value of separated milk, 45,130–6. Water supply of creameries, 45,181–2.

MR. FREDERICK LACY ROBINSON, C.B., Deputy Chairman of the Board of Inland Revenue.

Abolition of land tax on personalty, 45,328–34, 45,599–616. Amount of land tax quota, 45,290–5. Appeals against land tax assessment, 45,346–52. Appointment of land tax assessors, 45,344–5; of land tax commissioners, 45,262–85. Assessment of farmers under Schedule B., 45,535–8; under the Finance Act, 1894, 45,427–8; of income tax, 45,405–9, 45,416–25, 45,634–7; insufficiency of, 45,312–7; of land tax, 45,340–3, 45,379–80, 45,492–3, 45,496, 45,627–8; of land tax and fall in value of land, 45,296–311; of personalty to land tax, 45,651–8; of tithe, 45,436; sufficiency of, 45,702–10; under Schedule B., 45,473–82; under Schedule B. on hop lands, 45,533–4. Authority responsible for raising land tax, 45,356–8. Cost of collection of land tax, 45,353–5, 45,500–4. Determination of income under Schedule B., 45,519–23. Duties, of assessors of income tax, 45,552–62; of land tax commissioners, 45,546–51. Effect of Finance Act of 1894, 45,465–72; of reducing land tax, 45,404; of sub-divisions of property on land tax, 45,711–13; of transfer of proceeds of land tax to local taxation account, 45,617–26. Exemptions under Schedule B., 45,460–4. Farmers assessed under Schedule B., 45,454–9; position under Schedule B., 45,451–3. Finance Act of 1894, effect of, 45,465–72. History of land tax, 45,246–8, 45,505–18. Incidence of land tax in different parishes, 45,369–78; on agricultural land and towns compared, 45,670–6. Income tax assessments and fluctuations in value of land, 45,575–88; and mortgages, 45,589–96; commissioners, 45,410–15; and the poor rate assessments compared, 45,429–35, 45,437–47. Increase of land tax from agricultural depression, 45,359–64. Instruction to land tax assessors for valuation of properties, 45,563–74. Land tax, commissioners, 45,259–61; divisions, 45,483–91; qualifications of, 45,286–9; variable rentcharge, 45,247–8. Objections to the land tax, 45,659–61, 45,677–8. Original object of land tax, 45,597–8. Payment, of assessors and collectors, 45,426; of clerks to Land Tax Commissioners, 45,498–9. Position of farmers under Schedule B., 45,451–3. Possibility of effecting changes in land tax, 45,381–91. Power of an appeal against land tax assessment, 45,629–33. Quotas fixed in 1797, 45,249–58. Rate in the £ for land tax, 45,365–8. Redemption of land tax, 45,318–27, 45,335–40, 45,392–403, 45,494–5, 45,662–9, 45,679–81. Reduction of assessments under Schedule B., 45,539–45. Remission of rent and income tax assessments, 45,448–50, 45,692–701. Repayment of income tax on claims for rebate, 45,638–50. Schedule B. in Ireland, 45,524–32. Uniform assessment of land tax, 45,682; valuation for local and Imperial purposes, 45,683–4. Valuation of railways for local purposes, 45,685–92.

MR. MATTHEW CHARLES THOMSON, Station Owner, Queensland, Australia.

Advantages offered to settlers, 46,076–86. Australian and Argentine cattle compared, 45,965. Condition of squatters, 46,087–97. Co-operation amongst farmers in Australia, 46,052–60. Cost of freezing meat, 46,041–4. Decrease of sheep in Queensland, 46,123–31. Demand for sheep farms, 46,133–4. Difficulty of selling frozen meat, 46,035. Diseases of animals in Australia, 45,977–8. Disposal of surplus meat in Australia, 45,973–6. Drought in Australia, 45,973–6, 46,107–13. Effect of low prices, 46,138–45; of "Protection" in Australia, 46,114–22. Export of lamb from Australia, 46,030–4; of live cattle, 45,901–19; of poultry, 46,008; of tinned meat, 46,045–51. Equipment of Australian cattle ships, 46,010–15. Freightage, 45,971–2. Fruit farming in Queensland, 45,998–46,007. Growth of barley and oats in Australia, 45,996–7. Immigration, 46,135–6. Improvement of mutton in Australia, 45,993–5; of Queensland cattle, 46,016–24. Irrigation in Australia, 46,051–65, 46,070–3. Loss of cattle in transit from Australia, 45,979–85, 46,066. Number of sheep and cattle, 46,137; of squatters, 46,132. Price at which Australian meat can be exported, 45,894–900; of English and Australian meat compared, 45,888–93, 45,920–43; of meat in America, 46,025–9. Process of thawing frozen meat, 46,035–40. Production of cattle and sheep in Australia, 45,986–92. Settlement laws in Queensland, 46,098. Stock-raising, 45,876–87. Sugar industry, 46,146. Wheat-growing in Australia, 45,944–64, 46,074–5.

Statement of total amount of income tax as paid by farmers in England and Scotland respectively (Schedule B.) - - - 593

XL. An account showing the gross assessment on lands under Schedule B. in the years 1873, 1880, 1889, and 1894 - - - - 594

XLI. Repayments of income tax in the last five years under Schedules A. and B. - - 595

XLII. Return showing the names of all parishes which stand charged with land tax at the rate of 4*s.* in the £, and approximately the rates which would be chargeable if the properties were assessed on the full annual value thereof as assessed under Schedule A. of the Property and Income Tax Acts - - - - 595

APPENDIX I.

Appendix A. I.

(Handed in by Mr. W. H. Lander, Question 33,288.)

REPORT of the JOINT COMMITTEE of the COUNTY COUNCIL and CHAMBER OF AGRICULTURE of the County of SALOP appointed to consider the condition of AGRICULTURE in the COUNTY and the causes of AGRICULTURAL DEPRESSION.

1. It will be remembered that the Committee in their report, dated the 13th January last, requested the Council to authorise them to prepare a list of questions, and to print and forward same to all the Farmers' Clubs and Agricultural Societies, &c. in the county with the request that they obtain answers thereto from reliable sources, and forward them to the Committee for consideration. The Council having acceded to this request, the Committee forthwith met, and after going very carefully and exhaustively into the matter, drafted a list of questions, copies of which were sent not only to Farmers' Clubs and Agricultural Societies in the County, but to a great number of private individuals.

In all nearly 300 copies of the list of questions were sent out, and the Committee, after having a tabulated statement of the replies received prepared at a cost of five guineas, have held several meetings for the purpose of considering them, and with the view of presenting them to the Council as clearly and concisely as possible, have prepared a summary or résumé of them, and this they now lay before the Council for consideration.

2. For the sake of convenience the Committee have divided the county into three divisions, viz.:—

(*a.*) The northern part of the county comprising Oswestry, Ellesmere, Whitchurch, Wem, and Market Drayton,

(*b.*) The South Western portion of the county comprising Chirbury, Ratlinghope, The Hill part of Church Stretton, and the country west and south of the Longmynd.

(*c.*) The Central and South Eastern portion of the county comprising the remainder of the county.

QUESTIONS.	SUMMARY OF REPLIES.
1. What branch of farming is principally carried on?	1. In the Northern Division, dairying, pasturing, and horse breeding seems to be largely carried on. In the South-Western Division the rearing and breeding of sheep and Hereford cattle and horse breeding prevails, and in the Hill Country comprised in this Division there are a considerable number of sheep walks. In the Central and South-Eastern Division it consists chiefly of stock feeding, with turnip and barley growing, also sheep and horse breeding.
2. What is the proportion of pasture and arable?	2. In the Northern Division the proportion is as follows:—One-third pasture and two-thirds arable; in the South-Western Division, the proportions in the less elevated districts are about equal: but in the Hill Country in this Division the proportion is about one-eighth arable and seven-eighths pasture. In the Central and South-Eastern Divisions the proportions of pasture and arable are about equal, with perhaps a slight preponderance of arable.
3. What is the average size of the farms?	3. In the Northern Division the average size of the farms is from 150 to 200 acres, the largest being about 500 acres, and the lowest about 100 acres. In the South-Western Division the average size is from 200 to 250 acres, the largest being about 1,000 acres and the smallest about 120 acres. In the Central and South-Eastern Division the average size is about 200 acres, the largest being about 500 acres, and the smallest about 80 acres. In this Division the sheep walk farms run from 400 to 1,000 acres.
4. Are there many small holdings, and their average size?	4. The county as a whole seems to be fairly well supplied with small holdings ranging from 1 to 20 acres and upwards.
5 (*a.*) What is the average rent on the best farms in the district?	5 (*a.*) Throughout the county good mixed farms average from 26*s.* to 35*s.* per acre, tithe included, but in the Hill Country the maximum rent of this class of farm appears to be about 20*s.* per acre.
(*b.*) How do these rents compare with 15 years ago?	(*b*). In the Northern Division the rents of the farms in the dairy districts are not much lower than they were 15 years ago, but in the other districts in this Division they are at least from 10 to 15 per cent. lower. In the South-Western Division the reduction appears to range from 10 to 20 per cent. In the Central and South-Eastern Division the reduction in a great many cases is very considerable. In the Bridgnorth District, which seems to have suffered most, ranging from 10 to 40 per cent.

Appendix A. I.

Questions.	Summary of Replies.
(*c.*) Are many tenants receiving temporary reductions, and to what extent?	(*c.*) Throughout the county a considerable number of temporary reductions of rent, varying from 5 to 20 per cent., have been allowed.
6. How are the farms equipped as to buildings, &c.?	6. Throughout the county the replies to this question may be summed up in the expression "Fairly well." The necessity for Dutch barns and covered yards is, however, very generally insisted on.
7. What is the general system of land tenure? Are leases common?	7. There are very few leases in the county, most of the farms being held on a yearly tenancy.
8. How is the produce generally disposed of?	8. In the rural districts cattle and sheep are sold at the large fairs and auctions. Grain (chiefly barley) is sold at Shrewsbury, Ludlow, Newport, Wellington, and the other markets. Cheese is sold to travelling dealers, and at places such as Whitchurch where cheese fairs are held.
9. Is "petite culture" much entered into?	9. In the proximity of the towns and the Black Country "petite culture" is practised to some extent, but this is not the case, speaking generally, in the other parts of the county, where very little attention is paid to the subject, and especially is this so with regard to the cultivation of fruit.
10. How does the question of railway and canal rates and charges affect your district?	10. In nearly every instance the answer to this question consists of the complaint that the railway and canal rates and charges are excessive, and in many cases complaints are made of the preferential terms granted by the railway companies for long distances and foreign traffic.
11. What is the demand for farms?	11. From all parts of the county the reply to this question is that there is a very good demand for the best class of farms, but very little demand indeed for farms of an inferior character. And in every instance it is insisted upon that the farms shall be well equipped with buildings, &c.
12. Are there any farms unoccupied, or many in owner's hands?	12. It would appear that there are very few farms unoccupied or in owner's hands. In some instances a landowner has a "run out" farm on hand, &c., on which he has to lose some years' rent in order to place it in a fair state of cultivation.
13. Is labour plentiful, and how are wages compared with 15 years ago?	13. Throughout the county regular labourers are fairly plentiful. Wages have increased about 2*s.* or 3*s.* per week. Complaints as to the quality of the workers and the quantity of work done are very frequent. Occasional labourers are in many districts scarce, and of an inferior character.
14. What class of farmers and what system of farming have withstood the depression best?	14. We quote one reply received to this question as being typical of the whole, viz.:—"Hardworking, "energetic men with sufficient money to work the "farm." Dairy farms and graziers appear to have done the best.
15. What is the general standard of farming and state of farms at the present time?	15. The standard of farming appears to be moderately good, but the farms do not seem to be in quite so good a condition as they were a few years back, the farmers not having sufficient capital to employ adequate labour, &c.
16. Is technical education taken advantage of, if so to what extent?	16. From the replies received it would appear that technical instruction has not been appreciated or taken advantage of by the farmers to any great extent.
17. Does the "Truck Amendment Act," 1887, affect farmers in your district?	17. This Act does not appear to have affected the farmers in any part of the county to any extent.
18 (*a*). Is there over-preservation of game to the detriment of farmers?	18 (*a*.) The almost unanimous reply to this question is "No," the only exceptions being two from Market Drayton and three from Newport; but these replies do not bear any signature.
(*b.*) How does the "Ground Game Act" operate?	(*b.*) The provisions of the Act appear to be very widely appreciated by the farmers.
19. How do the brewing licences operate?	19. There seems to be a very general consensus of opinion that brewing licences operate very unfairly, and they are objected to on the ground that the house duty on which they are based is extremely high. An annual licence is recommended in lieu of the present system.
20. What is the opinion as to the following:— (*a.*) Incidence of taxation?	20 (*a*). The consensus of opinion throughout the county is that personal property should be made liable to local rates in order to relieve the land. The following are a few replies to this question: "That all incomes from whatever source should be "taxed." "That taxation of farms under Schedule B. "is oppressive." "That there should be a local in- "come-tax for local rates." "That land tax should "be abolished or allocated to the reduction of local "rates." "That land tax is most unjust, and is "virtually a double income-tax."

Questions.	Summary of Replies.
(*b*.) Application of "Merchandise Marks Act" to foreign meat and other produce.	(*b*.) The reply to this question is practically unanimous throughout the country, and is to the effect that the "Merchandise Marks Act" should be at once extended to foreign meat and other produce and strictly enforced.
(*c*.) "Agricultual Holdings Act," 1888, and land tenure generally.	(*c*). Public opinion seems to be distinctly unfavourable to the Agricultural Holdings Act, which it is urged requires very considerable amendment and extension. Several farmers advocate the formation of land courts, boards of arbitration, and fixity of tenure.
(*d*.) Division of rates.	(*d*). On this matter opinion seems to be equally divided in the county. On the one hand it is urged that the rates should be equally divided between landlord and tenant; on the other hand, that the division would make no practical difference one way or the other.
(*e*.) Pure Beer Bill.	(*e*). An universal desire for a Pure Beer Bill is expressed.
(*f*.) Foreign imports.	(*f*). The replies to this question are almost entirely in favour of the taxation of foreign imports in some form or other.
(*g*.) Bimetallism.	(*g*). Very few replies have been received to this question, but such as were received were generally in favour of bimetallism.

The remedies suggested in the replies received, as appears to a great extent in the foregoing, include the following, viz.:—

(1.) A reduction of rent.
(2.) The taxation of foreign imports in seme form or other, especially the manufactured article.
(3.) The lowering of railway rates and charges.
(4.) The institution of light railways in the rural districts.
(5.) The amendment and extension of the Agricultural Holdings Act.
(6.) Security of tenure and the formation of land courts and boards of arbitration.
(7.) The division of rates.
(8.) The revision and readjustment of the incidence of taxation in order to relieve the land from unfair burdens, both local and imperial.
(9.) The application of the Merchandise Marks Act to foreign produce.
(10.) Co-operation in the sale and distribution of produce in order to bring the producer and consumer nearer together.
(11.) Bimetallism.
(12.) The passing of a Pure Beer Bill, in order to stimulate the brewing of beer from barley, malt and hops.
(13.) A bonus on the growth of wheat.
(14.) An alteration in the Tithe Commutation Act, 1836, so that the tithe might be based on the rateable value of the land instead of on the gross produce.

The Committee are of opinion that the information contained in the foregoing, inasmuch as it has been derived from the most reliable sources—*i.e.*, landowners, tenant farmers, land agents, and others—is extremely valuable, and might be made of very great utility. The Committee recommend every one interested in the question of agricultural depression—a subject of the most vital importance to the country—to give the matter their most careful consideration, as they are convinced that a healthy public opinion will be formed thereby. There can be no doubt, notwithstanding the disastrous effect which the existing depression in agriculture has had upon the country at large, that very little real consideration has been given to the subject, and if it should prove that the Council, by joining with the Chamber of Agriculture in the appointment of a committee, and that the committee, by the course they have adopted in carrying out the work entrusted to them, have been able to awaken public interest in the matter, there can be no doubt that considerable benefit will ensue therefrom.

W. H. Lander,
Chairman.

Shirehall, Shrewsbury,
30th June 1894.

Appendix A. II.

APPENDIX II.

EXPLANATION OF ACCOUNTS.

(*Handed in by Mr. Westley Richards.* (*See Question* 33,735.)

The firs account shown is headed "Farm Produce supplied to House and Stables," and in this is given particulars of such produce supplied; also work done by farm hands and horses for the house. The total or totals are brought into the "Ledger Account."

The next account is an "Abstract" or Ledger Account, the items in which are posted from a cash book, under separate headings. This is a very useful account, as the totals can easily be ascertained and copied into the Balance Sheet.

The Balance Sheet consists of the totals, both of payments and receipts, brought forward from the "Ledger Account," with the addition only of a complete valuation at the commencement and also at the end of the year. To start with, the *Valuation* on May 1st is entered on the "Payments" side. This includes:—

1st. Value of tenant-right. The method of dealing with the unexhausted manurial value of cake consumed has been to take the amount of tenant-right given by the Agricultural Holdings Act to the off-going tenant, which is one-half of the cake *consumed on the farm* during the previous year. In this district it is the custom of valuers to give a quarter for two years, which amounts to the same thing. I, therefore, take this sum, which is a true figure for which vouchers exist, and enter it on the "Payments" side of the Balance Sheet.

2nd. Value of all cake, fodder, &c. in hand at date.

3rd. Value of live stock in hand. This I enter at cost price, giving the weight and cost per live stone.

(It may be noticed that I leave horses, carts, and implements out of my valuation. The reason is that I have the same number each year, and I take their value to be unaltered; therefore it makes no difference to the Balance Sheet. A farmer whose number of horses, &c. varies each year should of course include them in his valuation.)

The other figures on the "Payments" side are all copied from the "Ledger Account."

On the "Receipts" side is entered the totals of all sales of stock, and all monies *received* on behalf of the farm from whatever source as shown in the "Ledger Account." At the end is entered the valuation of tenant-right, feeding stuffs, live stock, &c. which is to be carried forward to the commencement of the following year, to be ascertained in precisely the same way as the previous valuation.

APPENDIX V.

Appendix A. V.

(*Handed in by Mr. R. Stratton* (*see Question* 34,893).)

MONMOUTHSHIRE CHAMBER OF AGRICULTURE.

PROPOSED SCALE of COMPENSATION for unexhausted IMPROVEMENTS, approved by the CHAMBER, February 2nd, 1884.

1. Purchased manures applied to grass, roots, or green crops consumed on the farm:—

For undissolved bones - ¾ for last year.
" " - ½ for second year.
" " - ¼ for third year.
Dissolved bones - - } ⅔ for last year.
Superphosphate - - } ⅓ for second year.
Other phosphatic manures - }
Nitrate of soda, soot, sulphate of ammonia and other nitrogenous manures - - } ½ for the last year, nothing beyond.
Stable manure - - ⅔ for last year.
" - - ½ for second year.
" - - ¼ for third year.

2. Manures applied to arable land, or grass off which a crop has been taken:—

Same scale as above.

Thus—In the case of a crop taken off, after an application of undissolved bones, of ¼ the value of bones would be held to be exhausted, and in the case of dissolved bones and phosphates ⅓ would be held to be exhausted.

In the case of nitrates the *whole* value of manure would be held to be exhausted.

3. The application of lime to arable or pasture:—

Compensation to be on the five years' principle; that is to say, 1–5th is held to be annually exhausted.

4. Draining:—

Where the tenant finds labour and the landlord tiles, compensation on the ten years' principle; when the tenant finds both, compensation on the twenty years' principle.

In all the above cases the cost of carriage and application to the land is to be added to the cost of the manure, lime, and cost of draining.

5. Compensation for feeding stuffs not produced on the holding:—

The manurial value of feeding stuffs shall be based as follows:

Linseed, cotton, and rape cakes, malt dust, beans, peas, and linseed, *one-third* of the cost price.

All other feeding stuff, including hay and straw, *one-fourth* their cost price.

The manurial value of the purchased feeding stuffs consumed on the farm having thus been ascertained the out-going tenant would be entitled to the full manurial value of such feeding stuffs as had not produced a crop, or had not been applied to his away-going crop, half the manurial value for feeding applied where away-going crop is taken, and to *two-thirds* where consumed on grass in last year of tenancy, and to *one-half* of the manurial value of such feeding stuffs consumed in the last year but one of the tenancy. In Candlemas takings the year to terminate May 1st.

Vouchers in all cases to be produced.

6. In reduction of the above, the out-going tenant shall pay to the landlord the manurial value of all hay, straw, and roots sold off the holding in the last two years of the tenancy on the following scale:—

	£	s.	d.	
Hay, clover, or seeds - -	1	0	0	per ton.
Straw - - - -	0	10	0	"
Roots - - - -	0	4	0	"

The expenditure in feeding stuffs and manures in the last year not to exceed the average of the two preceding years.

7. Compensation for laying down pasture:—

If laid within four years of the termination of tenancy the remuneration should be half the cost of seeding, plus the *net* value of a corn crop, such as the land might be fairly estimated to produce.

If the land had been laid more than four years, the remuneration should be the *net of a corn crop and a half*, that is, what it would be estimated to leave after paying every expense of growing, harvesting, and marketing.

The whole of the above are based on the assumption that in all cases the work is well done, that the manures and feeding stuffs are the value represented, and that waste is avoided as much as possible.

R. STRATTON, The Duffryn, Newport,
C. D. PHILLIPS, Newport,
} Hon. Secs.

Appendix A. VI.

APPENDIX VI.

Letter from Mr. T. Duckham supplementary to his Evidence (page 99).

The Right Hon. J. G. Shaw Lefevre and Members of the Royal Commission on Agriculture.

The Ryelands, Hereford,
January 8th, 1895.

My Lords and Gentlemen,

I feel constrained to ask the favour of your allowing me to supplement the evidence I had the honour of giving before you upon this great and serious national question.

The effects and causes of depression are beyond any question the driving of capital from the soil, because foreign competition has rendered its cultivation unremunerative to the occupier who finds himself utterly unequal to compete with the produce of foreign countries which is brought to our shores at a mere nominal freight after being grown on virgin soils, almost rent and tax free.

The only substantial relief that I feel can be given to meet the deplorable state in which the owners and occupiers of real property are now placed, is to equalise the taxation of the country. It has been done for the death duties, and many grants have been made for relieving real property of the heavy burdens which time after time have been placed upon it; but they are mere nibblings at a great and serious national question—a question that must be dealt with in a comprehensive manner. The extension of small holdings will tend to produce that result.

The non-rating of mines, woods, and plantations were subjects of complaint, and formed one of the early subjects dealt with by the Central and Associated Chambers of Agriculture. After much pressure it was dealt with, and an Act passed in 1874; but it was so ambiguously worded that appeals were made against the rating that had long been in force. Up to that time the rates were levied upon saleable underwood only, the heavy timber not being taken into account, and land formerly under cultivation, when planted with larch or other forest trees, was not rateable. In our parish, in this, the Hereford Union, there are 1,258 acres of wood; upon appeal the rate was reduced from 954*l.* to 450*l.*, and in another parish there are 614 acres of wood which was reduced from 279*l.* to 185*l.*

An instance of plantations made in another Union on land rated at 1*l.* per acre was reduced after being planted to 3*s.* per acre. Now when it is considered that there are 39,106 acres of woods and 710 acres of plantations in the county, it can be no matter for surprise that much dissatisfaction has been expressed at the wrong inflicted. It was urged that all land should be rated at not less than the surrounding lands of a similar character and quality, whether encumbered with timber or not. The damage done to the roads by the removal of the timber for which no rates have been paid during its growth, but, on the contrary, the rateable value of the land upon which it has grown has been greatly reduced during its growth, forms a subject of great complaint.

In my evidence I submitted the average cost of the maintenance of the main roads of Herefordshire for 10 years previous to the Local Government Act coming into operation, and showed that in 1889 it was 14,926*l.*, and that their cost last year was 19,049*l.*, being an increase of 4,123*l.* Against that increase there was to be taken into account an increased mileage of 26 miles 5 furlongs at 40*l.* per mile, thus reducing the increased cost to 3,058*l.*

I have now obtained the financial returns from the highway boards for the year ending 25th March 1894, and herewith I beg to submit a comparative statement for those and the district roads for the years 1889–90, that being the first year in which the main roads came under the control of the County Council, and for the year 1893–94, the cost in each case being exclusive of salaries and miscellaneous expenses. A considerable portion of the salaries is borne by the County Council, the miscellaneous expenses falling exclusively upon the district ratepayers.

Comparative Statement.

Highway District.	1890. Main Roads.	1890. District Roads.	1894. Main Roads.	1894. District Roads.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Bredwardine	712 19 8	522 17 0	819 15 3	608 2 0
Bromyard -	2,402 13 9	2,219 11 9	2,412 0 5	2,014 8 11
Dore - -	1,307 17 10	2,275 11 11	1,575 4 7	2,505 17 7
Hereford -	2,401 12 7	2,382 15 5	2,862 12 3	2,687 1 11
Kington -	854 12 0	1,062 5 8	909 10 11	1,044 6 10
Ledbury -	2,001 0 6	2,187 9 7	2,813 2 0	2,474 15 1
Leominster -	1,153 14 8	2,019 5 2	1,681 10 1	2,225 12 2
Ross - -	2,621 17 2	2,970 9 5	3,335 17 5	3,424 17 0
Weobley -	1,130 19 11	1,693 5 8	1,469 6 4	2,055 8 1
Wigmore -	1,148 14 4	1,011 7 4	1,171 2 7	1,100 0 8
Totals -	15,736 2 5	18,344 18 11	19,050 1 10	20,140 10 3

During the period from 1890 to 1894 there were 17½ miles of district roads declared main roads, which at an average cost of 40*l.* per mile increased the total cost of main roads 700*l.*, and decreased the total cost of district roads to that amount. When that alteration is taken into account the increased cost of the maintenance of the two classes of roads shows a close approximation and confirms my statement of the increase of taxation. Yet the relief of the burden of taxation from the Exchequer, contributions which should be participated in by all ratepayers, as all contribute to the National Exchequer, and all pay alike to the county rate, differs very widely. In that respect it strikingly contrasts with the 61 urban counties. In those counties the relief obtained is participated in by all the ratepayers in an equitable manner. But counties proper being divided into several smaller areas of unequal sizes, and the relief obtained being localised, the ratepayers in one district obtain a relief far in excess of those in another, whilst those who obtain the least relief have to bear the heaviest burden for the maintenance of the district roads at the same time that they bear an equal share for the maintenance of the main roads with their more fortunately-situated neighbours. The remedy for this injustice is to be found in placing the whole of the roads on the county rate, as is now done in Ireland and in Buckinghamshire.

Seeing the injustice of the present system in 1890, when Chairman of the Roads and Bridges Committee, at considerable labour I prepared a comparative statement, setting forth the mileage in each district, and the cost of maintenance of each kind of road, the salaries paid, the incidental expenses, and total cost, together with the sources of payment for this county, which I now beg to submit to your notice.

It will be seen that there is a great difference in the proportion of mileage in the different districts; that the salaries paid for main roads vary from 1*l.* 15*s.* 1*d.* for Leominster, to 3*l.* 9*s.* 3½*d.* for Wigmore; for district roads from 11*s.* 1½*d.* for Ross, to 1*l.* 2*s.* 4½*d.* for Bramyard. That in some districts the payment from the County Council for main roads is considerably more than half the cost of the whole of the roads; in other districts it is little more than a third.

I have the honour to be,
My Lords and Gentlemen,
Your obedient Servant,
T. Duckham.

HEREFORDSHIRE COUNTY COUNCIL.

APPENDIX A. VII. (*a*).

MEMORANDUM ON THE DEVELOPMENT OF AGRICULTURAL EDUCATION IN GREAT BRITAIN BETWEEN 1888 and 1894.

(*Handed in by Mr. T. H. Elliott. See Question* 38,187.)

At the commencement of the year 1888, when the Departmental Commission on Agricultural and Dairy Schools made their final report, the only institutions in Great Britain known to be providing general agricultural education were the Royal Agricultural College, Cirencester; the Agricultural College, Downton; the Colonial Training College, Hollesley Bay; and the Agricultural School, Aspatria. A Chair of Agriculture existed at the University of Edinburgh, and there was a lectureship, on a very small scale, under the Fordyce Trust in connexion with the University of Aberdeen.

A Dairy School, where butter and cheesemaking were practically taught, had been in existence for a short time in Cheshire, and certain associations in the south-west of Scotland were providing peripatetic instruction in cheesemaking; while classes in agricultural chemistry, of a more or less elementary character, were held at the Glasgow Technical College. A few middle-class schools sent up lads to compete for the Royal Agricultural Society's junior scholarship, and one solitary individual was engaged in giving lectures to certain farmers' clubs in the north of England.

In addition to the experimental work of the two leading agricultural societies in England and Scotland, at Woburn and Pumpherston, a few agricultural associations in England and a local association in Aberdeenshire were conducting stations of field experiment or demonstration.

The Science and Art Department had, since 1875, made grants in respect of the subject termed "Principles of Agriculture," and, since 1879, had appointed a professor thereof, at the (then) Normal School of Science at South Kensington, where one short and one long course was held every year, the former lasting three weeks in summer and the latter for about four months in winter.

The extreme paucity of the arrangements for the provision of agricultural education which the foregoing state of affairs disclosed, and the fact that the institutions engaged in giving higher training were mostly of a semi-private character, left the Agricultural Department of the Privy Council a comparatively free hand in the administration of a grant of 5,000*l.*, which was placed at its disposal after the report of Sir R. Paget's Departmental Commission in 1888–89.

1888–89.

The sum of 2,930*l.* was expended by the Agricultural Department during the financial year 1888–89 under the following heads:—

England and Wales.

	£
Dairy schools and classes (fixed and travelling)	650
Agricultural lectures (courses)	140
Agricultural schools	325
Collegiate centre (Bangor)	200
Field experiments	315
	£1,630

Scotland.

	£
Dairy schools and classes	375
Agricultural classes at universities and colleges	850
Field experiments	75
	£1,300

The principal effect of the grant during the year 1888–89 was to bring into existence in England and Wales two fixed dairy schools in addition to the one previously mentioned in Chester, and to establish migratory dairy classes in connexion with two societies. Further, to enable an agricultural department to be added to an already existing institution of a high-class scientific character in the shape of the University College at Bangor.

In Scotland a fixed dairy school was formed at Kilmarnock, the bulk of the other Scotch grants for the year being allocated to existing institutions for work not initiated during the year.

1889–90.

In 1889–90 the Board of Agriculture, which then took over the work of the Agricultural Department of the Privy Council, distributed 4,585*l.* in grants in Great Britain, as follows:—

England and Wales.

	£
Dairy schools and classes	1,300
Agricultural schools	425
Collegiate centre (Bangor)	400
Field experiments	485
	£2,610

Scotland.

	£
Dairy schools and classes	500
Agricultural classes at universities and colleges	1,200
Forestry lectures	100
Field experiments	175
	£1,975

There was during 1889–90 nothing of note to chronicle as regards the actual formation of any new institution, although a project was on foot for the formation of an agricultural department to the Yorkshire College.

1890–91.

The policy hitherto pursued as to the distribution of grants had been of a tentative character, and in the year under consideration no change was made in it, owing largely to the fact that the passing of the Local Taxation (Custom and Excise) Act, 1890, had called into action a new series of agencies independently engaged in developing agricultural education, and, for the most part, on lines distinct from the work of the Board.

Grants amounting to 4,840*l.* were made during the year as follows:—

England and Wales.

	£
Dairy schools and classes	1,270
Agricultural schools	500
Collegiate centres (2)	550
Field experiments	510
	£2,830

Scotland.

	£
Dairy schools and classes	535
Agricultural classes at universities and colleges	1,050
Forestry lectures	100
Field experiments	325
	£2,010

It will be noted that a second university college, viz., the Yorkshire College at Leeds, which had recently an agricultural department, received aid during this year. In the annual report of the Board it was remarked that "a separate class of institutions must be "recognised. In these the grant awarded by the "Board of Agriculture, instead of being allotted to a "specific branch of training, is applied towards the "general outlay of a provincial centre providing "throughout a large district all forms of agricultural "teaching, including the training of teachers,"—*i.e.*, elementary school teachers who desire to have some instruction in agricultural subjects with a view of conducting classes and earning grants—"local lectures,

Appendix A. VII. (*a*).

"dairy schools, and experimental fields of demonstration."

This concentration of work was believed to possess certain advantages, both economic and administrative, as compared with the isolated work of small local bodies, or even as compared with schemes limited to the area of particular counties.

In this connexion the following passages may be quoted from the report made by one of the Board's inspectors as to the Bangor scheme, which has formed the type on which other centres have since been organised:—

"Speaking generally, it may be said that sufficient "experience has been gained to feel assured that the "plan of concentration works well, and is one which "is capable of imitation. Under no present existing "system is such a complete variety of subjects placed "at the immediate disposal of all classes connected "with farming at such a comparatively small extra cost.

"The quality of the instruction thus offered to "farmers is of an unusually high nature, since the "initiative is taken by a body of specialists skilled in "almost every branch of science.

"Moreover, under this system, the different classes "of instruction, at present carried on in various other "parts of the country in an unsystematised and disconnected manner, are here made mutually dependent, "while bearing, severally and collectively, direct "relationship to the college.

"The dairy schools may be classed as the representatives of the purely technical type of instruction "and are fed by the dairy lectures. In time these "schools may develop themselves and become more of "the nature of farm schools, in their turn fed by the "outside lectures on agriculture and the sciences allied "thereto. Again, the farm school may add horticulture to its general technical curriculum, and also "forestry.

"Furthermore, experimental stations for demonstration already exist, and these often serve the purpose "of texts for lectures to farmers and others; it is "possible to develop these stations still more, and to "connect them more closely with the technical school.

"Eventually it might be possible to have in each "district the technical school, fully equipped at all "points, existing as already said at the farmer's own "door, capable of acting as a continual source of information and instruction for him, his sons, and his "servants, and also for the local schoolmasters, but "dependent for its origin and its maintenance on a "body consisting of men whose lives are devoted to "the pursuit of education in its most scientific and its "highest aspects.

"It cannot be ignored that the key to the whole of "this Bangor system is the Board of Agriculture grant. "By means of it the college authorities can approach "landowners and county councils, and prove to them "that they have ample security that the money they "give the college will be well spent, because the whole "system has Government approval, and is under "Government inspection; without that the system "could not be the success which it is.

"It has been shown, however, that a most complete "system of agricultural education can be organised by "this college; one which will not only fulfil its own "proper duties, but form a type on the lines of which "it may be feasible to organise systematic agricultural "education throughout the Kingdom.

"It certainly has this merit, apart from the intrinsic "value of the instruction given, that under it local "effort is called out to its utmost extent, but is at "the same time systematised, while the Imperial "authority is called upon for the minimum amount of "funds which can be demanded by any organised "system of agricultural education."

1891–92.

In 1891–92, the system of aiding institutions of a collegiate character was pursued still further.

From information which the Board had received it was apparent that county councils were mostly inclined to expend their funds on instruction of the type of local lectures, demonstrations, dairy teaching, and special classes, some of it conducted as "extension" work, resting on, and drawing its scientific aid from, the pivot of a fully equipped agricultural department of a provincial college.

In consequence of this, and in view of the advantages of limiting, wherever practicable, the duplication of outlay from public funds and of machinery for agricultural instruction, inseparable from the existence of the varied authorities and bodies, local and central, which have at different dates and under different and independent conditions accepted responsibility for agricultural teaching, it became the aim of the Board to allot its larger grants to institutions whose sphere and operation partook more or less of a central character. Although it has not been in all instances feasible to discontinue grants previously made, purely local institutions have been warned of the necessity of adapting their future arrangements to the newer system, whereby, except in special instances, the county authorities are now to be regarded as the holders of the educational funds proper for such work, which has been provided under the Local Taxation (Customs and Excise) Act of 1890.

In this year (1891–92) the Parliamentary grant was increased from 5,000*l.* to 8,000*l.* The amount allotted in grants reached a total of 6,705*l.*, and was expended as follows:—

England and Wales.

	£
Dairy schools and classes	1,300
Agricultural schools	400
Collegiate centres (4)	2,000
Field experiments	310
	£4,010

Scotland.

	£
Dairy schools and classes	635
Agricultural classes at universities and colleges	735
Forestry lectures	100
Collegiate centre	400
Field experiments	325
	£2,195

Special experiments in connexion with potato disease and research into matters connected with cheese-making absorbed sums amounting to 400*l.*

The new collegiate centres in England and Wales were the Durham College of Science at Newcastle and the University College at Aberystwyth, while the Glasgow Technical College, which had hitherto been reckoned as only conducting classes in agriculture, had now been so far organised as regards work for surrounding local authorities that it could be recognised in some respects as a collegiate centre.

1892–93.

The amount expended in grants by the Board in 1892–93 reached a total of 7,425*l.*, and was expended as follows:—

England and Wales.

	£
Dairy schools	850
Agricultural schools	350
Collegiate centres (5)	3,000
Field experiments	300
	£4,500

Scotland.

	£
Dairy schools	400
Agricultural classes at universities, &c.	700
Forestry lectures	100
Collegiate centre (1)	600
Field experiments	375
	£2,175

Special classes:—

	£
Potato disease experiments and cheese research	350
Classes for instruction of dairy teachers	250
Class for instruction of working foresters and gardeners	150
	£750

The new collegiate centre in this year was the University of Cambridge, which, although not at present undertaking all the duties of a "centre," as ordinarily understood, nevertheless occupied such a position as to render it impossible to classify the work under any other head.

As regards the collegiate centre system, it had become increasingly apparent that in the direction of

inspection of the agricultural work of county councils, where such councils desire to place their work under the advice of the Board, and in the employment of the grants of the central authority in the more complete equipment of provincial centres of agricultural instruction, would be found the most useful application of the direct Parliamentary grants for agricultural teaching. By the aid of such institutions the work of county councils, in whose hands ample funds are available, has been materially facilitated, the colleges already established offering exceptional opportunities for the training of teachers in science subjects bearing on the practice of agriculture, and for the provision of higher instruction for students coming from the local and secondary schools aided by county scholarships or otherwise. These collegiate institutions have also proved valuable agencies for advising county councils on technical educational questions, and convenient centres of organisation for the effective and systematic conduct of extension work, such as could rarely be provided with equal economy in the limited areas of single counties.

1893–94.

In 1893–94 the Board stated that they had been "confirmed by further experience in their estimate of "the value of establishing fully-equipped agricultural "departments in collegiate institutions capable of "aiding the work of distinct groups of local authorities "charged with the provision of technical education. "By this means at the several centres selected, a "sufficient and well-qualified staff of instructors is "provided for thoroughly training students who desire "to pursue a consecutive study of the sciences "governing agricultural practice, while the same "educational machinery is available for utilising to "the best advantage the local expenditure of the con-"siderable sums which are now being devoted by "county councils, on a more general and extended "scale, to more elementary forms of agricultural "instruction."

The grants in this year amounted to 7,450*l.*, of which 350*l.* was expended in the reproduction of the records of the Rothamsted experiments.

The grants were allocated as follows:—

England and Wales.

	£
Dairy schools	600
Collegiate centres (7)	3,850
Field experiments	150
	£4,600

Scotland.

	£
Dairy schools	250
Agricultural classes at universities	650
Forestry lectures	100
Collegiate centres	600
Field experiments	325
	£1,925

Special classes:—

	£
Cheese and cider making, research	250
Class for dairy teachers	175
Class for working foresters	150
	£575

The new centres in England and Wales receiving grants were the University College, Nottingham, and the University Extension College, Reading, where agricultural departments were being organised.

1894–95.

During the current financial year, the precise amount which will be expended on grants has not yet been definitely decided, but there is no probability that it will differ very materially from the past year, although the amount allocated to collegiate centres must tend in the direction of increase. It is estimated that these institutions will absorb some 5,500*l.* out of the total amount available for grants.

In view of the extent to which the grants made by the Board have been concentrated upon the collegiate centres, it may be well to state in general terms what is expected of these institutions, although it is well understood that at the present time the ideal cannot be fully attained. At the outset, it cannot be too plainly insisted upon that agriculture is an art and not a science; that, logically speaking, there are no principles of *agriculture*, and no simple concrete science bearing that name. The principles involved in a correct understanding of the practice are those of a vast number of definite sciences, and it is primarily in the knowledge acquired by the study of these, whether in their elementary and more general form, or in their deeper aspects, according to the needs not only of the individual, but of the class to which he belongs; and, secondarily, in the mental growth which such study of necessity involves, that we find the complement to the keen observation of, and appreciation for, those minute and varying details of practice which have always distinguished the English farmer, all of which, when made mutually dependent as regards the teaching, go to form what is really comprised under the wide term "agricultural education." It was this view of the many sided character of the subject which led the Board to appreciate the assistance which institutions of the character of university colleges, having specialists skilled in almost every branch of science, might render to the cause of agricultural education, and hence the policy of the Board has been, wherever feasible, to throw on these centres the work of organising the subject throughout the areas over which they exerted influence. The work itself may, broadly speaking, be said to consist of the following heads:—

Appendix A. VII. (*a*).

(1.) The technical training of those teachers, mostly belonging to elementary schools, who are capable of giving instruction to lads in evening schools and classes.

(2.) The provision of experts for giving instruction in particular branches of practice, such as dairying, horticulture, poultry-keeping, and the like, and in the proper and necessary supervision of the instruction which such experts give.

(3.) The provision of instruction to actual farmers in those matters of a semi-scientific semi-practical character, which are now usually classified under the head of extension lectures, and which comprise such subjects as the economic use of artificial fertilizers and feeding stuffs; the injurious insects, and other pests affecting farm crops, and methods of their prevention or cure; the hygiene of the farm and the treatment of stock in health or disease.

(4.) The conduct of stations of field demonstration and experiment, whereby farmers are shown on their own farms the action of different manures, and are taught, by means of lectures, how to discriminate between them, and to choose and purchase those which are calculated to give the best return to the crops for which they are intended.

(5.) The provision at the college centre of such courses of scientific instruction as are likely to be of use to the sons of farmers in the district, at a cost within the reach of the class for which they are intended.

(6.) The provision of means for personal intercourse between the head of the agricultural department of the local college and his staff and the farmers in the neighbourhood, so that the college may become *the* place to which the agriculturists of the district will naturally turn for information and assistance in every matter of a scientific character bearing in any way upon their practical work.

(7.) The provision in each locality, for the benefit of the local authorities, of a body of scientific experts whose services may be available, both for instruction and for consultation, at a cost much below that which each council would have to pay if it were to attempt to set up an institution of similar character in its own area.

The foregoing is a broad statement of the proper work of a collegiate centre, but, as previously stated, it must not be supposed that the centres now brought into existence through the action of the Board of Agriculture are able at present to fully carry out all these functions; many of them are, however, in a fair way to do so, and the rest is merely a question of time and of the necessary financial support.

The following is a list of the collegiate institutions at present aided by the Board, with observations as to their respective spheres of work:—

(1.) The Durham College of Science at *Newcastle* is working for Northumberland and Durham, and probably Cumberland. It should also cover Westmorland.

(2.) The Yorkshire College at *Leeds* is working for the three Ridings of Yorkshire.

Appendix A. VII. (*a*).

(3.) The University College at *Nottingham* is working for Nottinghamshire alone, but will shortly be doing work for Derbyshire and Leicestershire, and should include Lincolnshire, Rutland, and Northamptonshire.

(4.) The Cambridge and Counties Agricultural Education Committee at *Cambridge*, though supported financially by surrounding counties, is at present confined to Cambridge itself, but members of the staff do work for the counties round, and when a proper head of the department is appointed there is every reason to believe that Cambridge will act as a centre for all the eastern counties, viz.: Cambridgeshire, the Isle of Ely, Hunts, Beds, Herts, Essex, East and West Suffolk, and Norfolk.

(5.) The University Extension College at *Reading* is at present working for Berkshire, Oxfordshire, and Hampshire, and may ultimately be expected to do the same for Wiltshire, Bucks, and Middlesex, and possibly Dorset, and the Isle of Wight.

In Wales:

(6.) The University College of North Wales at *Bangor* is engaged in working for Anglesey, Carnarvon, Denbigh, Flint, and part of Montgomeryshire.

(7.) The University College of Wales at *Aberystwyth* is engaged in working for Cardigan, Merioneth, part of Montgomeryshire, Radnor, Brecon, Carmarthen, and Pembroke.

In addition to the foregoing, the newly started college at Wye, which will come under the Board's inspection during the year, is acting in much the same capacity for Surrey and Kent as do university colleges in other parts.

It thus appears that the only counties in England and Wales not yet actually or theoretically provided for under the Board's central system, are:—

(*a.*) Lancashire and Cheshire, both of which are well provided for by their respective county councils. Lancashire, with the large funds at its disposal, is really creating for its own area those institutions (including a collegiate centre) which, in other parts, are acting for groups of counties. Cheshire, so far as dairy farming, in which it is mainly interested, is concerned, is doing much the same, though it uses the college at Bangor for the purposes of a complete two years' course for a certain number of pupils.

(*b.*) The group of counties comprising the west Midlands, viz.: Staffordshire, Salop, Warwick, Worcester, Hereford, and Gloucester. These might well be served by Mason College, Birmingham.

(*c.*) Glamorgan and Monmouth, which might ultimately be served by the Cardiff College;

(*d.*) Somerset, Devon, and Cornwall, which might be served by the new Extension College at Exeter were it to form an agricultural department.

(*e.*) Sussex.

In Scotland the centre system is not nearly so well advanced as in England and Wales, and it is not yet certain if it will answer for that country so well as in England. At present the Glasgow College does work for some of the south-western counties, but the work is not very clearly defined, nor are the relations between the counties and the college so close as they are as a rule in England and Wales. In Edinburgh, under very influential auspices, a scheme for the organisation of a fully-equipped agriculture centre in connexion with the university, which should consolidate several permanent teaching agencies, is being gradually elaborated, and a beginning in the same direction has been attempted at Aberdeen.

It is clear that if the "centre system" of organised agricultural instruction now set up, and which has made such rapid development, is not to be altogether checked, further funds for its support must be forthcoming, but the amount need not be large since the grant which each centre will require from Imperial sources may, for some years to come, be fairly limited to 1,000*l.* a year, and already three or four centres are getting nearly that amount, viz., 800*l.* a year.

A brief survey of the work which, in a general way, it is known that county councils are doing may be of service to the Commission.

The instruction given may be roughly divided into that which is intended for the young and that intended more for adults. Taking the last class first, the principal subjects in which instruction is given are—(*a.*) *Dairying* (including practical Buttermaking and sometimes Cheesemaking), *Horticulture*, *Poultry-keeping*, *Manual Instruction* (Ploughing, Hedging, Stacking, &c.), all of which may be generally classified as practical instruction in processes of agriculture; (*b.*) Evening lectures in matters relating to farm life and practice; (*c.*) Demonstrations in the open field in matters relating to the economical manuring of land.

As regards the young, the instruction comprises the training of elementary school teachers in technical subjects, and aid given to evening classes in continuation schools and science classes; and also aid given to middle-class schools.

It will thus be seen that the counties have taken up the *actual aiding* of the class of work which the Board originally subsidised prior to the Act of 1890, the supervision of which, and the initiation to which, being, as previously shown, in many instances obtained from the collegiate centres.

It is interesting to note that dairying is taught by 47 out of the 49 county councils in England (the two exceptions being London and Middlesex) and by all 13 in Wales. In Scotland it appears to be taught in about 18 out of 33 administrative counties. This work is ordinarily carried out by means of a "travelling dairy school," where courses, usually of 10 days, are given in the improved methods of buttermaking. Cheesemaking in one or more of its many varieties frequently forms a subject of instruction, and is usually given either at farm houses or at a fixed school. The necessity for these latter schools, where longer courses can be given, is becoming strikingly apparent. Apart from the two schools which the Board have from their commencement supported, viz., the Eastern Counties Dairy Institute and the British Dairy Institute, the Cheese School of the Bath and West of England Society, the funds for the maintenance of which are now derived from the Somerset County Council, and the Dairy School in Cheshire, which the county council took over some years ago, fixed schools have either been formed or are projected by County Councils in Lancashire, Warwickshire, Gloucestershire, Leicestershire, (with Nottinghamshire and Derbyshire), Northumberland with Cumberland, together with a semi-permanent school in Essex. In Wales, too, out of the three fixed schools originally formed by the Bangor College, two have practically been taken over by county councils, and form part of their regular organisation.

The next matter which most engages the attention of English county councils is Horticulture, a very large proportion of the councils giving instruction in connexion with this subject, mostly by means of lectures, and occasionally by demonstrations on allotment or other gardens. Nothing of the kind is, apparently, carried on in either Wales or Scotland.

Other matters of practical interest, such as poultry-keeping, bee-keeping, farriery, &c., form subjects of instruction in many counties; while in a few, manual instruction in processes of agriculture is carried on.

Evening lectures are given in many counties, mostly in connexion with collegiate centres. This class of work seems most popular in Yorkshire and other parts of the north of England.

Demonstrations are conducted in connexion with some 20 counties in England and Wales, almost always by means of a collegiate centre. These and the lectures accompanying them are, we consider, most valuable means of instruction, and should be more largely adopted than is now the case.

The training of elementary school teachers is, or has been, carried out, for their respective counties at all centres aided by the Board, and by some counties apart from centres, the precise form which the training of rural teachers may best take is a subject now engaging attention, although there are signs that for the present the demand for this class of work has in many districts been largely met.

Evening classes of one kind and another are aided by probably every county in England, and the improvement of these agencies of instruction, with a view to make them of still more direct benefit to the farming community, is a matter well deserving consideration.

In this connexion it is to be remarked that the recent Codes of the Education Department have brought into greater prominence the imparting of some forms of agricultural instruction in rural elementary schools, and have given facilities for dairy instruction by properly certificated teachers, while a syllabus revised in consultation with the Board has been suggested for general agricultural instruction in the evening continuation schools.

APPENDIX VIII.

Appendix A. VIII.

(*Handed in by Lord Farrer.* See *Question* 38,296.)

FURNISHED by LOCAL GOVERNMENT BOARD. RETURN of PAUPERISM since 1849.

Mean Numbers of Paupers of all Classes (In-door and Out-door) in England and Wales for each of the 46 Parochial Years ended at Lady-Day 1894.

Year ended Lady-Day.	Mean Number of In-door Paupers.	Ratio per 1,000 of estimated Population.	Mean Number of Out-door Paupers.	Ratio per 1,000 of estimated Population.	Mean Number of In-door and Out-door Paupers.	Ratio per 1,000 of estimated Population.

† In Mr. Preston's returns he gives the *coining* value of Silver in United States dollars. I have not converted these values into Sterling on account of the differences; especially in later years, between the United States coining value of silver and the market value. But Mr. Preston's figures can easily be converted and added in the two columns left blank above if it is thought desirable.

FARRER.

Appendix A. XII.

APPENDIX XII.

(*Handed in by Lord Farrer.* See *Question* 38,396.)

EXTRACT from the REPORT of the DIRECTOR of the UNITED STATES MINT, 1894, pp. 54 to 63.

NOTE.—Where the commercial value in dollars is given it has been converted into £'s sterling, and the conversion added.

The World's Production of Gold and Silver in 1892 *and* 1893.

In Part II. of this report a detailed account of the output of gold and silver of the principal foreign precious metal-producing countries of the world in 1892 and 1893 will be found. It has been necessary, for reasons stated in the papers in the second part, to modify materially the figures of the gold or silver output of certain countries in 1892, as estimated in this bureau's report on the production of gold and silver in that year. The new estimate of the silver output of the United States in 1892 has been referred to already, and the reasons for making it set forth. The principal changes in the estimate of the yield of the precious metals in foreign countries in 1892 are these: In the estimate of the gold product of Africa the output of the West Coast $1,011,924 (£207,915), calculated from the gold exports of that region to Great Britain, has been added to that of the South African Republic $23,220,108 (£4,670,928) giving a total African product of gold in 1892 of $24,232,032, (£4,978,843) representing 36,461 kilograms fine, against 44,096 fine, of the value of $29,305,755, (£6,021,322), in 1893; China, which was dropped by the former Director of the Mint (Mr. E. O. Leach) from the list of gold-producing countries in 1892, has been restored to it in the present report, for reasons explained in the paper on that country, in Part II., its gold output in that year being estimated as equal to the sum of the exports of gold bullion from the Empire to India and Great Britain, viz., 12,678 kilogrammes, of the value of $8,426,038 (£1,731,259). Germany, which had also been dropped from the list of gold-producing countries by Mr. E. O. Leech in 1892, is likewise restored to it, having had, according to official returns, a gold output from its own mines in that year of 3,142.2 kilograms, of the value of $2,087,642 (£428,938); the figures of the silver product of Germany in 1892 have, in accordance with official returns, been raised from 184,818 kilograms, of the coining value of 8,815,600. The estimate of the silver product of Mexico in 1892 has been lowered from 1,419,634 kilograms fine, of the coining value of $59,000,000 as estimated by Mr. Leech, to 1,228,994 kilograms, of the coining value of $51,077,000, officially reported to this bureau by the Mexican authorities. These are the principal modifications made in the present report of this bureau's estimate of the world's production of gold and silver in 1892.

According to the corrected figures the production of the precious metals in the world in 1892 was: gold, 220,133 kilograms, of the value of $146,297,600 (£30,059,092); and silver, 4,757,955 kilograms fine, of the commercial value of $133,822,600 (£27,495,911), and the coining value of $197,740,700, showing an increase over 1891 of a gold output of 23,547 kilograms, or 756,953 ounces, of the value of $15,647,600 (£3,215,040), and an increase in the silver output of 490,575 kilograms, or 15,769,200 fine ounces, of the commercial value ($0.875) of $13,798,000 (£2,835,011), and the coining value of $20,388,400.

The world's production of gold in 1893 was 234,000 kilograms, or 7,523,352 ounces, fine, of the value of $155,521,700 (£31,954,325), against 220,133 kilograms, or 7,077,146 ounces, fine, of the value of $146,297,600 (£30,059,092), in 1892, an increase in weight of 13,873 kilograms, or 446,216 fine ounces, of the value of $9,224,100 (£1,895,233), in 1893.

The world's output of silver in 1893 was, approximately, 5,013,740 kilograms, or 161,162,000 fine ounces, of the commercial value of $125,706,400 (£25,828,313), and the coining value of $208,371,100, as compared with the silver product in 1892 of 4,757,955 kilograms, or 152,940,100 ounces, fine, of the commercial value of $133,822,600 (£27,495,911), and the coining value of

$197,940,700, an increase in 1893 of 255,785 kilograms, or 8,221,900 ounces, fine, of the commercial value ($0.78) of $6,413,100 (£1,317,670), and the coining value of $10,630,400.

Russia is the only gold-producing country of any importance from which no returns had been received for 1893 when this report went to press.

The countries whose gold product shows an increase in 1893 over that of 1892 are:—

Countries.	Increase in Value.
United States	£607,150 $2,955,000
Australasia	£314,280 $1,529,600
Mexico	£36,182 $176,100
Sweden	£719 $3,500
Italy	£5,260 $25,600
Dominion of Canada	£4,027 $19,600
British Guiana	£34,621 $168,500
Africa	£1,042,490 $5,073,800
British India	£101,767 $495,300
Total	£2,146,496 $10,447,000

The countries whose product of gold in 1893 shows a decrease, as compared with 1892, are —

Countries.	Decrease in Value.
Germany	£120,957 $588,700
Great Britain	£1,829 $8,900
Colombia	£119,006 $579,200
Japan	£5,691 $27,700
Korea	£3,780 $18,400
Total decrease in 1893	£251,263 $1,222,900
Total net increase	£1,895,233 $9,224,100

The countries whose silver product shows an increase in 1893 over that of 1892 are:—

Countries.	Increase in Value.
Australasia	£1,876,166 $9,131,300
Mexico	£1,290,446 $6,280,600
Sweden	£37,723 $183,600
Great Britain	£22,334 $108,700
Colombia	£99,404 $483,800
Japan	£25,560 $124,400
Total increase, 1893	£3,351,633 $16,312,400

The countries whose output of silver in 1893 shows a decrease, as compared with that of 1892, are:—

Countries.	Decrease in Value
United States	£929,792 $4,525,300
Germany	£118,245 $575,500
Italy	£93,672 $455,900
Dominion of Canada	£25,745 $125,300
Total decrease in 1893	£1,167,454 $5,682,000
Total net increase	£2,184,179 $10,630,400

The following table shows the production of the precious metals in the world for the calendar years 1873 to 1893:—

Production of Gold and Silver in the world for the Calendar Years 1873–1892.

Calendar Years.	Gold.	Silver.		
		Fine Ounces (Troy).	Commercial Value.	Coining Value.
				$
1873	£19,765,769 $96,200,000	63,267,000	£16,872,817 $82,120,000	81,800,000
1874	£18,645,983 $90,750,000	55,300,000	£14,520,855 $70,673,000	71,500,000
1875	£20,032,874 $97,500,000	62,262,000	£15,939,593 $77,578,000	80,500,000
1876	£21,306,759 $103,700,000	67,753,000	£16,092,459 $78,322,000	87,600,000
1877	£23,423,053 $114,000,000	62,648,000	£15,459,215 $75,240,000	81,000,000

In Part II. of this report will be found separate papers on the gold and silver product of the various foreign countries. The Director has, in all instances, endeavoured to state the sources of his information on the output of the precious metals, and to use the exact language of the authority cited in order that the degree of credibility to be attached to such authority might be duly measured.

The United States in 1893 shared to the extent of 23·11 per cent. in the total gold production of the

Appendix A. XII.

world. The world's output of gold in 1893 was the largest in history, amounting as it did to 234,006 kilograms, of the value, in round numbers, of $155,522,000 (£31,954,387).

The highest previous yield of gold was in the period 1856–1860, when the production reached an average weight per annum, according to Dr. Soetbeer, of 201,750 kilograms fine, and an average yearly value of 562,900,000 marks, or $133,970,000 (£27,526,197).

The output of gold, therefore, in 1893 was 16·08 per cent. greater than the annual average of the period of the greatest productiveness of the Californian and Australian gold mines.

A still more notable fact, and one which will be a matter of surprise to the world of finance, as attention is now for the first time called to it, is, that the value of the gold product of the world in 1893 was only 8·77 per cent. less than the average aggregate value of the gold and silver product of the world in 1861–1865. Dr. Soetbeer estimates the value of the average total output of gold and silver in the world in 1861–1865 at 715,634,000 marks, or $170,473,383 (£35,026,379). The value of the world's production of gold in 1893 alone was, as remarked above, in round numbers $155,522,000, (£31,954,387), or ($1=4·1979222 marks) 652,869,000 marks, a difference of 62,765,000 marks, or $14,951,400 (£3,071,992). In other words, the value of the yield of the gold mines of the world in 1893 was only $14,951,400 (£3,071,992) less than the value of the average yield of both the gold and silver mines of the world in 1861–1865.

The average value of both the gold and silver product of the world for the period of eight years, 1866–73, which just preceded the beginning of the depreciation of silver, was 801,093,000 marks, or $190,831,000 (£39,209,164), a difference between the value of the average total of the gold and silver production of these years and that of the gold product of 1893 alone of only $35,309,000 (£7,254,777). If the production of gold in 1894 exceeds that of 1893 by 22·7 per cent., it will reach in value the world's production of both metals ($190,831,000) (£39,209,164) 20 years ago. This is a most momentous fact, and one which must have much influence on the monetary policy of all civilised States n the future.

The great probability is that the value of the world's output of gold in 1894 will equal that of both metals in the years 1861–65, and in 1895 or 1896 that of the years immediately preceding the beginning of the depreciation of silver, *i.e.*, the average of 1866–73 inclusive. It may be predicted with certainty that it will be greater in 1897 than such average.

Of the $14,951,400 (£3,071,995) of gold needed to bring the value of the yield of the gold mines of the world in 1894 up to that of the world's average output of both gold and silver in 1861–65, it is even now demonstrable that South Africa alone will furnish at least $8,574,235 (£1,761,061), leaving an excess of only $7,361,915 (£1,512,819) to be supplied by other countries.

The production of the Witwatersrandt during the first four months of 1894 was:—

	Ounces.
January	149,814
February	151,870
March	165,372
April	168,745
Total	635,801

The total of the Witwatersrandt for the whole year will, in all probability, be three times this amount, *i.e.*, over 1,907,403 ounces.

If 200,000 ounces for the rest of South Africa be added to the above sum, the total gold output of the Transvaal in 1894 would amount to 2,107,403 ounces of the value of $36,920,436 (£7,585,871), an increase over the value of the gold product of South Africa in 1893 of $8,626,605 (£1,772,469), or of 30·49 per cent.

Should the gold product of the other countries of the world increase in 1894 over that of 1893 in the same ratio as that of 1893 did over that of 1892, viz., by $4,150,000 (£852,681), or 3·288 per cent., the production of the world in 1894 would amount to $168,299,000 (£34,572,618).

Again, should South Africa's product in 1895 increase in only the same proportion over its estimated output for 1892, viz., 30·49 per cent., or $11,257,041 (£2,312,924) (the yield of the West Coast continuing stationary at that of 1892, $1,011,924 (£207,914)), and the product of the rest of the world in the same ratio as in 1893, the total gold production of the world would in 1895 increase over that of 1894 by $15,543,500 (£3,193,651), and reach the figure of $183,842,000 (£37,713,166), leaving a difference in the value of the estimated production of gold a year and a half hence, and the value of the production of both gold and silver in 1866–1873 of a little less than $7,000,000 (£1,438,257).

From what has been said it is plain that in 1894 the value of the output of gold alone will very nearly equal that of the yield of the world's mines of both gold and silver in 1861–65, and a little later that of the total production of both metals before the demonetisation of depreciation of silver. Value, not weight, is the thing to be chiefly considered in the production of gold and silver, viewed from a monetary point of view.

The results reached above will be made clearer from the following tabular view:—

Average value of the world's output of gold and silver, 1861–1865	£35,026,379 / $170,473,383
Average value of the world's output of gold and silver, 1866–1873	£39,209,164 / $190,831,000
Value of the world's output of gold alone, 1893	£31,954,387 / $155,522,000
Estimated minimum value of the world's output of gold alone, 1894	£34,579,618 / $168,299,000
Estimated minimum value of the world's output of gold alone, 1895	£37,773,166 / $183,842,000

If the gold output of the mines of the world in 1893 found its way to the mints of the civilised countries of the earth in the same proportion as to value that both gold and silver did in 1866–1873, the fact that the value of the gold output in the near future will probably equal the value of the average output of both gold and silver in the years immediately preceding the beginning of the depreciation of silver, must have an important bearing on the question of the necessity of international bimetallism. It cannot, however, be admitted to be decisive of such necessity.

But although the value of the yield of gold in 1893 does not come up to the average of that of both metals in 1866–1873, there is a possibility that the value of the new gold available for original coinage in 1893 was greater than the value of the newly produced gold and silver available in the average, for a like purpose, in the period 1866–1873, and this possibility depends mainly on the approximate correctness of the estimates that have been made of the amounts of gold and silver employed annually in the industrial arts. This much being premised, it may be asked: How much of the 234,006 kilograms of gold produced in the world in 1893 has served, or will probably serve, monetary purposes? The new gold annually produced is employed partly in the industrial arts; part is definitively exported to the East, and is there hoarded, being withdrawn entirely from the monetary uses of civilised countries. These are the two principal non-monetary employments of gold. The 37,325 kilograms of gold, at which Russia's production is estimated in 1893, will be kept in the country as was that of 1892, and will, for the present presumably serve no monetary purpose. To obtain the amount of gold available in 1893 for new coinage in civilised countries, outside of Russia, the sum of these three items must be deducted from the total gold product in the year from the mines of the world.

But what was the amount of gold employed in the industrial arts in 1893? Perhaps as fair a way of calculating it as can be imagined would be to take the average of the estimates made of it in recent years, by this bureau and by competent precious metal statisticians.

This bureau has estimated it in the present report at 75,500 kilograms; Ottomar Haupt in 1894 at 79,000 kilograms; Dr. Soetbeer placed it in 1891 at from 100,000 to 120,000 kilograms; Prof. Lexis believes it cannot exceed 100,000 kilograms. Dr. Soetbeer's estimate may be taken at the mean of his maximum and

minimum. The estimates of the amount of gold used in industry would, therefore, stand thus :—

	Kilo.
Bureau of the Mint - - -	75,500
Ottomar Haupt - - -	79,000
Prof. Lexis' maximum - - -	100,000
Mean between Dr. Soetbeer's maximum and minimum - - -	110,000
Total - - -	364,500
Average estimate - -	91,125

Or in round numbers 90,000 kilograms, representing $59,814,000 (£12,289,706), or in round numbers $60,000,000 (£12,327,922). The net imports of gold into India in 1893 amounted to 4,575·7 kilograms, of the value of $3,039,000 (£624,409).* The product of the Russian mines was 37,325 kilograms, of the value in round numbers of $25,000,000 (£5,136,634). The sum of these items is $88,000,000 (£18,080.953), which sum deducted from the value of the world's output of gold in 1893, *i.e.*, $155,522,000 (£31,954,387), leaves an amount of gold available for the new coinage of civilised countries (Russia excepted) of $67,522,000 (£13,873,434).

How does this value of the amount of gold available for coinage purposes in 1893 compare with that of both gold and silver available for the same purposes in the years 1866–73? It will be seen from the following calculation that there is at present little difference between them. The average total output of gold in the world in these years was 187,105 kilograms. The net average amount of gold consumed in the arts in 1871–73, according to Dr. Soetbeer, was 84,000 kilograms. The average definitive export of gold to India, 1866–73, was 30,478 kilograms, or $20,255,615 (£4,161,828). Thus the total gold devoted to other purposes than coinage in 1871–73 was 114,478 kilograms, leaving 72,627 kilograms, of the value of $48,267,904 (£9,917,395), gold to be employed in the coinage of civilised countries.

The average total output of silver in the world in the years 1866–73 was 1,575,462 kilograms. The net average amount of silver consumed in the arts, 1871–73, was, according to Dr. Soetbeer, 471,000 kilograms, or in round numbers 470,000 kilograms. The average net export of silver to India, 1866–73, was 809,647 kilograms, of the value of $33,648,925 (£6,913,689).† The total silver, therefore, employed otherwise than in the coinage of civilised States was 1,279,647 kilograms, leaving for the latter purpose an average of 295,815 kilograms of silver, of the value of $12,294,071 (£2,526,006). Adding this amount to that of the gold available for new coinage in 1866–73 gives an average total value of the two metals that might have gone to add to the monetary circulation of civilised countries in the years just previous to the depreciation of the white metal of $60,561,975 (£12,443,389), as compared with $67,522,000 (£13,873,433), the value in 1893 of the gold alone available for coinage purposes, an increase in the latter year of $7,000,000 (£1,438,257). The production of gold in the near future will increase this difference in favour of 1894 and the following years, thus giving a larger amount of gold for the coinage purposes of civilised nations (except Russia) to keep pace, to some extent at least, with the growth of population. No deduction from the total gold product of 1893 was made for the wear and tear of gold coins in circulation, which must be taken from the total available for coinage before there can be any real increase in the gold currency of the world, for the reason that, as compared with the other items, it is insignificant.

There is another point to which attention must be called here. It is this: gold at present exported to Russia is, to a very great extent, like the gold exported in years past to India. It is largely definitive exportation, and is hoarded not so much by individuals as by the Imperial Government and the bank of the State. Russia withdraws from circulation not only the product of its own gold mines but the foreign coin and gold bars which it imports. The net import of gold bars and coin into Russia in 1891 and 1892 amounted to $55,301,098 (£11,362,461) and $89,301,098 (£18,348,284) in those years respectively. As the balance of trade is favourable to Russia, and has been for a number of years, this excess of imports of gold bullion and foreign gold coin into Russia, like the gold output of its own mines, serves no monetary purpose, and to the extent of the excess of the imports of foreign gold, at least, impoverishes the gold monetary circulation of some other country.

The amount of gold accumulated in the Imperial Russian Treasury and Bank of the State was as follows at the end of the years named :—

Years.	Roubles.	Dollars.	Years.	Roubles.	Dollars.
1883 -	187,000,000	144,326,600	1889 -	312,000,000	240,801,600
1884 -	196,000,000	151,272,800	1890 -	348,000,000	268,586,400
1885 -	211,000,000	162,849,800	1891 -	355,000,000	273,989,000
1886 -	284,000,000	219,191,200	1892 -	545 000,000	420,631,000
1887 -	255,000,000	196,809,000	1893 -	612,033,000	472,367,000
1888 -	273,000,000	210,701,400			

This fund has been amassed, to a large extent, by draining the channels of the monetary circulation of foreign countries, which must be again replenished from newly-produced gold before there can be any increase in the actual active gold circulation of the world from the annual output of the metal.

Just now, very little gold leaves Russia, except to pay the interest on its gold debt.

That Russia's balance of trade is favourable to it, appears from the following table :—

	Exports in credit roubles.	Imports in credit roubles.	Excess of exports credit roubles.
1884 - -	589,000,000	536,000,000	53,000,000
1885 - -	538,000,000	435,000,000	103,000,000
1886 - -	488,000,000	426,000,000	62,000,000
1887 - -	622,000,000	399,000,000	223,000,000
1888 - -	793,000,000	386,000,000	407,000,000
1889 - -	766,000,000	431,000,000	335,000,000
1890 - -	703,000,000	406,000,000	297,000,000
1891 - -	721,000,000	379,000,000	342,000,000
1892 - -	470,000,000	367,000,000	130,000,000

There may be some doubt as to whether the product of Russia's gold mines in 1893 should be considered as not available for monetary purposes, and the right decision of the question is not devoid of difficulty. The same may be said of its net imports of gold from foreign countries, which during the past few years, have been devoted to increasing its gold treasure. What Russia's policy is in accumulating so large an amount of gold has been explained in different ways by different publicists. It has been said that Russia is increasing its gold stock in order to increase its credit and its financial standing, with the leading States of the world. If this be the explanation, it has succeeded. Then it has been claimed that the gold accumulated by the Empire fund is a war fund. Lastly, it is contended that it is amassed as a step towards the reform of Russia's currency and the adoption in practice of the gold standard. If accumulated as a war fund, it has at present, at least, no monetary use. If as a measure of currency reform, or as a redemption fund at some future day, for the paper credit roubles, now the exclusive monetary medium of the country, it must be considered even at present as serving a monetary purpose; and in this case the amount of new gold available in 1893 for coinage would have to be placed, not at $67,000,000, (£13,766,180) but at $92,000,000, (£18,902,915) an increase of 53·3 per cent. over the amount of both gold and silver that could have been employed for the same purpose in 1866–1873.

No matter for what purpose for which Russia has collected its vast amount of treasure, it must sooner or later find a monetary employment at home or abroad.

* Note that gold is now returning from India.—Farrer, Dec. 1894.
† Note that silver is ceasing to go to India.—Farrer, Dec. 1894.

(*a*) The receipts of local authorities include money borrowed, Government contributions, and receipts from sales of property, &c.
(*b*) The tax was not extended to Ireland until the year 1853.
(*c*) For ten months only.
(*d*) The nationality of emigrants was not distinguished before 1853.
(*e*) The number of vagrants relieved is not included.
(*f*.) Imports were first entered by real values in 1854.
(*g*) Until 1873, vessels engaged in the coasting trade, carrying minerals, British timber and British quarried stone, fresh meat and fish, and a few other articles, were omitted from the coasting returns. The increase caused by including these vessels was about 4¼ million tons.
(*h*) Vessels belonging to the Channel Islands and the Isle of Man are included.
(*i*) The Post Office Savings Banks were established in 1861. The accounts for these banks are made up to the 31st December, and for the Trustees' Savings Banks to the 20th November.
(*k*) The decrease is stated to be due to the relief which was given in 1880 being discontinued.
(*l*) The increase is stated to be due to food and clothing supplied at the schools through the Duchess of Marlborough, Mansion House, and "New York Herald" Committees.
(*m*) The decrease is stated to be due to exceptionally severe weather, and the prevalence of scarlatina and measles
(*n*) The decrease is stated to be caused by the partial failure of the potato crop, and the prevalence of epidemics and distress.
(*o*) There is no definite explanation of the decrease, but 37 teachers are reported to have been arrested for complicity in Fenianism.
(*p*) The decrease is stated to be due to the severity of the weather.
(*q*) Sugar is now used as an article of manufacture as well as of personal consumption.
(*r*) These figures are not properly comparable with those for previous years on account of the cancellation of over 30,000,000*l*. of stock in 1887–8, and the transfer of an equivalent amount of local loans assets to the local loans fund. The local loans stock now amounts to about 41,000,000*l*.
(*s*) Exclusive of payments to local taxation account, consisting in 1890–1, 1891–2, and 1892–3, of half the probate duty, the proceeds of certain license duties, and a portion of the beer and spirit duties.
(*t*) Cannot be given, the returns for Scotland being incomplete.
(*v*) These figures are exclusive of the "casual poor" in Scotland, probably numbering about 5,000.

ded 31st October, 1894

own to the present time.—T. H. FARRER, Abinger Hall.

APPENDIX XV.

(Handed in by Lord Farrer. See Question 38,447.)

From "The Silver Situation in the United States."—Taussig, New York, and London, 1893.

Chapter VII.

General Conclusions.

If we now review the history of the silver situation, we find it leading to one conclusion, much at variance with the usual expectations and predictions. The expansion of the silver currency has followed, and not preceded, the rise in prices, the speculative activity, and the other phenomena which are associated with an increase in the supply of money. The general impression derived by the reader of most text-books on political economy is that an increase in the quantity of money is the direct cause of a rise of prices. But the increase of our silver currency seems to have been effect rather than cause. When it was first issued in 1878, at a time of quietude in business operations, it caused no expansion or inflation; on the contrary, the Treasury was unable to get the silver into circulation. When the general revival set in during 1880–81, it went into circulation rapidly and in large amounts; but the movement of silver followed, and did not precede, the general industrial change. When the period of depression began in 1884, the Treasury went through a period of slow circulation, and the regular issue of silver currency had not the slightest effect in checking the tendency to depression and falling prices. The attempt to get out the silver money simply led to embarrassment; it flowed back to the Treasury in tax receipts. The phenomenon repeated itself in 1890–92. The attempt to put forth more silver money had the same effect as it had in 1885; it caused a back-flow into the Treasury. For an easy and ready circulation of the new issues—if that is to come at all—we must await a revival of general industrial activity.

This contradiction between current expectation and the facts as they have actually appeared is a case of a sort not uncommon in the economic field. The growth of our knowledge, or at least its spread, has not kept pace with the development of the phenomena themselves. Explanations which held good half a century or a century ago, and were then propounded by the economists, have gradually filtered into popular knowledge; but by the time they have become public property, the phenomena themselves have so changed that a new or modified explanation becomes necessary. That the general range of prices depends on the quantity of money, and that an increase in the quantity of money will bring about a general rise in prices, has become one of the common places of economic theory. In this simple form of statement, "money" means what we usually denote by that term, coin, Government notes, bank notes. Five hundred years ago, even a hundred years ago, when almost all purchases were made with actual coin or notes, the proposition in all essentials was true. But the enormous development of credit in modern times compels a modification which has not indeed failed to receive attention from economic writers, yet has rarely been explained as fully, and certainly has not been kept in mind as constantly, as it needs be. The importance of the new conditions is indeed dawning on the public at large; but their full bearing is rarely perceived.

The true way to state the conditions on which, in our days the general range of prices depends, is to compare the quality of commodities offered for sale with the total volume of *purchasing power in terms of money*. In this volume of purchasing power the largest item consists in our day not of actual money, but of credit in various forms. In countries like England and the United States it consists chiefly in the form of credit supplied by deposit banks, bank deposits, and bank cheques. That bank deposits and cheques are the means payment in all large transactions, and in many small ones, that the exchanges carried on through them are greater than those carried on with any other form of currency; that they are completed through the machinery of clearing-houses, with the use of an insignificant amount of coin or notes, these are facts familiar enough. Indeed, the effects of credit as a substitute for money have been explained in economic text-books so fully that they may be assumed to be well understood; it is the extent rather than the nature of the effects that needs to be insisted on.* At any one time, and for considerable lengths of time, the general range of prices, with a given volume of transactions, depends not on the quantity of money simply, but on the volume of credit used as purchasing power; and of this volume of credit the chief item in countries like England and the United States is bank currency in the form of deposits and cheques.

In such a state of things the increase of other forms of currency can have, in itself, only a minor effect. Indeed, worse than this; so long as the volume of credit, and especially that of the bank currency of cheques and deposits, is not affected, there is a strict limit to the quantity of any other form of currency which will, in fact, be used. It is obvious, for instance, that the quantity of dimes and quarter dollars which will keep in circulation in any community, at a given range of prices, is a definite and determined amount. People need a certain number of small coins for the convenience of making change. If more are issued than are needed for such purposes, the coins will not remain in circulation. They will accumulate in the tills of the shopkeepers, street car companies, and other receivers of small payments, and then make their way into the hands of the banks; finally, the excess will work its way into the Government Treasury. Under our very sensible legislation on subsidiary coins, the Government not only issues such pieces in any quantity desired, but redeems them in any quantity. The amount outstanding is allowed to regulate itself, and, so far from being a factor in determining the general range of prices, is itself determined by the general range of prices. At a higher range of prices more of them will be called for, and the larger denominations may form a greater proportion of the whole; at a lower range of prices less will be called for, and in smaller denominations.

What is true of the subsidiary coins is equally true in all essentials, of the dollar prices, the five dollars, the 10 dollars. The dimes, and quarters, and half dollars are the small change of the people; the dollars, and five dollars, and 10 dollars are the large change. They, too, in a country where credit has reached as high a state of development as in the United States, are a sort of subsidiary money. Credit, chiefly in the form of bank deposits, is the main factor in affecting the ups and downs of prices; and the expansion or contraction of credit depends on conditions among which the quantity of money (in the ordinary sense) plays at any given time no important part. The quantity of money which may affect its fluctuations is not, in any case, the general supply in the community, but the supply held as reserve against deposits in the vaults of banks. Even as to this, the connexion with the variations in purchasing power used by the community in the form of bank deposits and cheques is only a loose and indirect one.

At all events, the silver money of recent years has not had any direct effect in stimulating the growth of this bank currency, the largest and most important part of the circulating medium. The attitude of the banks toward the silver currency of 1878–90 prevented it from accumulating on their hands or forming any part of their effective reserves. The contraction or expansion of the currency of bank deposits and cheques therefore was not directly affected by it. The silver

* While the general effects of credit as a substitute for money have been more dilated on, the peculiar effectiveness of bank deposits as currency, and their preponderating importance in the machinery of exchange in England and the United States, have received comparatively little attention. For a systematic exposition, *see* Professor Dunbar's *Chapters on the Theory and History of Banking*; and for an examination of the part played by bank deposits as currency in the United States, *see* a paper by the same writer in the *Quarterly Journal of Economics*, vol. 1, p. 401, July 1887.

Appendix A. XV.

issues supplied, in great part, what I have called the large change of the community; but the total volume of the currency and the general range of prices were not directly affected by them.

This is the key to the history of the silver currency under the Act of 1878. It did not cause any expansion in prices. The volume used by the public was effect and not cause. In times of activity more of large change was called for; in times of depression less; but the large change, for which the silver issues have been used, were not the cause of either rising or falling prices. On the whole, and in the long run, and barring periods of difficulty such as the years 1884–85, the quantity issued under the Acl of 1878 was not greater than was readily used in the retail transactions of a community growing as rapidly in wealth and population as the United States. The contraction of the national bank notes aided in making a ready place for them in such cases. The silver currency under the Act of 1878 simply supplied the community with the increasing amount of money needed for its every-day retail transactions.

It may, indeed, be said that in the absence of the silver there would have been severe contraction. Prices, in fact, have probably fallen somewhat, notwithstanding the silver issues, a phenomenon of which the meaning will be discussed in the second part of this paper; and it may be said that the fall would have been even greater, and its effects more serious, if there had been no silver. But in that case it cannot be doubted that some other form of large change would have come into use. It is idle to say what sort of currency would have taken the place now occupied by silver: whether Congress might have rescued the national bank circulation from slow extinction, whether other forms of credit money would have been issued by the Government itself, whether still larger amounts of gold would have flowed in from abroad. The only thing certain is that in a country like the United States no real inconvenience or suffering from a scarcity of this sort of money would have been permitted. The fact has been that the silver currency supplied the need, for good or evil, supplanting the bank notes and supplementing the greenbacks.

APPENDIX XVI.

(*Handed in by Lord Farrer. See Question* 38,472.)

The "Times," December 6, 1894.

The Commercial and Economic State of Chili.

(*From our Special Correspondent lately in Valparaiso.*)

In my last letter on Chilian affairs I dealt with the financial situation of the Government; I have now to turn to the general position of commerce in the country —a less satisfactory and more intricate subject to handle. One the one hand is a Government exceedingly rich, on the other a commercial community suffering from severe depression caused by the abuse of credit, and the depreciation of the paper dollar, and accentuated by the low prices ruling in the European markets for some products of the country, such as wheat, silver, and copper. In addition to the fall in the price of wheat which the Chilian farmers have had to contend with the harvest for the present year is an exceedingly short one, the quantity available for export being barely one-half of the amount shipped in 1893.

With regard to the first of the causes I have enumerated as instrumental in bringing about the present state of commercial trouble, it is easy to see how directly it is connected with the existing depression. For years past the banks have been lending money freely on all classes of real estate and share property of every description. As long as times were good and interest paid regularly all went merrily as a marriage bell; suddenly difficulties of many kinds cropped up, and little by little the country drifted into the position of to-day, when a crisis has been reached and a general liquidation becomes necessary to secure a return to a sound basis of trading, whether in the production of articles of export or in ordinary commercial business. The situation in many points is analogous to that of the the Australian Colonies in 1893, with the difference that the trading community have to deal with the additional complication of a depreciated circulating medium. As in Australia, the banks in Chili appear to have had only one ruling idea—the payment of heavy dividends to shareholders. This has been done regardless of the first principles of banking, insomuch as no sufficient metallic reserve has been provided for by setting aside any proportion of profits; the directors of the leading banking concerns did not believe that the drastic measure of a return to a metallic currency could ever take place, and wilfully shut their eyes to the possibility of the Government acting honestly and insisting upon the conversion of the paper dollar. The debtors to these banks, owing as they do currency obligations, have had a solid interest in the depreciation of the paper money, every drop in exchange meaning a decrease in the intrinsic value of the debt owing; as property has a gold value their position improves as the value of gold rises, although the increase in the selling price in currency of real estate, though considerable, has not been in proportion to the fall in the value of the dollar. On the other hand, the conversion of the currency to a gold basis means that the debt increases 100 per cent. True, real estate gains in gold value by the conversion, but not to such an extent as to enable many very heavily mortgaged properties to remain in the hands of the present owners. This means that the banks will be left with landed property on their hands, and in addition, a great quantity of stocks and shares in mining and industrial concerns, the value of these being less than the money advanced on them when the advances come to be calculated at 24*d.* to the dollar. Hence we find that the interest of the principal banks and a large proportion of the landowners is used to force down the value of the paper dollar, in the hope that the situation of the country will make the position of the Government untenable as regards the conversion law and lead to the repeal or, at least, postponement to a distant date of that measure. So far as one is able to ascertain, the total value of the advances made by the banks on all classes of property is about $150,000,000 currency, but I am unable to obtain exact *data* on this point. Turning from the commercial banks to the group of mortgage banks where the business is confined to advances on real estate, I do not find nearly such strong opposition to the conversion on the part of the managers and shareholders. The debtors, of course, take up the same stand as do those owing money to the ordinary banks. From what I gather from various sources I am of opinion that these concerns have been managed in a more careful manner; then, again, not being banks of deposit, they are not subject to calls for heavy payments in case of sudden panic. The total amount of money advanced by these mortgage banks is stated to be, in round figures, $130,000,000 currency, the limit of an advance being fixed at 50 per cent. of the value of a property. Here we find one of the direct causes of the falling off in trade. By Chilian law personalty left to widows and orphans must be invested in bonds of the mortgage banks. The fall in the value of the dollar from 24*d.* to 12*d.* at once reduces the purchasing power of the interest on these bonds so far as all imported articles are concerned. Roughly the interest on the capital is $10,000,000 currency; this at 24*d.*, gives one million sterling; at 12*d.* the sterling value is only £500,000. This has a direct bearing on the falling off in such articles of importation as cotton goods, sugar, tea, and other common necessaries of

life, the class of people holding these bonds being amongst the most steady consumers of this class of imports.

I will now show how the reduction of the purchasing power, owing to the depreciation of the paper dollar, of another class of Chilians directly affects commerce. The following may be taken as an approximate estimate of the number of the labouring population of Chili, and the average wage earned by each class:—

	Number of Labourers.	Average Daily Wage.	Total Wages in Year.
		$ currency.	$ currency.
Nitrate districts -	30,000	3	27,000,000
Mineral districts* -	40,000	2⅔	30,000,000
Agricultural districts -	430,000	1	129,000,000
Totals -	500,000	—	$186,000,000

* The wage rate varies greatly, workers in silver and copper mines receiving up to $3 per day, whilst those employed in coal mines are paid from $1 to $1⅓ a day. Say, average $2½.

I have taken as a basis a working year of 300 days, thus allowing 65 holidays in the 12 months. As a fair average per-centage of the wages earned we may calculate 33 1–3 per cent. as being spent on imported articles. A careful calculation shows that only 10 per cent. of the amount earned in the nitrate districts is thus expended, the majority of these men being single; but amongst the workers in the mineral and agricultural sections the proportion is about 40 per cent., these latter being nearly all married men with families. Hence I have taken a basis of 33 1–3 per cent. throughout. It is worth wile glancing at what these figures imply to commerce. To-day the labouring class in the districts I have mentioned earn yearly $186,000,000 currency; reducing this we get in sterling:—Purchasing power at exchange of 12*d.*, £9,300,000; 33 1–3 per cent. expended on imports, £3,100,000. With the currency converted at 24*d.* one must allow for a reduction of 25 per cent. in the nominal wage rate; this gives $139,500,000 currency of gold dollars, worth 24*d.* each, as the yearly earnings of the 500,000 labourers. This gives in sterling:—Purchasing power at exchange of 24*d.*, £13,950,000; 33 1–3 per cent. expended on imports, £4,487,500. These figures show that general commerce has lost from this source alone the sum of £1,387,500 during this year by the rate of exchange being at 12*d.* instead of 24*d.* and that it will gain this amount by the conversion law being brought into force. Indirectly the gain is very much greater, for the greater purchasing power of the dollar after the conversion means a large consumption of home-grown produce. The producers thus benefit, and a proportion of this benefit finds its way into the hands of the merchants. I could proceed to give examples of many other classes of Chilians, such, for example, as Government employés where the low exchange reduces materially the purchasing power and hence tends to aggravate the commercial depression, but the two examples I have quoted are sufficient to show clearly that the low exchange is in great part the cause of the difficulties the commercial community are called upon to confront to-day. How this decrease in the purchasing power of the mass of the population is turned to the benefit of certain groups of individuals I will show later on in my letter; before doing this it is necessary to consider the trade statistics for the past two years.

In 1892 a short period of inflated prosperity followed close upon the heels of the ending of the civil war. This induced commerce to commit the error of overtrading, the exports being returned at £10,200,000 sterling and the imports at £12,700,000 sterling, thus leaving a balance against the country of £2,500,000 sterling. This rush of goods was greatly owing to the wish to get the imports into the country before the higher duties ruling from January 1, 1893, came into force. In 1893 the exports were valued at £9,640,000 sterling and the imports at £8,172,862 sterling, leaving a balance in favour of the country of £1,467,438 sterling. The figures for 1892 are those officially published and are not throughly trustworthy, the valuations being calculated on a 20-year-old tariff drawn up when prices of nearly all commodities were higher in value than is now the case; those for 1898 I have obtained from private sources, and they may be considered as correct. The exports for 1893 were:— Appendix A. XVI.

	£
Saltpetre and iodine -	6,150,000
Wheat -	1,057,000
Silver -	1,000,000
Gold -	20,000
Copper -	900,000
Wool -	125,000
Manganese -	58,000
Barley -	80,000
Lead and tin -	100,000
Minor products -	150,000
	£9,640,000

The lesser value of the exports for this year is probably accounted for by the fall in prices of wheat, silver, copper, and other products. The falling off in the value of imports is, however, far greater than the shrinkage in value of the exports, and, moreover, corresponds very nearly to the decreased purchasing power of the wage-earning classes, due in great measure to the fall in value of the paper dollar. Indeed, it is in such articles as cotton goods, worsteds, and woollen tissues that the greatest decrease is apparent; this gives an instructive lesson and demonstrates clearly that the greatest sufferers at the present moment are the working section of the population. I have taken all possible trouble to ascertain the correct values of imports and exports, but smuggling is carried on to such an extent as to preclude the possibility of obtaining absolutely accurate figures. The value of goods annually introduced into the country by contraband may be roughly estimated at £250,000 sterling, the chief offenders according to common report being Germans. The high duties offer a great temptation to unscrupulous importers and the poorly-paid Custom House officials are, I am afraid, in many instances quite ready to connive at the defraudation of the revenue. The Chilian Government are quite aware that this smuggling is not uncommon and are now preparing measures to endeavour to check it. Whilst on the subject of imports I must point out that there is only a slight decrease in the values of luxuries imported, thus showing clearly that it is the poor rather than the rich who feel most the present hard times. It is evident from the statistics I have given that a return to a currency with an intrinsic value of 24 pence will at once increase the purchasing power of the principal consumers of imported articles. It is very necessary to bear in mind when considering the question of imports and exports that two-thirds of the value of the latter consist in the products of the nitrate districts; the profits derived from the working of these concerns do not form part of the purchasing power of Chili, this being due to the fact that practically the entire capital is held abroad and the dividends paid are spent in Europe, or elsewhere, and not in this country. This is an important factor, and must not be forgotten in any calculations regarding Chilian trade.

The direct causes of the depreciation of the paper dollar are not difficult to find once the commercial situation is understood. At first it may seem an anomaly that a by no means excessive emission of paper money by a Government in a thoroughly solvent position should be depreciated no less than one-half of its face value. I must call attention to the fact that the currency is based on a silver dollar, worth to-day 23*d.*, and not on a gold basis as is often thought to be the case. Hence one of the principal reasons for fixing the conversion to a gold basis at the rate of 24*d.* The reasons for the fall in value of the paper dollar are overtrading during 1892, the low prices for many of the principal products of Chili in the European markets, the storage by the Government of large reserves of specie to effect the conversion in 1896, the regulations as regards the payment of 25 per cent. of Customs duties in gold coin, the scarcity of bills in the market, the heavy speculation in exchange, the distrust fostered by the opponents of the conversion law. These are the chief causes tending to bring about the existing depreciation. The exchange market in Chili is an extremely limited one, and has become more restricted since the commercial depression became so marked. Then again the portion of the nitrate duties payable in bills on London is drawn to a very great extent by the various companies on their London offices and transmitted by the Government to Europe to meet foreign charges, thus still further contracting the number of bills available in the market. Those who have sterling bills to

Appendix A. XVI.

sell are in command of the situation, and take every advantage of their position. The lower the value of the paper dollars falls, provided the fall be rapid enough to forestall any rise in the wage rate, the greater are the profits obtained from the working of any enterprise where the product has a gold value, such, for example, as saltpetre, minerals, or cereals for export. In fact, to put the matter tersely, we may consider that in all cases the employers of labour gain by the depreciation, whilst the loss falls on the working classes. Added to this is the speculation. If we take £10,000,000 sterling as a figure for the the total annual requirements for necessary remittances to be made annually from Chili, and calculate 1–10 per cent., the recognised brokerage, as the amount of the commission, the sum available for distribution amongst the brokers would be £10,000 sterling at the end of each year. Yet in Valparaiso alone there are now 40 exchange brokers, many of them making large incomes, and not a few comfortable fortunes. This means that these men manipulate the market to suit their own ends and draw in the general public to gamble. The groups who substantially benefit by the depreciation and fluctuations of the currency are the debtors to the banks, the employers of labour in the nitrate, mineral, and agricultural districts, the brokers, and certain financial firms in a position to take advantage of the situation and any turns in the market. The Chilian judicial authorities disapprove of the speculative gambling transactions so frequent of late, and in several recent instances they have decided that claims for "differences" are not recoverable in a court of law. Some sanguine people imagine that these decisions will have a deterrent effect on such transactions in the future, but the speculation will, undoubtedly, continue in one form or another until the conversion law comes into force.

Appendix A. XVII.

APPENDIX XVII.

MEMORANDUM ON THE TITHE ACTS, 1836 TO 1891. (*Handed in by Mr. T. H. Elliott. See Question* 39,042.)

As is well known, the origin of tithes in this country is of great antiquity, being, not improbably, coincident with the introduction of Christianity among the Saxons.

Tithes were a property of a special nature, arising out of the lands liable to them, and ownership of the tithes was distinct from the ownership of the lands. Without entering into unnecessary particulars, tithes may be described as, in general, the tenth part, or some other thing in lieu thereof, of the annual increase arising from the lands, and the animals which drew sustenance from the lands. Personal tithes, which were mostly excepted from the operation of the general Tithe Commutation Act, need not be here referred to.

With certain exceptions, tithes were payable of common right in respect of the produce of all lands not barren.

For several centuries tithes of the annual increase were taken in kind, but the inconveniences arising from this method of payment gradually drew attention to the necessity for some mode of compensating the owner of the tithes by payments other than payments in kind. The most obvious substitute was a payment in money, and many ancient compositions were made on the basis of a money payment, but it became apparent that if the purchasing power of money varied, a money payment of a fixed amount would cease to represent the value of the original tithe. As an instance of this might be mentioned the case of a modus, or fixed customary mode of tithing, in lieu of tithes in kind, and which must have originated before the time of legal memory, that is, before the first year of the reign of Richard the First. Now, the commonest modus was 2*d.* an acre for the tithe of land, and this sum was presumably the full value of the tithes at the time when the modus originated, not later than towards the end of the 12th century, since a contract would not have been assented to, and continuously acted on, which was manifestly unfair to one of the parties at the time of making it. But at the time of the general commutation in 1836, the tithe in kind of an acre of land may be taken as probably averaging about 4*s.*, and if this be so it follows that 2*d.* in or about the 12th century represented in these cases approximately the same value as 4*s.* in the 19th, or, in other words, a money payment fixed at the earlier period would be depreciated now to about one twenty-fourth of its then effective value.

The expedient of substituting corn, which is not liable to the same depreciation as money, as a medium of payment, was adopted in Queen Elizabeth's reign as regards college leases, at the instance, it is said, of Lord Burleigh, by a provision that at least one-third of the old rent reserved in such leases should be paid in good wheat or malt at the rate of a quarter of wheat for each 6*s.* 8*d.*, or a quarter of malt for every 5*s.*, the lessee to pay according to the price at which wheat and malt should be sold at the market day next preceding the rent day.

About the middle of the 18th century, when a period of great activity in inclosing common fields and waste lands set in, provisions began to be inserted in the numerous Private Inclosure Acts then passed, for commuting the tithes, in some cases of the lands to be inclosed, and in some of the whole parish, and between that time and the period of the general commutation over 2,000 Acts, including such provisions, were passed. The earlier of these Acts provided for commutation either by allotment of land or by fixed yearly payments, or by both together; but in the year 1771 the principle of expressing the payment in terms of corn was adopted in an Act of 11 Geo. 3., which provided that all the tithes of the parish of Sebergham, Cumberland, should be commuted by a corn rent or yearly money payment equal in value to two hundred and sixty-seven bushels, one peck, one quart, one pint, and one quarter of a pint of wheat, Winchester measure, according to the prices of grain, as settled by the grand jury at their Michaelmas Session in each respective year. The precedent thus created did not indeed obtain any large adoption, but by the year 1835 about 224 Acts has been passed creating corn rent in lieu of tithes, leaving out of account those which created fixed money payments. In general, these Acts stated the quantity of wheat to be paid, or authorised its ascertainment, and provided means for fixing the equivalent in money from time to time, usually by application to Quarter Sessions at the end of fixed periods of 21 or 14 years, the price then ascertained to govern the payments during the following period.

The wisdom, under the circumstances, of adopting the method of payment in fixed quantities of corn, rather than in fixed sums of money, when contemplating payments to extend over long periods of time, has been generally acknowledged. The Commutation Act both extended the principle, and secured an additional element of stability by making the payment consist of equivalent values of three kinds of grain—wheat, barley, and oats—instead of one only.

Awards of corn rents commonly set out the quantity of wheat payable by each portion of land, and similar details might have been stated in each tithe apportionment as regards wheat, barley, and oats, but the Tithe Acts made this amount of detail unnecessary, and provided that only the total sum of money fixed as the commutation in each parish, and its equivalent in corn at the fixed price per bushel of 7*s.* 0½*d.* for wheat, 3*s.* 11½*d.* for barley, and 2*s.* 9*d.* for oats need be stated in each apportionment.

It will thus be seen that payments of tithe rent-charge are in reality corn payments. Each rent-charge in a tithe apportionment can be resolved into its fixed equivalent of corn by converting one-third of its amount into wheat, one-third into barley, and one-third into oats at the above respective prices, and the value of that quantity of corn at the average prices of wheat, barley, and oats for the preceding seven years, as published in the London Gazette in January every year, is the sum to be paid by the tithepayer for the following year.

The process of commutation under the General Tithe Commutation Act, 6 & 7 Will. 4, c. 71, was to be either voluntary or compulsory.

Voluntary Commutation.—In this case the annual sum for which the tithes of a parish should be commutated was setted at a meeting of the titheowners and

landowners of the parish, and the agreement resulting therefrom was binding on the whole parish if executed by owners representing two-thirds in value of the titheable lands, two-thirds of the great tithes, and two-thirds of the small tithes. Land up to an extent of 20 acres might be given in place of the whole or part of the tithes. The agreement was then sent to the Tithe Commissioners, who satisfied themselves of the *bona fides* of the transaction, and after submitting it, in the case of ecclesiastical tithes, to the bishop of the diocese for his opinion, confirmed it.

Compulsory Commutation.—In cases where no parochial agreement for a commutation was made within a reasonable time, the Commissioners were directed to take the initiative. Having given notice of their intention, either by themselves or an Assistant Commissioner, to make an award of the value of the tithes of the parish, they instructed an Assistant Commissioner to hold a meeting in the parish for the purpose of ascertaining awarding the total sum to be paid. This was based upon the average of seven years preceding Christmas 1835. In estimating it the Assistant Commissioner made deductions on account of expenses of collecting, preparing for sale, and marketing in cases where the tithe had been paid in kind, but no deductions were allowed on account of any parliamentary, county, parochial or other rates, charges, or assessments to which the tithes were liable, and where the tithes had been compounded for on the basis of the tithepayers paying the rates, that portion of the tithes which was represented by the rates was directed to be added to the other tithes. In cases where disputes were pending between the titheowners and landowners, which might hinder the process of commutation, the Commissioners might decide between the parties who had, however, a right of appeal against their decision to a court of law. On this basis the Assistant Commissioner framed a draft award, declaring the amount of rentcharge to be paid in respect of all the tithes of the parish, and this, having been placed in the parish, objections to it were heard and determined.

The Commissioners then confirmed the Assistant Commissioner's award, with or without alterations, and, after confirmation of the agreement or award, valuers were chosen at a parochial meeting, who apportioned the rentcharge among the lands of the parish liable to tithes, either according to principles of apportionment agreed upon by the landowners, or, if no principles were agreed upon, then having regard to the average titheable produce and productive quality of the land.

Before confirmation of the apportionment a draft was prepared setting out:—

1. The agreement or award fixing the annual sum to be paid.
2. The number of bushels and decimal parts of a bushel of wheat, barley, and oats which such sum represented at the fixed prices already stated.
3. The names, &c., of the respective owners and occupiers.
4. A reference number to the lands of such owners, corresponding with a number on the map accompanying the apportionment.
5. A description of the cultivation of the lands, as arable, pasture, woodland, &c.
6. The quantity in statute measure of the lands.
7. The sum charged upon the respective lands.
8. To whom, and in what right payable.

The draft apportionment was then deposited in the parish for 21 days, and a meeting held by an Assistant Commissioner to hear objections, and these having been heard and determined the apportionment was engrossed on parchment, with the map attached, and was signed by the valuer and confirmed by the Commissioners, and from a date specified in the agreement or award, or failing this, from a date named in the Acts, the lands of the parish were absolutely free of the tithes and subject to a rentcharge. These dates might be either the 1st January, 1st July, 1st April, or 1st October.

The Commissioners might by a later Act (2 & 3 Vict. c. 62.) settle disputed boundaries of parishes, or townships, or estates, in the case of the latter on the application of the owner, in the case of the two former on the application of a majority of not less than two-thirds of the landowners of the parishes or townships. But this provision did not apply to boundaries which were also the boundaries of a county, nor to boundaries of copyhold or customary lands unless with the consent of the lord of the manor.

No one was to be personally liable to the payment of tithe rentcharge, which was a charge on the land and not on the person owning it.

Tithe rentcharge was liable to rates which, by the Act of 1836, were to be assessed upon the occupier of the lands out of which the rentcharge issued, who might deduct what he had paid from his rent, and the landlord might in turn deduct it from the rentcharge or might otherwise recover it from the owner of the rentcharge. But by a later Act rates might be assessed directly on the owner of the rentcharge.

Under the Tithe Act, 1891, however, rates are now assessed on and recovered from the owner of the rentcharge.

Tithe rentcharge is payable half yearly, on January 1st and July 1st, or April 1st and October 1st. When it was in arrear and unpaid 21 days after it became payable, the titheowner might distrain on the lands liable to the rentcharge, or on any part thereof, for all arrears up to two years. Distraint might also be made upon any land in the same parish as the land in respect of which the arrears arose, which might be in the occupation of the person occupying the land on which the arrears arose, and holding under the same landlord. But no land was to be liable to be distrained upon for the purpose of satisfying any such rentcharge charged upon lands which might be washed away by the sea, or otherwise destroyed by any natural calamity.

The commutation of tithes is now practically completed, and all the provisions in the Tithe Acts referring exclusively to commutation have been repealed, with a saving clause that the repeal shall not extend to tithes not yet commuted.

The total of the tithe rentcharge, as commuted and apportioned, including apportionments confirmed under the London (City) Tithes Act, 1879, amounts to 4,054,653*l.* 0*s.* 3½*d.* To this should be added a sum of 5,305*l.* 12*s.* 7*d.* representing corn rents converted into tithe rentcharge. Of these sums, 24,223*l.* 15*s.* 4½*d.* has since been redeemed, and 54,804*l.* 19*s.* 11¼*d.* merged in the lands. Extraordinary tithe rentcharge, the amount of which at the original commutation cannot be accurately stated, but which may be set down approximately as about 30,000*l.*, has been converted, under the Extraordinary Tithe Redemption Act, 1886, into rentcharge at 4 per cent. on a capital sum.

It may be desirable to refer to the subject of extraordinary tithe rentcharge, although rentcharge of that description has recently been dealt with, as above stated, under the Extraordinary Tithe Redemption Act, 1886. In the process of commutation of tithes the creation of some kind of shifting charge was, in certain parishes, a necessity of the case, since it was obvious that where the titheable produce was of more than the average value, as in the cases of hops, fruit, and market-garden produce, it would be a hardship if the land which had produced those crops during the seven years of average were permanently saddled with a rentcharge on that basis, notwithstanding the possibility that the cultivation might be discontinued on those lands, and at the same time be newly established on other lands subject only to rentcharge at the ordinary rate. The device was therefore adopted of empowering division of the tithe rentcharge into two parts, ordinary and extraordinary, when the facts justified it and the landowners so desired, the extraordinary rentcharge being made a rate per acre, payable in addition to the ordinary rentcharge, but shifting with the cultivation, so as to be payable only from the land which was under the special crop, and to cease when the cultivation ceased. The extraordinary rentcharge might thus disappear altogether. In the county of Nottingham, for instance, the former production of hops in parishes subject to an extraordinary rentcharge had entirely ceased in 1886.

Extraordinary tithe rentcharge has now, however, been dealt with by capitalisation of the actual charge existing in 1886, under the powers of the Extraordinary Tithe Redemption Act of that year.

The Act provided that no extraordinary tithe rentcharge should be levied or charged in future on land which might be newly cultivated with the special crops. As regards existing rentcharges the Land Commissioners were to ascertain the capital value of the rentcharge, taking into account the net annual value of the same, the value of the land subject thereto, the length of time for which it had been paid, the prospect of the continuance or discontinuance of the special cultivation, the right of the cultivator to discontinue such special cultivation, and any other special circumstance applicable to the case under consideration, and they might

Appendix A. XVII.

hear evidence. The capital value being fixed and certified, an annual rentcharge of 4 per cent. on the capital value was charged upon the land, and this might at any time be redeemed by payment of the capital value. The work of fixing the capital value was completed by 1890.

The work of the Board of Agriculture as successors of the Tithe Commissioners and Land Commissioners is at the present time mainly confined, as regards tithe rentcharge, to two subjects: (1) the re-apportionment of the rentcharge as lands become sub-divided; and (2) the redemption of the rentcharge.

Apportionments might be either *gross* or *farm* apportionments, where the rentcharge was charged in one sum upon all the land in one farm or ownership; or *field* apportionments, where the gross amount was sub-divided, and a proportion charged on each close or field. When the commutation of tithes commenced, gross apportionments were largely adopted to save trouble and expense, but field apportionments are so much more convenient that under the Act of 1840 they were made the rule, unless at the special request of the landowners.

Apportionments can be adjusted to meet changes of circumstances connected with the land, provided there be no sub-division of rentcharge below 5*s*., as where land charged with one entire rentcharge becomes vested in several owners, or when inconvenience is felt owing to sub-division of the land. It may be carried out in some cases on the application of the person entitled to the rentcharge, in others on the application of the landowners.

Tithe redemption.—After the commutation of tithes into a rentcharge it became necessary to give powers for the redemption of the rentcharge.

In certain cases this is obligatory, for instance, when land subject to tithe rentcharge was taken for the following purposes:—

a. The building of any place of public worship.
b. The making of a cemetery or burial ground.
c. Building a school under the Elementary Education Act.
d. Building a town hall, assize court, gaol, hospital, or any other public building, or carrying out improvements under the Artizans Dwellings Act, 1875.
e. Making sewage farms under the Sanitary Acts, or making sewers, or drainage or gas works.
f. Enlarging or improving any of the above works.

The person proposing to carry out these works is under obligation to apply to the Board to order the redemption of the rentcharge at 25 years' purchase. When land is subject to a rentcharge not exceeding 20*s*. the Board may order redemption at 25 years' purchase on the application of the landowner or the tithe-owner, but in practice redemption in such cases is not ordered, except on the application of the tithe payer, on account of the expense and hardship which would frequently be entailed upon him. In the case of rentcharges exceeding 20*s*., they may do so on the joint application of the owner of the land and the owner of the rentcharge. In the case of lands divided for building or other purposes into numerous plots, so that it seems that no further apportionment can conveniently be made, the Board may order redemption on the application of any one owner, without the consent of any other owner or of the titheowner, and without regard to the amount involved, at 25 years' purchase.

On completion of redemption the Board seal a certificate declaring the rentcharge to have been redeemed.

The money received for redemption of a rentcharge payable to any spiritual person in respect of his benefice or cure, is paid to the governors of Queen Anne's Bounty.

When the rentcharge is payable to a person entitled thereto in fee-simple in possession and who is not a spiritual person entitled in respect of his benefice or cure, or a corporation prevented from alienating such rentcharge, except under the provisions of the Acts, the payment is made to such person or corporation.

When the rentcharge is held in limited ownership, the redemption money may be paid to the trustees of the will or settlement, or if there be no such trustees, then to trustees appointed for that purpose by the Board.

The Tithe Act of 1891 did not impose any fresh duties on the Board of Agriculture. Its object was to amend the process for the recovery of tithe rentcharge when due.

The main features of the Act are three:—

1. Alteration of the method of recovery.
2. A more precise definition of the person liable to pay the rentcharge.
3. Provisions for remission of a portion of the rentcharge when the circumstances justify it.

1. Rentcharge is now recoverable through the county court. In cases where the owner is also the occupier of the land on which the rentcharge is due, the court can order distraint, as under the former Acts. In cases where the ownership and the occupation are divided, a receiver of the rents is appointed by the court, and he may receive the rents of land belonging to the same owner elsewhere. If the rent of the land is insufficient to pay the rentcharge, the court may proceed as if the occupier were the owner, *i.e.*, by distress, and the occupier may deduct what he has had to pay from his rent, or recover it from the landlord.

2. Tithe rentcharge is now payable by the owner instead of the occupier of the land liable to the charge. There are certain exceptions to this, however, and the Act does not affect:—

a. Corn rents or other payments in lieu of the tithes, which have not been converted into tithe rentcharge.
b. Rentcharges payable under the extraordinary Tithe Redemption Act, except as regards recovery.
c. Rentcharges payable in respect of gated or stinted pasture.
d. Sums or rates payable on each head of cattle or stock on common lands.
e. Sums due on account of rentcharge in arrear before the passing of the Act.
f. Rentcharge from the lands of railway companies.

If, under a contract made before the passing of the Act, *i.e.*, March 26th, 1891, the occupier is liable to pay the rentcharge, the owner is to pay the amount, but can recover from the occupier the amount properly paid by him.

3. Section 8, sub-section (1) of the Act of 1891 runs as follows:—

> "Where a sum is claimed on account of tithe rentcharge issuing out of any lands, and the county court is satisfied that, if the sum claimed is paid, the total amount paid on account of the tithe rentcharge for the period of twelve months next preceding the day on which the sum claimed became payable will exceed two-thirds of the annual value of the lands as ascertained and entered in the assessment for the purpose of Schedule B. to the Income Tax Act, 1853, or as certified as herein-after mentioned, the court shall order the remission of so much, whether the whole or part of the sum claimed, as is equal to the excess, and the amount so ordered to be remitted shall not be recoverable: and if the court is satisfied that neither such remission, nor the liability thereto, has been taken into account in estimating the rateable value of the tithe rentcharge, the court may remit such amount of any then current rate assessed on the owner of the tithe rentcharge as appears to the court to be proportionate to the amount of the remission of tithe rentcharge."

This section does not apply to any lands other than those used solely for agricultural or pastoral purposes, or for the growth of timber or underwood.

In the case of lands, which, at commutation, were the subject of a special apportionment, that is, when the tithe rentcharge in respect of a larger area was, by the desire of the landowner, specially apportioned on a smaller area, so that the smaller area bears a greater proportion of rentcharge than it would otherwise have borne, remission is not to be granted unless the court is satisfied that the applicant would have been entitled to remission if no special apportionment had been made.

If the lands with regard to which application for remission is made are assessed to Schedule B. with other lands, the surveyor of taxes for the parish is, on the application of either owner or occupier, to divide the annual value stated in the assessment between the lands of the applicant and the other lands, and give notice of the annual value as so determined, to the applicant and the titheowner; and either of these

parties can, if dissatisfied, appeal to the General Commissioners of Income Tax for the division in which the lands are assessed.

If in any case the annual value is not ascertained and entered in the assessment under Schedule B., the General Commissioners of Income Tax for the division are, on the application of either owner or occupier, to ascertain the annual value and inform the applicant; and, on payment of 1s., they are to give a certificate of the annual value of any lands. The production of this certificate appears to be necessary to obtaining remission.

Appendix A. XVII.

APPENDIX XVIII.

Appendix A. XVIII.

EXTRACT from a REPORT of the TITHE COMMISSIONERS dated the 1st May 1838, as to the manner in which certain discretionary powers given to the COMMISSIONERS by the Act for the COMMUTATION of TITHES in ENGLAND and WALES ought in their judgment to be exercised, and as to the rules which seemed to them expedient to lay down for the guidance of Assistant Commissioners.

(*Handed in by Mr. T. H. Elliott. See Question* 39,043.)

Those discretionary powers enabled the Commissioners, while commuting tithes for rentcharges, to increase or diminish the amount of the tithe-owners' receipts or compositions by one fifth; and further enabled them, in certain special cases (each of which was to be separately reported on by them to one of Her Majesty's principal Secretaries of State), to disregard the past compositions altogether, and to award rentcharges with reference to the average rate which shall be established in respect of lands of like description, and similarly situated, in the neighbouring parishes.

The Commissioners thought it expedient to add the following remarks as to the proper mode of assessing the expenses incurred in certain processes of commutation.

On the Increase or Decrease of the receipts of Tithe-owners when the Tithes are commuted for Rentcharges.

"A demand for an increase or decrease of the average compositions for tithe, or the amount of receipts of tithe in kind, may have reference to the compositions generally, or especially to that part of them which, instead of being paid directly to the tithe-owner, has been paid for him as rates or taxes. With the exception of one class of cases, which shall hereafter be pointed out, whenever a party applies to have an addition made to the average compositions of the seven years preceding Christmas 1835, the Assistant Commissioner we think should, as a preliminary and indispensable step, require the tithe-owner to produce proof that the value of the titheable produce during that seven years exceeded the amount of the compositions, after deducting the expenses of collecting and making due allowance for the inferiority in value produced by the mixture in the tithe-owners' samples, and by the hazard and damage incident to his mode of collecting and housing his produce. When such proof has been adduced, the tithe-payer may support the reasonableness of the composition; first, by showing any facts which make it probable that, if the tithe had been taken in kind, or if a higher rate of composition had been demanded, the average titheable produce would have been less than it was, to an extent which made the actual compositions a reasonable equivalent for the rights of the tithe-owner; or, secondly, by proving any facts which make it probable that the amount of titheable produce raised during the seven years, which are to govern the average, was only a temporary, and was not likely to be a permanent production.

"We are somewhat reluctant to attempt any enumeration of the facts, or classes of facts, which might be produced in proof of either of these propositions, because we do not wish to narrow the discretion of the Assistant Commissioners, who, when on the spot, will be the best judges of the nature of the evidence calculated to throw light on each particular case.

"In order, however, to make our own views more intelligible, we will point out some of the facts, which, it may be assumed, will be the most commonly relied on, without meaning to exclude others which may at any time appear to the assistants to bear upon the cases immediately before them. Proof may be received, we think, on the part of the tithe-payer, that the collection of tithes in kind would have been more than ordinarily troublesome and expensive; that difficulties as to roads and markets would have reduced the value of the titheable produce when collected more than usual; that unusual and expensive crops have been grown on the faith of continued compositions; that an unusually expensive system of tilling and manuring has been adopted on the faith of continued compositions; or that peculiar facilities exist for changing the culture from arable to grass. If one or more of these, or any analogous circumstances, satisfy the Assistant Commissioner that the compositions, though not representing the full value of the titheable produce, were still a fair equivalent for the rights of the tithe-owner, he should refuse to increase the rentcharge. If, after making full allowance for all such circumstances, he thinks the average compositions fell below a fair equivalent for the rights of the tithe-owner, he should increase the rentcharge, by adding to the average compositions either a whole fifth of their amount, or such a proportion of that sum as appears to him reasonable'

"When a tithe-payer applies to have the average of the compositions, or the amount of receipts of tithe in kind diminished before a rentcharge is declared, it will be for him to show, either, first, that the compositions have actually exceeded the real net value of the titheable produce during the seven years; or, secondly, that there is valid ground for believing that the cultivation and produce would not have continued to be what it was during the seven years preceding Christmas 1835, if the full rate of past compositions had continued to be exacted.

"The Assistant Commissioner may receive in evidence any facts which tend to establish either of these propositions. Two are obvious. Land may have been laid down to grass during the seven years preceding Christmas 1835, or, indeed, at any time before the passing of the Tithe Act, under circumstances which make it probable that it will continue in grass; or, the cultivation, the produce, and the compositions may have been gradually and continuously declining during the seven years preceding 1835, and the decrease may be likely to be permanent. If these or any analogous circumstances satisfy the Assistant Commissioner that the average compositions or net receipts of tithe in kind of the seven years preceding Christmas 1835 would form a rentcharge which would be more than an equivalent for the rights of the tithe-owner, he will diminish the rentcharge either by a whole fifth of the average amount of the compositions or receipts, or by such a proportion of that sum as appears to him reasonable. If he is not so satisfied he will refuse to diminish the rentcharge.

"Where tithe has been taken in kind continuously and for a considerable period, it may be assumed that the cultivation of the land has been accommodated to that state of things. In such cases the Assistant Commissioner will only have to make proper allowances for the expenses of collection, and for the inferior value (as compared with other produce) of tithe produce collected and housed by the tithe-owner. But when tithe has been taken in kind unexpectedly, discontinuously, and for a portion only of the seven years preceding Christmas 1835, then the titheable produce may have been greater, because the actual cultivation had been adopted on the faith of a continued composition. In such a case we are of opinion that the average should be amended and lowered by substituting for the receipts of these years the succeeding compositions, or, if there have been no succeeding compositions, then such a composition as may appear to the assistant would have been reasonable under the

circumstances. It must be understood, however, that this substitution is not to be carried so far as to reduce the rentcharge by more than one-fifth of the average receipts, for that would be exceeding our powers. Subject to this limitation the average obtained by such a substitution should still be open to objection as too high or too low to be perpetuated.

"We have already intimated that there is one class of cases in which the tithe-owner, making an application for an increase, should not be obliged, as a preliminary step, to prove that the actual net value of the titheable produce during the seven years preceding Christmas 1835 exceeded the amount of the compositions.

"In making this exception from the general rule, we had in view certain cases in which the accounts of the seven years may show a progressively increasing amount of titheable produce, arising from the spread of tillage, from improved, though not unusually expensive farming, from the restoration of lands to a productive state, which litigation and doubtful productive ownership or the misfortunes of the occupiers had caused to be temporarily neglected or abandoned, or from analogous causes. In some such cases the Assistant Commissioner may have a decided conviction that the increased production will be permanent, and is not dependent on the continuance of the average rate of past compositions or receipts. In such cases we are of opinion that grounds would be laid for an addition to the rentcharge to the extent of one-fifth of the compositions or receipts for tithe in kind, or some portion of that sum; as in the corresponding case of a progressive decrease of titheable produce from the decreasing breadth of arable land, or from other causes, we have already stated that grounds would be laid for a reduction of the average of the compositions or amount of receipts, whenever the assistant is satisfied that the decrease in the produce is likely to be permanent.

"We have pointed at the facts or rather classes of facts best calculated to guide the decisions of the assistants when they are called on to increase or diminish the average compositions, and in many cases direct evidence of such facts may be adduced sufficient to satisfy their minds, but this will not be the case in all. In many instances it may be impossible to obtain direct and satisfactory evidence as to the alterations which would have taken place in the efficiency or the modes of cultivation if a higher rate of composition had been demanded, or if tithes had been taken in kind. The assistants will diligently obtain all the local information possible and carefully weigh all such evidence as may be adduced by either party, and still considerable doubts may remain on their minds as to what effects a more rigorous exaction of tithe would have had on the produce. In all such cases of doubt, it appears to us clear that the rates of composition which they find prevailing in neighbouring parishes similar in quality and position ought to have considerable weight in determining their decisions. Circumstances which it may be impossible to detect in an examination of a few days have in many cases influenced in the long run the rates of composition in large districts, and accommodated those rates to the inferior state of cultivation which would gradually have followed any attempt on the part of the tithe-owner to have exacted his full legal rights. In districts in which numerous cases of voluntary commutation have already occurred, the rentcharges established by the parties themselves will, of course, afford a yet safer standard of comparison when the assistant is called on to decide cases which the direct evidence adduced has left doubtful.

"Circumstances connected with the payment of parochial rates may occasionally form a special ground for applications to increase or diminish the sum formed by the joint amount of compositions and rates. We understand the main object of the Tithe Commutation Act to be to perpetuate in the form of rentcharges the sums which the parties themselves have treated tithes as worth during the seven years preceding Christmas 1835, with the exception of certain special cases, and subject to a variation in all to the extent of one-fifth of the whole of such sums. While doing this it is also the purpose of the Act to put upon exactly the same footing the tithe-owners who have paid their own parochial rates and the tithe-owners whose rates have been paid for them by the tithe-payers. If, therefore, in two parishes, in both of which the tithes have been treated as worth 600*l.*, the tithe owner in one has received 600*l.* and paid his own rates, and in the other the tithe-owner has received 400*l.*, and 200*l.* have been paid for him as rates, that 200*l.* must be added to the 400*l.* to make up the tithe-owner's real average, and put him on a footing with his neighbour.

"There are cases, however, in which the tithe-payers, having contracted to pay rates for the tithe-owner, have proceeded to assess the tithes at a much smaller sum than they would have been assessed at had the rates been paid by the tithe-owner himself. This fact, of course, can only be established by showing the principle on which tithes had customarily been assessed in that immediate neighbourhood; and that being shown, a ground may be laid for adding something to the joint amount of rates and compositions, not strictly perhaps under the 20 per cent. clause, but because in all such cases the joint amount of the compositions, and of the rates which are shown to have been paid on the actual assessments, do not represent either the sums agreed to be paid by the tithe-payers, or the sums really paid by them when the greater amount of rates necessarily levied on their own farms, in consequence of the low assessment of the tithe, is taken into account. On the other hand, there are cases where the sums paid by the tithe-payers as rates on their tithe, represent larger sums than those which were in the contemplation of either party at the time the agreement between them was made; and form, with the compositions therefor, a larger sum than either party can be said to have treated the tithes as worth. These are cases in which unusual and therefore unexpected circumstances have swelled the rates in particular years beyond the amount of the expenditure of the parish for ordinary objects, and beyond the amount, therefore, which either party reckoned on at the time their contract was made.

"The rules which we have here established appear to us such as, when fairly and steadily applied to individual cases, will do justice to both parties. Our conviction is, that while doing such justice they will carry on the compulsory commutation very much in the spirit and with the results that have hitherto characterised the voluntary commutation. It appears from the Returns made to Parliament that the rentcharges fixed by voluntary agreement in the different counties have oscillated within moderate limits on each side of past compositions; and we believe that the rules which we now submit for the guidance of the assistant Commissioners will have the effect of making the rentcharges established by compulsory awards oscillate in a similar manner."

Special Cases.

"Special cases are cases reserved by the 38th clause of the Act for a separate adjudication. In these cases the past dealings of the parties are to be wholly neglected, and the rentcharges decreed are to be determined by the rentcharges established in lands of the like description, and similarly situated, in the neighbouring parishes. Such cases will probably be very much confined to the three classes enumerated in the Commutation Act; namely, cases of direct fraud and collusion; cases in which a great length of time has elapsed since the making a composition which remained in force during the seven years preceding Christmas 1835; and cases in which the parties have stood in some peculiar relation to each other, by which the free agency of one of them was restrained, or in consequence of which the composition nominally made for tithes was only part of a bargain including other property demised, and affords no evidence of the separate value of the tithes. But as we are in every case to report to the Secretary of State the grounds upon which we have reserved a parish for such separate adjudication, and as we are confined to the establishment of rentcharges limited by the rate of those fixed on similar land, in the neighbouring districts, we think the rule to those cases may, without any danger, and with some advantage, be put in a more general form; and that every case should be declared to be a special case in which it appears that, for some peculiar circumstances, the past compositions afford no evidence of what the parties themselves considered the tithe-owner's rights as worth during the seven years preceding Christmas 1835."

APPENDIX XIX.

TITHE COMMUTATION.

SUMMARY of the INFORMATION in the POSSESSION of the BOARD OF AGRICULTURE as to the COMMUTATION OF TITHE RENTCHARGE in certain PARISHES, with an ANALYSIS of the respective TITHE APPORTIONMENTS.

(*Handed in by Mr. T. H. Elliott. See Question* 39,084.)

Parish of High Laver, Essex.

It was stated at the award meeting that a survey of the parish had recently been made at the expense of the occupiers, and the area of arable land, meadow, wood, gardens, homesteads, &c., and of the roads and waste as ascertained by the survey, was reported. The figures given included the glebe, the total contents and annual value of which were separately stated.

Taking the receipts at 375*l.* and the rates at 75*l.*, 450*l.*, the landowners offered to consent, without further discussion, to a rentcharge of 500*l.*, the tithe-owner's agent having required a special case on the ground that his principal was and had been incapable of managing his own affairs.

The offer was refused, and the titheowner's agent then stated that the compositions had averaged 362*l.* 0*s.* 6*d.* during the previous seven years, and claimed an allowance of 73*l.* 10*s.* for rates, or a total of 435*l.* 10*s.* 6*d.*, an increase of 20 per cent. on this sum being required.

This would have given a rentcharge of 522*l.* 12*s.* 7*d.*, and after much discussion the landowners stated that they would offer no evidence against a rentcharge of 520*l.* This sum was awarded.

An analysis of the apportionment shows that the arable land in the parish was charged on the average at 6*s.* 2*d.*, the pasture at 4*s.* 10½*d.*, the wood at 1*s.* 5¼*d.*, and the miscellaneous lands at 6*s.* 7*d.* per acre.

Parish of Abbotts, Roothing, Essex.

In the award report the area of the parish and its division as between arable land, meadow and pasture, wood, homesteads, and gardens, and roads and lanes are stated. The total area and annual value of the glebe are also given. The average receipts for tithes during the seven years were stated to have been 325*l.*, and the average allowance for rates had been ascertained to have been 64*l.*, or a total of 389*l.*, to which no objection was made. An increase of 20 per cent., was then claimed by the titheowner under section 38 of the Act, on the ground that his compositions had been founded upon a quantity of 1,325 acres, whereas a recent survey of the parish had shown the real quantity to be 1,601 acres. The landowners having considered the statements of the titheowner then said if he would reduce his claim from 77*l.* 16*s.* to 61*l.* they would not bring forward any evidence against it. The titheowner assented, and a rentcharge of 450*l.* was thereupon awarded.

An analysis of the apportionment shows that the arable land in the parish was charged on the average at 6*s.* 3¼*d.*, the pasture at 4*s.* 8¼*d.*, the wood at 1*s.* 3*d.*, and the miscellaneous lands at 4*s.* 11*d.* per acre.

Parish of Grainthorpe, Lincoln.

At the award meeting a letter dated 6th June 1724 was put in, which described in considerable detail, "the custom of paying the tythes in the said parish." The titheowners were, however, not prepared to admit the correctness of the description, which they stated to be inconsistent with an Exchequer Decree of the 22nd year of the reign of Charles II. Several meetings were held, and eventually the landowners and titheowners "put an end to all disputes by mutually acceding to "a rentcharge of 900*l.*"

The award sets out the area of the parish and its division as between arable and meadow and pasture land, and enumerates certain instances which have been established.

An analysis of the apportionment shows that the arable land in the parish was charged on the average with 8*s.* and the pasture with 3*s.* 0¼*d.* per acre.

Darish of Hedon, East Riding, York.

At the award meeting the average payments were admitted to be 45*l.* 16*s.* 8*d.*, but notice was given on behalf of the titheowner that the average payments did not fairly represent the sum which ought to be taken for calculating the permanent rentcharge, and the titheowner claimed an increase.

All parties concerned in an increase of 20 per cent., or 9*l.* 3*s.* 4*d.*, making a total proposed rentcharge of 55*l.*; and at an appeal meeting no objections of any kind were made.

Subsequently a question was raised by the Tithe Commissioners as to the validity of one of the compositions, an alleged modus of 20*d.* an acre for the summer pasture of the lands lying outside a certain ancient foss or canal called the Old Haven, then filled up. This modus did not appear to have existed for a sufficient period to give it validity, and several further appeal meetings were held, the result being that the modus had to be treated as invalid.

The final award was:—

	£	s.	d.
Tithe compositions - - -	45	16	8
Rates on two-thirds of ditto, paid by occupiers - - - -	6	0	0
Land tax - - - -	0	16	0
Add one-fifth - - -	10	7	4
	63	0	0

The compositions included 2½*d.* for milk cows, 1*d.* for every stock of bees, 2*d.* an acre for the grazing of certain lands, as well as prescriptive payments and tithes in kind.

An analysis of the apportionment shows that the arable land in the parish was charged on the average with 15*s.* 3¼*d.*, the pasture with 2*s.* 10¼*d.*, and the miscellaneous land with 12*s.* 10½*d.* per acre.

Parish of Newchurch, Radnor.

	£	s.	d.
At the award meeting the compositions, which had not varied during the septennial period, were admitted to have been - -	138	7	0
The rates and taxes had been paid by the occupiers for the first six years, and by the rector for the seventh year. The average amount being admitted to be 12*l.*, six-sevenths of 12*l.* equals - -	10	5	8
	148	12	8

Notice was given by the rector under section 38 that the average receipts for the seven years did not represent the full value of the tithes, and he claimed an increase.

On the other hand, notice was given by certain of the landowners that the average compositions exceeded the just and true value of the tithes, and they claimed a decrease of 20 per cent. Evidence was given by the landowners in support of their claim, but it was so discrepant that the Assistant Commissioner decided to award the average receipts, namely, 148*l.* 12*s.* 8*d.*

At the appeal meeting objection was again urged, on behalf of the rector, to the amount proposed to be awarded, but after examination of the evidence tendered the award was adhered to.

An analysis of the apportionment shows that the arable land in the parish was charged on the average with 3*s.* 4¼*d.* and the pasture with 2*s.* 0¾*d.* per acre.

Appendix A. XIX.

Parish of Ashford, Devon.

The tithes had been compounded for on a method apparently based partly on produce and partly on a poundage rate, but the amounts of the compositions were nearly uniform during the seven years of average, the average receipts being 75*l.* 5*s.* 4¾*d.*

All parochial rates on the tithe were paid by the titheowner.

After a long negotiation an increase of about 10*l.* was agreed to, on the ground that the compositions were low, and the value of the tithes of pigs, geese, and honey not sufficiently accounted for; and a rentcharge of 85*l.* was agreed to by all parties.

A rough estimate showed that the value of the tithes in kind might have been expected to be about 84*l.*

An analysis of the apportionment shows that the arable land in the parish was charged on the average with 5*s.* 6½*d.*, the pasture with 3*s.* 6½*d.*, and the miscellaneous land with 6*s.* 4*d.* per acre.

Township of Houghton-le-Spring (Parish of Houghton-le-Spring), *Durham.*

The tithes had been compounded for, the average of the compositions being 236*l.* 3*s.* 6*d.* In addition the tithepayers had paid poor rates amounting to 25*l.* 3*s.* 1*d.*, making a total of 261*l.* 6*s.* 7*d.* In lieu of these compositions and of the tithes of the glebe land the parties agreed to a rentcharge of 344*l.* 7*s.* 1*d.*, of which 83*l.* was to be apportioned on the glebe lands, leaving 261*l.* 7*s.* 1*d.* to be paid by the tithepayers.

A rough estimate of the value of the tithes, if taken in kind, showed the net value to be about 355*l.* 11*s.* 8*d.*

An analysis of the apportionment shows that the arable land in the parish was charged on the average with 5*s.* 2*d.*, the pasture with 4*s.* 7*d.*, and the miscellaneous land with 6*s.* 4*d.* per acre.

Township of Aintree (Parish of Sefton), *Lancaster.*

A meeting was held for the purpose of making an award for this township. As a result of this meeting, it appears to have been considered that the tithes were worth more by 20 per cent. then the average of the seven years.

Finally the parties came to an agreement to commute by a rentcharge of 135*l.*, made up as follows:—

	£	s.	d.
Average of the seven years' receipts	109	4	8
20 per cent. added	21	16	11
Collecting, &c., 2½ per cent.	3	5	7
Small tithes and Easter dues	0	12	10
	135	0	0

This sum was ultimately admitted by the landowners rather than defend a lawsuit, which was considered to be the only alternative, and which there was some reason to apprehend might have upset the custom of taking one-eleventh for tithe corn, if not also the hay moduses.

The rough estimate of the value of the tithes, taking the corn tithe as one-tenth, and accepting the moduses as valid, gave a total of 134*l.* 3*s.* 0¾*d.*

An analysis of the apportionment shows that the arable land in the parish was charged on the average with 3*s.* 9½*d.*, the pasture with 3*s.* 3¾*d.*, and the miscellaneous land with 4*s.* 0¼*d.* per acre.

Parish of Appleshaw, Hants.

The tithes were compounded for. When the agreement was made the titheowner stated his average receipts to have been 202*l.* 4*s.* 10*d.*, as made up below, and it was unanimously agreed that the commutation should be fixed at 206*l.*, being an increase of 2 per cent.

	£	s.	d.
Total compositions in years of average	1,314	19	0
Less abatements made	152	4	0
	7)1,162	15	0
Average	166	2	1
Add rates paid by landowners	36	2	9
	202	4	10

It appeared by inquiry that had the tithes been taken in kind they would have closely approached the above figure, the net value being estimated as 203*l.* 8*s.*

An analysis of the apportionment shows that the arable land of the parish was charged on the average with 5*s.* 10½*d.*, the pasture with 7*s.* 8½*d.*, the wood with 1*s.* 1½*d.*, and the miscellaneous land with 7*s.* 5½*d.* per acre.

Township of Nuthurst (Parish of Hampton-in-Arden), *Warwick.*

The tithes of this township were not taken in kind. The average compositions received during the seven years of average were 114*l.* 3*s.* 4¾*d.* To this was added a sum of 7*l.* 10*s.*, which it was admitted by the landowners had been omitted to be collected through an error of the agent. The rates were reckoned as 8*l.* 6*s.* 6*d.*

The parties agreed to a rentcharge of 132*l.*, of which 2*l.* was placed on the glebe land.

The inquiry appeared to show that if the tithes had been taken in kind the net receipt might have been expected to be 183*l.* per annum.

An analysis of the apportionment shows that the arable land of the parish was charged on the average with 4*s.* 8½*d.*, the pasture with 3*s.* 0½*d.*, the wood with 10*d.*, and the miscellaneous land with 7*s.* 4*d.* per acre.

Appendix A. XX.

APPENDIX XX.

Memorandum on Agriculture in Denmark.

(*Handed in by Mr. T. H. Elliott. See Questions* 39,304; 39,916; 39,922.)

1.—Information as to the general condition of Danish agriculture, and the distinctive and local features of the rural economy of Denmark may be found in the report supplied by Mr. H. M. Jenkins, one of the Assistant Commissioners to the Duke of Richmond's Commission of 1881–2 (C. 2,678–80). The same report refers also to the earlier growth of an export trade in certain agricultural products between Denmark and the United Kingdom.

Later details have, from time to time, been furnished in the Diplomatic and Consular Reports published by the Foreign Office, and from these, together with the official publications of the Danish Government, the Board of Agriculture prepared, in 1892, a special report on the Danish dairy industry, which was published, together with similar reports relating to Sweden and Germany, in (C. 7019).

From the information thus available, supplemented and brought up to date from more recent Danish publications, the present memorandum has been compiled, dealing with the steps, both educational and administrative, which have been taken by the government of Denmark to develop the export trade in dairy produce, live stock, and bacon from that country.

2.—The territory of Denmark covers an area of about 9,350,000 acres, and the total population at the last

census, February 1890, was 2,185,335, comprising 723,547 in urban districts, and 1,461,788 in rural districts.

3.—According to the official returns of 1888, the cultivated area is about 7,000,000 acres. The relative importance of the different crops may be seen from the following statement of the distribution of the arable and pastoral acreage at different periods:—

Description of Crops.	Acreage, 1871.	Acreage, 1876.	Acreage, 1881.	Acreage, 1888.
Wheat	140,200	152,701	137,818	119,691
Barley	750,430	760,492	781,408	734,844
Oats	914,257	940,448	991,394	1,050,456
Rye	611,029	625,668	660,065	692,587
Buckwheat	49,159	54,167	46,814	55,855
Beans and Peas	87,438	89,461	70,409	42,594
Mixed Corn	134,617	179,618	226,772	333,377
Total corn crops	2,687,130	2,802,555	2,917,680	3,029,404
Potatoes	105,882	104,240	110,306	128,849
Turnips, Beet, and other Roots.	13,876	23,157	46,683	130,439
Colza	4,284	1,384	2,743	1,149
Spergula	4,689	5,074	29,159	46,779
Flax, Hemp, Hops, &c.	14,553	8,935	7,045	5,599
Clover and Grass under rotation.	334,516	403,158	396,418	456,585
Grass meadows and permanent pasture.	2,647,492	2,664,445	2,766,766	2,625,865
Bare fallow	585,729	610,883	638,116	637 696

4.—The most striking feature in the foregoing statement is the increase in the areas devoted respectively to oats, mixed corn, spergula (spurrey), roots, and clover and rotation grasses, and it is to be noticed that this extension of the cultivation of fodder crops has been accompanied by a corresponding development of the number of horses, cattle, and swine reared in Denmark.

5.—The estimated numbers of live stock from 1871 to 1893 are shown below:—

Year.	Horses.	Cattle.	Sheep.	Swine.
1871	316,570	1,238,898	1,842,481	442,421
1876	352,262	1,348,321	1,719,249	503,667
1881	347,561	1,470,078	1,548,615	527,417
1888	375,533	1,459,527	1,225,196	770,785
1893	410,639	1,696,190	1,246,552	829,131

The number of cows in the census years since 1871 may be shown as follows:—

Years.	Number of Cows.	Number per 1,000 of the Population.
1871	807,513	448
1876	898,012	474
1881	898,790	452
1888	954,250	448
1893	1,011,098	449

6.—Although the steady increase in the numbers of horses, cattle, and pigs has been accompanied by a great augmentation of the arable acreage under fodder crops, the development of the dairying industry and, in a lesser degree, of pig-keeping has created a greater demand for natural and artificial feeding stuffs than could be satisfied by the productive capabilities of the kingdom.

7.—This will be evident from the following table, showing the net imports into Denmark of bran and oil-cake since 1878–79.

Year.	Bran.	Oil-cake.
	Lbs.	Lbs.
1878–79	12,430,000	13,750,000
1879–80	30,910,000	34,287,000
1880–81	85,635,000	47,509,000
1881–82	85,712,000	48,565,000
1882–83	73,161,000	43,032,000
1883–84	143,825,000	57,177,000
1884–85	176,233,200	71,577,000
1885–86	121,121,103	52,002,967
1886–87	200,457,400	95,559,100
1887–88	215,627,500	141,695,719
1888–89	233,502,465	147,994,155
1889–90	263,055,089	136,564,307
1890–91	177,916,190	173,328,143
1891–92	189,948,205	133,778,981
1892–93	194,411,472	150,437,994

8.—The export trade of Denmark in agricultural produce is mainly confined to animals, animal products, and barley. The net exportation of these articles for a series of years is shown in the statements below:—

Year.	Cattle.	Sheep.	Swine.
	No.	No.	No.
1882–83	110,336	80,457	323,230
1883–84	104,103	79,948	317,730
1884–85	88,761	47,379	193,377
1885–86	79,019	55,774	198,647
1886–87	87,788	53,685	259,088
1887–88	77,297	26,255	60,745
1888–89	87,542	55,737	24,914
1889–90	125,992	50,201	67,315
1890–91	95,407	26,462	200,361
1891–92	95,101	17,872	197,148
1892–93	77,685	1,521	53,885

Year.	Butter.	Bacon.	Barley.
	Lbs.	Lbs.	Bushels.
1882–83	29,319,382	13,090,000	2,617,393
1883–84	28,614,678	28,490,000	129,366
1884–85	27,241,737	21,120,000	1,019,255
1885–86	35,457,206	21,890,000	2,391,256
1886–87	38,592,646	30,800,000	2,443,084
1887–88	51,950,236	65,780,000	2,227,503
1888–89	56,884,643	71,940,000	1,018,065
1889–90	72,042,593	64,460,000	579,739
1890–91	77,610,187	62,040,000	1,545,539
1891–92	75,960,038	78,540,000	731,823
1892–93	78,956,086	84,150,000	1,195,905

9.—As regards the exports of bacon, it may be observed that the sudden increase in 1887–88 was coincident with the establishment of co-operative bacon factories in Denmark. The first organisation of this kind was formed in 1887 by a number of farmers in the Horsens district. In view of the success which had already attended the application of co-operative principles to the dairy industry, the new venture was regarded with much interest by the agricultural community, and companies were hastily formed in several districts for the erection of similar establishments. The closing of the German ports to live swine from Denmark in the winter of 1887–88 afforded a further impetus to the movement, and bacon factories sprang up rapidly in all parts of the country, so that by the end of 1890 there were 34 of these establishments, of which number 17 had been erected by co-operative associations of farmers.

The remarkable and rapid growth of the exports of butter may render it desirable to state in more detail the circumstances under which this trade has developed.

Appendix A. XX.

Dairy Industry in Denmark.

10.—The importance of fostering the dairy industry in Denmark was first recognised by the Royal Danish Agricultural Society, and the encouragement offered by this society, subsequently seconded by State aid, induced a number of eminent scientific men to undertake a series of investigations with the object of determining rational principles for the various processes of dairying. As a result of these inquiries the thermometer and scales were adopted as indispensable appliances in properly managed establishments, and a reliable and detailed method of book-keeping was gradually introduced. These useful innovations were followed by the organisation of a systematic and thorough scheme of practical instruction in dairy management.

About 1870 it became usual to cream the milk in deep cylindrical tin vessels by means of ice. Numerous exhibitions throughout the country aroused the interest of farmers, and helped to bring under their notice the improvement and development of which the industry was capable. The manufacture of machines and utensils used in dairy farming, and the exports of butter, colouring substances, and rennet, as well as of dairy appliances, began to assume considerable proportions.

Agriculturists next directed their attention to the selection, feeding, and management of their cows. Autumn calving made it possible to produce large quantities of butter in the winter. Large owners and farmers showed the way to this reform and the small men soon followed.

11.—A further impetus was given to the dairy industry by the adaptation of centrifugal power for obtaining the cream from the milk. At the present time steam centrifugal separators are employed in all parts of the country by large proprietors and farmers. The dairies are either run by landowners who buy up milk from small farmers and occupiers (*Fællesmælkerier*), or co-operative societies (*Andelsmælkerier*) are formed by the farmers themselves for the purpose of establishing factories, to which the milk is consigned by the shareholders and made into butter.

Separated milk is sometimes retained at the dairies, and made up into skim-milk cheese, but it is more frequently used for feeding swine and young stock.

12.—The manufacture of cheese in Denmark is chiefly confined to the production of various forms of skim-milk cheeses for local consumption, and is not yet of sufficient importance to require detailed notice.

Trade in Butter.

13.—Until about the year 1880 the butter produced in Danish dairies was delivered to local dealers or agents, who afterwards disposed of it through a broker to the wholesale exporters. But with the increasing demand for Danish butter in England, the export merchants found it to their advantage to negotiate directly with the producers. The middlemen have gradually disappeared, and as the weekly trade communications have become reliable and regular, the exporters have arranged for the delivery of the butter from the dairies. The various deliveries of butter are graded according to quality, and the product is then ready for direct export to England.

14.—Having thus dispensed with the services of the middleman at home, the Danish exporters appointed by the State, subsequently succeeded in avoiding the English commission agents by entering into direct business relations first with the wholesale butter merchants, and later with the retail dealers in this country. The trade is now arranged in such a manner that the English merchants and dealers telegraph their orders weekly on Thursday to the wholesale exporters in Denmark, and the butter is despatched by steamship on the following day. The freight is paid by the purchasers, and the price is regulated by the Copenhagen quotation on the day of shipment. M. Böggild, in his work on the Dairy Industry of Denmark, says that this arrangement has three advantages: in the first place, the risk is avoided of the butter remaining unsold in the hands of a commission agent; secondly, the agent's commission of two or three per cent. is saved; and finally, the English purchaser is sure of receiving the article in such quantities as he requires.

15.—The market price of Danish butter is fixed by a committee at Copenhagen. The committee meets every Thursday to fix the wholesale price of butter for the ensuing week, this being a fair price arrived at after taking the quotations of foreign markets and other factors into consideration.

The following table, taken from a report by M. Böggild,* gives the average of the highest weekly prices, wholesale, in each month of the last 10 years.

* Tidskrift for Landökonomi, 1894.

Average Wholesale Prices per Lb. of the Finest Danish Butter.

—	1883–4.	1884–5.	1885–6.	1886–7.	1887–8.	1888–9.	1889–90.	1890–1.	1891–2.	1892–3.
	s. d.	*s. d.*	*s. d.*	*s. d.*	*s. d.*	*s. d.*	*s. d.*	*s. d.*	*s. d.*	*s. d.*
November	1 3½	1 2½	1 1½	1 1	1 0½	1 0½	1 0½	1 1	1 1½	1 1
December	1 3	1 2½	1 0¾	1 1¼	1 0½	1 1½	1 0¾	1 0¾	1 1½	1 0½
January	1 2½	1 1½	1 1	1 0½	1 0	1 0½	0 11¾	1 0½	1 1¼	0 11¾
February	1 3	1 0¾	1 0¼	0 11½	0 11¾	1 1	1 0	1 0	1 1	0 11
March	1 1¾	1 0¾	0 11½	1 0	0 11¾	1 0½	0 11¾	1 0¾	1 0½	0 11
April	1 0¾	0 11¾	0 10½	0 10½	0 10	0 10¾	0 11½	0 11	0 11	0 10½
May	0 11½	0 10½	0 10	0 9¼	0 9½	0 10¼	0 10	0 9½	0 11	0 9¾
June	0 11	0 10¼	0 9	0 9½	0 10½	0 10½	0 9¼	0 9¾	0 10½	0 10¼
July	0 11¼	0 10¾	0 10½	0 11	0 10¾	0 11	0 9¼	0 10¼	0 10¾	0 11½
August	1 0½	0 11¾	0 10¾	1 0¼	0 10½	0 11	0 10	0 10¾	0 10¾	0 11½
September	1 1¾	1 1	0 11½	1 0½	0 10¾	0 11¼	0 11¼	0 11½	0 11¾	1 0¾
October	1 3¼	1 1¾	1 1¼	1 1¼	1 0¼	1 0	1 0½	1 1	1 1¼	1 0½

Attention is directed by M. Böggild to the fact that these prices do not always represent the highest prices paid, as in 1888 several dairies received 1*d.* per lb. in excess of the highest wholesale quotation, and in more recent years many dairies producing butter for export have regularly received from ¼*d.* to ¾*d.* per lb. over the Copenhagen quotation.

16.—In the winter of 1888–1889 an association of about 100 co-operative dairies was formed in Zealand and Lolland, with the object of exporting butter direct from the dairies to England without the intervention of the export merchants. Agents have been appointed in England to whom the butter is consigned, and as the result of a spirit of competition, which has arisen between these representatives of the associated dairies and the export merchants at Copenhagen, the price of Danish butter to the English consumer has been considerably reduced. M. Böggild remarks that the facilities of export have contributed to the development of this consignment trade, which has injured the interests of the butter exporters and can scarcely have been of advantage to the producers.

17.—Denmark's exports and imports of butter are shown, in English equivalent weights (1 Danish pund = 1·102 lb. avoirdupois), in the following tables:—

Net Exports of Butter from Denmark.

Years.	Net Exports.
	Lbs.
Average 1865–9	9,669,771
„ 1870–4	18,762,324
„ 1875–9	23,517,401
„ 1880–4	24,445,625
Single year 1884–5	27,242,000
„ 1885–6	35,457,000
„ 1886–7	38,592,000
„ 1887–8	51,950,000
„ 1888–9	56,884,000
„ 1889–90	72,043,000
„ 1890–1	77,610,000
„ 1891–2	75,960,000
„ 1892–3	78,956,000

It may be interesting to show the figures for the last three years in more detail; these are given by M. Böggild, in a report* to the Royal Agricultural Society of Denmark, as follows:—

Imports of Butter into Denmark in the Years 1890–1, 1891–2, *and* 1892–3.

Countries.	1890–1.	1891–2.	1892–3.
	Lbs.	Lbs.	Lbs.
From Sweden	10,767,000	12,120,000	13,105,000
„ Russia	9,197,000	8,738,000	10,252,000
„ Germany	2,312,000	2,832,000	2,714,000
„ America	1,165,000	299,000	—
„ England	409,000	251,000	303,000
„ other countries	98,000	17,000	103,000
Total	23,948,000	24,257,000	26,477,000

Exports of Butter from Denmark in the Years 1890–1, 1891–2, 1892–3.

—	1890–1.	1891–2.	1892–3.
	Lbs.	Lbs.	Lbs.
To England	98,348,000	97,680,000	102,008,000
„ Germany	1,832,000	1,457,000	2,078,000
„ Sweden	585,000	285,000	780,000
„ Norway	290,000	387,000	198,000
„ Holland	236,000	107,000	146,000
„ other countries	267,000	299,000	222,000
Total	101,558,000	100,215,000	105,432,000

From the foregoing table it will be seen that about 97 per cent. of the total quantity of butter exported from Denmark in 1890–93 was shipped to the United Kingdom.

Co-operative Dairies.

18.—The development of the dairy industry in Denmark has been accompanied by a remarkable extension of the co-operative system. This system has been adopted to meet the want of organisation felt by the farmers, and has proved eminently successful so far as the dairies are concerned.

It is estimated by M. Böggild that there are now about 1,000 co-operative dairies in existence throughout the country. In nearly all cases the farmers who produce the milk are also the owners of the dairy buildings and plant. The milk is always paid for by weight and not by measure, but in many dairies, between 300 and 400, the price is also regulated by the percentage of fat in the milk.

19.—In a work published in 1887,* M. Böggild furnishes several copies of the articles of association of co-operative dairies. The following specimen may be regarded as typical of the lines upon which these associations of dairy farmers are constituted.

Articles of Association.

Par. 1.

The object of the co-operative association is to erect a dairy and to provide the members with the highest possible profit on their cows, by separating the milk in centrifugal separators and manufacturing the cream into butter for sale, while the separated milk shall be made into sufficient skim-milk cheese to supply the requirements of the members and the neighbourhood, and the remaining separated milk, butter-milk, and whey shall be sold to the members at a fair price.

Par. 2.

Any person holding milch cows may be admitted to the association, provided two-thirds of the members vote in favour of his admittance, but any member admitted after the association has begun its operations shall pay an entrance fee of 5*s*. 6*d*. per cow. Every member has as many votes as he has cows.

Par. 3.

The directorate of the association shall be elected by the members, and shall consist of five directors, who shall choose from among themselves a chairman, a secretary, and a treasurer, but these three offices must never be combined in one and the same person. The directorate shall represent the interests of the individual members in all matters concerning the association, and the signature of the directorate is absolutely binding on the association. One director shall retire every year; in the first five years of the association he shall retire by ballot, but afterwards in rotation; he is eligible for re-election. The directors receive no remuneration, but they may employ a book-keeper, whose annual salary shall be at the rate of 6*d*. per cow, and they have the right to take any sums from the funds of the dairy for the payment of expenses incurred on behalf of the association.

Par. 4.

The highest authority is vested in the general meeting, which shall be regularly held in the month of February, when every question at issue between the directorate and the members, or between members, shall be finally settled. At this meeting the directorate shall present the account and balance sheet of the previous year, and a statement of the proposed operations for the ensuing year. The meeting shall proceed to the election of a new director, an accountant, and an auditor (the auditing shall be carried out by two members of the association, one of whom shall retire each year). An extraordinary general meeting may be called whenever the directors consider necessary, or when three-fourths of the members hand in a written request to that effect. No general meeting shall be valid unless at least two days' notice thereof has been given in writing or printing to every member, together with a list of the subjects to be discussed. Members can introduce special subjects, but a decision can only be taken thereon when such subjects have been formally recognised, otherwise the decision must be deferred till the next meeting. Alterations in, or additions to, the articles of association, and resolutions to liquidate the association can only be carried when three-fourths of the total votes are recorded in favour thereof. All other matters and election of officers shall be carried by a simple majority.

Par. 5.

The directorate is authorised to contract a loan for the erection of the dairy and purchase of plant. For the repayment of this loan every member is held liable

* Tidskrift for Landökonomi, 1894.

* Andelsmœlkerier.—Meddelelser samlede og bearbejdede af Bernhard Boggild, 1887.

Appendix A. XX.

in the proportion to the number of his cows, until the loan has been repaid.

Par. 6.

When a farm belonging to a member is sold, or otherwise transferred, the share in the dairy is sold therewith, provided that the new owner or tenant will accept all the rights and duties of his predecessor in respect to the dairy. In other cases the association shall pay to the outgoing member, or his heirs, or his creditors, one-half only of the amount of his share. Until the debt on the dairy is paid off a member can only withdraw on giving up his farm. A member who desires to withdraw must give three months' notice to the directorate, and even then he shall only have a right to receive half the amount of his share. Any member expelled by a vote at the general meeting forfeits all claims on the dairy.

Par. 7.

The directorate may engage a dairyman, who shall manage the operations of the dairy and keep all the books with the exception of the cash book and minute book. The dairyman shall engage, pay, and board the assistants; of the latter there shall be at least one person experienced in dairying, and understanding the preparation of butter, and at least one must be acquainted with the management of the machines. The dairyman shall receive a small fixed salary quarterly as well as free lodging, with a garden, light, and firing, and sufficient butter and cheese to meet the requirements of himself and his family; he shall also receive a commission on every hundred pounds of butter sold at a satisfactory price.

Par. 8.

The milk shall be paid for according to its fat contents, which shall be determined by the dairyman; the milk will be weighed on its arrival at the dairy.

Par. 9.

In proportion to the quantity of milk he delivers every member is bound to take back the butter-milk and separated milk, and he shall pay for these by-products at the rate of one öre per lb. until the debt on the dairy is fully paid off. Later, the general meeting will decide every year at what price these by-products shall be sold to members, but as a rule the actual value shall be paid. Cheese must only be made in such quantities as will return the actual value of the milk used for the purpose.

Par. 10.

Any balance accruing under paragraphs 8 and 9 shall be devoted to covering the expenses of working and maintenance, while all the remainder is to be used in payment of the interest on, and the extinction of, the debt of the dairy. Losses on the other hand shall be borne by the members, each in proportion to the sum representing the quantity of new milk he has delivered.

Par. 11.

As soon as the debt on the dairy is paid off, the chairman, accountant, and dairyman shall take an inventory of the society's assets. The total value thereof shall be apportioned as shares among the members in proportion to the quantity of milk each has delivered since the foundation of the dairy. Thereafter the yearly profits are to be divided in such a way that in the first place five per cent. is paid on every share, and the remainder is to be distributed in proportion to the value representing the milk delivered by each member during the previous year.

Par. 12.

The dairy shall provide and maintain the necessary transport churns and shall undertake the transport of the milk to the dairy. If a member supplies less than 100 lbs. of milk daily, he must take the milk to the nearest high road along which the dairy cart runs. Quantities exceeding 100 lbs. will be fetched from the member's house, but he must keep the private road in good condition. The milk churns must be ready for delivery at the time fixed for the cart to call.

Par. 13.

Every member must keep his transport churns perfectly clean, and he must see that the milking is properly carried out, that all the milk is immediately passed through a strainer into the churns, and that the latter are placed in cold water which is changed when necessary. Milk from sick cows must not be sent to the dairy, and no milk must be sent until five days have elapsed after calving. It is the duty of the dairyman, when weighing the milk at the dairy, to see that it is fresh and good. If the churns are not clean or the milk not sweet, the dairyman shall on the first occasion give notice in writing to the member concerned. If these faults are not at once remedied the dairyman may refuse to receive the milk, and if the cans are repeatedly found to be improperly cleaned the member concerned shall be fined each time 2*s*. 3*d*. for every cow he holds. Members are not allowed to offer butter or cheese for sale, nor are they permitted to sell their milk to other dairies. But they may keep a sufficient quantity of milk to meet the requirements of their families, and they may give away or sell milk to the peasants in the neighbourhood who keep no cows, provided the interests of the association are not thereby injured. The members have the right to obtain butter for their families from the dairy at a price per pound equal to that which the dairy is receiving for the product.

Par. 14.

Members are bound to feed their cattle in such a way that the milk possesses no flavour which is likely to depreciate the quality of the butter. Cabbage, turnip tops, and kohlrabi tops must never be given to the cows. Turnips, kohlrabi, potatoes, rye, vetches, beans, as well as sunflower seed-cake, earth-nut cake, and similar foods, are not absolutely prohibited, but when such questionable or doubtful feeding materials are given to milch cows the member using them must notify the fact to the dairyman, in order that special attention may be given to the quality of the milk. If the milk, or cream, or butter is detrimentally flavoured thereby, it is the duty of the dairyman to notify the fact to the member concerned, and if no improvement is observed the dairyman may refuse to receive the milk. The chairman of the dairy and the dairyman can at any time prohibit the use of any fodder considered unsatisfactory. Any member who infringes such a prohibition shall be fined from 2*s*. 3*d*. to 11*s*. per cow, and pay for any damage or loss he may have occasioned as estimated by the chairman, accountant, and dairyman.

Par. 15.

In order that the members may obtain cheap and good feeding materials the directorate shall arrange for the purchase of such materials in bulk, and shall undertake the delivery of same to the members. In order to ensure that the butter may at all times have a satisfactory aroma, every member is bound to purchase as much rape cake as shall furnish at least 1lb. of the cake daily to every cow during the winter. Finally, the directorate shall seek by every means to get the members to adopt a good, rational, and economical system of feeding their cows, by arranging for the purchase and delivery of grass seeds, &c., so that such grasses and plants may be cultivated as shall have a beneficial influence on the quality of the butter.

Par. 16.

It shall be the duty and right of the directorate and of the dairyman, whenever they think fit, to visit the members' farms and to inspect the sheds, fodder lofts, and troughs, fields, milking sheds, &c., and the members must give them all necessary help and information. If it is afterwards found that a member has concealed anything, or given false information, he shall be fined from 2*s*. 3*d*. to 11*s*. per cow, and make good any loss or damage he may have occasioned.

Par. 17.

In order that no infectious disease may be spread through the dairy, and that the separated milk may be

of the greatest use to the members, the separated milk shall always be heated at the dairy in order to preserve it. If an infectious disease breaks out in the family, or among the stock of a member, the member must immediately cease to deliver milk at the dairy until the disease has disappeared and his farm has been properly disinfected. In the event of sickness among the staff of the dairy the dairyman shall have the sick person removed immediately and the dairy must be disinfected. Any infringement of this clause shall be punished by a fine up to 5*l*.

Par. 18.

It is the duty of the directorate to supervise the work of the dairyman and to take care that the dairy, together with the machinery and plant, is at all times in proper working order. It is especially the duty of the directorate, in the spring of each year, to see that the dairy and all machinery, &c., is thoroughly overhauled and repaired, so that the work may proceed in good order during the hot and busy summer season. Every spring after the repairs have been carried out, the chairman, accountant, and dairyman shall take stock of all the plant and fittings in the dairy so that the members may have an estimate of the value of the property and ascertain whether there has been any depreciation.

Par. 19.

It is the duty of the directorate to see at all times that the balance in cash is invested in some suitable manner for the benefit of the association. Once a month there shall be a settlement of the amounts due to the members for milk, after deducting the value of butter, &c., which they may have received from the dairy. The distribution of dividends and profits is made once a year after the accounts have been made up and the general meeting held.

Par. 20.

All matters not provided for in these articles must be brought before the general meeting, which alone can make changes in or additions to these provisions.

Commenting on the above rules, M. Böggild remarks that it is of the utmost importance to the success of the dairy that the dairyman shall be thoroughly competent. He should not only understand the manufacture of butter, but should also be able to keep the books, test the milk, check deliveries, &c.

Members of co-operative societies are recommended to thoroughly clean the transport churns in which the skim-milk and butter-milk are brought back from the dairy, using boiling water for the purpose. To spare soda, M. Böggild says that the churns can be scrubbed inside and outside with lime water, and afterwards rinsed out several times.

In the rules of most co-operative dairies, it is provided that the cows shall be milked dry. The hour is sometimes fixed at which the milk for domestic use is to be taken, and in several instances members are not allowed to take any milk out of the churns after it has once been strained into these receptacles. The dairyman is advised to be always on the alert to discover any addition of water, or of skim-milk, to the milk; but since the introduction of the system of paying for the milk according to its fat contents, there has been less necessity for vigilance in this direction.

M. Böggild observes that the regulations as to feeding should be arranged to meet the conditions of the district, but in any case they should not be more stringent than is necessary to ensure the good quality of the butter.

Education in Dairying.

According to the latest information at the disposal of the Board, there are in Denmark only three agricultural schools, where instruction is provided in the theory of dairying, and allied subjects. There are, however, a large number of school-dairies where the pupils are trained as apprentices in practical dairying. The good work being done by these schools and dairies is supplemented by lectures on the higher branches of dairy science at the Royal Veterinary and Agricultural College in Copenhagen.

The Government exercises no control over the dairies, nor does it directly support the dairy schools, but indirectly it assists them in many ways. Besides offering bursaries and scholarships, the State makes a large grant annually to the Experimental Laboratory for Rural Economics, this institution being mainly occupied at present in arranging a series of butter shows in which more than 400 dairies take part. Other special grants are made in aid of experiments. The State has also appointed three consulting dairy experts in Denmark, and one in England, with duties which will be described later.

20.—There can be little doubt that butter producers in Denmark have derived great benefit from the new system of butter shows, and it may be interesting to reproduce here a report, dated December 1889, by Mr. A. P. Inglis, who was Her Majesty's Consul at Copenhagen at that date,* in which valuable details are given respecting the organisation of these shows.

Dairy Shows in Denmark.

A very interesting series of butter shows has been organised by Professor Fjord, the well-known director of the dairy section of the Danish Agricultural Department, the first of which was opened on November 18, 1889.

It appears that the shows hitherto held had not been of much practical benefit, and with a view to maintaining the position of this country as a producer of first-class butter, and effectually tracing to their source any faults in manufacture, an entirely new system of shows has been started, in which a large number of dairies, dairy experts, and leading butter merchants of Copenhagen and the provinces will co-operate in endeavouring to advance the general interests. It is expected that the evidence and practical information thus collected can hardly fail to be most instructive to all concerned.

21.—In the printed prospectus, setting forth the aim and general arrangement of these shows, from which the following particulars are taken, Professor Fjord states that, while in many of the countries with which Denmark has to compete the most strenuous efforts are being made to improve and develop the yield of butter, the produce of that country has not gained in quality with the rapid increase in the number of associated dairies, whose members, he says, are often not competent to look after the important interests entrusted to them. Complaints, it seems, are not unfrequently heard of want of good-keeping qualities, and of the presence of water in butter; and now that the export of this article has become one of the principal sources of the country's income, it is held to be of the utmost importance that every means be taken to maintain the acknowledged position which it has acquired in the markets of the world, and it is contended that the readiest means to attain this end is to organise butter shows on the following plan:—

1. A continuous butter show will be held at the expense of the State during several months of each year, and a suitable building will be provided, where an even temperature can be maintained winter and summer.
2. Fresh samples of butter will be accepted every 14 days, to remain on exhibition until the judges have given their decisions; firstly, on the sample as received, and secondly, 14 days later. The casks of butter will be submitted to the judges in no particular order, and so arranged that it will be impossible for them to be guided in their decisions by any outward sign or mark.

   A visit made to the exhibition showed that every cask, on receipt, was weighed, first in bulk, and then the contents separately. The hoops at one end having been removed, the cask, with contents replaced, is lifted on to a funnel-shaped stand made of tin, in the bottom of which is a locked receptacle, containing a glass bottle, to receive the brine or water which percolates through the loosened staves. When the judges go their rounds, the cask itself is further entirely concealed from view in a tin cover secured by lock and key to the stand above mentioned. An aperture at the top allows the contents to be tested.

   In previous shows, held in 1888, it had been found that many samples of butter classed as "finest" did not after a short time merit that

* Foreign Office, Miscellaneous Series, No. 151, 1889, Report on New System of State Butter Shows in Denmark.

Appendix A. XX.

character. In order to obviate this objection there will in the present shows be two distinct testings, with an interval of two weeks.

The loss of weight frequently complained of, and which sometimes takes place during transport from the dairy to the merchant's warehouse, may arise, says Professor Fjord, from the water that comes from the butter-milk being imperfectly pressed out; this fluid, mixing with the salt, runs off in the form of brine, and constitutes a fault in manufacture, which ought not to occur. He remarks that it will now be an easy matter to determine the loss of weight during the fortnight that the casks remain on exhibition, and every facility will be afforded for ascertaining the cause of these defects.

3. Dairymen desiring to take part in the shows must, as soon as they receive a communication by letter or telegram, at once (*i.e.*, on the same day) send in a ready-made cask of butter, and undertake to repeat this as often as required. Butter sent in for exhibition must not be pressed or kneaded again after receipt of such notice. The dairyman in this way will be unable, as in previous shows, to make one special cask of butter with an exhibition in view. It is the dairy's ordinary produce which is to be submitted.

Competing dairies have, moreover, to send in a return of feeding and system generally followed on the farm, with especial reference to the week during which the cask was sent in.

It is expected that a comparison of the feeding in the different dairies will give a very valuable insight into the influence of certain foods on the quality of butter.

22.—The services of many of the leading butter merchants in Copenhagen and the provinces have been secured as judges. Of these, nine act at one time, so that six out of the nine take part in both first and second examinations. The nine are further sub-divided into three groups, each of which records an independent judgment on each cask of butter, without communicating with the other two. By each group thus giving an independent award, which will in its turn be subject to comparison with those of the other two groups, it is expected that greater care will be exercised, and that the final award will be invested with an authority it would not otherwise possess. Besides the butter merchants, three dairy experts will be employed, one acting in each group. These officers will thus have an opportunity of gaining a more accurate knowledge of the requirements of the trade: they will learn to recognise what are considered faults in manufacture, and be able to use their experience in the interests of the dairies. Great importance is attached to this working together of the various interests involved.

23.—Invitations to take part in the shows are sent to dairies equal to turning out at least three casks of butter per week, and therefore likely to have a cask ready when the invitation reaches them. The butter sent is paid for at current market price. The authorities also defray cost of carriage from the station or port nearest to the dairy. As the same dairy will send in butter several times in the course of the year, great facilities will be offered for ascertaining which are the best-managed dairies, or the reverse. It will then be seen where the art of butter-making can best be learned.

24.—The expenses attending these shows, which will be held at intervals of a fortnight during eight months of each year, are estimated at about 165*l.* per month, and the Government grant for the current financial year is about 1,350*l.*

24.—The following queries had to be answered by managers of competing dairies, with special reference to the show of December 2nd, 1889:—

1. How many pounds of sweet milk are daily made into butter in your dairy?
2. From how many cows is the milk drawn?
3. How many of these cows have calved since August 1st, 1889?
4. How many pounds of butter, of the same description as the sample now sent in, are made in the dairy daily?
5. Is the butter now sent in the produce of one day's churning? If so, which day? Or, of several days' churning? If so, which days?
6. How many pounds of milk were used to one pound of butter on the days referred to in query 5?
7. Is the milk set to cream in tubs? or pans? And of what kind? Are the tin pails set to cool in water without ice? or in water with ice? After how many hours is it skimmed? Is the milk churned?
8. Is a separator used? Is the milk warmed before being put into the separator? If so, to how many degrees of heat (Réaumur)? Is the milk cooled off at once after coming from the separator? If so, how? To what temperature? How much per cent. of cream is taken off?
9. Is saltpetre used? If so, how much to 100 lbs. of milk? or to 100 lbs. of cream?
10. With reference to souring cream, at what temperature does this begin? and terminate? How many hours did the cream stand? Is any ingredient used? If so, how is it prepared?
11. With reference to churning and kneading, at what temperature does churning begin? and terminate? How many minutes did the churning occupy? Is the butter when taken out washed in water? Is it washed a second time? How much salt is used per 1 lb. of butter? How often is the butter kneaded after salting? How many hours does the butter remain between salting and final kneading? At what temperature is the butter kept between each time of pressing?
12. Is the dairy satisfied with the quality of its butter? If not, are you acquainted with the nature of its defects? Was the butter merchant satisfied with the last consignment? If not, of what did he complain?
13. With reference to feeding, especially for manor farms, but may be answered by other dairies. Food for new milch cows? Food for old milch cows? Amount per day per cow of the following food stuffs:—Corn, bran, oil-cake, turnips, carrots, &c., turnip leaves, cabbage leaves, mangel leaves, ensilage, hay, straw, other food stuffs?

Queries for associated dairies:—What is the usual scale of feeding of milch cows on the farms from which the dairy takes its milk supply? Are any special conditions laid down as to feeding? If so, what are they? With reference to the use of roots as food for cows, how long had the roots been taken up before they were used? How long after milking were the roots given? Had the roots or leaves been lying in the stall during milking time?

N.B.—This form is to be filled in and returned within two days after receipt.

26.—It may be remarked that the Government is fully alive to the necessity of maintaining the high reputation of Danish butter abroad, especially in the English market, and to this end several laws have been enacted since 1885 for the regulation of the manufacture and sale of margarine and margarine cheese.

The last and most effective of these measures came into force in May 1891. It provides for the registration and inspection of all manufactories of margarine, and prohibits the sale of the article, except in properly marked receptacles of a certain shape. It prescribes moreover that margarine shall be of a lighter colour than butter, and forbids its use as an adulterant for butter, and its fraudulent sale as the genuine dairy product.

The full text of this enactment is contained in a report, dated May 1891, by Mr. Inglis, who observes that its wisely stringent regulations are rigidly enforced, and that any doubts as to the purity of Danish export butter may be safely laid aside.

27.—It may be noted that concurrently with the growth of the exports of butter there has been an increase in the consumption of margarine in Denmark. Butter of an inferior class from Finland is also now more largely imported for home consumption, thus setting free a corresponding quantity of Danish butter for export.

According to the *Ugeskrift for Landmænd* of the 19th October last, there were 16 margarine factories in operation in Denmark on the 31st March 1894 as compared with 19 at the same date in 1893. The total production of margarine from Danish factories in the year ended 31st March 1894 was 17,800,000 lbs., and the import of this article during the same period amounted to about 2,487,000 lbs.

28.—The export of margarine from Denmark is, however, practically "nil," so that about 20,287,000 lbs.

of margarine appears to have been consumed in Denmark in the 12 months ended March last, this being at the rate of about 10 lbs. per head of the population.

29.—The production of margarine cheese is on the decline the total output in the year 1893–94 is estimated to have been 33,000 lbs., as against 220,000 lbs. in the previous year. This decline is accounted for by the fact that the cheese has to be marked "margarine cheese," and this name is said to discourage customers from purchasing it.

Agricultural Experts appointed by the State.

30.—One of the measures adopted by the Danish Government with a view to aid the development of agriculture has been the organisation, with the aid of the Royal Danish Agricultural Society, of a body of consulting experts on different branches of agriculture.

In February and December, 1887, the Council of the Royal Agricultural Society of Denmark represented to the Ministry of the Interior the desirability, in view of the difficulties and competition with which agriculturists had to cope, of taking some steps to provide expert advice upon the different branches of farming pursued in the country. As a result of these representations the Government voted, in the spring of 1888, a sum of 800*l.* for the training of three experts to serve at home, and a further amount of 550*l.* annually for the appointment of a dairy expert to represent the interests of the Danish butter industry in the United Kingdom.

Since 1888 there has been a material increase in the sums annually voted for the organisation of this body of official agricultural advisers, the total annual expenditure by the State on this service being at the present time about 4,500*l.*

31.—According to the latest report of the Ministry of the Interior (1894), 17 consulting experts on the different branches of agriculture have already received official appointments. Two of these experts are stationed in the United Kingdom.

The State also affords assistance in the shape of grants to 19 consulting advisers attached to district agricultural associations.

32.—Until May, 1892, the Ministry of the Interior, while retaining a right of veto, delegated to the Royal Danish Agricultural Society the duties of administration connected with the work of the experts appointed by the State, but at the above date a special department for the control of the State experts was formed at the Ministry under the direction of Captain la Cour, formerly Secretary of the Royal Danish Agricultural Society. Objections to this system have been raised by the leading agricultural societies. Value, it was urged, lay in the old system, whereby a close relation was maintained between the agricultural experts and the agriculturists themselves through the medium of the central society, and fears were expressed that the change would eventually result in a loss of touch on the part of the Government officials with the conditions and requirements of practical agriculture.

The views of the societies were subsequently supported by Captain la Cour, and on April 28, 1894, the Government adopted a proposal submitted by the Ministry of the Interior to the effect that the superintendence of the work of twelve of the consulting experts appointed by the State should be again delegated to the Royal Danish Agricultural Society; the remaining five, viz., Professors Segeloké, Rostrup, and Boas, who are the State advisers in dairying, botany, and zoology respectively, and the two officers stationed in the United Kingdom, are responsible directly to the Ministry.

33.—Of the 12 State consulting experts working under the direction of the Agricultural Society, three are experts in dairying, one is an agricultural chemist, three are in charge of agricultural experiment stations, one deals with questions on horse breeding, two are experts in live stock, one is an agricultural engineer, one is an expert in horticulture.

34.—The nature of the duties performed by these gentlemen may be gathered from the text of their instructions. Extracts are given below from the instructions issued to the consulting experts in dairying and live stock.

Instructions for Consulting Dairy Expert.

1. The duties of the consulting dairy adviser shall lie chiefly in Zealand, Lolland-Falster, and neighbouring islands, including Bornholm and Samso. Upon application being made to him, he shall assist, by direct advice and actual supervision, the operations and processes of production in the dairies, and shall assist local associations formed with the object of promoting the dairy industry wherever his assistance is desired.
2. He must keep a book wherein he must enter a short summary of all applications made to him, in the order in which he received them, together with a short account as to the time occupied and the importance of the matter on which his advice was sought.
3. For guidance on all doubtful matters and questions of administration he must address himself to the Royal Danish Agricultural Society, who shall determine his plan of operations and supervise his work, and whose approval he must obtain before publishing any paper, report, or communication introducing new and untried arrangements. Applications he may desire to make to the Ministry should be sent through the same society, unless the Ministry shall find it convenient to enter into direct communication with him.
4. He must live in Copenhagen, and must keep the Agricultural Society constantly informed of his address.
5. Any dairy, association, or individual farmer receiving assistance from the consulting expert must pay his expenses to and fro (2nd class railway fare and 1st class steamer), as well as an allowance of 4*s.* 6*d.* per day, reckoning a half day from his house or from and to the dairy, and then until he quits the dairy requiring his services. Instead of this allowance the consulting expert can, if he likes, accept board and lodging in lieu of his allowance. In cases where he visits several dairies in one journey he must apportion his charges for travelling expenses amongst them. The fees are to be paid direct to the consulting expert, who shall give a receipt, and send the counterpart, attested by the signature of the party requiring his services, to the Royal Danish Agricultural Society.
6. The consulting expert is not allowed to receive a gratuity of any kind for the advice he gives, nor is he permitted to trade in dairy products, dairy appliances, materials, &c.
7. The consulting expert shall not, without special permission, give testimonials or recommendations either to persons desiring to find employment in dairies, or for appliances, materials, &c., nor shall he recommend butter or other dairy products.

35.—As already indicated, one of the two State experts appointed to act in England is chiefly concerned with the maintenance of the interests of Danish butter producers. His duties are given in the 1889 report of the Danish Ministry of the Interior as under:—

Duties of Consulting Expert in England.

1. You will seek to promote the reputation and sale of Danish agricultural products, especially dairy products, in the English markets by all existing means at your disposal, and when these do not seem sufficient you will propose fresh arrangements.
2. You must direct your attention to the conditions affecting the trade in and transport of Danish agricultural products, especially dairy products, both before the goods reach the English market and after they have arrived.
3. You will be required to contradict in the press, especially the English press, unjust and injurious assertions affecting Danish agriculture, especially the dairy industry and products; and you will endeavour to bring about a just appreciation of such products.
4. You will be on the look-out for fraudulent practices in England and elsewhere which may injure the reputation of Danish butter, as well as for cases of fraudulent use of the name Danish, adulterations of Danish butter with margarine and similar practices; and you will make the necessary representations as to the measures for preventing these fraudulent practices; to this end you will be provided with the necessary

Appendix A. XX.

apparatus (microscopical and chemical) to enable you to detect adulterations.

5. You will ascertain whether other advantageous markets can be opened for our agricultural products, especially dairy products.
6. Whenever there is occasion, and at least once a year, you will send, through the Royal Danish Agricultural Society, a report on the English market for agricultural produce, especially dairy produce, together with an account of your observations and experience respecting the requirements of consumers, the disadvantages or defects which may be detrimental to the sale of Danish agricultural products, especially dairy products, and the changes in the trade arrangements which appear to be desirable.
7. As far as possible you will be required to answer inquiries concerning agricultural and dairy matters which may be addressed to you by institutions or private persons in Denmark. You will also, as far as it seems to you to be useful to Danish interests, answer inquiries from English dealers in, and consumers of, Danish agricultural and dairy produce.
8. You must have no direct or indirect personal interest in the sale of Danish agricultural and dairy produce.

36.—The nature of the work performed by the State experts on live stock may be gathered from the following summary of the instructions issued by the Ministry of the Interior:—

Instructions for the Consulting Expert in Live Stock.

1. As consulting expert in live stock you will chiefly direct your attention to the improvement of Danish red cattle, you will keep yourself accurately informed as to the condition and requirements of this breed of cattle, you will assist both private individuals and institutions in their endeavours to improve this race, and you will endeavour by writing and by lectures to bring about the introduction of rational principles in all matters concerning the breeding and rearing and feeding of such cattle.

2. In the same way and with corresponding methods, you will endeavour to bring about a rational system of pig breeding in this country.

3. When diseases and defects of a nature hitherto unknown make their appearance, you will direct your attention to these circumstances, and, so far as special investigations may appear to you to be necessary, you will make proposals in that direction.

4. In addition to the duties mentioned above, you will have to become a member of the State Commission for Cattle Shows, and, so far as your duties as consulting expert will permit, you will undertake any work which may be entrusted to you by that Commission, or by its President. It follows from your position as a member of the Commission that you must always take care that your work as consulting expert is in harmony with the work of the Commission, and you will keep them informed, through the President, of any matters of special interest for the Commission which may come under your notice.

5. You must keep yourself, as far as possible, well informed of all movements inaugurated by local agricultural associations, cattle shows, committees, and breeding associations, or by other bodies, for the improvement of Danish red cattle, and development of pig breeding; and you will keep yourself conversant with all theories concerning live stock such as will enable you, in the best possible manner, to answer questions which may be put to you, and to furnish such reports as may be required by the Ministry, or by the Royal Agricultural Society concerning red Danish cattle and swine in Denmark.

6. In carrying out your duties as consulting expert, you must arrange your work in accordance with the regulations which will be given you, on behalf of the Ministry, by the Royal Danish Agricultural Society, and you will send your reports and other documents to the Ministry through that society except in cases where the Ministry may have found it necessary to enter into direct communication with you. You must keep the society constantly informed as to your address, and you must follow the instructions given you by the society concerning the arrangement of your work, and the keeping of your diary.

7. In the event of a Stud Book being organised, with the aid of the State, for Danish red cattle, you will be required, should the Ministry so desire, to aid in the preparation and carrying out of this work.

37.—The duties of the consulting veterinary expert stationed in the United Kingdom are contained in the following paragraphs extracted from the text of his instructions:—

Instructions for Consulting Veterinary Expert in England.

1. You will watch over the interests of Danish live stock imported into Great Britain, with a view to ensuring that the inspection which takes place on the shipping of the animals from Denmark is carried out in a satisfactory and thorough manner, such as will secure and maintain the confidence of the British authorities as to the healthy condition of our live stock.

2. You must constantly keep the Government informed, through the Royal Danish Agricultural Society, on all points to which it may be necessary attention should be given in this respect, and when the matter is of sufficient importance you will communicate by telegraph; in less important cases you may confine yourself to communicating directly with the veterinary surgeons concerned in Denmark.

3. In order that you may carry out your duties, permission has been obtained from the English Government that you may have access to the landing places and quarantine stations in the English ports. In this way you can inspect animals imported from Denmark, both live and dead, but in carrying out your inspections you must, in order to prevent any misunderstanding as to your mission, avoid interfering with inspections, which may be carried out by English veterinary surgeons, and you must especially refrain from making any criticisms thereon.

4. If the Diplomatic or Consular Representatives of Denmark in Great Britain should desire your assistance in connexion with any question, it will be your duty to afford such assistance to the best of your ability. These representatives will also be instructed by the Danish Government to afford you advice or assistance when you make application to them.

5. You must interest yourself in the English live stock industry, especially in respect of cattle, sheep, and swine, both with regard to breeding and feeding, as well as fodder and fattening. So far as possible you must investigate the different conditions of selling and buying in the English market, and you must furnish information as to the supply and quality both of live and dead meat. You also must follow movements in English agricultural circles and in the English Parliament which may have an influence on the importation from Denmark. On these points you must direct attention by reports, and on all questions which may be of importance for Danish interests. You must also furnish such information for societies or private individuals as you may consider is of general interest. In such cases the information must be transmitted to the parties concerned through the Agricultural Society, or a copy of the information must be simultaneously sent to the Society.

The other paragraphs of the instructions provide that the consulting expert shall have no direct or indirect interest in the trade in Danish cattle or in any other business, and also that he shall not undertake any practice as a veterinary surgeon for which he would directly or indirectly receive any honorarium.

PRESENT POSITION OF AGRICULTURE IN DENMARK.

38.—The position of agriculture in Denmark has recently formed the subject of an article in the *Tidskrift for Landökonomi* by Captain J. C. la Cour, who holds an appointment under the Danish Ministry of the Interior, as Director of the Department charged with the supervision of the agricultural consulting experts attached to the Ministry.

Captain la Cour, who was formerly Secretary to the Royal Danish Agricultural Society, states that the depressing influences, which have manifested themselves

for several years past in the agriculture of most European countries, have also been experienced in Denmark. The cause of the depression is attributed mainly to the fall in prices of live stock, cereals, and butter, brought about by foreign competition. Particular stress is laid on the increasing competition of Australia in the English butter market. Reference is also made to the prohibitions in force in the United Kingdom and elsewhere against the importation of Danish live stock, and to the general depression of trade and industry, as having led to a lessened demand for Danish produce.

In addition to the fall in prices, increased rates and taxes, and enhanced expenses of management and maintenance of holdings, together with the greater cost of labour, are mentioned as contributory causes of the present depression.

39.—As regards the increase in the wages of agricultural labourers in Denmark, it may be of interest to reproduce here some statistics compiled by Captain la Cour from reports collected from all parts of the kingdom. From these statistics, published in the *Tidskrift for Landökonomi*, it would appear that in 1893 the average wages of the different classes of labourers employed on Danish farms were as under:—

—	Summer.	Winter.	Harvest.
	s. d.	*s. d.*	*s. d.*
Day farm labourers, without board.	1 4½	2 1½	2 5½
Day farm labourers, with board -	0 8½	1 4	1 8½

Farm labourers engaged by the year.	£ *s. d.*	£ *s. d.*	Total wages per annum. £ *s. d.*
Adult male labourer - -	3 9 2½	7 15 10½	11 2 8½
Cowman or herdsman - -	—	—	11 5 1½
Dairymaid - - - - -	2 14 2	3 14 2½	6 1 6½
Housemaid - - - -	2 8 6½	3 9 1½	5 12 10½

* These rates are given in English currency, taking the krone as equal to 1*s.* 1*d.*, the current rate of exchange.

In 1893 wages were highest in Fyen, West Jylland, and Schleswig, and lowest in the Hjorring, Aalborg, and Thisted districts.

40.—The difference in the wages of an adult labourer in these districts ranges from 43*s.* 4*d.* to 65*s.* yearly. It seems that complete statistics of annual average wages for the whole kingdom are wanting for earlier years, so that a comparison can only be made for certain districts. Captain la Cour offers a statement of the wages of labourers engaged by the year in Fyen in 1872, 1883, and 1893, as follows:— Appendix A. XX.

Year.	Adult Male.	Woman.
	£ *s. d.*	£ *s. d.*
1872 - -	7 11 8	4 1 3
1883 - - - -	9 4 2	5 19 2
1893 - -	12 1 7	6 3 6

41.—As regards the wages of day labourers, a comparison can be made for a longer period. The average wages of day labourers, finding their own board, are given as under:—

Year.	Average Daily Wage.
	s. d.
1819–39	0 5½
1839–49	0 8½
1851	0 9¾
1871	1 1¼
1883	1 4¾
1888	1 5½
1893	1 10¼

42.—The condition of affairs referred to by Captain la Cour has brought about a movement amongst agriculturists in Denmark similar to that which has recently taken place in this country, and is an indication that, notwithstanding the largely increased export trade of the country, the rural community are far from satisfied with their existing circumstances. On November the 22nd, 1893, a Conference was held at Odense, which resulted in the formation of a National Agricultural Union. The objects of the new body are stated to be "the maintenance of the economic and social interests "of Danish agriculture by such measures as will meet "the changed conditions and requirements of the "time. . . . . The union will, therefore, seek to "unite all classes (including the labourers) interested "in the land in order to secure the necessary influence "with the Legislature."

The necessity of protecting the home industry by imposing duties on imports of agricultural produce has also been urged recently by several of the provincial agricultural societies.

Appendix A. XXI.

APPENDIX XXI.

Memorandum on Agriculture in the United States of America.

(*Handed in by Mr. T. H. Elliott. See Questions* 39,304; 39,918; 40,089.)

1. Extent of the United States of America.
2. General Agricultural changes since 1880.
3. Suggested division into Groups of States.

Memorandum on the United States of America.

1.—No summary of the agricultural position of so vast a territory as that of the United States can do more than present a very rough and general estimate, drawn from statistical records, many of which are, by the necessity of the case, incomplete and not always exactly comparable.

Extreme difficulty must no doubt be encountered in pursuing identical methods of inquiry in the wide and diversified areas which have to be covered. It may therefore be, perhaps, expedient to limit any comparative survey to a few specific features, where the suggestion of agricultural development or retrogression, offered by the figures collected, is supported to a greater or less extent by similar impressions derived from the experience of more limited and more exactly measured districts, or where the evidence of independent and competent observers points in the same direction as the general statistics.

On special points, such as the growth of settlements, the production and export of wheat, and that of meat, it may be felt, even where the available figures differ somewhat in details, that their general tendency is sufficiently uniform to denote the actual course of events and illustrate prevailing variations in the forms of culture pursued.

An impressive general sense of the magnitude of that wide section of the world's surface which is included in the inquiry may at least be safely drawn from the official returns. Between the Atlantic and Pacific Oceans on the East and West, and practically from the 49th to the 30th parallels of latitude on the North and South, the area of the Union exceeds three million square miles. If the detached territory of Alaska be taken into account, this would add at least one-sixth part more, and give to the Republic a nominal surface area of roughly 2,300 million acres. The aggregate is thus but slightly less than the entire area covered by Europe, with conditions and extremes of climate, of produce, of race, and of density of population as varied as Europe has to show. On the other hand, the fact that the United States is occupied by less than 70 millions of persons, in contrast with the total of nearly 370 millions who find a home on our more familiar continent does not render it easier to gauge the present agricultural position in America than it would be to treat as one all the States of Europe.

Omitting Alaska, and confining attention to the 1,900 million acres distributed in the 49 States and territories of the Union, the leading and practically undisputed features of the agricultural changes between 1880 and 1890, so far as these are broadly shown by the census of 1890, may be defined to be an addition of 16 per cent. to the area occupied in farms, and one of 25 per cent. in the surface of these farms which is returned as "improved," that is at one time or another actually cultivated, and now under crop, fallow, or grass in rotation. At the same time a much more diversified use is seen to be now being made of the surface occupied in the older States, and there is an arrest, and even, on balance, an apparent net diminution in the extent devoted to the growth of wheat.

These changes can be traced in the yearly figures of other departments at Washington as well as in those of the census, while, for individual States, local records of more or less value may be used as subsidiary confirmation of the course of events.

Other changes shown by the recent census reports bring out, more particularly in certain parts of the country, the growth of tenant farming as contrasted with occupation by the owners of the soil during the last decade. But these and the comparative estimates of farm values and of the recorded farm indebtedness are not dealt with in this memorandum.

2.—Of the agricultural distribution of the surface it may be said, that, in 1890, just one-third of the measured surface of the Union was reported as apportioned out in upwards of 4½ million farms; that a very little more than half this farmed area was stated to be actually "improved," that is occupied for the regular cultivation of crops and grass, while of this "cultivated area" of some 358,000,000 acres—less than one-half—somewhere about 140,000,000 acres—was, as the detailed returns of 1893 also show, carrying grain crops. Much the largest of these crops is maize, the only others covering important areas being oats and wheat. The wheat area is now but one-fourth of that under cereals, and one-tenth of the cultivated land.

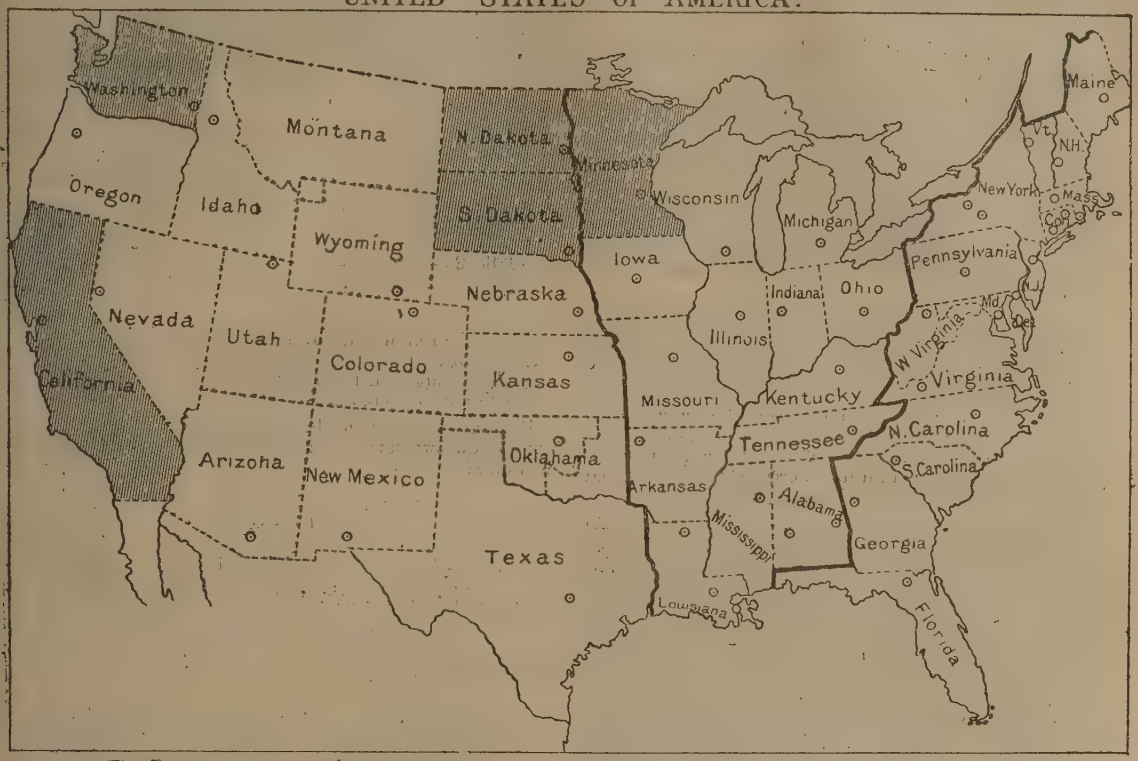
5.—The grain bearing area, if regarded as a whole, was, according to the census figures, 18 per cent. greater in 1889 than in 1879; and the later figures rendered by the Agricultural Department at Washington for 1893 do not add to this total. Almost exactly one-half—in average seasons more than one-half—of the cereal area of 140,000,000 acres carries Indian corn or maize. Wheat, which occupied a secondary place occupied 30 per cent. of the cereal acreage in 1879, but covered less than 25 per cent. in 1889, and apparently no more in 1893; while the oat crop, from forming less than 14 per cent., had risen to 20 per cent., or from under 13,000,000 acres in 1879 to over 28,000,000 acres in 1889. Only 4 per cent. roughly of the cereal area carried barley, rye, or buckwheat at either census. The most noteworthy of the changes is the restriction of the wheat fields of the United States, viewed as a whole, to a smaller area than was cultivated for a like purpose at the date of the Richmond Commission. This is the net result of very opposite movements the extent of which can be best realised by examining separately the course of events in different sections of the Union.

4.—The area of the United States may indeed be much more conveniently dealt with in detail than regarded

as a unit; and there are reasons, partly historical, partly geographical, that suggest three distinct and characteristic but somewhat unequal divisions, which, for this purpose, may be respectively denominated the east, the centre, and the west.

The suggested divisions may be shown as under :—

UNITED STATES OF AMERICA.



The Positions of the Agricultural Experiment Stations in the United States are marked ⊙.

The Eastern group may be said to include what American census tables regard as the North Atlantic and South Atlantic regions; in other words, it consists of the 13 original States of the Union, with the addition of Maine and Vermont in the north, and of Florida in the south (areas which were subsequently acquired) and including as a separate unit the so-called district of Columbia, surrounding the capital of the Republic. Geographically it may be said that the States included in this group are those of the first settled fringe which line the Atlantic seaboard, and lie to the east of the range of the Alleghanies and of the more easterly of the Great Lakes.

The Central group, for the purpose of the present classification, may be taken as combining the States next in national seniority which lie to the west of the Atlantic belt, and extend up to a western boundary which may be described as roughly coinciding with the 95th meridian, including, therefore, the agriculturally most important valley of the Mississippi, and embracing a surface of 14 separate States. Of these eight form the older part of the *north central* division of the census and six the older part of the *south central* division. This sub-division of the central area may, in regard to some characteristic features, have to be borne in mind if the investigation is pushed into details.

In the Western group is included the entire remainder of the States and Territories of the Union, from Texas on the Gulf of Mexico to Dakota on the Canadian frontier, extending westward to the Pacific Ocean, and grouping together all the more newly settled regions of the Trans-Missouri, the Rocky Mountain, and Pacific States.

5.—According to the latest census the measured surface, the area appropriated in farms, the acreage actually improved or brought into cultivation, the land employed for wheat-growing, and the population of the three groups thus suggested, stood roughly and in *millions* in 1890 as under :—

		Total Area.	Land in Farms.	Land improved.	Land under Wheat.	Population.
		Acres.	Acres.	Acres.	Acres.	
1890	I. Eastern	263	163	84	4½	26
	II. Central	462	289	180	17	28
	III. Western	1,175	171	94	12	8
		1,900	623	358	33½	62

Ten years previously the census of 1880 credited to the States, if grouped in the same divisions and credited with the same total area, the following totals also in millions under each of the last five columns :—

		Total Area.	Land in Farms.	Land improved.	Land under Wheat.	Population.
		Acres.	Acres.	Acres.	Acres.	
1880	I. Eastern	263	169	83	5½	22
	II. Central	462	269	157	23½	23
	III. Western	1,175	98	46	6½	5
		1,900	536	286	35½	50

While therefore the east with its growing cities and industrially occupied population gained four million residents in the decade, it has, apparently, if the figures be really comparable, only added one million acres to the surface of the land farmed which is brought actually into regular cultivation, while of that cultivated area

Appendix A. XXI

one million fewer acres are now devoted to wheat. The shrinkage in the area under this cereal in the 10 years 1879–89 is practically a new feature in the agriculture of the United States. It is, in absolute extent, twice as great as the loss of wheat-bearing acres which occurred in Great Britain in the same interval; and, as a matter of ratio, the per-centage of decline is 19 per cent. in eastern America, against 17 per cent. in this country in the years contrasted.

In the Centre, regarded as one group, the growth of population was even somewhat greater than in the east. About five millions were added to the previous 23 millions; and here, apparently, occurred a taking up or appropriating of new land not before occupied in farms, which is given as 20 million acres, and an extension of the improved or cultivated area equal to 23 million acres. But alongside of this movement there appears, according to the census figures, a decline of more than six million acres in the enumerated wheat fields—a withdrawal from wheat-growing in the decade the significance of which is striking, for it represents a loss of 27 per cent.

Before looking to the changes in the newest region of the West it may be suggested that if these two great divisions of the older United States, lying east of the eastern border of Texas, Kansas, Nebraska, and Dakota —and embracing the most fertile land on each side of the Mississippi—be combined and regarded as a whole, it will be found that this section of the Union, which carries nearly seven-eighths of the whole population, shows a loss of seven million acres of wheat, coupled with an addition of nine millions of inhabitants.

6.—Westward of the line suggested the agricultural conditions are reversed. There also, together with a large extension of the settled, the farmed, and the cultivated areas, there has been a notable growth of population, which has added three million persons to the five millions who peopled the vast prairies and valleys of Western America in 1880, but in this case the expansion has been accompanied, still more rapid, by an opening up of new wheat areas of from 6½ million acres to 12 million acres in the decade. The whole of this addition has occurred in a relatively restricted section of the wide territory included in the western group of States.

7.—Setting against the losses of the centre and east this western development of wheat culture, so far as it will go, on balance there would appear by the last census to have been nearly two million fewer acres of wheat grown altogether, although there were 12 million more consumers of bread-stuffs in the States in 1890 than in 1880.

In arriving at this general conclusion the data followed have been simply those of the two census reports. These statistics, however, are taken only at decennial intervals, and not under continuous and identical supervision at the dates contrasted. As they do not agree in detail with the annual records of the U.S.A. Department of Agriculture, and as in certain cases the differences are material, it may be necessary to examine also the last-named series of official figures. These returns of crop areas are obtained annually, but it is to be remembered that they do not, as with us here, reproduce statements of ascertained acreage directly furnished by the occupiers engaged in farming the areas reported on. They are rather local deductions resting on estimates made by the numerous correspondents of the Department, of the apparent per-centage of increase or decrease on the preceding year's area. Remembering the many cases of lost crops from insect pests, frosts, or droughts which sometimes sweep off the wheat crops of whole counties between seed-time and harvest, it is of course easy to see that there must always, without practically ubiquitous reporters, be considerable room for error.

It would almost seem as if the census inquiry made by fresh and independent inquirers as to absolute facts rather than proportional changes, though open in itself to the grave risk of falling on a year when the crop was above or below the nominal average, would naturally be successful in bringing to light radical, yet progressive, changes in the yearly distribution of crops of which the regular reporters had failed to measure the exact percentage.

8.—Judging from the two sets of data it would certainly appear that the basis of the annual records of the Department appear to have been revised materially in the years following each census enumeration. The aggregate wheat areas shown by the Agricultural Department were 3 million acres in 1879 below the census total, or 32·5 millions only. They were raised to 38 million in 1880. From that date to the present time, the yearly estimate has on two occasions, in 1884, and again in 1891, exceeded 39 millions (39·9 in the last instance), and on two occasions also, in 1885, and again in 1893, has the total been given as under 35 million acres, taking the mean of three yearly periods, the Agricultural Department's estimate comes out above the two census calculations, and presents a fairly steady record, wherein the various Western extensions about balance the losses of the Eastern and Central wheat farmers as under:—

Mean of Years.	Wheat Acreage.
1879–80–81	36·1 million acres.
1882–83–84	37·7 „
1885–86–87	36·2 „
1888–89–90	37·2 „
1891–92–93	37·7 „

It is to be remarked, however, that the last figure is but the mean of rapidly declining totals which gave 39·9 million acres in 1891, 38·5 million acres in 1892, and 34·6 million acres in 1893.

Bringing together in the separate groups before indicated the two series of records they contrast roughly as under:—

		1879.	1889.	1893.
		Million acres.	Million acres.	Million acres.
The East	Census	5·6	4·5	—
	Agricultural Dep.	5·2	5·3	4·7
The Centre	Census	23·2	17·2	—
	Agricultural Dep.	19·7	19·7	16·1
The West	Census	6·6	12·0	—
	Agricultural Dep.	7·6	13·1	13·8
Total	Census	35·4	33·7	—
	Agricultural Dep.	32·5	38·1	34·6

The Agricultural Department's figures, which can be followed down to 1893, clearly corroborate the earlier suggestion of the census, and show that wheat growing has fallen off at a late date in the East and in the Centre, and has extended only in the new regions of the West.

9.—The meaning of the change is still better appreciated by examining the movement in still smaller groups of States. Taking the census period of 1879–89, the area of wheat growing has declined in the six New England States from 79,000 acres to 15,000. The total at the still later date of the Agricultural Department's statistics being practically the same.

In the neighbouring group of well-peopled Eastern States, New York, New Jersey, and Pennsylvania, the census showed a drop of 19 per cent., or 429,000 acres in the decade, and the South Atlantic States contributed 575,000 acres more to the general decline.

In the eight Northern States of the central region, where two-thirds of whole American wheat acreage was found in 1879, the shrinkage shown by the census was from 20·3 million acres to 15·2 million, or 25 per cent.; Iowa, Wisconsin, and Illinois accounting for most of this decline; a smaller decrease in Michigan being about balanced by an extension of over 300,000 acres in Minnesota.

In the Southern States of the central division a further considerable cessation of wheat growing is to be remarked, while some reductions are apparent in Kansas and Nebraska within the limits of the Western division itself.

10.—Altogether there would seem to be 8¼ million acres not under wheat at the date of the last census which had carried wheat in 1879.

The States which have found the bulk of the increase which nearly balanced this loss are easily enumerated. The two Dakotas, North and South, which have sprung to statehood in room of the single territory known as

Dakota in 1879, are still but sparsely settled, but by 1889 they had largely augmented their wheat area from the 265,000 acres given in 1879 to the 4,969,000 acres of 1889, and the Agricultural Department's figures for 1893 carry the total over 5 million acres. Here, therefore, alone was an addition of 4¾ million acres, while nearly 1½ millions more were added on the Pacific slope in the three States of California, Washington, and Oregon, although according to the Agricultural Department's figures the first-named of these three States has subsequently decreased its wheat acreage, which in 1892 was over 3,000,000 acres, by about 13 per cent. in 1893.

11.—Testing the recorded changes over a more recent period, 1883–93, for which the Agricultural Department's figures are available, it may be useful to show in the case of some selected and characteristic States what has been, not only the relative decline or advance in wheat growing, but in what respect the areas under the other two great cereals have varied. Selecting states for the east, the centre, the south, and the west, we have in thousands of acres—

States.	Maize.		Wheat.		Oats.	
	1883.	1893.	1883.	1893.	1883.	1893.
	1,000 acres.	1,000 acres.	1,000 acres.	1,000 acres.	1,000 acres.	1,000 acres.
New York - -	761	517	780	472	1,345	1,259
Tennessee - -	3,213	2,988	1,323	809	586	531
Ohio - - -	2,818	2,710	2,588	2,684	871	952
Iowa - - -	6,981	7,429	2,435	587	2,006	3,849
Dakotas (N. and S.)	270	886	1,008	5,168	210	1,256
Washington - -	3	8	170	487	63	87
California - -	101	72	2,794	2,620	71	59

These figures bring out as their most remarkable contrast the comparative steadiness of cereal culture in Ohio, the abandonment of wheat for oats in Iowa, and rapid development of the Dakotas. The addition to the oat crop in the states named is also worthy of note and is a special feature of the decade.

Agricultural Exports.

12.—The interest of Europe in the agricultural changes of America is largely centred in the results experienced from three forms of export in which the surplus produce of the cultivated surface cross the Atlantic. It is, therefore, necessary to note what are the figures available as regards production and exportation.

The exports referred to are cotton, grain, and meat. For the present purpose the circumstances of the first of these need not be dwelt upon beyond noting that in 1879 the area under cotton in the States was practically identical in extent with that under oats, or 12½ million acres. Here as in the case of oats has there been an increase, although only half as great. Cotton covered about 20 million acres in the United States at the last census. Two-thirds of the crop are exported, the total varying with the diminution of the crop (which has been estimated as low as 5½ and as high as 9 million bales) from 1,800 million pounds to 2,900 million pounds.

13.—The grain export again practically narrows itself into two unequal branches, that of wheat, including wheat flour, and that of maize, which together make up 95 per cent. of the 200 million dollars worth exported in 1893.

14.—The produce and the export of maize or Indian corn both vary much from year to year. At no time have the exports of this cereal represented a large portion of the crop. The years 1876 to 1880, inclusive, saw much the largest export relative to production in the last 20 years, ranging from 5½ to 6½ per cent. of the total crop. In absolute figures the years of largest export have been that ending 30 June 1880, when nearly 100 million bushels of maize were sent away out of the large crop of 1879, and that of the years 1889-90 when 103 million bushels were exported, which was more than four times the amount sent abroad two years before. The maize exports of 1892–3 little exceeded 47 million bushels, or less than 3 per cent. of the crop available.

15.—With regard to wheat and wheat products, the figures which have been already noted as to acreage and population changes bear closely on the surplus available for foreign consumption and the relative estimates of annual acreage variations, mean yield, and price per bushel, and of the gross production and total export of the domestic crop may be thus quoted from the United States of America Agricultural Department's Reports.

In Millions.

Year.	Acreage.	Yield.	Average "Farm Value."	Estimated Crop.	Whereof exported in Year to 30th June *following.*	Proportion exported per cent.
	Million acres.	Bushels per acre.	Cents per bushel.	Million bushel (Winchester.)		
1880 -	38·0	13·1	95	499	186	37·4
1881 -	37·7	10·1	119	383	122	31·8
1882 -	37·1	13·6	88	504	148	29·3
1883 -	36·4	11·6	91	421	112	26·5
1884 -	39·5	13·0	65	513	133	25·9
1885 -	34·2	10·4	77	357	95	26·5
1886 -	36·8	12·4	69	457	154	33·7
1887 -	37·6	12·1	68	456	120	26·2
1888 -	37·3	11·1	93	416	89	21·3
1889 -	38·1	12·9	70	491	109	22·3
1890 -	36·1	11·1	84	399	106	26·6
1891 -	39·9	15·3	84	612	226	36·9
1892 -	38·5	13·4	62	516	192	37·2
1893 -	34·6	11·4	54	396		

Such a table suggests that, while the acreage has been, with some fluctuations, stationary or receding, the estimated yields have varied between 10 bushels and somewhat over 13 per acre, with a single exception, 1891, when 15·3 bushels were recorded. The total wheat crops have on four occasions fallen below 400 million bushels, and on four occasions exceeded 500 million bushels. The great crop of 1891, still believed in many quarters to have been undervalued, standing alone of the official records above 600 million bushels. The resultant exports of wheat and flour in the fiscal year following that crop are put at 226 million bushels, but it would seem that the wheat exported from the United States of America had never until that date been above the figure of 186 million bushels, credited to the crop of 1880 with which the table begins, while it had fallen below 100 million bushels on more than one occasion. There has thus been no special development of competition in wheat in the markets of the world from the United States, and this result is just what might be expected from the examination of the changes in the American wheat acreage and American population.

16.—So large a share of the wheat export of the United States of America is directed to Great Britain, that it may be asked whether the proportion which comes here has materially varied in the period under review, or has reflected the position noted as regards acreage and yield. For the decade 1881–1890, the total arrivals of American wheat in our ports tended to decrease rather than augment.

Quoting in weight and from our ordinary calendar years, it would seem that from 1881 to 1883 the average yearly receipt of American wheat and flour was under 44 million cwt. In the next three years it was less than 39 million. The single year 1887 saw indeed an importation of more than 50 million cwt., but for the years 1888–90, the mean receipts were little over 32 million cwt. The three years 1891–93 have, it is true, seen larger arrivals, 43·2 million, 60·9 million, and 57·3 million having been respectively reached. As assisting to measure what has been the annual effect in our markets, it may be useful to contrast, as in the following table, the yearly totals of the American exports received in the United Kingdom with the relative aggregate of like arrivals of wheat and flour from all other countries.

Appendix A. XXI.

IMPORTS of WHEAT and FLOUR into the UNITED KINGDOM (in MILLIONS of CWTS.).

Year.	From United States of America.			From other Countries.	Total received into the United Kingdom.
	Atlantic.	Pacific.	Total.		
1881	33·1	12·5	45·6	25·7	71·3
1882	28·3	16·7	45·0	35·8	80·8
1883	6·7	13·9	40·6	44·5	85·1
1884	25·3	10·7	36·0	30·9	66·9
1885	23·6	16·2	39·8	42·5	82·3
1886	26·8	13·1	39·9	27·1	67·0
1887	39·1	11·5	50·6	29·6	80·2
1888	21·9	9·9	31·8	48·6	80·4
1889	17·2	13·8	31·0	47·9	78·9
1890	21·3	12·6	33·9	48·5	82·4
1891	35·0	8·2	43·2	46·3	89·5
1892	52·7	8·2	60·9	34·7	95·6
1893	44·4	12·9	57·3	36·5	93·8

INCREASE of LIVE STOCK.

17.—If the census of 1890 exhibited an increase of ne more than 18 per cent. in the grain-cropped area of the United States, and a decrease rather than a development of the area devoted to the chief cereal exported, it has been otherwise with the number of certain descriptions of the live stock maintained. The horses on farms were more numerous by 45 per cent., the milch cows by 33 per cent., and the other cattle by 50 per cent. Of swine the advance was 20 per cent. Sheep, however, did not increase according to these reports by much more than 2 per cent. in the decade.

18.—For cattle, sheep, and swine, the relative growth must necessarily be contrasted with that of population, and it has been somewhat irregular.

In millions the numbers shown for each year by the Agricultural Department stand as under:—

——	Milch Cows.	Oxen and other Cattle.	Sheep.	Swine.
1880	12·0	21·2	40·8	34·0
1881	12·4	20·1	43·6	36·2
1882	12·6	23·3	45·0	44·1
1883	13·1	28·0	49·2	43·3
1884	13·5	29·0	50·6	44·2
1885	13·9	29·9	50·4	45·1
1886	14·2	31·3	48·3	46·1
1887	14·5	33·5	44·8	44·6
1888	14·9	34·4	43·5	44·3
1889	15·3	35·0	42·6	50·3
1890	16·0	36·8	44·3	51·6
1891	16·0	36·9	43·4	50·6
1892	16·4	37·7	44·9	52·4
1893	16·4	36·0	47·3	46·1
1894	16·5	36·6	45·0	45·2

These figures certainly suggest a somewhat arrested development in the more recent years. In swine there is a decline of over six millions since 1890; in sheep, there have been fluctuations, in oxen a practically stationary position for the past five years.

19.—Taking the three census years and the year 1893, to which most of the other data quoted has been brought, the changes may be thus compared:—

Year.	Population.	Milk Cows.	Other Cattle.
1870	38,558,000	10,096,000	15,389,000
1880	50,156,000	12,027,000	21,231,000
1890	62,622,000	15,953,000	36,849,000
1893	66,826,000	16,424,000	35,954,000

In the earliest of these years the milch cows are 261 to each 1,000 persons; in the latest year 245 only. The steers and other cattle on whom the beef export trade mainly draws developed in numbers up to 1890 from 399 to 588 per 1,000 persons, but have been nearly stationary since that date, and are now but 538.

20.—Neither sheep nor swine appear to keep pace with the population. In these classes of stock the figures for the same years stand thus:—

Year.	Population.	Sheep.	Swine.
1870	38,558,000	40,853,000	26,751,000
1880	50,156,000	40,766,000	34,034,000
1890	62,622,000	44,336,000	51,603,000
1893	66,826,000	47,276,000	46,095,000

ANIMAL EXPORTS.

21.—The meat exports of the United States so far at least as cattle and beef is concerned, for hardly any mutton is exported, have shown more expansion than those of her cereal produce, and somewhat more than the growth in numbers would explain. Still, however, even translating the dead meat into an equivalent number of cattle, the whole export in both forms makes but a small proportion of the stock. In 1884 the export of cattle alive and in the form of canned, dressed, and salted beef, was under 500,000. In 1893 the total exceeded 1,000,000. Even the last figure is under 3 per cent. of the cattle other than cows.

22.—In 1880 the number of live cattle exported was 183,000; in 1890, after a temporary reduction, they had risen to 395,000 head, a figure which was nearly or quite maintained in the two following years, and although the total sunk to 287,000 in 1893, the figures for the past year, 1894, however, will again show an increase.

23.—The exports of fresh beef, which were 85 million pounds in 1880, were doubled by 1890, making 173 millions; and have exceeded an average of 200 millions in the three years 1891–2–3; details are given below.

24. The exports of what are called hog products at one time bulked much more largely than now. In 1880, the bacon and hams sent out were 760 million pounds. In 1882 they had fallen to 468 millions and in 1883 to 340 millions, pork and lard likewise declining. The subsequent course of this class of imports are also shown below.

25.—The exports of live cattle, sheep, and swine, from the United States of America to all countries in the past 10 years may be quoted as under:—

Year.	Cattle.	Sheep.	Swine.
1884	191,000	274,000	46,000
1885	136,000	235,000	55,000
1886	119,000	178,000	74,000
1887	106,000	122,000	75,000
1888	140,000	144,000	24,000
1889	206,000	129,000	45,000
1890	395,000	68,000	91,000
1891	375,000	61,000	95,000
1892	395,000	47,000	32,000
1893	287,094	37,000	27,000

26.—The following shows the quantities of beef and tallow exported from the United States from 1884 to 1893 (*in millions of lbs.*) :—

Years.	Beef Products.				
	Canned Beef.	Fresh Beef.	Salted or Pickled Beef.	Other Cured Beef.	Tallow.
1884 - -	*—	120·8	42·4	0·6	63·1
1885 - -	*—	115·8	48·1	0·6	50·4
1886 - -	*—	99·4	58·9	0·8	40·9

1893 - -	391·8	82·2	0·9	52·5	365·7

(*From the Statistical Abstract of the United States*, 1893, *p.* 172.)

NOTES ON PARTICULAR STATES.

The course of agriculture, according to the general figures above given, may be further illustrated by certain notes on the changes and present condition of characteristic States :—

Iowa.

28.—Perhaps the most striking of all the changes in the American wheat areas is the shrinkage shown in the State of Iowa. In 1879 both official estimates credit this State with upwards of 3,000,000 acres under wheat, and the State was pointed to in Mr. John Clay's Report to the Richmond Commissioners in 1882 as possessing a larger breadth of wheat than any other State of the union. It grew, however, but 10 bushels to the acre, and the Assistant Commissioner of that day pointed out how surely the greater suitability of the soil to stock and maize would lead to a change of system, and a relegation of wheat-growing to those soils which were most fit for the purpose. The change has occurred very rapidly here.

29.—The census figures for Iowa in 1889, and those now adopted by the Agricultural Department for 1893, only account for under 587,000 acres of wheat. What has happened here is a type of what is less rapidly occurring elsewhere. In the early settlement of this State, one of the most flourishing in the union, wheat, no doubt, largely predominated, and in some sections formed almost the exclusive feature of the arable area. In 1881 a contraction of the wheat area was first signalled by the estimators of the Agricultural Department, who put the reduction at 7 or 8 per cent., and connected it at the time with a phenomenally reduced yield, but it is obvious that the course of events outside the State itself was teaching the farmers of Iowa that, at existing values, beef promised better than wheat, and that owing to the demand of the East for other products, such as butter and cheese, production of this class was becoming the more profitable. With the keeping of cattle, increased dairies and creameries came into existence, Indian corn or maize was more largely grown, forage crops came into demand, and clover and blue-grass took a more prominent place in the rotation.

30.—It would appear from a note by the late statistician of the Agricultural Department, Mr. Dodge, that the decline in the acreage of wheat in Iowa owed something also to the frequent attacks of the insect enemies of this cereal, alluded to in the Report of the Assistant Commissioners to the Richmond Commission, 1879–80, wide areas having been injured by the Chinch bug. Whole fields were ploughed up in despair, and corn took the place of wheat. Another tendency was traced to the same period whereby winter was superseded by spring wheat. This had been previously grown but little in Iowa, and was almost confined to the south-eastern counties of the State. Even in Iowa, however, it is to be remembered the course of events has not been the same everywhere. There are some counties in the north-west, or were a year or two ago, where the area is greater than in 1879, while the rate of diminution is extremely varied, some counties reporting in 1889 their growth of wheat to be less by only one-fourth part, some by one-half, some by three-fourths. A reduction of nine-tenths of the area has, however, been reported by certain correspondents.

31.—It is scarcely to be wondered at that in the face of changes so rapid as those above referred to much inaccuracy of estimate as to the exact extent of the change arises. Although both the census reports and those of the Agricultural Department indicated large reductions, neither the absolute figures nor the relative proportions reported agree, and it would almost appear as if the Agricultural Department's correspondents still reckoned in 1889 on a wheat area greater by one million acres than that which ultimately appeared in the tables of the census.

32.—What the change meant in Iowa may be gathered from more recent reports, which show that in the interval, 1879–89, the area under oats increased by 150 per cent. from 1,500,000 acres to 3,750,000.

The meadows returned in the new census report, the text of which has not yet been received here, are said to have expanded from 2,500,000 to 5,250,000 acres, or by 112 per cent.

The new land taken up is suggested as providing three-fourths of the acres thus added for hay and oats, but the rest must have been taken from such of the discontinued wheat fields as were not turned over to maize. According to recent statements the apparent increase of maize in Iowa up to 1889 has not proved more stable than the growth of wheat, and much of the advance has been lost in the years which followed, nearly nine million acres were reported to be thus occupied in 1889, and less than seven and a half million in 1893.

But in Iowa, as elsewhere throughout the west, the growing and, as it would seem, permanent demand for the great forage crops, hay and oats, may be taken to provide the key to the discontinuance of wheat growing for export at such values as has been lately current, at least where settlement has progressed so far as to enable the easy or poor man's crop, as wheat has been described, to be dropped for some more special produce.

33.—The hay crop of Iowa was put in 1893 as over eight and a half million tons, exceeding in quantity the estimate of any other State, and approached only by that of New York, and although the values in the west could not of course stand on the level of those of the "Empire" State, Iowa is none the less credited with a hay crop worth over 10,000,000*l.* sterling.

34.—It may not be without its interest in connection with the changes in this State to note what the estimates of the census, rough and imperfect as they must be on such heads, show to have been the course of development of other agricultural industries in Iowa in the decade 1879–89, which saw the abandonment of 2,400,000 acres of wheat. No other state in the Union shows so large a valuation for live stock. Milk was returned as produced to the extent of less than 16,000,000 gallons in Iowa in the 1879 inquiries for the census of 1880, whereas no less than 487,000,000 gallons are set down as the production of the same State in 1889, while the

Appendix A. XXI.

poultry of the State is put roundly at 22,000,000 head against 8½ millions 10 years before, and the estimated production of eggs is put at more than double the outturn of 1879, or over 69,000,000 dozens, a figure barely exceeded by Ohio, which stands in the census tables as the largest egg-producing state in the Union.

35.—The numbers of live stock in Iowa contrasted at the two census dates stand as under:—

	1880.	1890.
	No.	No.
Horses	792,000	1,312,000
Milch cows	854,000	1,498,000
Other cattle	1,755,000	3,395,000
Sheep (except spring lambs)	455,000	547,000
Swine	6,034,000	8,267,000
	£	£
Estimated value of the live stock	25,000,000	41,000,000

ILLINOIS.

36.—Taking as another example a state with a superficial area in farms about exactly equal to that of Iowa, the "Garden" State of Illinios has long occupied a prominent agricultural position. There the normal yield of wheat according to local records considerably exceeds that of Iowa, and is given as somewhat the same as that credited to France. The bulletins of the State Board of Agriculture differ in some respects as to area and yield from those of the central office, but enable a continuous record to be shown not only of the area, yield, and estimated value of certain crops for the State of Illinois from 1879 to 1894, but furnish also a local estimate of cost per acre, of price, and of loss or profit on the year. The following table is reproduced from these statistics, which may be of interest, although they contain some errors of calculation:—

WHEAT (Spring and Winter).

	Number of Acres.	Average Yield per Acre.	Price per Bushel.	Value per Acre.	*Cost of Production per Acre.	Profit.	Loss.
		Bushels.	$ c.	$ c.	$ c.	$	$
1879	2,440,808	18¾	0·87	16·36	10·55	14,180,104	—
1880	3,256,350	17⅝	0·82	14·27	10·55	11,642,610	—
1881	3,642,589	7⅞	1·07	7·90	10·00	—	8,365,458
1882	2,846,117	18⅓	0·89	16·41	10·70	16,237,102	—
1883	2,047,956	10	0·95	9·50	11·10	—	3,358,749
1884	2,717,592	12	0·76	9·35	10·75	—	3,862,400
1885	1,068,364	8	0·86	6·70	10·65	—	4,196,019
1886	1,991,336	14	0·74	9·47	10·75	—	2,558,082
1887	2,391,297	16	0·65	10·47	10·90	—	1,030,365
1888	2,277,001	15	0·70	10·60	9·50	2,496,305	—
1889	2,052,388	18	0·70	12·71	9·48	6,633,207	—
1890	1,215,797	12	0·82	9·86	10·25	—	473,655
1891	1,871,968	18	0·79	14·55	10·25	8,080,875	—
1892	1,665,964	18	0·69	12·65	10·20	4,059,904	—
1893	1,630,797	12	0·48	5·60	10·40	—	7,837,544
1894	2,071,354	20	0·43	8·60	9·90	—	2,712,013

* 1879 estimated same as reported for 1880.

37.—Here, with the exception of the increase of 1894, the tendency to reduced areas is again visible, but the serial nature of the record enables the wide differences between one season's wheat area and another to be apparent. The total areas range from 3,600,000 acres in 1881 down to little over 1,000,000 in 1885, and after further rises and falls to 1,631,000 acres in 1893 and 2,000,000 acres in 1894, the statisticians of the State, it is to be noted, estimate nine years of loss on wheat growing against seven of profit, and the profits of the early years were never again reached.

38.—In contrast with this table the parallel record from the same local source for oats may be quoted, showing the area, yield, and value of this cereal from 1879 to 1894. Here, again, more losses than gains are proclaimed by the local estimators, but notwithstanding this the rate of yield seems high and the acreage with some fluctuations on the whole augmenting.

Year.	Number of Acres.	Average yield per Acre.	Price per Bushel.	Value per Acre.	*Cost of production per Acre.	Profit.	Loss.
		Bushels.	Cents.	$ c.	$ c.	$	$
1879	1,631,139	33	22	7·39	9·40	—	3,273,544
1880	1,749,391	35	24	8·40	9·40	—	4,516,861
1881	1,922,389	35	30	10·50	9·40	1,932,048	—

* 1879–81 estimated same as reported for 1880.

39.—A Table showing the area, yield, and value of the hay crop for the State of Illinois from 1879 to 1894, appears also in the local reports, from which the following figures may be taken, and apparently they teach the lesson that with only one exception the hay crop has been profitable. It is not explained in what way the cost of production, which seems high, has been estimated:—

Year.	Number of Acres.	Average yield per Acre.	Price per Ton.	Value per Acre.	*Cost of Production per Acre.	Profit.	Loss.
		Tons.	$	$	$	$	$
1879	2,161,760	1·20	6·37	7·60	7·35	543,076	—
1880	2,259,857	1·5	6·50	9·75	7·35	5,912,985	—
1881	2,384,366	1·5	6·95	10·42	7·35	6,666,617	—
1882	2,629,333	1·75	7·75	13·56	7·35	14,615,456	—

1884	3,004,342	1·64	5·47	9·00	7·35	4,961,364	—
1885	3,197,688	1·33	6·05	7·96	7·30	2,027,591	—
1886	3,393,961	1·45	5·90	8·53	7·15	6,192,328	—
1887	3,316,016	·78	8·70	6·77	7·30	—	1,691,291
1888	3,043,723	1·41	6·70	9·71	6·85	8,643,854	—
1889	3,176,281	1·55	5·45	8·44	6·85	5,006,041	—
1890	2,704,965	1·48	5·75	8·47	7·40	2,874,634	—
1891	2,564,294	1·40	6·70	9·44	7·40	5,273,363	—
1892	2,351,085	1·63	6·20	10·13	7·40	6,398,452	—
1893	2,788,903	1·30	7·20	9·35	7·45	5,280,131	—
1894	2,787,218	1·18	7·50	8·80	7·40	4,010,897	—

* 1879–1881 estimated same as reported for 1880.

40.—Illinois, like Iowa, is a state claiming a large possession of live stock, the census valuation coming next in magnitude and reaching 36,000,000*l.*, the houses on farms being given in 1890 as 1,335,000, the cattle of all sorts as over 3,000,000, and the swine 5,925,000 head.

The valuation put on farm land in Illinois considerably exceeds that of Iowa, the census of 1890 putting it at 41 dollars per acre against under 32 dollars in 1880.

Ohio.

41.—Among the older settled states which have maintained their wheat acreage, Ohio is the most important. Its valuation of 45 dollars or 9*l.* per farm acre placed it above Illinois, but it is noteworthy that unlike the latter state it seems to have slightly reduced, rather than increased, its valuation in the intercensal period.

With 18,000,000 acres of improved land keeps pretty steadily 2¾ million acres under wheat and under maize respectively. According to an official statement given in the 47th annual report of the State Board of Agriculture, the wheat area of the period of 27 years from 1850 to 1876 was on the average 1,680,000 acres. By 1883 this seems to have risen to nearly 2,500,000 acres and to have been maintained at a slightly higher average up to 1892 when 2,800,000 acres were recorded.

Like many other American states the average of a whole state covers wide varieties of local soil and practice. The mean yield of the 10 years before 1890 was under 14 bushels to the acre. In a recent bulletin of the Ohio Experimental Station treating of 40 years' experience in wheat growing, it is pointed out, that the northern section of the state had increased its average yield in the 40 years reviewed by nearly three bushels an acre, and the central counties by from one to two bushels, and that in one county an average yield of 19½ bushels over the ten years 1880–89 had been secured. The conclusion drawn was that by higher farming it was quite possible the average yield of the whole state could be raised to this level, and if this were so, Ohio alone could produce bread enough for 12 million mouths. At all events the Director of this Station estimates that it will be centuries before Ohio contains people enough to consume all her wheat.

These considerations open out another view of possibilities of wheat development even in the older states where the cereal has been long grown and indicate a reserve of possible production which could be called into action by a rise in values or a material decline in the cost of labour.

Abandoned Farms in New England.

42.—Among the notablechanges in American agriculture, it is to be remarked that, especially in the Eastern section of the country, and in States, populous and wealthy like many parts of Great Britain, one hears of deserted and abandoned farms as a feature of the times. The various changes of crop distribution already noted as in progress, have not, therefore, everywhere sufficed to meet the new conditions of western competition, and the resultant low values of agricultural products, which do not in all cases, it would appear, allow a profitable use to be made of the soil formerly occupied for farming. These cases may not be permanent, but they are signs of the friction and dislocation necessarily accompanying the transformation from earlier practice where local wants were met by local crops.

It would be easy to exaggerate this matter to a prominence it does not deserve, but as illustrating the pressure in Eastern America of what is recognised in Europe as agricultural depression, a note may be made of the issue of officially published lists of unoccupied and abandoned farms in Connecticut, Massachusetts, Vermont, and New Hampshire.

43.—The first of these States issued in 1892 a list for the guidance of possible purchasers of land so circumstanced. The State Board of Agriculture invited, in January 1892, the owners of such estates to supply them with information to be published and widely distributed, at the cost of the Board. An official circular issued by the secretary contained the following passage:—

"Frequent inquiries have been received by me for lists of 'abandoned farms' in Connecticut. While this name is a misnomer as applicable to any considerable extent to any lands in Connecticut, yet it is true that in most of the rural districts there are farms for sale at very low prices, taking into account the buildings and other improvements upon them, and to meet the wants of those who are looking for homes in Connecticut, and in the interest of those who have farms to sell, the Board of Agriculture undertakes the work of collecting and publishing a list of farms for sale in Connecticut, with brief description and price."

In further explanation it is stated in the volume subsequently issued, that the question of "abandoned farms" has been so widely discussed that it has been hard for many persons to see that it was not in that class of property alone that our interest was enlisted. Some farms have been abandoned because, from location or otherwise, they ought to be abandoned, their legitimate use was for growing wood and timber, rather than for general farming.

The diversion of travel and the removal of small business centres and small manufacturing industries have caused some property once occupied to be no longer in demand. In other cases the owners have preferred to let houses and lands remain unoccupied "abandoned" as far as occupancy is concerned, rather than to be at the expense of repairs to fit the place for tenant, or even to persuade themselves to a sale to some chance customer who might offer.

Our expressed opinion, that such cases are rare of "abandoned farms" in Connecticut has been confirmed by the reports returned to this office. Many read, "No

Appendix A. XXI.

"abandoned farms in this town," others "No farms for sale in this town."

But when we set aside these two classes, the "abandoned farms" and the townships where there are none, or where there are no farms for sale, we find that there are a large number of farms in every degree of desirability and condition of culture and buildings which are for sale at very low prices, in proportion to the cost of the buildings and fences expended even in a very few years. Death of the owner, or other family circumstances, place on the market much very valuable property. There are in some sections small farms very desirable as residences, where the owner used to follow some trade, now removed to the village, or city, gaining only a part of his support from his farm. In some towns these places, as they came on the market during the last fifty years—for that period covers about the time of this change—were bought up and absorbed by the larger farms, used for pasturage or the growth of wood; in others they remain as separate holdings, and are offered at very low prices.

44.—In Massachusetts, with a density of population per square mile not very dissimilar to that of the United Kingdom, and with a predominance of industrial and manufacturing industries which leaves the agricultural population as with ourselves to form only some 4 per cent. of the whole—action like that of Connecticut has been taken to endeavour to attract customers to lands which have been more or less completely abandoned from a farming point of view.

As early as 1889 the State Board of Agriculture invited an expression of opinion in one of its bulletins as to the increase or otherwise of deserted farms in each district, and the legislature in 1891 voted funds for an inquiry and publication of a list as a means of restoring occupiers to the untilled areas. In the circular issued to the local assessors, calling for the information desired, it was stated that they must exercise their own discretion in regard to definition, but any farm not occupied for cultivation, or as a summer home, might be, it was suggested, called an abandoned or partially abandoned farm if for sale at a low price. Farms so long abandoned that the buidings had disappeared, and the land mostly given up to brush and wood were not to be included.

The publication of these lists has been made at intervals since this date, and in the fifth edition published in December, 1894, the following figures are given:—

Number of abandoned or partially abandoned farms reported	1,563
Number of advertised farms sold	150
Number of farms reported as sold in reply to requests for description	47
Number of farms of which descriptions were received	543
Number of farms withdrawn from the catalogue	79

There were, according to the Massachusetts local census of 1885, 45,000 farms altogether in the state with an acreage with an average acreage of 86·6 acres—the average value of the lands and buildings given in this estimate was nearly $4,113, or roughly 817*l.*, about 9*l.* 8*s.* per acre. The 150 farms sold after the advertisement above alluded to, had an average acreage of over 100 acres, and the value set against them was $1527·5, or not much over 300*l.*—a rate apparently of 3*l.* per acre.

45.—The Massachusetts Bureau of Statistics of Labour has also collected a number of interesting statistics concerning abandoned farms in this state, which may be found in the 21st annual report of the Bureau (1890, pp. 177–258), from which the following extracts are made:—

The returns as to abandoned farms were made directly to the bureau by the assessors of the several towns at the close of the year 1889 and early in the year 1890.

The following definition—which differs somewhat, it must be remembered, to that before quoted of the term "abandoned farm" was placed upon the form sent out to the assessors:—

"By 'abandoned farms' in this inquiry are meant those formerly cultivated but now deserted, upon which cultivation is now abandoned, and the buildings, if any, unoccupied and permitted to fall into decay. In some cases the grass is still cut on these farms, but nothing is done in the way of enrichment of the soil, and the land is practically unproductive and left to run wild."

The returns were made in accordance with this explanation, which described what is generally understood by the term "abandoned farm"; and the following statistical tables, so far as they refer to such farms, are limited by the definition given:—

The State and Counties.	Farms with Buildings.	Farms without Buildings.	Total.
The State	772	689	1,461
Berkshire	120	92	212
Franklin	113	116	229
Hampshire	92	124	21
Hampden	101	112	214
Worcester	187	157	344
Middlesex	52	24	76
Essex	2	—	2
Suffolk	—	—	—
Norfolk	25	11	36
Bristol	33	19	52
Plymouth	24	31	55
Barnstable	13	2	15
Dukes	10	1	11
Nantucket	—	—	—

The following table shows the comparative acreage and value of all farms and abandoned farms, with per-centages:—

The State and Counties.	Acreage of Farms.	Acreage of Abandoned Farms, 1890.	Per cent. of Acreage abandoned.	Value of all Farm Land, 1885.	Assessed Value of Abandoned Farms, 1890.	Per cent. of Total Valuation.
The State	3,661,833	126,509	3·45	93,803,077	1,076,328	1·15

46.—In the following summary the bureau recapitulates the salient points brought out by the investigation:—

Abandoned farm land in Massachusetts is principally confined to the western counties. Such land aggregates 3·45 per cent. of the total farm acreage of the State, outside the limits of cities, and about 0·87 per cent. of the value of such farm land. In Nantucket and Suffolk counties no abandoned farm land is returned. The per-centage of abandoned farm land of total farm acreage for the counties returning abandoned farm land is highest in Hampshire County, reaching therein 6·85 per cent. It is lowest in Essex County, being therein only 0·06 per cent.

The average size of abandoned farms with buildings is 86 acres, and for those without buildings 87 acres. The average value of abandoned farms with buildings is $894, and for those without buildings $561. The average value of buildings on abandoned farms is $337 per farm, ranging much less than the average value of buildings upon farms under cultivation. Much of the abandoned land may be bought for less than $10 per acre.

While some to the towns containing abandoned farms show a recent decline in the value of agricultural pro-

ducts and property, this is not universally true, and the decline in certain localities is overbalanced by increase in others in the same county; so that, notwithstanding the existence of abandoned farms, each county, except Nantucket, shows an increase since 1875, in the value of agricultural products, and every county shows an increase in the value of agricultural property.

The action of the other States quoted in respect of abandoned farms was much of the same character of that above detailed.

47.—The Vermont authorities entitled their published records issued in 1893 "A list of desirable farms at low prices"—the intention being, however, to include all unoccupied farms where the name of the owner could be reached.

There were 376 cases in all reported, but not over 200 of these were of long standing. The list does not include, however, tracts of land where farm buildings had once been, but which had passed out of the list of farming lands some years ago, and are now described as reverting "to their original and proper use, the growing of forest trees." In connection with this state of matters it may be noted that the assessed value per farm acre in the State of Vermont has declined from $22·40 in 1880 to $18·30 in the last census.

48.—In the New Hampshire list stress is laid on the beauty of the scenery, and the adaptability of much of the abandoned farm land to occupation as summer homes for urban business men. About 750 farms, which for want of a better term were called abandoned, were stated in the pamphlet issued in April last to be offered for sale, making with the number advertised in 1890 a total of 1,342. The reasons of abandonment vary. It is pointed out there is no exhaustion of the soil, but that owners have found town business more engrossing, attractive, and profitable, and it is urged that they offer a good opportunity for investment, as they could, in many instances, be purchased for less than it would cost to replace the buildings, and for one-fifth of the cost of the permanent improvements upon them.

49.—As an indication of the extent to which agricultural depressions is recognised as a topic of discussion in New England, and at the same time of the hopeful attitude held by American experts, it may be of interest to quote from a speech reported in one of their list of unoccupied farms made by Professor W. H. Brewer, of Yale, whose position among agricultural teachers is well known, and who was one of the special experts on cereal production employed in the census of 1880, under Gen. Walker.

He says: "We hear much of the decadence of New England farming, and all the great city newspapers are just now speaking of it. They treat it as if it were an independent economical fact, and this decline of farming in New England has been the subject of many a pathetic article. But is it a fact that New England farming is declining, in any other sense than that which applies to agriculture all over Christendom? If so, in what sense is it declining? It is changing, unquestionably; so is the farming of every civilized region that is reached by railroads and telegraph. New England farming is certainly changing, but I question very much if it is declining,—I mean declining in the amount of its productions, declining in the value of its productions, or declining in its relative profits as compared with farming in other places, or even with many other kinds of business. No safe investment pays so well to-day as it did 25 years ago. It is more difficult now to make safe investments yield 5 per cent. than it was then to yield 7 or 8 per cent. I believe, from all the data I have been able to collect, that New England as a whole is not declining in its agricultural productions, either as to amount or value. It is certain that this State of Massachusetts is not.

"We have a census of the agricultural products of Massachusetts beginning 50 years ago; that is, going back to before the days of railroad transportation and before the days of reaping machines or telegraph. I have spent much time and study on agricultual census tables in general, and of Massachusetts in particular, because this State is the only one in New England which has a census of its own, alternating with the national census, and more complete than that in agricultural details. This is a rich theme for study, but I can only glance at some of the facts which have an especial bearing on the subject I am discussing.

"The figures show that during the last 10 years, the years of greatest agricultural depression, not only in New England but elsewhere, the total production did not decline, but actually increased 28 per cent.; during this period the total area of land in farms increased, the acreage of cultivated land increased, and the number of persons employed in agriculture increased. The decline, if there was any, was not in the amount of land tilled, nor in the number of persons employed, nor in the value of products produced.

"If we look at the whole period of 50 years, the results are very instructive. There has been an enormous increase, instead of decline; some things have greatly declined, especially mutton, cheese, wool and some other products; but even grain raising has declined less than is popularly believed. I have constructed tables showing the amount of each of the cereal grains produced in each of the census years, and also the total amount of cereals. The tables would be too extensive for this place; sufficient to say that the decline, even in grain, has not been great. Using only round numbers, hundreds of thousands of bushels, the decline has been from 41 (hundred thousand bushels) in 1840 and 29 in 1845, to 28 in 1880 and 31 in 1885. On the other hand, there has been an enormous increase in many productions. For example, eggs, from less than 26,000 dollars in 1845 to over one and one-half millions in 1885, an increase of sixty-two fold. Hay has doubled in value: milk has increased from less than 305,000 dollars in 1845 to ten and one-third millions in 1885.

"I cite these figures more to show the changes in our agriculture than to show that there is not a relative decline; because I wish to impress the fact of the actual change going on in our New England farming, and also the fact that, even rapid and great as it has been, it has not been fast enough to keep up with the changing conditions.

"Farming is certainly changing here, but the change in New England is not so great as it is in Old England, nor is it, after all, attended with so much distress.

"The American farmer, who owns the land he tills and is free to change his methods and his crops, easier adjusts himself to the new condition of things; and yet the decline in agricultural land has gone on in all the older States. One writer says that it amounts to a hundred million of dollars in Michigan; another, twice that in New York, another states higher figures as to the decline in Illinois; and so the story goes. Another class of writers is discussing the amount and number of mortgages on farms, and is trying to make political capital out of it; but foreign papers tell us the same story of France and Germany and Italy. We all know how the Italian peasants are now seeking relief by flocking to America.

"The fact cannot be denied that farming is under a cloud, and has been so for the last few years; but I believe that the bottom of the decline has been reached, at least in this country. The United States has given away land, and the old States have had to compete with land that cost nothing. But the land is practically all given away now; the "frontiers" are gone. So, too, the pasturage is taken up, and hereafter land must be bought for farming, and New England farms will again rise in value."

Appendix A. XXII.

APPENDIX XXII.

Notes as to the Acreage and Live Stock of certain European Countries in the period 1883–93.

(*Handed in by Mr. T. H. Elliott. See Questions* 39,304; 39,921; 40,327.)

The following Tables are extracted from the Annual Returns, published by the Board of Agriculture with a view to show, so far as the information available permits, what, if any, change has occurred in the area devoted to corn crops generally, and in particular to wheat, the acreage under potatoes, and that under grass of all description in Austro-Hungary, France, Germany, and Italy during the period 1883-93.

Table I.—As regards corn crops, with the exception of certain years in the Italian figures the information is fairly complete, and appears to indicate that while the area so occupied in the United Kingdom has diminished by about 10 per cent., that of Austria has after an increase fallen nearly to the total of 1883; that of Hungary shows a distinct rise in the later years, after allowing for the change of area dealt with. The French figures are fairly stationary; and the German show an apparent increase since 1888, which, however, may be due to some change in the form of returns. In Italy a small increase is apparent.

Table II.—The Table giving similar particulars as regards wheat show that the Austrian acreage increased up to 1885–8, and has fallen but very slightly since; the Hungarian figures indicate a distinct increase of area. In France, with the exception of the year 1891, when the crop was largely destroyed by weather, the tendency is rather towards increase, though there is scarcely any change between the 1884 and 1893 totals. In Germany, and to a smaller extent in Italy, the area returns is greater than in 1883. In the United Kingdom the drop has been 26 per cent. since 1888.

Table III.—Taking potatoes as a special crop, common to many parts of Europe, the decline in the United Kingdom is very slight. The French and German crop area show a distinct increase.

Table IV.—The Italian figures do not enable a comparative statement to be made for that country, and those for Germany are complete only for the last seven years. Only in the United Kingdom and in France do the reports indicate a material increase—the increase in the latter country being greater than our own.

Table V.—As regards live stock none of the countries named, except France, has a yearly census, and statements of the number of cattle and sheep for isolated years are, owing to the frequently possible fluctuation, of uncertain value. Up to 1892 inclusive, the total of cattle and the proportion returned as cows showed an increase both in this country and in France—the drought of 1893 caused a reduction on both sides of the Channel.

Table VI.—In sheep the numbers followed the same course as cattle here, but in France the decline has been considerable since 1885–7. In Germany, Italy, and Austria such figures as are available indicate more or less striking reductions—the drop in Germany being nearly 30 per cent.

Table VII.—Pigs in the United Kingdom and in Italy are apparently fewer. A large extension in these numbers appear in Germany and Austria, while in France they appear to have been nearly stationary.

As regards Roumania, from which country particulars are now received the comparative figures only go back four years, and have been therefore excluded from these tables. If used they would show for that interval a somewhat growing area in corn, but a reduced portion under wheat in 1893. The grass area seems greater.

The statistics of Russia present certain difficulties of comparison. As rendered they appears to indicate an extension of about 2½ per cent. in the corn crops generally, a much larger one of 13 per cent. in wheat, and a still greater extension in the area under potatoes.

APPENDIX XXVII.

(Handed in by Mr. Thomas Henry Elliott. See Question 42,707.)

Memorandum in respect of Legislation relating to the Drainage and Improvement of Land.

In 1846, by 9 and 10 Vict. c. 101, the Treasury were empowered to make advances not exceeding 2,000,000*l.* for Great Britain, and 1,000,000*l.* for Ireland to promote the improvement of land by drainage. The object of the Act is set forth as follows in the preamble thereto:—

"Whereas the productiveness and value of much of the land in Great Britain and Ireland are capable of being greatly increased by drainage, and the extension of the operation of drainage is calculated to promote the employment and effectiveness of agricultural labour, and tends also to prevent disease and to improve the general heath of the community."

The administration of the Act (so far as it applies to Great Britain) was entrusted to the Inclosure Commissioners, who had been appointed under the Act of the previous session.

Landowners desirous of obtaining advances had to make applications to the Commissioners, setting forth such details of the proposed drainage works, their estimated cost, and an estimate of the increased value of the land anticipated therefrom as would enable the Commissioners to form an opinion of the desirability of entertaining the application. Should there appear to them to be a *primâ facie* case in support of the application, the Commissioners might require from the applicant security for the expenses of the investigation, which they subsequently had to make by an Assistant Commissioner or surveyor or engineer. Should the report based on such investigation be favourable, the Commissioners issued a provisional certificate for the execution of the works. When the Commissioners were satisfied that the works had been executed as required by the provisional certificate, or that a portion complete in itself had been executed in a durable and effectual manner, a certificate for the payment of the advance, or of a completed portion thereof was granted. The repayment of the advance thereupon became a rentcharge upon the land of 6*l.* 10*s.* per cent. per annum, extending over a period of 22 years. It was recoverable by the Commissioners of Stamps and Taxes, and the legal process was in England the same as that employed for the recovery of tithe rentcharge under the Tithes Act, 1836. It was (in England) a charge on the land subsequent to tithe rentcharge or to any quit rent or chief rent incident to tenure. In Scotland it was recoverable in the same manner as any feu, duty, or rent, or annual rent payable to Her Majesty out of the same lands would be recoverable. It was subsequent in order of charge to any feu duty, but had priority of all other charges.

Should land charged under the Act be occupied in separate farms, or have become subdivided, or if the owner desired to sell part of it, or if for any other reason the Inclosure Commissioners thought it desirable, they might apportion the rentcharge on the different parts of the land, so that no rentcharge was less than 1*l.*, and the rentcharge was redeemable by the owners.

Persons interested in the land might object to the application for an advance, and the Commissioners were then unable to make the advance unless the dissent were withdrawn, or were set aside by the Court of Chancery or Court of Session.

So long as any part of an advance remained unpaid, the landowner was bound to maintain the works in respect of which it had been granted, and was compelled to certify yearly as to their condition, and, if he failed to maintain them, he was liable to an action of waste at the suit of the next heir of the lands, who might become in the future liable for the payment of the rentcharge.

By the Act of 1847 no provisional certificate could be issued for more than 10,000*l.*, but this was subsequently reduced in 1850 to 5,000*l.*

In pursuance of the policy of encouraging drainage the Act of 1847 was passed.

Under it persons interested in lands capable of improvement by drainage or warping by means of works to be executed on the same, or other lands for obtaining or improving the outfall or otherwise, and who were desirous of executing the works, but were unable to do so by the disability or objection of the owner of the lands which would be entered upon, or cut through, or interfered with, might memorialise the Commissioners for authority to execute the works. After due notice of the memorial was given, a public inquiry into the case was made at which all parties were heard, and the Commissioners might then grant the authority asked for. Under this authority the persons named in it might carry out the works, with all powers necessary for the execution as regards entry, &c., but the owners of the lands were entitled to compensation for all loss and damage, and no entry could be made on their lands until the compensation was paid. There was also power to purchase sites for engine houses or other necessary purposes, to any extent not exceeding three acres, and not being in a park or pleasure grounds. Nor might any work be authorised which would cut through, or divert, or interfere with ornamental waters, or the feeders of reservoirs, unless with the consent of the owner.

If an owner of drains, streams, or watercourses forming a boundary neglected or declined to co-operate with the other riparian owners to maintain the banks of such stream, or to cleanse or scour them, and thereby caused injury to the other lands, the other owners or occupiers might call on him to carry out, or assist in carrying out, the works, and in his default might do the work themselves and charge him, and, if necessary, recover from him by distress this just proportion of the expense, and they had power of entry on his lands under a warrant of two justices.

In 1850 a further grant of 2,000,000*l.* was made to Great Britain, and 200,000*l.* to Ireland. The total amount lent was, in England, 2,116,510*l.* 17*s.* 7*d.*, of which, on March 31st, 1894, 4,733*l.* 3*s.* 8*d.* remained unpaid. The sum lent in Scotland was 1,874,367*l.* 2*s.* 5*d.*, of which, on the same date, 4,375*l.* 5*s.* 11*d.* was unpaid.

In 1851 a portion of the funds granted under the Drainage Acts was diverted from their purpose.

"Whereas," says the preamble of 14 and 15 Vict. c. 91., "great distress prevails in certain parts of the High-" lands and Islands of Scotland which would be most " effectually relieved by affording facilities for the " voluntry emigration of a portion of the population of " those districts; and it is expedient to enable owners " of land in the said Highlands and Islands to defray " the whole or part of the expense of the emigration of " poor persons desirous of emigrating from the parishes " or combinations in which such land is situate;" any landowner might, with the consent of the Board of Supervision for the relief of the poor in Scotland, apply to the Inclosure Commissioners for an advacne of money for the above purpose. Inquiry should then be made into the case by the Inclosure Commissioners and the Colonial Land and Emigration Commissioners, and on receipt of their reports, the Treasury might instruct the Inclosure Commissioners to issue a provisional certificate and make an advance in the same way as in cases of drainage, and make its repayment a rentcharge on the land. There was in these cases no limit on the amount of the advance.

Land Drainage and Improvement.

As we have seen, several Acts, beginning with the year 1846, had been passed under which public money was devoted to drainage works under the supervision of the Inclosure Commissioners. But meanwhile an Act was passed in 1849, known as the "Private Money " Drainage Act," which was designed to encourage the application of private moneys to drainage operations. The execution of works under this and succeeding Acts was much facilitated by the formation of four companies (to be further referred to hereafter) incorporated by Act of Parliament, by whom money is advanced for drainage and other works applicable to the improvement of land.

Operations under the Act of 1849 proceeded until the year 1864, when the "Improvement of Land Act" was passed, which replealed the Act of 1849 except so far as related to any proceedings or applications pending under it.

The Act of 1864 was designed "to amend and consolidate the law relating to the improvement of lands by owners of limited interests, and to enable such owners to charge their lands with money subscribed for the construction of railways and navigable canals, which will permanently increase the value of such lands," and is administration was placed, as regards lands in Great Britain, under the Inclosure Commissioners.

A "landowner" for the purposes of this Act, as regards England, is defined as follows:—"The person who shall be in the actual possession or receipt of the rents or profits of any land, whether freehold, copyhold, customary, or other tenure, except when such person shall be a tenant for life or lives holding under a lease or an agreement for a lease for a term of years not renewable, whereof less than 25 years shall be unexpired at the time of making any application to the Commissioners without regard to the real amount of the interest of any person so excepted; and in the case where the person in the actual possession or receipt of the rents or profits of any land shall fall within the above exceptions, then the person who for the time being shall be in the actual receipt of the rent payable by the person so excepted, unless he shall also fall within the above exceptions, shall, jointly with the person who shall be liable to the payment thereof, be deemed for the purposes of this Act to be the owner of such lands."

In Scotland "landowner" denoted and included "every fiar, life-renter, or heir of entail who shall be in the actual possession of the land, or in receipt of the rents payable on the tacks, leases, or tenancies of the tenants in the actual possession thereof."

"Persons" included companies and corporations.

"Improvement of lands" meant:—

1. The drainage of land, and the straightening, widening, deepening, or otherwise improving the drains, streams, and watercourses of any land.
2. The irrigation and warping of land.
3. The embanking and weiring of land from the sea or tidal waters or from lakes, rivers, or streams, in a permanent manner.
4. The inclosing of lands and the straightening of fences and re-division of fields.
5. The reclamation of land, including all operations necessary thereto.
6. The making of permanent farm roads and permanent tramways, and railways, and navigable canals for all purposes connected with the improvement of the estate.
7. The clearing of land.
8. The erection of labourers' cottages, farmhouses, and other buildings required for farm purposes, and the improvement of and addition to labourers' cottages, farmhouses, and other buildings for farm purposes already erected, so as such improvements or additions be of a permanent nature.
9. Planting for shelter.
10. The constructing or erecting of any engine-houses, water-wheels, saw and other mills, kilns, shafts, wells, ponds, tanks, reservoirs, dams, leads, pipes, conduits, watercourses, bridges, weirs, sluices, floodgates, or hatches, which will increase the value of any lands for agricultural purposes.
11. The construction or improvement of jetties or landing-places on the sea coast, or on the banks of navigable rivers or lakes, for the transport of cattle, sheep, and other agricultural stock and produce, and of lime, manure, and other articles and things for agricultural purposes; provided that the Commissioners shall be satisfied that such works will add to the permanent value of the lands to be charged to an extent equal to the expense thereof.
12. The execution of all such works as in the judgment of the Commissioners may be necessary for carrying into effect any matter hereinbefore mentioned, or for deriving the full benefit thereof.

This schedule of improvements still holds good as regards Scotland, but with reference to England it has been (as will be seen later) considerably extended by the Settled Land Act, 1882 and 18 90.

Any landowner, or two or more landowners jointly, desirous of advancing or borrowing money for the improvement of their lands may apply to the Board of Agriculture (now representing the Inclosure Commissioners) to sanction such improvement, and the Board then investigates the application, which must be accompanied by plans and specifications of the work to be done, and can require alterations in the proposed improvements if they think fit.

If the proposed improvements affect Church lands the consent of the patron and bishop of the diocese in England, and of the presbytery of the bounds in Scotland, is necessary.

If the Board are of opinion that the proposed improvements would interfere with a navigable river or canal, notice must be given to the body or bodies managing the same, and they may dissent in the same way as remaindermen.

Should the application refer to lands in Scotland, notice thereof must be advertised and given to all persons interested, who can within a month signify their dissent. In such a case no order can be made sanctioning the works, unless the dissent is withdrawn or overruled by the Court of Session. The sanction of the court is also necessary when the remaindermen are infants. This was also the rule in England, but has been altered by the Settled Land Act, 1882.

These preliminaries being disposed of, the Board may, by a provisional order, sanction the improvements, and fix the rate of interest on which the absolute charge is to be based, which interest is never to be above 5 per cent.

The works must be submitted to and approved by the Board before the execution thereof.

Adjoining lands necessary for the execution of the improvements may be acquired or entered upon for that purpose.

The rights of the Crown, the Commissioners of Her Majesty's Works, the Duchies of Lancaster and Cornwall, and of the Admiralty and Board of Trade are saved, unless consent is obtained.

In cases of works to be done in tidal waters below high-water mark, in certain cases where they deal with places named by the Admiralty under section 9 of the Harbours Transfer Act, 1862, the previous approval of the Admiralty is required; in other cases the approval of the Board of Trade is necessary.

In addition to the above there are saving clauses as to the rights of the War Office, Commissioners of Sewers, the Thames Conservancy Board, the Metropolitan Board of Works (now London County Council), water companies and commissioners, and rivers, canals, &c. under conservators, trustees, &c.

When the works, or part of them, are completed to the satisfaction of the Board, they are by absolute order to execute a charge on the inheritance of the lands for the whole sums chargeable thereon (or a proportionate part), the charge to be by way of rent-charge, payable half-yearly.

In case the money is advanced by one of the land improvement companies the charge may be made so as to operate under the Acts applying to such company; or any improvement company may elect to avail themselves of this Act, and thereupon may, with the consent of three-fourths of the shareholders at an extraordinary general meeting, advance money for the purposes of this Act, even though not authorised to do so under their own Acts.

If by Act of Parliament, Royal Charter, or Commission under the Great Seal, or the Seal of the Duchy of Lancaster, any landowner is assessed for the execution of public works of drainage or other improvement, the Board of Agriculture can, on his application, make an absolute order charging the amount assessed upon the inheritance, as if the works had been done under the Act of 1864.

Charges on lands created by absolute order have priority of all other charges, except quit rent, Crown rents, chief rents, feu duties, ground annuals and other charges incident to tenure, tithe rent-charges, and teinds, and certain charges under Act of Parliament for the improvement of the lands. The charges are personal property, but may be merged in the land charged.

Rent-charges are recoverable as tithe rent-charges under the Act of 1836, or feu duties, and they may be apportioned.

So long as any part of the charge is unpaid the works in respect of which it was made must be kept up, and in

Appendix A XXVII.

default the remainderman may bring an action of waste for neglect.

Buildings erected under this Act must be insured, and in default the person entitled to the charge may insure, with the consent of the Board, and recover the amount paid.

If complaint is made that the works are not being upheld, the Board may require the execution of the work necessary, and in default may execute them themselves, and recover the cost, as if it were part of the charge.

The Board may release the landowner from the obligation to uphold the works.

If an embankment or other work affecting tidal water or a navigable river is abandoned or falls into disuse or decay, the Admiralty or Board of Trade, as the case may require, may abate or remove the same, at the cost and charge of the landowner.

If a landowner desires to subscribe for shares in a railway or canal company, or in any branch, extension, or deviation thereof, whereby his property will be benefited, he may apply to the Board to have the subscription made a charge on the lands so to be improved, and the Board may sanction the arrangement by provisional order, which is assignable to any company or person who may advance the money.

When the work is completed, and the railway or canal opened for traffic throughout, and the shares subscribed for fully paid-up, and the certificates deposited with the Board, an absolute order is made charging the amount subscribed on the inheritance of the lands. The shares stand in the name of the person liable to pay the charge, and during the term of the charge are not transferable except to persons for the time being entitled to them.

According as the charge is paid off the shares are proportionately released, and the residue finally become the property of the person paying the last charge.

Limited Owners' Residence Acts.

The Limited Owners' Residence Acts of 1870 and 1871 were designed to enlarge the scope of the previous Acts. Under them estates could only be charged for works of a directly agricultural character. Under the Acts of 1870 and 1871 this power was extended to include the building or improvement and enlargement of mansion houses and the usual outhouses and offices attached thereto. The estate may be charged to an amount not exceeding two years' net rental of the estate. In the case of an owner having several different estates settled tot he same uses and subject to charges effecting the whole, then the charge may be two years' rental of the estate on which the mansion house is to be built, after deducting from the gross rental a proportionate share of the charges. The term "estate" includes any land in the same neighbourhood belonging to the same owner and settled to the same uses.

Settled Land Acts, 1882 and 1890.

The preceding legislation relates to improvements where the money expended on them is made a charge upon the estates. The Settled Land Act of 1882 made a further change. Under that Act, capital trust money may be expended in making improvements.

The duties of the Board under this Act, where the capital money to be expended is in the hands of trustees, consist (upon application being made to them) in certifying that the works or operations have been properly executed, and what amount is properly payable by the trustees in respect thereof.

The approving of a competent engineer or able practical surveyor, nominated by the trustees, to certify in like manner.

Where the capital money to be expended is in Court, the Court may, if it think fit, require a report or certificate from the Board before authorising the payment for any work or improvement.

The Board may prescribe the period during which the tenant for life or his successor shall maintain and repair at his own expense every improvement executed under the provisions of the Act, and the amount, if any, for which a building or other work comprised in thei mprovements shall be insured against damage by fire, and they may direct the tenant for life or his successors to report whether these things have been done.

Under the Settled Land Acts, 1882 and 1890, the works on which capital trust money may be expended are wider in scope and more numerous than those contained in the Improvement of Land Act, the enumeration of which was extended so as to comprise all improvements contained in the Settled Land Acts.

Improvements as here defined are the making or execution on, or in connexion with, and for the benefit of, settled land of any of the works enumerated in section 25, or of any operation incident to or necessary or proper for carrying them into effect, or securing the full benefit of them, and are thus defined :—

1. Drainage, including the straightening, widening, or deepening of drains, streams, and watercourses.
2. Irrigation; warping.
3. Drains, pipes, and machinery for supply and distribution of sewage as manure.
4. Embanking or weiring from a river or lake, or from the sea, or a tidal water.
5. Groynes; sea walls; defences against water.
6. Enclosing; straightening of fences; redivision of fields.
7. Reclamation; dry warping.
8. Farm roads; private roads; roads or streets in villages or towns.
9. Clearing; trenching; planting.
10. Cottages for labourers, farm servants, and artizans, employed on the settled land or not.
11. Farmhouses, offices, and outbuildings, and other buildings for farm purposes.
12. Saw-mills, scutch-mills, and other mills, waterwheels, engine-houses, and kilns, which will increase the value of the settled land for agricultural purposes or as woodland or otherwise.
13. Reservoirs, tanks, conduits, watercourses, pipes, wells, ponds, shafts, dams, weirs, sluices, and other works and machinery for supply and distribution of water for agricultural, manufacturing, or other purposes, or for domestic or other consumption.
14. Tramways; railways; canals; docks.
15. Jetties, piers, and landing places on rivers, lakes, the sea, or tidal waters, for facilitating transport of persons and of agricultural stock and produce, and of manure and other things required for mining purposes.
16. Market and market places.
17. Streets, roads, paths, squares, gardens, or other open spaces for the use, gratuitously or on payment of the public or of individuals, or for dedication to the public the same being necessary or proper in connexion with the conversion of land into building land.
18. Sewers, drains, watercourses, pipe making, fencing, paving, brick making, tile making, and other works necessary or proper in connexion with any of the objects aforesaid.
19. Trial pits for mines, and other preliminary works necessary or proper in connexion with development of mines.
20. Reconstruction, enlargement, or improvement of any of those works.

This has been further extended by the Act of 1890 to include the following :—

1. Bridges.
2. Making any additions to or alterations in buildings reasonably necessary or proper to enable the same to be let.
3. Erection of buildings in substitution for buildings within an urban sanitary district, taken by a local or other public authority, or for buildings taken under compulsory powers, but so that no more money be expended than the amount received for the buildings taken and the site thereof.
4. The rebuilding of the principal mansion house on the settled land; provided that the sum to be applied under this sub-section shall not exceed one-half of the annual rental of the settled land.

It is to be observed that neither the Limited Owners Residences Acts nor the Settled Land Act apply to Scotland.

Drainage and Land Improvement Companies Acts, 1849 to 1863.

As has been seen, the earlier Drainage and Improvement of Land Acts depended on capital advanced by the State, the later Acts depend on private capital.

To supply this, four companies have been formed and incorporated by Act of Parliament, viz., the General Land Drainage and Improvement Company in 1849; the Lands Improvement Company in 1853; the Scottish Drainage and Improvement Company in 1856; and the Land Loan and Enfranchisement Company in 1860.

In cases where an application for power to raise money is made to the Board under one of the public Acts, viz., the improvement of Land Act, 1864, or the Limited Owners Residences Act, the application is made by the owner direct to the Board, but when the money is obtained by the owner from one of the above-named companies under the private Acts, the application to the Board is made by the Company, and the proceedings relating thereto are carried out between the Board and the Company.

In other respects the procedure under the Companies Acts is practically the same as that under the public Acts.

The maximum term fixed for the repayment of a rentcharge under the Improvement of Land Act, 1864, the Limited Owners Residence Act, the Lands Improvement Company's Act, the Scottish Drainage and Improvement Company's Act, and the Land Loan and Enfranchisement Company's Act is 25 years; under the General Land Drainage and Improvement Company's Act the term is 31 years.

The powers of the Lands Improvement Company and the Land Loan and Enfranchisement Company extend to England and Scotland; the General Land Drainage and Improvement Company is confined to England, and the Scottish Drainage and Improvement Company to Scotland.

Land Drainage Act, 1861.

Although the Land Drainage Act of 1861 is in the Board of Agriculture Act classed among the Drainage and Improvement of Land Acts, it can more properly be considered apart from them and in connexion with the Thames Valley and Somersetshire Drainage Acts.

For, whereas the Drainage and Improvement of Lands Acts, beginning in 1846 and ending with the Settled Estates Act of 1882, deal with works undertaken 1861 by private persons for their own benefit, the Act of (with the exception of a few clauses in Part III.) is concerned with arterial drainage, of a public character, undertaken for the benefit of a district, carried on with money raised by public rates, and administered by public bodies.

Drainage, it will be understood, is under these Acts confined to the clearing of land from water.

This represented no new departure in legislation. Since the time of Henry VIII., and by Acts passed under succeeding Sovereigns, public drainage works had been carried out by Commissions of Sewers, many of which continue to exist at the present time.

The first and second parts of the Land Drainage Act of 1861, 24 & 25 Vict. c. 133, relate entirely to the issue of Commissions of Sewers, and their functions, and the establishment of separate drainage districts, and the functions of Drainage Boards, the main difference between them being in the mode of appointment and their tenure of office.

A Commission of Sewers is issued by the Crown on the recommendation of the Inclosure Commissioners (now the Board of Agriculture), which recommendation is obtained on an application by the proprietors of the lands within the area proposed to be placed under the Commission, unless one-third of the proprietors dissent, and the area under the Commission is fixed by the Board of Agriculture. A Commission of Sewers once issued continues until superseded by the Crown, and the Commissioners are appointed by the Crown.

An elective drainage district is formed by any person or body of persons being proprietors of not less than one-tenth part in acreage of any bog, moor, or other area of land requiring a combined system of drainage, warping, or irrigation, subject to the consent of the Board of Agriculture and confirmation by Parliament. The superintendence of drainage matters in the district is vested in a Drainage Board elected annually by the ratepayers of the district, the voting power of each voter being proportionate to the rateable value of his property, ranging from one vote for property under 50*l.* rateable value to 10 votes for property over 1,000*l.* rateable value.

In other respects the powers and functions of Commissions of Sewers and Drainage Boards are the same.

The duties of these bodies are to cleanse, repair, and maintain, any existing watercourse or outfall for water, or any existing wall or defence against water; to deepen, widen, straighten, or improve any existing watercourse or outfall for water, or to remove mill-dams, weirs, or other obstructions, or to raise, widen, or alter, any existing wall or defence against, or to make any new watercourse or outfall for, water, or to erect new defences against water, or to erect any machinery or take any measures required for the drainage, necessary supply of water for cattle, warping or irrigation of the lands within their district, and they must pay compensation for any damage done.

In carrying out these orders, however, they have no power to remove or interfere with any mill-dam or other obstruction, whereby the level of the water is raised for milling or other purpose of profit, without the consent of the owner, until they have proved their right to do so, and have paid compensation. To determine this, three points have to be settled, either by the justices in petty sessions or (if the owner object to that) by arbitration. These are:—

1. Is the removal or interference necessary for effectual drainage?
2. Will the proposed removal or interference cause injury to the owner?
3. Is or is not the injury of a nature to be fully compensated for by money?

The consequence of any decision shall be as follows:—

1. If it is that the removal or interference is not necessary, the Commissioners or Board are not entitled to make it.
2. If it is that it is necessary, but the injury is not of a nature to be fully compensated for by money, they are not entitled to make it.
3. If it is that it is necessary and can be fully compensated for by money, then they can make it.

If the Commission or Board desire to purchase land for new works they must petition the Board of Agriculture, who after inquiry may make a Provisional Order, which must, to be valid, receive the sanction of Parliament.

Both these bodies may levy rates for the works done by them. If any proposed work other than the maintence of existing work involves an expenditure of more than 1,000*l.*, they must give two months' notice, and if one half of the proprietors of the area liable to the rate object it cannot be carried out. They have also the power, with the consent of the Board of Agriculture, of mortgaging the rates for a period not exceeding 30 years.

There are certain limitations in the powers of the Commissioners or Boards.

They cannot interfere with, so as to injure, sewers or other works for drainage, preservation, irrigation, or improvement of lands made under any local or private Act of Parliament, or with any river, canal, dock, harbour, reservoir, &c. so as to injuriously affect the navigation or use or maintenance thereof or with any towing-path so as to interrupt the traffic in cases where tolls or other dues are payable in respect of them to any person or persons, nor can they interfere with works or supply of water to any town or place, so as injuriously to affect the same; and they cannot divert a river in such way as to injure or diminish the supply of water to any harbour without the consent of those having the management of the harbour. No rivers, canals, or inland navigation, or any works appertaining thereto, which at the passing of the Act were subject to any local or private Act of Parliament exempt from the control of the Commissioners or Drainage Boards, are under their control.

The third part of the Act deals with cases where private owners desire to obtain outfalls through an adjoining owner's property, or to have improvements made in drains belonging to an adjoining owner. There is no difficulty if the adjoining owner assents; but if he dissents, the case is submitted to the justices in petty sessions or (if the adjoining owner desires) to arbitration.

The questions submitted are:—

1. Will any injury be caused by the proposed works?
2. Can such injury be compensated for by money?

If the first question is decided in the negative, the applicant can at once execute the work.

If the answer to both questions is in the affirmative the applicant can execute the works on paying compensation.

Appendix A. XXVII.

If, however, it is decided that injury will be caused which cannot be compensated for by money, then the work cannot be executed.

Thames Valley Drainage Acts, 1871 to 1891.

In 1871, it being found that the drainage of divers lands adjoining and near the River Thames and its tributaries in the counties of Berks, Oxon, Wilts, and Gloucester was defective, and the value of the lands thereby diminished, and that it would be of public as well as private advantage to provide for the drainage of such lands, the Thames Valley Drainage Act was passed to achieve those results. The Amending Acts of 1874 and 1891 may be dismissed, as they only extend the operation of the original Act to new districts, and in no way alter its working.

By the Act of 1861 we have seen that public drainage works are administered either by a Commission of Sewers, or by an elective Drainage Board. The system adopted for the Thames Valley is a combination of the two. By the Act of 1871 a Drainage Commission was constituted, and the Commissioners appointed. These Commissioners, with the assent of the Inclosure Commissioners (now the Board of Agriculture), defined the limits of their jurisdiction, and divided the territory within those limits into drainage districts, prescribing the number of members of each district's board and the number of representatives which each board might send to the Commission.

The district boards were elected (subject to any provisions to the contrary made by the Commissioners) in the manner prescribed in the Drainage Act of 1861. The newly-elected boards then proceeded to elect Commissioners, and on the election of the new Commissioners those appointed in the Act went out of office. In the somewhat improbable event of a district board not electing Commissioners, the Inclosure Commissioners might fill up the vacancies. In the Somersetshire Drainage Act this power is given to the Court of Quarter Sessions.

Lands adjoining the Thames or its tributaries outside the limits fixed by the original Commissioners may be brought within the jurisdiction of the Commissioners by order of the Board of Agriculture, on the petition of a majority in number of the owners and occupiers of such lands.

As in the Drainage Act of 1861, newly formed Commissioners of Sewers and Drainage Boards cannot interfere with districts under other authority, so in the Thames Valley the Commissioners and district boards may not interfere with such portions of the river as are under the control of the Conservancy, unless by arrangement with the Conservancy; and in case of difference, the matter is referred to the Board of Trade. Subject to this, their duties are, speaking generally, to take all steps necessary for the effective drainage of their district, and for purposes of irrigation, giving due compensation to persons injuriously affected, and with the consent of the Board of Agriculture in case objection is made to the proposed works by any person affected.

Arterial drainage works are to be exclusively done by the Commissioners, all works not specially reserved to them by the district boards; but the two bodies can respectively delegate their powers to each other.

Except with the consent of the owners, the Commissioners and district boards cannot interfere with mill dams, weirs, or obstructions whereby the level of water is raised for milling or other purpose of profit. If the owner objects, recourse is had to petty sessions; but if either party objects to that, an arbitrator is appointed by the Board of Agriculture, and the questions for decision are similar to those set forth in the Act of 1861.

The Commissioners or district boards can purchase or take on lease such lands or casements as may be necessary for the execution of the Act; but where the land is acquired by a district board, it is vested in the Commissioners as trustees for the Board district board.

The process of the acquiring of land by a district board is as follows:—

The board certifies the same to the Commissioners, who satisfy themselves of the necessity of the proposed transaction. Thereupon, after giving due notice, they petition the Board of Agriculture for a Provisional Order, which may, after due inquiry, be granted, and must then be confirmed by Act of Parliament.

The Commissioners or district boards have power to make assessments for rating, either for general purposes when it is called a general assessment, or for special purposes when it is called a special assessment. The assessment may be made not only on lands within their jurisdiction, but also on lands or interests outside their jurisdiction which are likely to be benefited. Objections to the assessment may be made by the persons assessed, and are heard by the Commissioners. No part of the River Thames under the jurisdiction of the Conservators or belonging to any railway company, nor of any company named in section 29 of the Metropolis Water Act, 1852, is liable to be rated. If an owner fails to pay a rate, the occupier has to pay and can deduct what he pays from the rent; and if an owner pays a special rate in respect of lands demised for a term dependent on a life or lives, the lessee has to pay the owner 5 per cent. on the amount paid to the end of his tenancy, or a period not exceeding 30 years.

The Commissioners can make assessments in gross on the district boards, and issue precepts for the payment of the amount charged against each district.

If a limited owner is liable to pay a special rate of more than 100*l*., he can, with the assent of the Board of Agriculture, charge the special rate on the land subject to it for a period not exceeding 30 years; and such charge becomes a first charge on the freehold and inheritance of the lands.

If any person is liable by reason of tenure, custom, prescription, or otherwise to repair any walls, maintain any sewer, or do any other work within the Commissioners' jurisdiction, the Commissioners or district boards may, with the consent of the Board of Agriculture, commute the obligation for a sum of money, either as a gross sum, or as a charge on the lands; and where the person so liable is a limited owner, the amount payable in a gross sum for commutation can be charged on the inheritance as in the case of a special rate. Drainage companies incorporated by Act of Parliament or Royal Charter may lend money for the purposes of the Act.

The Commissioenrs or district boards may mortgage the rates for a period not exceeding 30 years with the consent of the Board of Agriculture.

If there are arrears of 3,000*l*. due on a mortgage, a receiver may be appointed; and if while the arrears are due the Commissioners or district boards decline to levy rates for their repayment, the receiver is vested with the powers of the Commissioners or district boards for levying the rate.

Appeals in respect of rates, assessments, &c. lie to the Quarter Sessions, who may refer the matter to an arbitrator if scientific questions are involved.

Somersetshire Drainage Act, 1878.

The Somersetshire Drainage Act is designed to attain the same ends as the Thames Valley Act in the valleys of the Rivers Parrett, Ile, Yeo, Brue, Axe, Cary, and Tone.

It is administered by Commissioners and district boards, as in the case of the Thames Valley, and is, with some small exceptions, practically identical with the above Act, and the consent of the Board of Agriculture is required as in the case of the Thames Valley, with the exception above noted in the case of the appointment of the Commissioners.

APPENDIX XXVIII.

(Handed in by Mr. T. H Elliott. See Question 42,752.)

COMPANIES ACTS under which Money is, or may be, advanced by the Companies and made a charge on Land through the medium of the Board of Agriculture.

Date.	Company.
1849	The General Land Drainage and Improvement Company; 12 & 13 Vict. c. 91. Offices:—Palace Chambers, 9, Bridge Street, Westminster, S.W.; R. E. Hebblethwaite, Esq., Secretary. (Applies to England only.)
1853	The Lands Improvement Company, 16 & 17 Vict. c. 154., 18 & 19 Vict. c. 84., 22 & 23 Vict. c. 82., 26 & 27 Vict. c. 140. Offices:—1, Great George Street, Westminster, S.W.; Granville R. Ryder, Esq., Managing Director. (Applies to England and Scotland.)
1856	The Scottish Drainage and Improvement Company, 19 & 20 Vict., c. 70, 23 & 24 Vict. c. 170. Offices:—20, Hill Street, Edinburgh; Charles Ritchie, Esq., Manager. (Applies to Scotland only.)
1860	The Land Loan and Enfranchisement Company, 23 & 24 Vict. c. 169 and 194. Offices:—22, Great George Street, Westminster, S.W.; Edwin Garrod, Esq., Secretary. (Applies to Great Britain, Ireland, the Isle of Man, and the Channel Islands.)
	PUBLIC ACTS, under which the Money for Improvements to be made a Charge on Land, has to be provided from Private Sources or from the Companies.
1864	The Improvement of Land Act, 1864, 27 & 28 Vict. c. 114. (Applies to Great Britain and Ireland.)
1870	The Limited Owners Residences Acts, 33 & 34 Vict. c. 56., 34 & 35 Vict. c. 84. (Applies to England and Ireland.)
1877	The Limited Owners Reservoirs and Water Supply Further Facilities Act, 40 & 41 Vict. c. 31. (Applies to England and Ireland.)
1875 1876 1878	By the Public Health Acts of England, Scotland, and Ireland, 38 & 39 Vict. c. 55. s. 31., 30 & 31 Vict. c. 101. s. 115 and 41., and 42 Vict. c. 52. s. 34., works for distribution and service for supply of sewage to lands for agricultural purposes are made improvements under the Improvement of Land Act, 1864. Forms of application under these Acts to be obtained from the office of the Board of Agriculture, 3, St. James' Square, London, S.W.
	UNIVERSITY and COLLEGE ESTATES ACTS, 1858 to 1880. Under these Acts money may be raised for Agricultural and other Permanent Improvements.
1858 1860 1880	21 & 22 Vict. c. 44. s. 27. 23 & 24 Vict. c. 59. s. 1. 43 & 44 Vict. c. 46. ss. 2. and 4.
	PUBLIC MONEY DRAINAGE ACTS, and Acts amending the same. The Funds under these Acts are now exhausted, and the greater portion of the Advances have been repaid to the Government.
1846 1850 1847 1848 1856	9 & 10 Vict. c. 101. First Act authorising advance of 2,000,000*l.* 13 & 14 Vict. c. 31. Second, authorising further advance of 2,000,000*l.* 10 Vict. c. 11. 11 & 12 Vict. c. 119. 19 Vict. c. 9. } Altering and amending proceedings.
	ACTS of PARLIAMENT under which Charges can be made on Land but not through the medium of the Board of Agriculture.
1845	8 & 9 Vict. c. 56. Applies to England and Ireland.
1770 1848 1853 1860	10 Geo. 3. c. 51. 11 & 12 Vict. c. 36. 16 & 17 Vict. c. 94. 23 & 24 Vict. c. 95. } Applies to Scotland only.

Appendix A. XXIX.

APPENDIX XXIX.

(*Handed in by Mr. T. H. Elliott. See Question* 42,752.)

PARTICULARS of EXPENDITURE charged on ESTATES for IMPROVEMENTS under the several DRAINAGE and IMPROVEMENT of LAND ACTS for each Year, from 1873 to 1894 inclusive.

Year.	Drainage.	Farm Buildings.	Labourers' Cottages.	Embanking.	Roads.	Reclamation.	Clearing.	Planking.	Inclosing.	Subscriptions to Railways.	Mansion Houses, &c.	Other Agricultural Improvements.

* These expenses include the commission charged by the Company (where the transaction is carried out through one of the Improvement Companies), their office charges and expenses, and stamps on deeds; likewise expenses incurred independently by the landowner for architects and legal charges, superintendence, and interest on advances; also the expenses and fees of the Board of Agriculture.

Appendix A. XXXI.

APPENDIX XXXI.

(Handed in by Mr. T. H. Elliott. See Question 42,792.)

DRAINAGE and IMPROVEMENT of LAND ACTS.

The total expenditure on land improvement in Great Britain, that has been made a charge on the land, from the commencement of the Public Money Drainage Acts in 1847, and under the subsequent Improvement Companies' Acts and others, up to the 31st December 1894, amounts to 16,521,277*l.* 12*s.*, distributed as follows:—

	£	*s.*	*d.*
Drainage	8,968,731	5	1
Farm buildings	4,702,361	5	4
Labourers' cottages	1,067,336	16	8
Fencing and embanking	432,998	12	9
Roads	161,275	18	4
Clearing and reclamation	146,442	16	11
Planting	93,190	2	7
Other agricultural improvements	265,660	7	0
Subscriptions to railways	116,923	1	1
Mansion houses, &c.	566,357	6	3
	£16,521,277	12	0

Four millions of this was public money advanced by the Exchequer under the Public Money Drainage Acts for the drainage of agricultural land, nearly all of which has now been repaid by those to whom it was advanced. The remainder has been found through the several Land Improvement Companies under their special Acts, and by landowners themselves under the Improvement of Land Act, 1864, and the Limited Owners' Residences Acts.

APPENDIX XXXII.

Tables handed in by Mr. C. N. Dalton. (*See Question* 42,311).

TABLE 1.

RATE in the £ of the RURAL RATES for 1803, 1813–15, 1826–27, 1868, and 1890–91.

COUNTY.	1803. Poor and County Rates, with a part of the Church and Highway Rates.	Average of 1813–15. Poor and County Rates, with a part of the Church and Highway Rates.	1826–27. Poor and County, Church, and Highway Rates.	1868.* Poor and County, Church, and Highway Rates.	Average of 1890–91. Poor and County, and Highway Rates, with Rural, Sanitary, and Rural School Board Rates.	Fall in 1890–91, as compared with 1868.	Fall in 1890–91, as compared with 1803.

* In column (*a.*) for the year ending the 5th of April.
† This is the annual value returned for the year ended the 5th of April 1804.

* In column (*a.*) for the year ending the 5th of April.
† This amount is slightly different from the amount given in the Annual Poor Law Reports, which is 100,612,734*l.*, but it is the corrected amount in the Return, No. 430, Session 1870.

NOTES.

PRELIMINARY.

It should be explained that the serial statement of the "Poor Rates" (Col. *c.*), is less useful for comparison than it would otherwise be, in consequence of the variations in the number and objects of the rates levied under that title at different periods. It is probable that between the years 1803 and 1815, Church and Bye-Highway Rates, either wholly or partially, were levied with the "Poor Rates." The amounts of these for the years 1813, 1814, 1815, as stated in the House of Lords, Burdens on Land Return, Appendix No. 20, Sess. 1846, are the same as the amounts specified in Marshall's "Digest," Part I., p. 39, under the heading of "Parochial Assessments;" and, according to an account of those at p. 35 of the same compilation, they included some charges under the heading of Church and Bye-Highway Rates. In the years from 1815 to 1865, however, the Poor Rates apparently included no payments towards Church Rates or Highway Rates, and certainly they have not done so since 1840. In 1865 and in the subsequent years again, a sum varying between 500,000*l.* and 600,000*l.* was annually paid out of the Poor Rate to Highway Boards. Further, since the date of the passing of the "Municipal Corporation" Act, Borough and Police Rates have been included in the Poor Rate, rates which did not exist before. No real comparison can be drawn on account of these discrepancies between the amounts levied under the title of "Poor Rate" at the various above-mentioned periods.

(*a.*) The amounts in this column, with the exception of the year 1803, are obtained from the Official Returns of the Inland Revenue Department. The amount for 1803 is that given in Marshall's "Digest," Part II., p. 29, where the authority mentioned is No. 103, Vol. xii, fol. 363, Sess. 1806.

(*b.*) The figures in this column are taken from the Poor Law Reports.

(*c.*) The figures in this column, subsequent to 1840, are from the Poor Law Reports. From 1785 to 1830 they are from Marshall's "Digest," Part I., p. 39. For the intermediate period, the authority is Appendix No. 20, to House of Lords' Report on "Burdens on Land" in 1846, from which also all the figures from 1813 to 1843 might have been taken.

The figures in italics, for the years 1865–69, show the total of the poor rates for these years, deducting the payments to the highway boards which were:—

	£
In 1865	550,976
„ 1866	578,494
„ 1867	595,699
„ 1868	614,803
„ 1869	658,469

(*d.*) The figures in this column are obtained from Marshall, Part I. p. 39, for 1785 and 1803, and subsequent to the latter date, from the Burdens on Land Return and the Poor Law Reports.

* The rateable value was not ascertained till 1841, but the Parliamentary Returns referred to in Tables I. and V. in the Appendix to Mr. Goschen's Report contain a statement of the rate in the £, which is used for the sake of comparison; in 1814–15 the calculation appears to have been based on the annual value of property in Schedule A., and the same figure was taken in calculating the rate in the £ in 1826–27.

† ‡ The figures marked thus, †, are taken from page 11 of the Appendix to Mr. Fowler's Report; those marked thus, ‡, are (with the exception of the rates in the £, which have been calculated to one more place of decimals) taken from page xiii of the Poor Rate Return for 1892–93.

Appendix A. XXXII.

TABLE 3 (*a*). (*See Question* 42,356).

STATEMENT showing the Amount expended for Relief to the Poor during the Years ended Lady Day 1868 and 1893.

Number of Unions in which there were no Urban Districts in 1895	142*
Total expenditure on Relief to the Poor in such Unions during the year ended Lady Day 1893	£ 530,070†
Total expenditure on Relief to the Poor in such Unions during the year ended Lady Day 1868	715,876‡
Decrease in 1893 as compared with 1868	185,806 or 26·0 per cent.
Population of such Unions in 1891	1,642,721§
Do. do. 1871	1,673,481
Decrease in 1891 as compared with 1871	30,760 or 1·8 per cent.

Including Scilly Isles.

Excluding 7,637*l.* in respect of the Lunesdale and Pontardawe Unions, for which no corresponding expenditure can be given for the year ended Lady Day 1868, as these Unions were formed after that date from parts of other Unions.

‡ Excluding expenditure in respect of certain parishes added to the Hartley Wintney, Great Ouseburn, Wetherby, Tadcaster, and Stokesley Unions after Lady Day 1868, which cannot be given.

§ Excluding 29,047, the population of the Lunesdale and Pontardawe Unions.

Statistical Department,
Local Government Board,
March, 1895.

Appendix A. XXXII.

TABLE 4 (*a*). (*See Question* 42,409.)

ASSESSMENTS and RATES in the £ of Rates Levied by COUNTY COUNCILS other than the LONDON COUNTY COUNCIL.

[In this Table the figures entered against the heading "Police" relate only to Rates levied exclusively for police purposes; where the County is divided into Police Districts the Rate in the £ of the General Police Rate is given, and the highest and lowest Rates in the £ of the Special Rates for the various districts. The letters prefixed to the amounts bracketed against the heading "Other Purposes" in Cols 2, 4, 6, 8, indicate the purpose for which the rate was levied. Thus: B., Bridges; C.D., Contagious Diseases (Animals) Acts; F.D., Sale of Food and Drugs Acts; L., Lunatic Asylums; M.R., Main Roads; and W.M., Weights and Measures.]

1893	1,491,434	—	—	53,110,804	— 6·7

* The figures for this year in Mr. Goschen's Report are given at page 7 as 1,378,000*l.*, and at page 71 as 1,538,000*l.* From an examination of the Highway Returns for that year it would appear that the figures should have been 1,336,292*l.*

† The Returns published for 1877 do not contain a complete record of the rates raised by all Rural Highway Authorities.

‡ These figures have been arrived at by deducting the rateable value of boroughs for the borough rate valuations, and the assessable value of other urban sanitary districts for the general district rate assessment, from the Extra Metropolitan Poor Rate Valuation. See note ‡ on page 9 of the Appendix to Mr. Fowler's report.

§ The figures for 1875, 1876, 1877, and 1878 cannot be obtained.

1868	47,766,000	33·20	68,012,000	47·27	15,980,000	11·11	12,112,000	8·42	143,872,000	100

* The figures for this year, as above stated, are from the estimate of Mr. Pitt in proposing the tax; but the estimate is probably excessive as to some of the items. His general total is 127,600,000*l.*, including 40,000,000*l.* from trades and professions; but the actual return in 1803 was 115,351,952*l.* (Marshall's "Digest" p. 29, Part II.), of which Schedule D. amounted to 34,854,206*l.* In 1803 the annual value of the property assessed under Schedule A. was 34,864,000*l.*, which seems to show conclusively either that Mr. Pitt over-estimated the value of real property in 1798, or that at first the machinery of assessment was defective; but as no detailed Return for 1803 has been observed, the distribution of Mr. Pitt in 1798 is taken for comparison.

Table 10.

Gross Assessments to Income Tax of Lands, Messuages, &c., Railways, and other Properties, and Per-centage of each to Total (England and Wales). (*See Question* 42,479.)

Note.—The figures in Columns 2, 3, 4 and 5 of this Table are taken from the Annual Reports of the Inland Revenue Commissioners.

* The properties in this Column include not only lands which are or could be used for agricultural purposes, but also ornamental grounds and parks, and open spaces vested in local authorities, gardens attached to houses when exceeding one acre in extent, farm houses and farm buildings, tithe rentcharges, tithes not arising from lands, Easter offerings, surplice fees, dues and money payments in right of the Church, manors and other royalties, fines in consideration of any demise of lands or tenements, and other profits, such as profits of cemeteries, easements, rights of way, &c. They exclude gardens of less than an acre attached to houses, and lands occupied as railways, canals, quarries, &c.

† The properties in this Column include quarries, mines, ironworks, gasworks, salt springs or works, alum works, waterworks, canals, &c., fishings and shootings, markets, tolls, &c.

Table 11.

Total Rateable Value according to the Poor Rate Valuation of Property in *England* and *Wales*, as given in the Annual Reports of the Inland Revenue Commissioners; Rateable Value of Property not Assessed to Income Tax in Schedule A. (being in respect of Railways, Gasworks, Waterworks, Canals, &c.), and Rateable Value of Property Assessed to Income Tax in that Schedule; together with Estimated Approximate Apportionments of the Rateable Value of Lands and Messuages, and Per-centages of the Rateable Values of Lands, Messuages, &c., and other Properties. (*See Question* 42,479.)

Appendix A. XXXIII.

APPENDIX XXXIII.

The Rating of Personalty.

(Handed in by Mr. Dalton. See Question 42,597.)

Prior to the passing of the Parochial Assessments Act of 1836 (6 & 7 Will. IV. c. 96), there had been a considerable number of legal decisions on the question whether any, and, if so, what kinds of personalty were liable to be assessed for the relief of the poor. The first of these cases appears to have been Earby's case (2 Bulst. 354), decided in the ninth year of the reign of Charles the First, in which it is said to have been held that assessments under the 43 Eliz. c. 2.* ought to be made according to the visible estate of the inhabitants of the parish, both real and personal, and that no inhabitant there is to be taxed to contribute to the relief of the poor in regard to any estate he hath elsewhere in any other town or place, but only in regard of the visible estate he hath in the town, where he doth dwell.

The next reported case bearing on the subject seems to have been Reg. *v.* Barking (2 Lord Raymond, 1280), decided in the fifth year of the reign of Queen Anne, on which a majority of the judges are said to have held that a farmer is not chargeable and taxable to the poor rate for his stock, but that a tradesman is to be charged and taxable for his stock in trade. But in Viner's Abridgment, Title "Poor," 426, it is said, a farmer shall be taxed for his riches and stock, in case the stock is more than is necessary for the carrying on his farming and paying his rent, for then it is like a stock in trade; but for stock necessary to his farming he shall not be taxed. So for extraordinary stock he shall not be charged, if it be not more than is necessary; for the Act says, "every inhabitant and every occupier of land," &c., so that there may be an inhabitant that is not an occupier of land, and he must be charged in respect of his personal estate and ability, and so it is usual to tax clothiers. *Note*:—Farmers were never taxed before, nor were tradesmen ever taxed till within these few years. The order above-mentioned was for rating the farmers for the corn and hay which was in their barns and stables.

In 1769 an attempt was made to rate an officer of His Majesty's Commissioners of the Salt Office in respect of his salary; but it was held by Lord Mansfield that the salary was not rateable (Rex *v.* Shalfleet, 4 Burr. 2011). In delivering the opinion of the court some days after the argument, Lord Mansfield said: "This being a case of general and extensive consequence "we took time to consider of it, though I had no doubt "upon it. The man is rated for his salary only; for a "specific species of property which is not within the "words or meaning of the Act. Tithes, coal mines, "&c., are within the words of the Act, and nothing is "within the meaning of these words but personal "property, and personal property is the surplus of a "man's estate and effects, after payment of debts, the "maintenance of his family, and necessary expenses. "This is not stated to be personal property; but the "man is stated to have been rated for a specific thing, "his salary only. The earnings of servants, fees of "profession might as well be rated. We are, therefore, "of opinion that this is not such a species of property "within the intention of the Act, as can be rated to "the relief of the poor as personal property lying "within the parish."

In the following year, in the case of Rex *v.* Whitney (5 Burr. 2634) where the question whether stock in trade was rateable came before the Court of King's Bench, Lord Mansfield is reported to have said: "The court "will not give an opinion on every general question, "which the sessions may think fit to bring before it. "If this court should determine so vague and general "a question, as to whether stock in trade be rateable, "without any distinction or enumeration of particulars, "it would sow the seeds of dissension all over the "kingdom."

In 1775 the same question was brought before the Court of King's Bench in the case of Rex *v.* Ringwood (Cowper, 326), where a poor rate had been made, which on appeal the sessions had quashed, stating that it appeared to them, that A. B. and C. were possessed, as co-partners of stock in the trade and business of common brewers and maltsters, in the parish of Ringwood, to the value of 4,000*l.*; for no part of which the said co-partners, or either of them, were or was, in the said rate, assessed to the relief of the poor of the said parish: that the said A. B. and C. were all, at the time of making the said rate, and still are, inhabitants of the parish of Ringwood: and it doth not appear to this court, that stock in trade hath ever before been rated in the said parish. Lord Mansfield: "The court are "not obliged to give an opinion upon every general "question which the sessions may think fit to bring "before it. In general, I believe, neither here nor in "any other part of the kingdom is personal property "taxed to the poor. The justices at sessions should "have amended the rate, if they thought this property "rateable; and then, on attempting to do it, they "would have discovered the wisdom of conforming to "the practice, which they expressly state in the case, "of not rating it. If they had tried to have amended "it, how would they have rated this stock? Are the "hops, and the malt, and the boiler, to be rated at so "much for each? Or, is the trader to be rated for the "gross sum which his whole stock would sell for? If "the justices had considered, they would have found "out the sense of not rating it at all; especially when "it appears that mankind has, as it were, with one "universal consent, refrained from rating it; the "difficulties attending it are too great, and so the "justices should have found them. As to the authori-"ties which have been cited, they are very loose indeed; "and even if they were less so, one would not pay "them much deference, especially as they differ; and "the rules they lay down have not been carried into "execution for upwards of 100 years. They talk of "visible property; what is visible property? I confess "I do not know what is meant by visible property. If "every visible thing should be determined to come "under that description, in that case a lease for years, "a watch in a man's pocket, would be rateable. "Visible property is something local in the place where "a man inhabits. But that does not decide what a "man's personal property is. Consider how many "tradesmen depend upon ostensible property only. "As to the case in Lord Raymond, the only question "submitted to the court was, Whether the stock of a "farmer was rateable to the poor? and they held it "was not. But according to the report, they go on "and say, the stock of an artificer is rateable: they "had no case before them as to that point, therefore "the judgment upon that question is extrajudicial. "But supposing it were not, What do they mean by "the visible stock of an artificer? Some artificers "have a considerable stock in trade; some have only "a little; others none at all. Shall the tools of a "carpenter be called his stock in trade, and as such be "rated? A tailor has no stock in trade; a butcher "has none; a shoemaker has a great deal. Shall the "tailor, whose profit is considerably greater than that "of the shoemaker, be untaxed, and the shoemaker "taxed? Under the land tax in London to avoid "inconveniences, they tax the house in which a person "lives at a certain sum, by guess: and to avoid dis-"covering a man's stock, they tax it at random: "insomuch that I have known a house occupied by a "physician taxed the same as when a merchant had "it." Aston, J.: "There has been no decision that "personal property is rateable: all the opinions upon "the subject are only dicta of judges. Lord Hale "says, the usage has been against rating personal "property, and that the inconveniences attending it "would be very great. In Ringwood it never has been

* This Act requires the overseers of every parish to raise by taxation of every inhabitant, parson, vicar and other, and of every occupier of lands, houses, tithes impropriate, propriations of tithes, coal mines or saleable underwood, in such competent sum and sums of money as they shall think fit, a convenient stock of flax, hemp, wood, thread, iron and necessary ware, and staff to set the poor on work, and also competent sums of money for and towards the necessary relief of the lame, impotent, old, blind and such other among them, being poor and not able to work, and also for the putting out of such children to be apprenticed, to be gathered out of the same parish according to the ability of the same parish.

" rated. If the justices had amended the rate as they " ought to have done, they would, in the attempt to " make a better rate, have found the difficulty of rating " personal property." Willes and Ashurst, JJ., were of the same opinion, and the order of sessions was quashed, because the justices had quashed the rate, instead of amending it.

In 1777, in the case of Rex *v.* Hill (Cowp. 613), it was held that where it had been the usage in a parish to rate persons to the poor for their stock-in-trade within the parish such persons were liable under the Act of Elizabeth to be rated to the poor in respect thereof. The facts of the case were as follows :—

F. H. for some years past had been an inhabitant of Bradford (Wilts), where many other tradesmen, particularly clothiers and manufacturers of woollen goods, likewise lived. He there carried on the business of a clothier, and at the time of making the rate in question was actually possessed of a considerable stock in such his trade within the parish. He was charged a penny as his share or contribution towards the relief of the poor of the said parish for the year 1775, in respect of his stock in the said clothing trade which he then had in the said parish; and which charge of a penny was proved to be no more than his just proportion or share towards the said rate, if, in respect of such his said stock-in-trade, he was legally bound to contribute anything towards the relief of the poor of the parish. The sessions also stated that it had been the usage heretofore in the parish of Bradford to rate persons there for their stock-in-trade. The court confirmed the rate.

The decision in this case was followed in 1782 in Rex *v.* Rodd (Cald. 147), where proof was given that in the borough of Bridgewater " it had been usual and " customary from the 43 Eliz., and ever since the " existence of rates for the relief of the poor, to rate " and assess the inhabitants of the said borough, and " amongst them such as had been of the same trade " and in similar circumstances with the appellant for " or in respect of their personal property or stock-in-" trade in the said borough towards the relief of the " poor of the said borough and parish."

In a note to this case Mr. Caldecott says: " There " are not wanting authorities of a recent as well as a " more early date to show that stock-in-trade is rate-" able to the poor; but there is no clear and express " authority, either of more ancient or modern times, in " the instance of any one trade, adjudging the stock in " that particular trade to be liable; except in those " places in which an usage to assess such stock has " been proved; though in many boroughs the stock in " all trades has immemorially, and even from the very " date of the statute 43 Eliz., been in point of fact " rated."

In 1792, in Rex *v.* White (4 T.R. 771), several important questions with respect to the rating of personalty to the relief of the poor were raised :—

S. W., A. W., I. L., T. L., W. C., R. D., and W. S., inhabitants in the parish of St. J., appealed against a rate, alleging that neither they or either of them had any property liable to be rated, &c. It appeared on the rate that it was a rate of 1*d.* in the £ on all lands, and 3*d.* for every 100*l.* of personalty. It was proved that it was usual in that parish to rate the inhabitants towards the relief of the poor for their personal property within the parish, in the following proportion, viz., on a calculation that every 100*l.* of which any inhabitant was possessed did or might produce interest to the amount of 3*l.* per annum, such interest at 3*l.* per cent. per annum being considered as a test of the ability of such person, and such person is charged in the sum of 1*d.* for each pound of such supposed interest. That it was usual also within the parish to rate all officers in the Army, Navy, customs, or excise, being inhabitants of the parish, according to a supposed ability arising from their several and respective salaries. S. W. was rated, according to the proportion before stated, in the sum of 13,500*l.* for his personal property, which consisted of certain ships or vessels employed in carrying on the Newfoundland trade from the port of Poole, in the parish of St. J., in the town and county of Poole, and moneys vested on real securities, the lands on which the same were charged lying out of the parish of St. J. A. W., widow, was assessed for a personal property within the parish in the sum of 1,000*l.*, according to the proportion before stated; such personal property consisting of principal money to that amount. J. L. was rated for his personal property in the sum of 200*l.* He was collector of the customs payable at the port of Poole; he had no personal property, except his salary payable to him as such collector, and which he received by an order of the Commissioners of His Majesty's Customs, in the parish of St. J. T. L. was assessed for his personal property in the sum of 100*l.* He was a captain of His Majesty's Navy, and had no other personal property but his pay as captain in the Navy, which was paid to his agent in London for his use, and the household goods and furniture of the house in which he lived in the parish of St. J. W. C. was rated for his personal property in the sum of 100*l.* He was a clerk to a merchant then an inhabitant of the parish, and had no personal property except his pay as such clerk, and which he received from a merchant in the parish. R. D. was rated for his personal property in the sum of 100*l.* He was master of a merchant vessel trading from the port of Poole to other parts, and had no personal property but his pay which he earned as such master of a vessel, and which he received in the parish of St. J. W. S. was rated for his personal property in the sum of 300*l.*; such personal property consisting of stock-in-trade as a shopkeeper. Lord Kenyon, C.J.: " This is a question " of great difficulty, and of vast importance to the " public. The statute of Elizabeth was passed to " enforce (what are called) duties of imperfect obliga-" tion. For it was a duty, before that statute was " made, to relieve the poor and necessitous. And the " provisions of that Act were adapted to the enforcing " of those duties in the only way in which they could " be enforced, namely, by raising a fund from persons " who are deemed competent to pay it; and in the " case in Bulstrode it was said that the rate should be " on persons in respect of visible property locally " situated within the parish. Then apply that rule to " these cases. First, as to the ships, I think that they " are rateable; this parish is their home, and must be " so considered for the purposes of the register Act. " With regard to the money lent on real securities, I " think that it cannot be rated; for it is stated that " the money was lent by persons out of this parish on " landed securities elsewhere. This therefore is not " personal property in the parish; and I am not " prepared to obviate the difficulty of such a person " residing in two parishes. In the Act of Parliament " which imposes a tax on horses and servants the " Legislature have guarded against this difficulty by " directing the person liable to the duties to give an " account to the collector of the number for which he " pays in any other parish; but there is no such pro-" vision for this case. I have doubted a great deal, in " the course of the argument, on the case of the " person rated for 1,000*l.* in specie; but the inclination " of my opinion is that she is rateable for this, because " it is stated to be property within the parish, and it " may be productive if the owner choose. For the " same reason, I think, that the household furniture is " not rateable, because it produces nothing; the party " might as well have been taxed for his clothes; for a " house, indeed, the occupier must be taxed, because " the Legislature have said so in express terms. The " case of the stock-in-trade is admitted to be rateable. " But the cases of the salaries have been long at rest; " those are not the subject of a rate." Buller, J.: " I " concur with my Lord in all the points, except that " relative to the 1,000*l.*; for which I think the owner " is not rateable. The reason for which it was admitted " that household furniture is not rateable, namely, " because it does not produce any profit, must also " govern this; it is stated that the owner has it in " hard money, and therefore we must take it, upon " this state of the case, that it does not produce profit. " In the next place, I am of opinion that money is not " rateable within this Act of Parliament. The Legis-" lature could not intend that inquiry should be made " as to every guinea which a man has in his pocket. " If the rate be confined to visible property yielding " profit in the parish there will be no difficulty in " adhering to that rule; but it will be dangerous in " the extreme to extend it farther, and to look into " every man's bureau to see what money he has there. " But at all events I think this person cannot be rated " for the reason first given." Grose, J.: " I have no " difficulty upon the question respecting the ships; " they are rateable like stock-in-trade. But the party " cannot be rated for the money at interest. And as " to the 1,000*l.* not at interest, I have had great doubts " in my mind. But, after consideration, I agree with " my brother Buller that the Legislature did not " intend to rate money. The Act of Parliament has " enumerated all the different species of property " which should be the subject of a rate, but has " omitted money. Besides which, considering how

Appendix A. XXXIII.

"much this statute has been at different times discussed, and that it has never been held that money "is rateable under it, I am satisfied that this is the "true construction of the Act. For though, generally "speaking, usage contrary to an Act of Parliament "cannot bind us in construing it, the not rating money "shows what has been the opinion of the profession "upon this subject." Lord Kenyon, C.J., then said that he thought there was great weight in the reasons urged by his brethren against rating money; that he had himself expressed great doubts of his own opinion; and that he was therefore glad that that part of the rate would be quashed by the opinion of the court. And on a subsequent day his Lordship mentioned an expression of Yates, J., upon the subject of rating personal property, in a case in Hilary Term, 1769, which was not taken notice of by Sir J. Burrow in his report of it: "If personal property be rateable, it is "not to be done at random, and to leave the party "rated to get off as he can; but the officer making the "rate must be able to support what he has done by "evidence. And no personal property can be rated, "but the clear liquidated surplus, after paying all his "debts."

In 1795 in Rex *v.* Dursley (6 T.R. 53), J. H. appealed against a poor rate made for the parish of Dursley upon the ground that T. T., T. M., J. and E. W., W. P., T. and N., and several others, without naming them, were not rated for their goods, stock in trade, and personal effects, and the Sessions being of opinion that stock-in-trade and personal property ought to have been rated quashed the rate, and stated the following case: "The "usage has been not to rate the personal property in "the parish, except that in the parish books, from the "year 1566 down to the present time, there were "entries from the year 1769 to 1775, intituled 'Stock "charged,' in which several persons were rated for "their stock-in-trade, who paid for the same. Clothiers "were not included in this charge, nor have they ever "been rated for their stock, nor was any personal "property rated before 1769, nor since 1775. T. T. and "Co., J. and E. W. and J. P., were, at the time when "the rate was made, clothiers possessed of visible "stock-in-trade in the parish to the amount of 100*l.* "each. T. M. is a grocer, and T. and N. mercers "possessed of visible stock-in-trade to the amount of "50*l.* each. Such respective stocks were intended to "produce a profit, and from it the parties did or ought "to receive a profit. Such trades were sometimes "productive and sometimes not. It was not proved "that these parties made any profit of their stock-in-"trade, nor that it was exclusive of their debts, nor "that it left a clear residue, nor that it belonged to "them, but from its being in their possession." Lord Kenyon, C. J.: "There is no doubt but that personal "property is rateable, but the difficulty in this case is "to know for what these persons should have been "rated. They appeared indeed in the possession of "stock-in-trade, some to the amount of 100*l.*, others to "that of 50*l.*, but the justices at the Sessions have not "stated whether or not this property belonged to the "several persons whom the appellant wished to include "in the rate, or if it did, whether or not it produced "profit, or whether or not it was liable to incumbrances "equal to the value of the property itself. The bare "possession of personal property is, to be sure, evidence "from which the justices may draw the conclusion that "the possessor should be rated; but here the justices "after stating the possession have raised a doubt re-"specting other facts which they should have inquired "into, and determined upon. They have raised a mist "which we cannot dispel. The facts are not suffi-"ciently disclosed to enable us to draw the conclusion "that these persons ought to be rated." The order of sessions quashed.

In 1796 in Rex *v.* Darlington (6 T.R. 468):—G. A. and J. W. appealed against a poor rate, because seven persons, particularly T. P. and S. B. were not rated for their stock-in-trade, the sessions quashed the rate, and stated a case for the opinion of this court. The facts of the case, as far at least as it is necessary to state, were as follows, it did not appear whether stock-in-trade had or had not been rated in Darlington prior to 1745, from 1746 to 1752 it had, and again from 1788 to 1794 it had been rated. At a parish meeting in 1794 at which most of the inhabitants and some of these parties attended, the parish officers were requested not to rate stock-in-trade. The appellants then proved the rate made in August 1794, which continued in force for the remainder of that year, against which neither of the seven persons in question appealed, though it appeared that they were thereby rated for their stock-in-trade, as yielding certain profits (stating them); and which the appellants contended was an admission that to that time those seven persons possessed stock-in-trade producing the profits there stated. This rate was paid by some of the traders, but not by others, to enforce payment from whom no steps had been taken. The appellants then proved that T. P., in January 1795, when the rate was made kept a grocer's shop, and S. B. an hardware shop in D., that each possessed a visible stock-in-trade there, and that they appeared to carry on business there to the same extent as in 1794. "The circumstances of the ability "of P. and B., and the other five persons, or that they "respectively made profit of their stock in trade, or "that it was exclusive of their debts, or that it was "a clear residue after debts paid, did not appear other-"wise than as hereinbefore is stated." Lord Kenyon, C.J.: "The case of Rex *v.* Dursley has been particularly "pressed upon us, as a decision of our own, but the "present case is clearly distinguishable from that. "There the court of Quarter Sessions had forborne to "draw any conclusion from the facts proved before "them and left a mass of evidence for our considera-"tion, but so incomplete that we could not say upon "the facts stated whether the parties ought or ought "not to have been rated, whereas here the justices "have drawn the conclusion. They have indeed added "to the case, that it did not appear to them that the "stock was productive, &c., "otherwise than as herein-"before stated," but then it becomes material to see "what is before stated. It is stated that these persons "had large visible stock-in-trade, that in the preceding "year they were rated for that stock, and that they "submitted to the rate, for whether paid or not at the "time is immaterial, no appeal having been made "against the rate. Then, their circumstances not "being altered, the question is, whether all this was "not primâ facie evidence for the justices to proceed "upon, and whether, as this evidence was not opposed "by evidence on the other side, it was not sufficient to "enable them to draw the conclusion which they have "drawn. Undoubtedly it was strong primâ facie "evidence against the persons rated, and they should "have discharged themselves in such a case by evidence "showing that they ought not to have been rated. I "feel indeed the severity of compelling persons in "trade to make a disclosure of their circumstances, "but this is not a singular case, persons appointed "sheriffs in some corporations being sometimes obliged "to disclose their situation in order to excuse them-"selves serving the office. In this case the evidence "was before the justices in support of the rate; it was "competent to them to decide on the weight of it, they "have decided, and we cannot now say that the con-"clusion they drew was certainly wrong." Grose, J.: "There is no doubt but that generally speaking stock-"in-trade is rateable, under what circumstances indeed "it is rateable is another question, and in some cases "it is a question of considerable difficulty. Here there "was evidence to a certain degree that the stock in "question was productive, the owners were rated for "it the preceding year, that rate was not appealed "against, and their situation does not appear to be "altered. And as this evidence was not contradicted "by other evidence, we cannot say that the justices did "wrong in thinking it to be sufficient evidence for the "purpose for which it was adduced." Lawrence, J., declared himself to be of the same opinion. Order of sessions confirmed.

In 1797 it was decided in Rex *v.* Startifant (7 T.R. 60) that an attorney was not rateable to the relief of the poor for the profits of his profession. The defendant appealed against a poor rate in which he was assessed 2*s.* 3*d.* in respect of his profits and fees of his profession as an attorney; the sessions confirmed the rate, and stated the following case for the opinion of this court: The appellant is an attorney at law, and an inhabitant practising within the borough of Preston. There are many other attorneys also inhabiting and practising in the borough. The usage of rating attorneys for the profits and fees of their profession first commenced by an assessment made for the relief of the poor in the year 1732 and has ever since prevailed, such attorneys being rated according to the supposed profits and fees of their profession or business; some at 12*s.*, others at 9*s.*, and others at less sums in each rate or assessment. Objections have frequently been made by the attorneys so rated to the legality thereof, and in some few instances payment has from time to time been resisted; but no appeal to such rates or assessments has before been brought to trial. The sum of 2*s.* 3*d.* is no more

than the appellant's just proportion or share towards the rate, if in respect of such his profits and fees of his profession he is legally bound to contribute anything towards the relief of the poor of the borough. The court said that there was no doubt in the case, and they quashed the order of sessions.

In 1813 in Rex *v.* Ambleside (16 East, 380) a poor rate was appealed against because certain persons were not assessed or rated for or in respect of their stock-in-trade. The rate in question was made in respect of real property only, and no stock-in-trade or other personal property was included in the rate. W. W. had stock-in-trade which was visible personal property within the said township, producing profit, and no assessment was made upon him in the said rate in respect thereof; but no stock-in-trade or other personal property had ever been rated within the township. The sessions quashed the rate, subject, &c. Upon this case being called on, it was stated that the question intended to be submitted was whether, if stock-in-trade produce a profit, the usage can vary its rateability. Lord Ellenborough, C.J., said: "Is there not another "question; whether the rate ought not to have been "amended instead of being quashed? As to the rate-"ability of stock-in-trade, that has been settled in Rex "*v.* Darlington if it be ascertained to be profitable. "It is then an objection applicable to one person, and "the justices should have amended the rate, and not "quashed it. The 41 Geo. 3. c. 23. was passed for the "very purpose of enabling them so to do, in order to "prevent the inconvenience of the parish being with-"out funds for the maintenance of its poor in the "mean time. We say, therefore, that this rate was not "properly quashed, but ought to have been amended. "If there are any circumstances to take it out of the "general rule, as stated in Rex *v.* Darlington, they "should be stated; if there are none such, the property "is rateable."

The following is a copy of a minute of the Poor Law Commissioners which it appears from page 36 of their Sixth Annual Report that they were in the habit of furnishing to parties who consulted them on the subject:—

Rating of Stock-in-Trade.

Copy of a Minute of the Poor Law Commissioners.

14th September 1837.

The opinion of the courts on the subject of rating stock-in-trade has fluctuated, and the extreme opinions have been held at different times that it was rateable generally, and that it was not rateable at all.

The opinion of the Court of King's Bench, as expressed by Lord Mansfield in Rex *v.* Whitney (5 Burr. 2634) and Rex *v.* Ringwood (Cowp. 326), was decidedly against the practice.

The first case apparently in favour of the practice is that of the Queen *v.* Barking (2 Lord Raymond, 1280) where (as observed by Lord Mansfield in Rex *v.* Whitney) the question did not properly arise.

The first cases in which the legality of the practice was partially affirmed were the cases of Rex *v.* Hill (Cowp. 613) and Rex *v.* Rodd (Cald. 147), in the first of which the case was sent back to sessions to ascertain the local practice, which, being found to have prevailed, the court decided in favour of the rate on such stock; and in the latter of which, the local practice being found by the sessions, the Court of King's Bench confirmed the rate professedly on the same grounds as Rex *v.* Hill was decided on.

But it is clear that in a matter of so recent institution as the poor rates a legal custom cannot exist; and the statute of Elizabeth, which points out the subject of the rate, could alone be relied on as authority for including or omitting any property in the rate.

Subsequent cases, expressly founded on the preceding cases, and especially the case of Rex *v.* Ambleside (16 East, 380), have apparently, though not distinctly, extended the doctrine in favour of rating stock-in-trade so as to appear to authorise the practice generally, without reference to local practice.

The practice, however, has, with very few exceptions, hitherto prevailed only in the old manufacturing districts of the south and west of England.

The Commissioners, bearing in mind the nature of reasoning by which the conclusion is supported that personal property is rendered liable to the rate by the 43rd Elizabeth, the conflict of decisions in the Court of King's Bench, and the grounds on which the decisions in favour of rating stock-in-trade were originally based, the difficulty of rating this property equally, the injustice of rating it in certain districts and not rating it in other districts, and the difficulties that would arise from the attempt to introduce the practice in districts where it has not hitherto existed, have hesitated to express an opinion favourable to the adoption, or even the continuance, of the custom of rating stock-in-trade.

The Commissioners have, moreover, to observe that, although the Parochial Assessments Act has neither affirmed nor negatived the legality of rating stock-in-trade, it appears to contemplate the assessment only of hereditaments, *i.e.*, of real property, such kinds of property as are expressly enumerated in the Statute of Elizabeth. It, in fact, prescribes a rule of rating generally inapplicable to personal property. The Commissioners have, therefore, considered this as in some measure discountenancing the opinion that stock-in-trade is liable to be rated.

The Commissioners have further to state that, if stock-in-trade should still be held to be rateable, it should at all events be rated separately from the premises in which the trade is carried on; and it must be borne in mind that the stock must be visible stock, locally situated within the parish, that the person rated for the stock must actually inhabit the parish, Rex *v.* Hull Dock Company (3 B. & C. 525); and it must be susceptible of proof that it produces a profit, Rex *v.* Macdonald (12 East, 324) after payment of all debts, Rex *v.* White (6 T.R. 771).

In conclusion, the Commissioners have to observe that they have no authority to determine whether any kind of property shall be included in the rate or not, as such a power involves the power to tax the community or to remit the tax. All they can do in such a matter is to advise upon what appears to them to be the intentions of the legislature, and upon the best means of carrying those intentions into effect.

It was, however, decided in the case of Reg. *v.* Lumsdaine (10 Q.B. 157) that the Parochial Assessment Act had not altered the law as to the rateability of personal property, and that therefore a poor rate made after the Statute omitting stock-in-trade yielding a profit in the parish was liable to be quashed on appeal.

The following was the decision of the court on this case:—

Lord Denman, C.J.: "It is not improbable that "legislature intended to alter the law upon the subject "of rating personal property; but I am clearly of "opinion that the intention has not been carried into "effect. The object of the Act does not appear to "have been to introduce any new principle of rating, "but to affirm that which had been already established "by decisions of this court. The form given in the "schedule certainly contemplates only the rating of "corporeal hereditaments; and this is urged as a "declaration of the law by Parliament upon a point "which is suggested to have been before doubtful. "There has, however, existed a known and long esta-"blished practice of rating personal property in many "case, and the legality of such rates has been affirmed "by this court. The law, therefore, is not to be altered "except by express enactment. We cannot, in such a "case, admit it to be repealed by implication, where "the legislature might so easily have repealed it in "direct terms."

Littledale, J.: "Stat. 43 Eliz. c. 2. s. 1, embraces "two classes of persons subject to taxation; occupiers "of real property and inhabitants in respect of per-"sonal property. Hitherto rates upon the latter class "have been in practice confined to stock-in-trade and "shipping; but on future occasions other kinds of "personal property may perhaps be rated, and be held "rateable. The provisions of this Act apply only to "the former class of rateable objects, and leave the "second at large as before. There is nothing that "amounts to a repeal of the law on this head, nor can "the Act be considered as a declaratory one."

Patteson, J.: "Personal property is rateable, if "visible and profitable, and this Act points at no "repeal of the existing law. The provision respecting "the uniform mode of rating evidently points at the "decisions in Rex *v.* Joddrell and similiar cases."

Coleridge, J.: "We are told that we must collect "from the Act an intention to alter Stat. 43 Elizabeth, "c. 2; but this cannot be done. The court has always "regarded personal property as being within the opera-"tion of that Statute. The reluctance with which the "rateabilit yof it has been admitted by the court, only

Appendix A. XXXIII.

" tends to strengthen the argument in favour of the " rate; and the silence of the Act as to the mode of " rating one species of property, is evidence that it " points only at the other." Orders quashed.

In consequence of this decision the Poor Law Commissioners in March 1840 issued the following circular to the churchwardens and overseers of every parish or place separately maintaining its own poor in England and Wales:—

COPY of CIRCULAR to the CHURCHWARDENS and OVERSEERS of every PARISH or other PLACE separately maintaining its own POOR in ENGLAND and WALES.

Poor Law Commission Office,
Somerset House,
6th March 1840.

GENTLEMEN,

SINCE the recent decision in the Court of Queen's Bench in the case of Regina *v.* Lumsdaine in last Easter term, it can no longer be doubted that inhabitants of parishes remain liable to the poor rate in respect of stock in trade, in the like manner as they were before the passing of the Act to regulate parochial assessments, and that every rate may be successfully appealed against, if any inhabitant, having productive stock in trade, be omitted therefrom.

Since the decision of the above case the Commissioners have been frequently applied to for instructions as to the form in which the rate in respect of stock-in-trade is to be made, and the value estimated. This subject has always been one of the greatest practical difficulty, and the Commissioners regret that it is not in their power to obtain any advice on the subject which can be of much practical utility to the persons charged with the duty of making poor rates. The Commissioners, however, conceive that the following remarks may be of some service:—

1st.—The rate in respect of stock-in-trade can only be made upon persons who are actually inhabitants of the parish. Persons not residing in the parish are in law frequently occupiers of lands, houses, &c., but no person can be rated for stock in trade unless he is resident within the parish. These are the words of Chief Justice Abbott in the case of Rex *v.* The Hull Dock Company (3 B. & C. 525). "Under the Statute of Elizabeth there was no " word applicable to personal property, and it " was only on the ground of his being an inhabi- " tant that any owner of personal property could " be rated for that property, because there was " no word in that Statute to include him except " the word inhabitant. Under that Statute, there- " fore, there was necessarily a distinction between " residents and non-residents, because the resident " would be rateable for his personalty within the " place, the non-resident not. The distinction, " however, under that Statute applied only to " those kinds of property which the Statute did " not specify; for the occupier of lands, houses, " &c., and whatever the Statute enumerated, was " rateable whether he were resident or not."

Those owners of stock in trade within the parish who do not reside in the parish must consequently be omitted from the rate in respect of stock-in-trade.

Residence, by reference to which the character of inhabitancy is to be determined (see above, and also Rex *v.* Collinson, 12 East. 342), has been defined in the case of Rex *v.* North-Currey (4 B. & C. 953), "to denote the place where an individual " eats, drinks, and sleeps, or where his family or " his servants, eat, drink, and sleep."

2nd.—The stock to be rated must be locally situate and visible within the parish in which its owner resides.—Earby's case (2 Bulst. 354), Rex *v.* Shepherd (1 B. & A. 109). It must not only be productive, but must be capable of being proved to be productive.—Rex *v.* Macdonald (12 East. 324).

3rd.—It appears that it is not all the productive stock-in-trade which an inhabitant may be possessed of that is liable to the rate. It is only the clear liquidated surplus, after payment of all the owner's debts, which is considered to constitute his ability. "If personal property be rateable, it is " not to be done at random, and to leave the party " rated to get off as he can; but the officer making " the rate must be able to support what he has " done by evidence. And no surplus property can " be rated but the clear liquidated surplus after " paying all his debts."—Rex *v.* White (6 T.R. 777). Personal property, with reference to the poor rate, was defined by Lord Mansfield in Rex *v.* Shalfleet (2 Burr. 2001), "the surplus of a man's estate and " effects after payment of debts, the maintenance " of his family and necessary expenses." It is laid down that a trader may deduct the interest of borrowed capital, that being in the nature of an incumbrance upon his goods.—Rex *v.* Dursley (6 T.R. 53).

4th. The determination of the rateable value of stock-in-trade is the chief subject of difficulty. The Parochial Assessments Act, which prescribes the rule for estimating the annual value of the various hereditaments, the subjects of occupation, and liable in that character to the poor-rate, has evidently no application to stock-in-trade, the nature of which does not admit of its being let at a rent. It is, however, clear that the valuation of such stock-in-trade as may be rateable must be made in respect of the profit which may be realised by its means, and not of its total present value as so much capital. Lord Ellenborough says, in Rex *v.* Macdonald (12 East, 324): "Now visible property " in the place, such as stock-in-trade, merely as " being visible, is not liable to be rated, but to " make it rateable it must also be productive; but " the justices have found that it was not productive, " or, what is the same in effect, that it was not " proved to be so to their satisfaction."

Generally, on account of the great difficulty of the subject, extreme caution must be used in determining the rateable value of stock in trade; and this is the more necessary inasmuch as it is incumbent on the officers making the rate to show the grounds of their estimate. In Rex. *v* Topham (12 East 546), Lord Ellenborough says that "when " the question before the sessions is upon the " quantum of the rate, the officers making it must " show the justices some probable ground for the " amount at which they charge the party in the " rate."

5th. It is a rule applicable to the rating in respect of every kind of property, that the rate must show on its face the property in respect of which the rate is imposed. Rex *v.* The Undertakers of the Aire and Calder Navigation (2 B. & C. 713).

The schedule to the Parochial Assessments Act (6 & 7 Will. 4. c. 96) is generally inapplicable to the particulars which will be required to describe the assessment in respect to stock-in-trade. In such a rate the commissioners would suggest that the persons rated should be placed together, either at the beginning of the book or at the end before the declaration; that the entries should be numbered as in the case of the rate on occupiers; that the persons rated should be described as inhabitants, and not as occupiers; that the property should be described as the "property " in respect of which the inhabitant is rated," and that against the name of the inhabitant the situation or locality, and the kind, and perhaps the quantity of stock should be specifically described; that the annual value, or productiveness or profit, should be next estimated; and next, that the rate in the pound should be stated in the head of a column, and the sum assessed placed in that column opposite the inhabitant's name.

Signed by order of the Board,
EDWIN CHADWICK, Secretary.

To the Churchwardens and
Overseers of the Poor.

This circular excited strong protests from various boards of guardians, of which the following examples are given in Appendix A. to the 6th Report of the Poor Law Commissioners:—

CORRESPONDENCE as to the RATING of STOCK-IN-TRADE.

Stepney Union, 10, Church Row,
Limehouse, 18th March 1840.

SIR,

I AM directed by the board of guardians to acquaint you that on considering the subject of the "rating of stock-in-trade," and the observations thereon contained in the recent circular from the Poor Law Commissioners, the board are so convinced of the injustice and impolicy of this description of rating, and of the serious inconvenience that would result from attempts to introduce it, that they feel it their duty to address a strong representation to the commissioners,

urging the importance of endeavouring to procure its abolition by some legislative enactment in the course of the present session.

The board at the same time desire to express the doubts they entertain as to the expediency of giving such extensive promulgation to information of the kind communicated in the circular in question, which they consider to have rendered still more imperative the necessity of the application of a prompt and decisive remedy.

I have, &c.
(Signed) Wm. Baker, Jun., Clerk.

E. Chadwick, Esq.,
Secretary to the Poor Law Commissioners.

Whitechapel Union, 23, Leman Street,
Gentlemen, 19th March 1840.

As requested, I have called the attention of the guardians to the circular of the 6th instant on the subject of rating stock-in-trade.

The guardians are of opinion that the assessment of this class of property will be extremely objectionable; and they also consider it to be an unfair and partial mode of taxation, because the opulent possessor of stock-in-trade will be enabled to evade the rate by non-residence; and they further think that in their district at least it will be impracticable to make an assessment approaching to any degree of fairness or equality.

The guardians respectfully submit that, as the evils incidental to this mode of rating are generally admitted, the commissioners should take the opportunity of introducing a clause in the intended Poor Law Amendment Bill repealing the existing law as it now affects this branch of poor law.

I have, &c.
(Signed) John Smith,
Clerk to the Board of Guardians.

To the Poor Law Commissioners.

Stockport Union, Stockport,
Gentlemen, 19th March 1840.

On the other side I send you a resolution passed by the guardians of the Stockport Union in reference to the consequences which must arise from the decision in Regina *v.* Lumsdaine.

I have, &c.
(Signed) Henry Coppock,
Clerk to the Union.

The Poor Law Commissioners.

Board Room,
18th March 1840.

Present, 10 guardians.

Resolved unanimously,—That the revival of the system of rating stock-in-trade would be attended with very serious consequences. It would be impracticable to make a fair rate, and the attempt would only occasion frequent litigation and much bad feeling in the different townships affected by it.

This board therefore agrees to petition both Houses of Parliament, and also to memorialise the Poor Law Commissioners, in order to obtain a law to prevent the mischiefs which otherwise must arise from the decision in Regina *v.* Lumsdaine.

(Signed) Henry Coppock,

South Shields Union, South Shields,
Sir, 20th March 1840.

I have read with attention, and, as far as my humble ability goes, weighed well your circular respecting the rating of "stock-in-trade." This subject, as your report justly states, is liable to a complication of difficulties, inasmuch as (notwithstanding the copious explanations laid down in your circular for the government and guidance of the rate makers) I am fearful it never can be executed so as to make a rate legal; and it is to be lamented that in passing the Poors Rate Assessment Act a clause was not inserted therein abrogating entirely the assessment of stock-in-trade. It is a rate, as you are aware, that is not general, as also the rate upon shipping; and where it is, or rather has been in use for a certain period, and the overseers or others who interest themselves in making rates please to omit it (a circumstance which a few years ago occurred in this parish), it matters not if in every other point the rate be legal, this gives a quietus to the rate in case of appeal. Would it not be well for a short Bill to be brought in to abrogate the rating of stock-in-trade and shipping altogether? It is but few parishes comparatively that do assess them to the poor's rate. I speak from lengthened experience both as an overseer in my own right, as an assistant overseer under 59 Geo. III, and from the observations I have made since my appointment as relieving officer to the South Shields district in this union. I never in my time had either ships or stock-in-trade liable to assessment; therefore you may readily judge I have no interested motive but that of, if possible, getting the rates made so perfect, that in the event of an appeal when the overseer has made out his case on principle, the appellant, as a last resource, brings forth the imperfections of the rating of ships or stock-in-trade. This, in court, I have experienced as an overseer; and I feel perfectly convinced that those who have the making of rates never can surmount the difficulty of rating stock-in-trade so as to stand the test of an appeal. In the instance of this parish (upon the books), the amount of stock-in-trade and shipping assessment was productive to the amount of 800*l.* per annum for the maintenance, &c., of the poor. A certain set of select vestrymen who were interested in ships and stock-in-trade got into power, and they without any ceremony struck it out, and this sum had of course to come upon such as myself who were householders only. This occurred about five years ago, and I hold that the parish of South Shields has not made a legal rate since, and I doubt not but you will agree with me that when an overseer is aware that he is not upon sure grounds he is apt to make allowances and reductions that are a serious loss to the parish rather than go to the session.

I trust you will excuse the liberty I thus have taken, but they are the offspring of a warm and sincere advocate to an improvement to the New Poor Law Bill in all its ramifications, amongst which I hold the rating not to be the least.

I have, &c.
(Signed) Thomas Wilson.

E. Chadwick, Esq.,
Secretary to the Poor Law Commissioners.

N.B.—I have just learnt that there is not a single parish in Northumberland, and but three in the county of Durham, assess stock-in-trade; these two counties will, I think, be an average specimen of England and Wales.—T.W.

Salford Union, Town Hall, Salford,
Gentlemen, 21st March 1840.

I am directed by the board of guardians to forward you the annexed extracts from the minutes of the proceedings of the weekly meeting of the board, held on the 21st instant.

I have also to acknowledge your letter of the 19th instant, relative to the rating stock-in-trade, which came to hand whilst the board were sitting.

I am, &c.
(Signed) John Hope,
Clerk to the Guardians.

To the Poor Law Commissioners,
&c. &c. &c.

"Ordered,—That the report of the committee meeting of the 16th instant be sent to the Poor Law Commissioners by the clerk, viz.:—

"The board of guardians of the Salford Union have received a communication from the Poor Law Commissioners, dated Somerset House, 6th of March 1840, on the subject of the declared legality of assessing to the poor's rate 'stock-in-trade.'

"The board feel themselves called upon to express their strong opinion of the injustice, impolicy, and general impracticability of making such assessments on "stock-in-trade.'

"It has been the practice in this part of the country to assess to the poor's rate all property (and such only) as comes under the general term 'the freehold,' that is, such property as is usually let or capable of being let by landlord to tenant.

Appendix A. XXXIII.

"The term 'the freehold' having been held to apply in some cases to steam-engines fixed within mills, factories, &c., steam-engines, including mill-gearing, have been brought under assessment in this union during the last few years, after a long continued opposition on the part of the ratepayers.

"This board is of opinion that no further extension of rating can be equitably carried into effect; that all subordinate machinery and tools, being personalty do not come within the proper range of rateable property, and that if, further, it is meant that stock-in-trade, being goods contained in warehouses and shops, should be so rateable, there would be no end to the confusion and injustice which would arise.

"This board therefore strongly recommends to the Poor Law Commissioners, to move the Legislature for such an alteration of the law as may limit the assessment to the poor's rate, to such property as is usually included under the term 'the freehold.'

"This board will most gladly render its best assistance towards the attainment of this object, by petitioning Parliament respecting it, on the recommendation of the Poor Law Commissioners."

Bermondsey Union, Bermondsey,
26th March 1840.

GENTLEMEN,

I AM directed by the governors and directors of the poor of this parish, with whom the making the rates for the relief of the poor is placed, to acknowledge the receipt of the board's circular letter of the 6th instant, on the subject of the rating of stock-in-trade.

The contents of such letter have been the subject of consideration at a general meeting of the governors and directors, convened for the purpose of taking it into consideration, and I have been directed to represent to your board the unanimous feeling that prevailed of the impracticability of carrying into operation with fairness and justice, any rate upon stock-in-trade or other personal property, in a manufacturing district like that of this parish.

With this conviction on their minds, the governors and directors desire me further to submit to the consideration of your board the necessity that exists of procuring some legislative enactment repealing the existing law on the subject, and to express their hope that your board will see the expediency of procuring such a step to be taken for the security of those with whom the making of poor's rates is entrusted.

I have, &c.
(Signed) B. DREW, Clerk,

To the Poor Law Commissioners,
&c. &c. &c.

Strand Union,
14th April 1840.

GENTLEMEN,

I AM directed to transmit you the following extract from the minutes of the weekly meeting of the board of guardians of this union held this day :—

"Resolved unanimously, that the revival of a law become obsolete from its impracticability, and the enforcement of which would lead to infinite vexation and difficulty, is highly to be deprecated.

"The rating of stock-in-trade, and the leaving out other personal property, would be manifestly unjust, and inasmuch as the profits of a man's trade can by no inquisitorial process be accurately and equally ascertained, this board is of opinion that it ought to be abandoned.

"That the Poor Law Commissioners be respectfully requested, as the centre of rating operations, to urge upon the Government the propriety of repealing a law so impolitic and unequal."

I have, &c.
(Signed) JAMES CORDER,
Clerk to the Guardians.

To the Poor Law Commissioners,
&c. &c. &c.

Stoke-upon-Trent, Parish Office,
3rd April 1840.

GENTLEMEN,

HEREWITH you will receive a copy of resolutions passed at a meeting of the guardians, specially called to consider your circular relative to the rating of stock-in-trade, and I have particularly to request your immediate attention to the subject. I am perfectly satisfied that it is totally impracticable; and unless some decisive legislative enactment is brought forward to repeal the rating of such property, no guardians will be found to carry on parochial business, and no rate can be collected for the relief of the poor. Mr. Copeland, who was present at the meeting, suggested that a clause might be introduced in the Union Workhouse Bill now before the House of Lords.

I have, &c.
(Signed) THOS. GRIFFIN, Jun.

To the Poor Law Commissioners,
&c. &c. &c.

COPY of RESOLUTION passed at a MEETING of the GUARDIANS held 1st of April 1840.

"This board having received a circular from the Poor Law Commissioners stating the fact of a decision having taken place at the Queen's Bench (Regina *v.* Lumsdaine), that stock-in-trade is liable to be assessed for the relief of the poor, and seeing the injurious effects which would arise to the parish from an appeal against the present mode of rating, or from any attempt to carry this decision into effect. Resolved unanimously :—

"That it is the deliberate opinion of this board that to rate personal property to the relief of the poor would be unjust in principle, inquisitorial in its operation, and in fact would, in this parish, be impracticable.

"That these views be transmitted by the clerk to the Poor Law Commissioners, with the earnest request of the board that they will suggest some plan whereby the Legislature may relieve them from this difficulty which the board considers would be fatal to the working of the Poor Law Amendment Act in this parish."

Poor Law Commission Office,
Somerset House,
7th April 1840.

SIR,

THE Poor Law Commissioners acknowledge the receipt of your letter of the 3rd instant, forwarding a copy of the resolutions relating to the rating stock-in-trade, passed by the board of guardians of Stoke-upon-Trent on the 1st instant.

The Poor Law Commissioners request you will refer the board of guardians to the minute of the Commissioners on rating stock-in-trade, dated the 28th ultimo, and contained in the accompanying copy of the official circular for the 4th instant.

The Commissioners do not think that the difficulty which attends the rating of stock-in-trade ought to prevent the collection of the rate for the present, since whether the rate does or does not include stock-in-trade, it can be enforced until quashed or amended, notwithstanding it be appealed against.

Signed by order of the Board,
GEORGE COODE,
Assistant Secretary.

To Thomas Griffin, Jun., Esq.,
Clerk to the Guardians
of Stoke-upon-Trent.

Parish Office, Stoke-upon-Trent,
18th April 1840.

GENTLEMEN,

I BEG to forward you a copy of resolutions passed by the guardians of this parish at a meeting held on the 15th instant.

I have, &c.
(Signed) THOMAS GRIFFIN, Jun.

To the Poor Law Commissioners,
&c. &c. &c.

Spittals Workhouse.

At a meeting of the Guardians held 15th of April 1840.

"Resolved unanimously,—That this board, while it respectfully acknowledges the attention of the Poor Law Commissioners to their communication, regrets that their reply gives them no reason to expect that they will take any steps to bring about a change in the law complained of.

"That this board, as the executive of the parish in the management of its parochial concerns, would be wanting in its duty did it not express its opinion on the impracticability and injustice of rating stock-in-trade to the relief of the poor, and petition the Commons House of Parliament to alter the law without delay.

"That Messrs. J. Ridgway, L. Abington, and J. R. Bale be a sub-committee to prepare such petition against the next meeting.

"That the clerk be instructed to forward a copy thereof to the chief bailiffs at each township in the district, in order to call the attention of the inhabitants to this important subject."

On the 28th of March 1840 the Commissioners wrote the following minute on the question, which is also published in the same report:—

MINUTE of the POOR LAW COMMISSIONERS, explanatory of the object of the foregoing Circular.

28th March 1840.

The Poor Law Commissioners have recently received several communications relative to their circular letter of the 6th instant on rating stock-in-trade, which express a strong opinion against the expediency of rating that species of property.

The object of the Commissioners in the letter in question was not to express any opinion respecting the expediency or inexpediency of the rating of stock-in-trade, but to explain to parish officers, as well as the Commissioners were able, how they were to act upon the recent decision of the Queen's Bench in Reg. *v.* Lumsdaine; to guard them against extending that decision beyond its proper limits; and to point out to them the numerous precautions which they ought to observe in proceeding to carry it into effect.

The Commissioners did not think that it was consistent with their duty to express any opinion upon the expediency of the law as recently laid down by the Court of Queen's Bench when they were giving instructions to the parish officers as to the mode in which the law so laid down was to be carried into effect. If the Commissioners had expressed any opinion on this subject, they would have been inclined to concur with the remarks of Lord Mansfield in Rex *v.* Ringwood, as to "the wisdom of not rating stock-in-trade," and as to the insuperable difficulties attending the attempt.

Before the recent decision in Reg. *v.* Lumsdaine, the Commissioners had on several occasions dissuaded the rating of stock-in-trade, conceiving that the provisions of the Parochial Assessments Act (relating, as they do, exclusively to hereditaments) countenanced the desuetude into which the rating of stock-in-trade had fallen. (*See* the Commissioners' minute of 14th September 1838.) But since the doctrine of the rateability of stock-in-trade has been deliberately revived by the Court of Queen's Bench in the recent case just mentioned, the Commissioners thought that it was incumbent on them, as exercising a general superintendence over the administration of the laws connected with the relief of the poor, to furnish the parish officers with such advice respecting the practical measures for rating stock-in-trade as the Commissioners were enabled to collect from the reported decisions of the superior courts of law. If the circulation of this advice should lead to a more general comparison of the advantages and disadvantages attending the rating of this species of property, and if the subject should thus be brought under the consideration of the Legislature, the Commissioners would see no cause for regret in these effects of the course which they have thought it their duty to pursue.

On page 43 of their Seventh Annual Report the Commissioners say:—The promulgation of the decision in The Queen *v.* Lumsdaine directed attention to the rating of stock-in-trade throughout England and Wales, in the greater part of which the practice had never before been known; and the representations of dissatisfaction at the introduction or revival of the practice were so numerous and forcible, and the extent of the inconvenience which must evidently have attended the giving of general effect to the decision was so great, that we thought it necessary to address to your Lordship a further report upon the subject on the 14th of May 1840, in which we stated in more detail than on the former occasion, the anomalies in the law as it then stood, and the difficulties and the injustice necessarily attending its application. We subsequently received your Lordship's instructions to prepare a Bill to exempt inhabitants of parishes from liability to contribute to poor's rates in respect of stock-in-trade, and, with the assistance of Her Majesty's Attorney-General, we prepared a Bill accordingly. The measure passed; but its operation was extended only to the 31st of December in the present year. It was understood that the measure was thus made a temporary one in order that Parliament might be able, by means of a Select Committee, to re-consider in a more general and connected manner the subject of rating, which had recently been affected in many very material respects by Acts of Parliament and decisions of the courts of law operating in modes which had not been anticipated.

The following is a copy of the report of the 14th of May 1840, to which reference is made in the above paragraph:—

RATING STOCK-IN-TRADE.

COPY of a REPORT from the POOR LAW COMMISSIONERS to the Marquis of Normanby, on the Expediency of an Alteration of the Law in respect to the Rating of STOCK-IN-TRADE; dated 14th May 1840.

Poor Law Commission Office,
Somerset House,
14th May 1840.

MY LORD,

IN our Report to your Lordship, dated the 30th April, we explained the present state of the law respecting the rating of stock-in-trade, and the steps which we have taken for instructing the parish officers as to the performance of their duties in accordance with the recent decision of the Court of Queen's Bench, in the case of Reg. *v* Lumsdaine.

Since the date of that Report, the attention of Parliament has, as we perceive from the Papers of the House of Commons, been directed to the subject, and we therefore propose to submit to your Lordship a fuller statement of the existing law and the changes in it which appear to be desirable, than are contained in our Report of the 30th ultimo.

The observations which we are about to make are not confined to the poor rates. The county rates, the borough and police rates, the highway rates, and the whole system of local taxation either form part of the taxation nominally imposed for the relief of the poor, or are immediately founded upon the assessment to the poor rate. Any evil in the imposition of the poor rate is therefore multiplied in all the local taxes, and any extension of the poor rate to any kind of property not before burdened with it is practically an extension to the same property of the burden of all the other local taxes.

The statute of Elizabeth, upon which the system of taxation to the relief of the poor is founded, renders three classes of persons liable to the rate:—

1st. The parson or vicar, defined by the name of his office.

2nd. The occupiers of land or of buildings, or of other species of real property.

The description of the property perfectly identifies this class of ratepayers.

3rd. The other inhabitants.

The third class is not distinguished by any other words of description. It is on the use of the word "inhabitants" that the practice of rating stock-in-trade is founded. Like the rest of the ratepayers, the "inhabitants" are to be rated according to their ability.

For a century and a half after the passing of the statute the liability of inhabitants to be rated for personal property was not agitated. The rate had been laid universally on the tithe-holders and on the occupiers of the real property subject to the rate; but whether it was owing to the small relative value of stock-in-trade in the rural districts, or to other causes, the liability of inhabitants to be rated in respect of their stock-in-trade was not established for more than a century and a half after the passing of the statute of Elizabeth. Lord Mansfield, in the earlier cases before him, with the other judges, resolutely denied the general liability, and required a custom to be proved in each parish, in order to legalize the rate. Lord Mansfield strongly insisted on the impossibility, as well as the impolicy, of making the rate; and he described many of the anomalies, and anticipated most of the practical difficulties which have since been experienced.

The general liability was, however, finally established by Lord Kenyon; and a practice of making rates on stock-in-trade was extensively adopted in the clothing district of the west and south-west of England after long contest and litigation, in which the interests of the declining manufacturers unsuccessfully opposed the interest of the occupiers of land, and the owners of tithes. A tax so heavy as the poor rates were in this district (which after the commencement of the practice of rating stock-in-trade rapidly became one of the most pauperised in England, the pauperism constantly increasing as the manufactures declined), must have operated very disadvantageously in diminishing the inducements to the application of capital, and may reasonably be supposed to have had a large share in turning the scale (notwithstanding the long possession by these districts of this staple industry, their superior skill, their proximity to the ports of London and Bristol, and their equal advantages in possession of coal), in favour of their rivals in the north of England, where industry was not subjected to the like burden.

The practice of rating inhabitants for their stock-in-trade was adopted but very partially as regards the whole of England and Wales, but when once adopted, had usually been continued until the passing of the Parochial Assessment Act in August 1836. As that Act prescribes a criterion for rating real property and is silent on the subject of personalty, it was supposed to discountenance the rating of stock-in-trade, and the practice of rating it was generally abandoned where it had before existed. The question having, however, been again agitated, the case of Reg. *v.* Lumsdaine came before the Court of Queen's Bench for decision and that Court has again affirmed the general liability of inhabitants to be rated in respect of stock-in-trade.

Since this new promulgation of the law, attention has been excited to the subject in parts of England and Wales where the practice was before unknown. The inevitable difficulties of the subject will necessarily produce great irregularities in the application of the law with the consequent contests and litigation between the manufacturing and landed interests; and the most correct application of the law must produce great derangements in the profits of trade.

To prevent those evils, and the impediments which extensive litigation would create to the administration of the law generally, it appears to us that some legislative interference during the present Session would be of great benefit; and it is with a view to the passing of some measure on the subject that we have determined to present to your Lordship the following short statement of some of the anomalies in the law as it now exists.

By the statute of the 43rd Elizabeth, the relief of the poor was to be provided for by taxation of every inhabitant, according to the ability of the parish. The courts have decided that these words make an inhabitant rateable in respect of stock-in-trade.

But any rich possessor of stock-in-trade may escape the tax at his pleasure; it is only the poorer inhabitants who cannot escape the tax. If the owner's concerns are sufficiently extensive to allow of his warehousing his stock-in-trade in a parish in which he does not reside, or if he is sufficiently opulent to reside out of the parish where his stock is kept, he, not being a resident inhabitant there, is not rateable; thus, three partners carried on business upon premises in which their foreman and his family resided, but they themselves resided in another parish; they were held not rateable—R. *v.* N. Currey, 4 B. & C. 953.

The owners of ships, packet-boats, &c., in places where these are rated, contrive to escape the tax by taking up their residence out of the parish of the ship's home. A shipowner, whose ships were registered at Liverpool, and who had warehouses and a counting-house in the parish of Liverpool, but resided in a different parish, was held not rateable for his ships—R. *v.* Liverpool, 8 East 455.

The tax is thus commonly escaped by the opulent owners of stock-in-trade who do not reside in the parish in which their stock lies. The escape from the rate of a large stock would indeed often be more than sufficient to pay the expense of a country residence; but to the poorer owners of stock, who must reside in the place of their business, the tax is inevitable.

Even amongst persons of exactly the same condition, the operation of the tax is strikingly unequal and anomalous; thus, of several partners one resided on the premises; he alone was rateable as an inhabitant for his share of the stock, to the extent of his interest in it—R. *v.* Gosse, 7 B. & C. 60.

The persons thus escaping the rate on their stock-in-trade, in the parishes where it is kept, cannot be taxed for it in the parishes where they reside—Earby's Case, 2 Bulst. 354; 1 Bott. 124.

Again, stock of one kind makes an inhabitant liable; stock of another kind does not; thus the stock-in-trade of common brewers and maltsters cannot be taxed, because, as it is said by the courts, it cannot be sufficiently ascertained—R. *v.* Ringwood, Cowp. 326.

Again, household furniture is not rateable, R. *v.* White, 4 T.R. 771, although an obvious source of ability in the hands of a lodging-house keeper, a family hotel keeper, or an upholsterer letting furnished houses. Thus the tax operates capriciously and as a discriminating tax against some kinds of stock-in-trade or industry, and in favour of others.

Another source of inequality in the imposition of the tax is contained in the rule laid down by the courts, that the profit is not to be presumed, but must be proved, and that it is not on the whole profit made, but on what is in excess after payment of all debts—R. *v.* White 4 T.R. 771.

The rate on land, houses, &c., is laid on the reasonable net annual value, but this rate on stock-in-trade is only to be laid on what the overseers can prove to remain after payment of debts. Thus he who can conceal his profits from the overseers, and he who by his imprudence is involved in debt, escapes a burden which will be thrown upon his neighbours, the nature of whose business or whose openness of dealing does not allow concealment, or whose prudence keeps them out of debt.

Another anomaly in the interpretation of the statute is the distinction between the kinds of "ability" by which inhabitants are rendered liable. Inhabitants are to be rated in respect of their "ability"; now although nothing is said in the statute about stock-in-trade, the courts decided that profits derived from stock-in-trade constitute a rateable ability; but the courts also decided that other kinds of personal profits do not constitute a rateable ability; thus furniture, money, stock in the funds, money lent on real security, the profits of manufacturers (as of silk throwsters), where the materials wrought up may not be the manufacturers' own stock, salaries and professional earnings (however large the ability constituted by them), have been decided not to constitute a rateable ability of an inhabitant. We refer to these decisions, not as being in themselves objectionable, but as tending to show how capricious has been the operation of the tax, which has no fixed relation either to persons or to income.

Thus although inhabitants without distinction are by the statute of Elizabeth made rateable according to their ability, it will be seen that by the decisions of the courts one class only of inhabitants is made rateable; that even within this class the liability is unsettled, capricious, and unequal; that other classes, though of equal ability, are excepted; and that the test of the ability in respect of which inhabitants are to be rated, that is to say, the amount of actual profits after provision for payment of debts, is most difficult to ascertain.

To apply the law of rating to lands, houses, and other objects of occupation, is comparatively easy, and the rule for rating these objects according to a reasonable estimate of their net annual value, renders it unnecessary to institute inquiry into the personal concerns of the ratepayer, and makes an evasion of the tax by concealment of profits impossible.

But the rate on stock in trade, dependent on the amount of profit as before described, cannot be made without minute investigations into the concerns of individuals; investigations so difficult, and the results of which are so fallacious, that a right conclusion can scarcely be obtained, while to the ratepayers every inequality, the result of a wrong estimate, is a subject of dissatisfaction necessarily begetting disputes and litigation.

From these difficulties, and from a desire to avoid appeals, another kind of injustice has ensued in places where stock-in-trade has been rated. Those who could most successfully conceal their profits, or could most easily reside elsewhere, or keep their stock away from the parish, have been able to make the best terms with the overseers, to which terms, rather than lose all, the overseers and other inhabitants are compelled to submit; and as an inducement to avoid appeals by such as might be supposed to be capable of appealing successfully, it has been the practice of overseers to

set the rate at sums which, being much below the true amount of the liability, were likely to be undisputed by the ratepayers and which the overseers were certain of being able to prove.

There is good reason to believe that there is no parish in the kingdom in which the overseers have ever been able fully to carry out the law. The instances which have come to our knowledge of attempts to carry it out, have been instances of compromise, and fully justify Lord Mansfield's enlightened views as to the impossibility of carrying the rating of stock-in-trade into effect. His Lordship's views appear to be still entertained in the manufacturing districts, and in other parts of the country; since the recent communications on the rating of stock-in-trade, which we have received, generally express a stronger sense of the impracticability of the law than of its injustice or impolicy.

It would appear to be unnecessary for us to make any remarks upon the general policy of a tax operating so unequally, affecting some trades and some classes of traders with inevitable burdens, from which others are exempt, without any other reason for the difference than the merely accidental variety in the ease with which the tax can be imposed in one class of cases, as compared with the other. But it is proper to call your Lordship's attention to the fact, that the tax, as yet, has never been imposed on the parishes in the greater part of England and Wales, and is practically unknown in the districts which have become the great modern seats of manufactures. Thus its extension to these would operate with all the disturbing effects of a new tax, and with an effect which we are not prepared to estimate, but which may be considerable in changing the relations of our trade and manufactures, both as regards other parts of Her Majesty's dominions (as Scotland and Ireland) where no such tax can be laid, and as regards the competition of our countrymen with the trade and manufactures of other countries.

On the other hand, as the tax has not yet been practically laid on these districts, the repeal of the law would not deprive the landed interest of any benefit now enjoyed by it in the taxation of the commercial and manufacturing classes. The repeal of the liability would leave the whole class of ratepayers in those districts in their existing relative position. In the districts in which the practice of rating stock-in-trade formerly prevailed, and has been recently resumed, the alteration, by the total repeal of the liability, would be comparatively small, on account of the limited extent to which the liability has hitherto from the causes before adverted to, been capable of being enforced.

It is likewise important to remark that rates are made by the parish overseers, who are unpaid officers, acting only for a single year, and therefore not likely to possess or obtain the skill, or to bestow the labour which would be requisite for so difficult a task as that of making a fair and legal rate upon stock-in-trade.

It has been sometimes suggested as desirable that the practice of rating inhabitants for stock-in-trade should be confined by legislative enactment to the places in which it has already been carried into effect.

If this suggestion should be adopted, it would be right to couple it with another, namely, that the rate should be made only in the same proportions to the actual profits as hitherto. For, as we have before stated, the practice has been such as to allow of a large escape of profits from the rate, and if ever a rate should be made in any place on the whole amount of profits legally liable to the rate, such a rate would to the extent of this difference be a new rate on the trade of the place; this provision, however, from the difficulty of discovering the proportion between the amount of profits which have been rated, and the amount of the true rateable profits, would be difficult of application.

We think that it would be most beneficial to repeal altogether the effect of the word "inhabitant" in the statute of Elizabeth. Hitherto no inhabitants, simply as inhabitants, have been rated other than the possessors of stock-in-trade, but inasmuch as stock-in-trade was affected, with its liability, above a century and a half after the passing of the statute of Elizabeth, and as the words of the statute would undoubtedly admit of a much wider signification than has yet been attributed to them, there is still danger that it may at some time or other have a wider practical effect given to it. It appears to us to be better to prevent such an extension than to postpone the remedy until the evil has arisen, especially as this can now be done without any derangement beyond the repeal of the liability to be rated in respect of stock-in-trade.

It would, however, be sufficient for the immediate purpose to repeal specifically the liability of inhabitants to be rated in respect of stock-in-trade.

Before we close the present report we think it right to add that neither the repeal of the general liability of inhabitants to be rated according to their ability, nor the repeal of their specific liability to be rated in respect of their stock-in-trade, would at all affect the question now pending before the Court of Queen's Bench in the case of Regina *v.* Capel concerning the extent of the respective liabilities to be rated of tithe owners and of occupiers of land.

We have, &c.
(Signed) John G. S. Lefevre.
Geo. Nicholls.
Geo. C. Lewis.

The Most Noble the Marquis of Normanby,
&c. &c. &c.

The first reference to this question which seems to have been made in Parliament in the year 1840 was made by Sir Robert Peel on the 11th of May 1840, in which, after setting out the inconveniences which had arisen from the decision in Regina *v.* Lumsdaine, and the great difficulty of properly rating stock-in-trade, he asked whether it was the intention of the Government to recommend Parliament to interfere and pass a measure to reconcile the conflicting decisions of the Court of Queen's Bench, and to satisfy the public mind upon the point, whether stock-in-trade ought to be rated.

In reply the Attorney-General (Sir John Campbell) explained the advice which he should certainly give the Government, and which he had no doubt would be followed. He thought that a Bill ought to be introduced immediately to apply a remedy, and expressed his opinion that the existing state of the law ought not to continue, for it forced a most inquisitorial research into the private affairs of individuals. His recommendation would be either that a separate Bill should be introduced, or that a clause should be inserted in some Bill during its progress through the House, to make that custom which had prevailed by universal consent a part of the law, and to declare that stock-in-trade should not be rated to the poor rates, and consequently not to the county rate or any other rate. (Hansard. Third Series. Vol. LIII., p. 1367.)

On the 22nd of May 1840 a discussion on the same question was raised in the House of Lords by Lord Portman, who moved for a copy of the letter addressed by the Poor Law Commissioners to the churchwardens and overseers of the several parishes within the country, relating to the subject of rating stock-in-trade, and recommended that a separate and distinct measure on the subject should at once be brought in. He also expressed his opinion that it would be better to do away with the charges on the person as prescribed by the Act of Elizabeth. In the discussion which followed no exception was taken to the proposal to exempt stock-in-trade from rating. The Duke of Richmond urged that if the stock-in-trade of the shopkeeper was not to be rated, it would be unfair to rate the stock-in-trade of the farmer. He said "the land was rated already, and "it was therefore most unfair to rate the stock, with-"out which the land would be worth little or nothing." (Hansard. Third Series. Vol. LIV., p 499.)

A Bill dealing with the subject was read a first time in the House of Commons on the 18th of June 1840, and a second time on the 22nd of June without discussion. (Hansard. Third Series. Vol. LIV., pp. 1261 and 1381.) It passed through Committee on the 23rd of July after a short debate, in which the only opponent of the Bill was Mr. Goulburn, who maintained that it would press hardly on the owners of tithe, and would inflict great injury on other species of property. It was read a third time on the 27th of July 1840, without discussion. (Hansard. Third Series. Vol. LV., pp. 931 and 1023.) On the following day it was read a first time and on the 31st of July a second time in the House of Lords without discussion. On the 4th of August the Marquis of Normanby on behalf of the Government moved that the order of the day for going into Committee on the Bill be read in order to be discharged, as there were some words in the last clause of the Bill which had occasioned very considerable doubt whether they did not carry the exemption provided for by the

Appendix A. XXXIII.

Bill much further than was originally intended. Lord Portman at the same time mentioned that a right rev. prelate, who had been obliged by illness to leave the House, had consented to the arrangement on the condition that the Bill to be brought in should be merely temporary. On the following day, the 5th of August, Lord John Russell in the House of Commons obtained leave to bring in the Bill for the Act which is now in force, exempting the inhabitants of parishes from liability to be rated as such in respect of stock-in-trade or other property. The Bill was brought in, and read a first time, and the Standing Orders having been suspended, it passed through all the other stages in that House without discussion, and was read a first time in the House of Lords. On the 6th of August it was read a second and third time in the House of Lords without discussion. (Hansard. Third Series. Vol. LV., pp. 1067, 1163, 1246, 1279 and 1343). The following is the text of the Act, which has since been continued annually:—

3 & 4 Vict. c. 89.

An Act to exempt, until the Thirty-first day of December, One thousand eight hundred and forty-one Inhabitants of Parishes, Townships, and Villages from Liability to be rated as such, in respect of Stock in Trade or other property, to the Relief of the Poor.

(10th August, 1840.)

"Whereas by an Act passed in the forty-third year of "the reign of Queen Elizabeth, intituled 'An Act for "the Relief of the Poor,' it was amongst other things "provided, that the overseers of every parish should "raise, by taxation of every inhabitant, parson, vicar, "and other, and of every occupier of lands, houses, "tithes impropriate, propriations of tithes, coal mines, "or saleable underwoods, in the said parish, in such "competent sum and sums of money as they shall think "fit, a convenient stock of necessary ware and stuff to "set the poor on work, and also competent sums of "money for and towards the relief of the poor not able "to work, and also for the putting out of poor children "to be apprentices, to be gathered out of the same "parish according to the ability of the same; and "whereas by another Act passed in the session of "parliament holden in the thirteenth and fourteenth "years of the reign of King Charles the Second, "intituled 'An Act for the better relief of the poor of "this Kingdom,' the provisions of the said Act of "Elizabeth were extended to certain townships and "villages: And whereas, by reason of the provisions of "the said Acts, it has been held that inhabitants of "parishes, townships, and villages, as such inhabitants, "are liable, in respect of their ability derived from the "profits of stock-in-trade and of other property, to be "taxed for and towards the relief of the poor, and it is "expedient to repeal the liability of inhabitants, as "such, to be so taxed." Be it therefore enacted by the Queen's most excellent Majesty, by and with the advice and consent of the Lords spiritual and temporal, and Commons, in this present Parliament assembled, and by the authority of the same, that from and after the passing of this Act it shall not be lawful for the overseers of any parish, township or village to tax any inhabitant thereof, as such inhabitant in respect of his ability derived from the profits of stock-in-trade or any other property, for or towards the relief of the poor: Provided always, that nothing in this Act contained shall in anywise affect the liability of any parson or vicar, or of any occupier of lands, houses, tithes, impropriate, propriations of tithes, coal mines, or saleable underwoods to be taxed under the provisions of the said Acts for and towards the relief of the poor.

II. This Act shall be in force till the thirty-first day of December in the year of our Lord one thousand eight hundred and forty-one and that from the said thirty-first day of December this Act, and all the provisions herein-before contained, shall absolutely cease and be of no effect.

In the January following the passing of this Act the Marquis of Normanby, the then Home Secretary, called upon the Poor Law Commissioners to prepare a statement of the condition of the law relating to the Poor's Rate and other local taxes. The result was an elaborate report by the Commissioners dated the 1st of June, 1843, commonly known as "The Report of the Poor "Law Commissioners on Local Taxation." In this report *inter alia* they recommend "that the exemption "of inhabitants in respect of stock-in-trade and other "personal property from the poor's rate should be made "permanent, and that the exemption should be extended "to all the other local rates." *See* page 88 of their report.

The Select Committee of the House of Lords appointed to inquire into the burdens on real property and the impediments to agricultural transactions, caused by the then existing system of excise duties, poor laws, and local taxation, in their report in 1846, make no recommendation on this subject. But another Select Committee of the House of Lords appointed to consider the laws relating to parochial assessments in their report of 1850 (Parliamentary Paper, No. 150) state "That until some mode is found, in which the value of "such descriptions of property as are commonly called "stock-in-trade, can be defined with sufficient accuracy "to enable the overseer to maintain a rate in cases of "appeal, it will be necessary to continue to exempt such "property from its legal liability to assessment." They also report "that any plan for the assessment of personal "property in aid of the rates levied on real property "requires to be considered in minute detail (and "specially with regard to the allocation of the money "so raised) before any opinion can be formed thereon."

Very valuable evidence on the subject of the rating of personalty and on proposals to make local expenditure of various kinds a national charge was given before this Committee by Sir George Cornewall Lewis, who was then in Parliament, and who had been one of the Poor Law Commissioners (*see* pages 3 to 39 and 313 to 325 of that Report). It is impossible within the limits of this memorandum to summarise this evidence; but the following extracts from it may be of service to the Commission:—

"Looking to the question of the rateability of personal property with reference to the agricultural interest, it is very uncertain whether they would be gainers by the rating of stock, generally, if the farmer's stock was rated as well as the stock of the tradesman." (Page 6.)

"33. If the farmer's capital that is now employed in agriculture were subjected to parochial rates, would those rates virtually and substantially be paid by the landlord?

"I have no doubt the effect would be that greater deductions from the rent would take place; the result simply would be an additional rate, coming from the same source as at present."

"34. Consequently subjecting the farmer's profits to parochial rating would, in reality, be an additional charge upon the landlord's rent?

"Yes, it would have that effect, so far as it would lead to any increased taxation of the farmer, as compared with other ratepayers in the same parish; but I am disposed to think, that even if farmer's stock and tradesman's stock were both rated, the practical effect would not be very considerable, for this reason, that in most rural parishes the only property which would be liable to rating would be land; and as between the different occupiers of land it would be perfectly immaterial whether you rated the farmer's stock, or whether you left the stock all out of the rate, provided you impose the rate upon the same principle upon each, the tithe-owner would decidedly be a gainer, if there were much stock of any sort within the parish; but as between the different farmers in the parish the effect would not be great; and I am disposed to think, that, taking the whole country through, the alteration of the law with regard to rating the farmer's stock and the tradesman's stock would have very little practical effect, much less than people usually suppose. The great effect would be in semi-rural parishes, in suburban parishes, in parishes which partly consist of houses and partly of land. In these there would be, no doubt, a considerable alteration; but then you would have a set-off, because the tradesman's stock would be assessed, and the farmer's stock would be assessed and the only persons who would gain would be the occupiers of dwelling-houses and the clergyman. With reference to the occupiers of dwelling-houses, I would say that there is no class of persons, if I had to make the law, whom I should be so unwilling to relieve as that class. I believe the Scotch Board of Supervision have decided very justly to put the highest amount of rating upon the occupiers of dwelling-houses, upon the assumption that the income of the occupier of a dwelling-house bears a larger proportion to his rateable value than the income of any other class. I confess I should be very much disposed to agree with them; and if any alteration were made with reference to the law of rating, there is no class of persons who appear to me less to deserve consideration. I would ask, what equity would there be in relieving the

occupiers of houses in Grosvenor Square at the expense of the tradesmen in Bond Street, or what equity would there be in relieving the occupiers of the great clubs in St. James's Street, or the occupiers of houses in St. James's Square, at the expense of the tradesmen of Piccadilly or Pall Mall? I can hardly conceive any shifting of burdens which would have less to recommend it in the way of equity."

"25. The Committee may infer from your evidence that your opinion is—that the practical difficulty of levying a rate upon personal property constitutes an insuperable objection to it?

"Certainly; that is my opinion; I never heard of any mode by which it would be practicable to levy a parochial rate upon personal property." (Page 14.)

"In the evidence which I gave on a former occasion, I attempted to lay before the Committee the circumstances in the working the English Poor Law and the other laws founded upon the English Poor Law, which showed a difficulty of imposing a parochial tax upon personal property; I illustrated that difficulty by a reference to decisions with regard to the rating of stock-in-trade, and the decision that was come to with respect to farmers' stock; I also showed that no attempt had been made to rate money or securities for money. As to the rate upon stock, there is a peculiar difficulty in determining the principle according to which the rate shall be assessed; but with regard to money, there is much greater facility of imposing a rate; for example, if a person has 1,000*l.* in the funds, which produce a known interest every year, it would be fair to say that you would impose a rate upon that interest. The same argument would apply to money invested in mortgage or any other real security. There is a facility for rating the produce of money which does not exist in the case of stock; therefore it might be said that an attempt ought to be made in equity and justice to impose the local rates upon money. I did not advert to this question upon the previous occasion, because I wished to confine myself as far as possible to those practical questions which had arisen under the law of rating. But in going into more general considerations it will be proper not to omit that part of the case. The difficulty of imposing a local rate upon money seems to me to arise in this manner, that money cannot properly be said to have any definite locality. In order to impose a parochial tax, it is necessary to be able to identify the locality of the property upon which the tax is imposed. With regard to money, there is great difficulty in fixing the locality to which the money shall be chargeable. I will take the liberty of putting a case, which I think must be admitted to be not an extraordinary one. We will suppose that a person occupies a house in London, and also a villa at Wimbledon, or at Richmond, that he is the owner of an estate in Sussex, where he has a house and a garden, and perhaps a farm, all in his own occupation, and that he is, besides, the owner of an estate in Lincolnshire, where he has a house, and also a park in his occupation. We will further suppose that he is the owner of 10,000*l.* in the funds and 5,000*l.* in real security; it may be assumed that the 10,000*l.* and the 5,000*l.* each produce an ascertainable yearly sum. The question would then arise to which of the different parishes in which he is rated are you to allow the benefit of those annual sums. It is quite clear there can be no reason for selecting one parish rather than another; if he is the occupier of hereditaments in different parishes, and it is necessary to make a distribution between those parishes, upon what principles is that distribution to be made? Is it to be made according to his rateable value in each parish, or according to the total assessment in each parish, or according to the expenditure of each parish? In short, what is the principle according to which the distribution is to be made? The answer to that question is one which I have never yet heard made satisfactorily, and it is in the difficulty of giving a satisfactory answer to that question that the practical objection to rating money appears to me to consist." (Pages 313 and 314.)

"Those who impose the tax for local expenditure naturally confine their attention to property which is situated within the district over which the expenditure is to extend, and the moment they attempt to go beyond that district they are met by very serious difficulties in practice. The difficulties which arise have been shown by the operation of the law of rating in Scotland. In Scotland the law of rating includes what is called means and substance, means and substance being all species of property, so that the poor rate in Scotland has included both personal and real property. Now, I am anxious to call the attention of the Committee to the manner in which the law of Scotland has worked. I will take the liberty of reading a short passage from the first Annual Report of the Board of Supervision for the Relief of the Poor in Scotland; it gives an account of the operations of the Commissioners who were appointed to administer the amended Scotch law. They say, 'According to the 'law of Scotland previous to August 1845, the principle 'of rating on means and substance was recognised in 'all assessments for the relief of the poor.' The Committee will observe, that means and substance includes every species of personal property. They then proceed to say, 'Whether it be from the influence of this law 'or from a belief in the justice of the principle on 'which is founded, the general feeling in Scotland 'certainly is that every man should contribute to the 'support of the poor in proportion to his means.' Now this was the way in which that principle was practically worked out:—'The old law proposed to effect 'this object by direct inquiry into the circumstances 'of the whole inhabitants of a parish. Owners of 'lands and heritages were assessed according to the 'annual value of their properties, and, if residing 'within the parish, were also liable to be assessed on 'any means and substance other than lands and heritages which they might possess. Each individual 'not being an owner of lands or heritages was assessed 'in the estimated amount of his means and substance. 'The burden of proving that he did not possess so 'much as he was assessed upon was thrown upon him, 'for the power of estimating and assessing or stenting 'the means, rested, in the first instance, exclusively 'with the administrative body, or with assessors or 'stent-masters appointed by them. To enable him to 'prove his objection to the assessment it might be 'necessary to expose his whole affairs to parties who 'were not bound to secrecy, and this not once, but 'every year, or as often as an assessment was im-'posed.' This is a description of the manner in which the old law of Scotland with reference to rating means and substance was acted upon. The report states that the general feeling of the country was in favour of rating every man in proportion to his means, but, notwithstanding the feeling in favour of that principle, we shall see what difficulties arose in its application. 'When commerce increased, and the state of society, 'as well as the transactions of individuals became 'more complicated, the inconvenience of this mode of 'proceeding produced attempts to arrive at a proxi-'mate estimate of the means and substance of indi-'viduals, without a direct and frequent investigation 'of each man's circumstances.' So that it appears that the mode to which it was necessary to have recourse in order to ascertain the personal means of each individual was not by a Government officer, who was sworn to secrecy, but a man's neighbour, perhaps a shopkeeper or a farmer in the parish, putting an arbitrary value upon his personal property, and leaving the party rated to prove that it was not the true value. That was the manner in which the law was carried into effect. An alteration has been made in the mode of rating in Scotland which has introduced a new principle; it has enabled the parochial boards to take the option of selecting one out of three modes of rating. The first of those modes is exclusively upon real property, and is described thus:—'One-half of the assess-'ment may be imposed upon the owners and the other 'half upon the tenants or occupants of all lands and 'heritages within the parish rateably according to the 'annual value of such lands and heritages.' This plan is very similar to our mode of rating, but it includes the owner as well as the occupier. The other two modes include rating means and substance, according to certain proportions. Now, it is important to see what has been the effect of the change because the law of Scotland, as it existed from about the time of Queen Elizabeth, or a little earlier down to the year 1845, recognised the rating of means and substance, and therefore there was the practice of the country in addition to an unaltered law. In the year 1845 the practice of the country being to rate means and substance and the feeling of the country as is stated by the Commissioners, being in favour of the principle upon which the law was founded, yet the practical difficulties of carrying that principle into effect were so great, that it was found desirable to give the parishes the option of adopting other modes of rating; and we shall see what has been the conduct of the parochial boards when the offer was made to them of other modes of rating. I will read an extract from the last Annual Report of the

Appendix A. XXXIII.

Board of Supervision dated August 1849. They state, 'In the 880 parishes and combinations in Scotland the 'funds for the relief of the poor are now raised in the 'following manner:—'First mode'; (that is to say), rating the owners and occupiers of lands without rating means and substance; 'first mode with classification'; that is in reference to a circumstance which, if the Committee wish I can explain presently; 'first mode, 'with classification, 92; without classification, 407; 'making together 499; according to the second mode, '34; and the third mode, 40, according to established 'usage, 52.' The second and third modes include means and substance; these numbers make altogether 625 assessed parishes in Scotland. So that out of 625 assessed parishes 499 have voluntarily repudiated the mode of rating means and substance since the year 1845, and only 74 assessments have been made according to the old law of rating means and substance. That change has taken place in rather less than five years, and, as far as I am aware, has been done entirely from the voluntary decision of the parochial boards themselves.

"4. Was the rate upon personal property confined to personal property within the parish, or did it extend to personal property without the parish?

"I believe that in Scotland any personal property which a person possesses is liable to the rate, no matter where it is situated: I have heard of cases where a person was assumed to be worth some hundred thousand pounds, and was rated accordingly, and was left to appeal and to prove that it was not the proper amount. Of course the result might be that such a person would pay nearly the whole rate of the parish. I have heard that persons have actually sold property in Scotland on account of the large rate imposed upon them in respect of personal property not situated within the parish. The inference which seems naturally to arise from these facts is, that however desirable and equitable it may be to impose a parochial tax upon a person in proportion to his means, those means, including both real and personal property, the practical difficulties of assessing such a tax are so great as to be nearly insuperable. We have, moreover, the practice of the English courts, who, in construing the Act of Elizabeth, have limited the words to 'real property;' though it is quite clear that the words have merely by the construction of the court been so limited, being sufficiently ample to include personal property if there had been any practical facility for rating it; while in Scotland where there was a practice of rating personal property, after that practice had existed for two centuries, it has been found so inconvenient, that although the general feeling of the country was in favour of rating all species of property, 499 parishes, as compared with 74 parishes, have preferred the simple mode of rating houses and land within the parish. There is one peculiarity in the Scotch mode of rating which I would wish to advert to: The Committee may remember that the first class which I read was divided into two parts; it is called the first mode with classification and without classification; that refers to a peculiarity in the Scotch law of rating of which we know nothing in England, viz., they divide the property into certain classes, and they put a different proportion of the rate upon different sorts of property. I have here a detailed account for each parish in Scotland of those varieties, but it is unnecessary for me to trouble the Committee with the details; I can give the Committee a general idea of the practice. We will assume a suburban parish which contains part of a town, with a rural district attached. We will first take the dwelling-houses, which will be entered in the rate book at 100 per cent.; then we will take the shops, we will suppose them to be rated at 75 per cent.; then we will take the manufactories, and put them down at 50 per cent.; and then we will take agricultural land, and put that down at 35 per cent. An equal rent is then imposed upon all those values; the result, of course, is, that a certain classification of different species of property takes place. The occupier of a dwelling-house pays considerably more in proportion to its annual value than the occupier of a manufactory or agricultural land. This is the mode of rating which is recommended by the Scotch Board of Supervision; they introduce it as far as they are able, and in some cases they have gone so far as to disallow rates upon the ground of their being equal rates, which, to a person accustomed to the English law, sounds very strange; for in England it is a ground of appeal against a rate that it is not an equal rate.

"5. Is the rating value, as it is in England, the specific value of the land or the net income?

"The rateable value in Scotland is, I believe, similar to the rateable value in England; it is the net annual value of land.

"6. Repairs are deducted from houses?

"Yes, I believe it is done in the same manner as in England; there seems to be less litigation in Scotland about assessment than there is in England; they appear to settle matters more amicably; but I believe the assessment is made in the same manner where the rate is imposed upon the occupiers of heritages; but the proportions for different classes of property may be taken, and then the rate is imposed equally on the whole, and the result is that it produces a sort of approximation to a parochial income tax. There is no doubt that, generally speaking, the income of the occupier of a dwelling-house bears a larger proportion to the rent of that dwelling-house than the income of the occupier of a farm bears to the annual value at which he is rated; and, therefore, in adopting this mode you approach as nearly as you can to the principle of an income tax, without going into the income of each individual. This is the mode of rating which Sir John M'Neill, who is the chief member of the Board of Supervision in Scotland, and who is extremely able, and has devoted much attention to the subject, informs me he thinks is the most equitable and the most practicable mode of rating that can be devised, and his opinion is that it has given great satisfaction in Scotland as far as it has been carried into effect.

"7. That amounts to its being the most equitable way of assessing means and substance?

"It is the nearest approximation to a parochial income tax which can be made." (Pages 9 to 11.)

The minutes of evidence before this Committee also contain some interesting evidence as to the various modes of rating for the relief of the poor in Scotland by Sir John McNeil, G.C.B., the chairman of the Board of Supervision for the relief of the poor in Scotland.

The following are extracts from that evidence:—

"The original mode of assessment in Scotland was upon means and substance, that is to say, in burghal parishes according to the means and substance of the whole of the inhabitants, and in rural parishes half upon the owners of lands and heritages and the other half upon the whole of the inhabitants according to their means and substance. . . . . The means and substance of our statute I believe to be but an equivalent for the term 'ability,' as used in the statute of Queen Elizabeth, either with the hope of making it more definite, or because it was a term better understood in Scotland. The principle of assessment in both countries was originally that of assessing according to ability." (Pages 365 and 366.)

"In the first instance there was a very strong disposition to assess upon means and substance. In Scotland the disposition now is to regard that as the fairest mode of assessment; but experience of the practical inconveniences and difficulties accompanying it has deterred many parishes from following it out." (Page 367.)

"I think that in Scotland the feeling of the country is that every man ought to contribute to the relief of the poor in proportion to his ability to do so; and I think that that feeling is probably founded upon a Scriptural view of the subject, regarding it as an act of charity. Undoubtedly, whatever it is founded on, that is the feeling which prevails in Scotland, that every man ought to contribute to the relief of the poor according to his means. In Scotland all the systems of assessment which have been adopted have been attempts to arrive at that result without the inconveniences of a direct assessment upon means and substance." (Page 379.)

"Do these practical difficulties and inconveniences arise from any peculiarity in the existing law, or are they difficulties and inconveniences necessarily inhering in the attempt in any form to assess means and substance?

"I think they are difficulties necessarily inhering in the attempt to ascertain what a man's means and substance are. I may, perhaps, best explain the inconvenience by giving a short account of a very important case in which the matter was most fully discussed, and which was before the Board of Supervision very lately. It was the case of the city parish of Glasgow, the largest and perhaps the wealthiest parish in Scotland; that parish, up to the year 1839, had been assessed under the old law as a burghal parish, on the means and substance of the whole of the inhabitants. The

inconveniences which were felt when transactions became more complicated, as commerce increased, led the parochial board to come to Parliament in that year for a local Act to exempt them from the operation of the Scottish statutes, which left them no alternative but to assess on means and substance. After an inquiry by Committees of both Houses of Parliament, of which, however, I doubt whether the evidence was ever printed, as I have not been able to find it, both Committees reported in favour of the local Act empowering the magistrates to assess in a manner very closely corresponding with the first mode described in the statute; that is, upon the owners and occupants of real property. When the recent Act was passed in 1845, the parochial board resolved to continue to assess according to their local Act of 1839-40, but in 1847 the parochial board passed a unanimous resolution to assess upon means and substance. I had very great apprehensions of the practicability of carrying out that mode of assessment in such a parish as Glasgow; but the parochial board being unanimous, and no ratepayer in Glasgow having raised his voice against it, I thought it my duty to advise the Board of Supervision to concur in the change; this year, after a severe contest, which has produced a good deal of contention in Glasgow, and after a keenly contested election of members to be returned to the parochial board, the majority has resolved to change the mode of assessment from means and substance to rental again. After a very mature examination, and a very careful investigation of the whole circumstances, the Board of Supervision thought it their duty to concur in that change. One of the circumstances which most weighed with us in inducing us to concur in the change back to rental was that in the three years during which the assessment on means and substance was levied in Glasgow they had accumulated an unrealised arrear of 80,000*l.* upon an expenditure of between 50,000*l.* and 60,000*l.*; more than that, the parochial board, having authority under the law to enforce the disclosure of his circumstances by every ratepayer who disputed the sum on which he was assessed, had not, from the odium of the measure, ventured to carry out the law in that respect; the consequence was that the amount to be paid by each individual became a matter of arrangement and compromise between him and the parochial board. They did not venture to enforce to law to compel him to divulge his whole affairs, because they were satisfied that public feeling would have been against them. It therefore became a most dangerous state of things when the sum to be paid by each ratepayer was not the sum assessed upon him or not the sum which could legally be enforced, but was a sum which was a matter of arrangement between him and the committee of the parochial board. The Board of Supervision, therefore, felt that there was great danger of abuse in such a state of things, as well as great danger of the poor being neglected with such an enormous arrear of rates uncollected; those are the kind of inconveniences and difficulties which are encountered in working out, in a complicated state of society, and where the means and substance of individuals are continually fluctuating, a direct assessment upon means and substance.

"2666. Does an assessment upon means and substance amount to the same thing precisely as an assessment upon income, from whatever source derived?

"There are two modes of assessing upon means and substance. In effect, as regards ratepayers so assessed, it is assessing upon income from whatever source derived (as our courts of law have hitherto interpreted it), including the profits of business, professional incomes and income from all sources. But there are two modes of assessing upon means and substance, by one of which half the assessment is imposed upon the owners of real property, and the other half upon the inhabitants according to their means and substance. By the other, the third mode of assessment, it becomes in fact an income tax, because it is imposed rateably upon the income derived from land, and upon the income derived from means and substance; that is, in fact, upon all income.

"2667. Suppose the case of a person of large means resident in two different parishes, both of which are assessed to means and substance; how do you treat that case?

"In that case he makes his election; the law leaves to him the right of election in which of the two he will be assessed on his means and substance; he cannot be assessed on both; he chooses which of the two he will be assessed in upon his means and substance.

"2668. Can he divide his assessment between the two parishes?

"No; he makes his election as to one of the two.

"2680. In endeavouring to ascertain the means and substance of an individual in Scotland, how do you get at the amount of his property in the funds?

"I do not know by what means it is arrived at. According to one law the parochial board may assess him at anything they please; and it is for him to prove that he has not the means, or that he is assessed above what he ought to pay. That he can only prove by a complete exposition of his whole affairs."

The difficulties of assessing according to means and substance led in 1861 to the passing of the 24 & 25 Vict. c. 37., by which this method of assessment was finally abolished. The Bill for this Act was brought in by a private Member (Mr. Baxter, Member for Montrose) and passed through the House of Commons without discussion. In the House of Lords it was discussed both on the second reading and in Committee. In moving the second reading the Earl of Airlie stated that he believed that the assessment on means and substance was universally condemned. In opposing the second reading Lord Camperdown stated that some 16 or 17 parishes had not given up the system, but that the Bill would make it compulsory on them to give it up, although they might be sincerely attached to it. The Duke of Argyll said he had no personal connexion with any parish in which that most unfortunate, and, as he deemed it, most unjust assessment, by "means and substance" prevailed; but he strongly objected to it on principle. It was true that the Bill was not a Government measure, but it had received the sanction of the Board of Supervision, the present and the late Lord Advocate, and, he believed, every Scotch Member of the other House. He had not heard anyone advocate the system of assessment on means and substance, which was in point of fact an assessment on income not derived from the parish. (Hansard, Third Series, Vol. CLXIV. p. 582 to 585.)

C. N. DALTON.

20th February 1895.

Appendix XXXIV.

APPENDIX XXXIV.

(Handed in by Mr. Dalton. See Question 42,617.)

On the PROPOSAL that the EXPENDITURE on the RELIEF of the POOR should be made a NATIONAL CHARGE.

The Poor Law Commissioners in their Report of 1834 carefully considered the proposal that the relief of the poor should be made a national charge, and pronounced unhesitatingly against it. Amongst other things they say:—

"Many persons, for whose opinion we have a great respect, have proposed that the relief of the poor should be made a national instead of a parochial charge, and be both provided and administered under the direction of the Government. . . . . There is no change that would have so numerous and so ardent a body of supporters; all the heavily-burdened parishes, and all those which, though still in a tolerable state, foresee, from the annual increase of their expenditure, the ruin that is creeping on them, all the ratepayers who are hesitating between a voluntary exile from the homes to which they are attached, and remaining to witness vice and misery, and encounter loss, and perhaps danger, would hail with transport the prospect of such a relief. Other changes may be submitted to; this alone would have enthusiastic partisans.

"Still admitting the force of all these arguments in favour of a national charge, we do not recommend one.

"In the first place, it is objectionable in principle. To promise, on the part of the Government, subsistence to all, to make the Government the general insurer against misfortune, idleness, improvidence, and vice, is a plan better perhaps than the parochial system as at present administered; but still a proposal which nothing but the certainty that a parochial system is unsusceptible of real improvement, and that a national system is the only alternative against immediate ruin, the only plank in the shipwreck, could induce us to embrace. . . . . If a national system had been adopted 100 years ago, it is probable that our present situation would have been worse than we now find it; that the mischief would have been still more general, and the remedy still more difficult."

Sixteen years afterwards Sir George Cornewall Lewis, when giving evidence on this question before the Select Committee of the House of Lords on Parochial Assessments, said:—

"I have already ventured to state to the Committee my opinion, that whenever there is a question of defraying any particular charge, the presumption always is in favour of making it a national charge, to be defrayed out of the National Exchequer. It is incumbent upon those who maintain the policy of making it a local burden, to prove their case, to show that the particular instance is an exception to the general rule. Those who have to prove that case must, I think, look mainly to two circumstances; the first of which is, whether it is, on the whole, expedient that the particular subject, whatever it may be, should be under local rather than national management; and, secondly, they should look to what is the existing usage in the matter. There are certain subjects in which unquestionably local management is preferable to national management; and the advantages of local management, as compared with national management, may be so great as to outweigh the inconveniences arising from the exclusive incidence of the tax upon real property. The relief of the poor appears to me to furnish one very remarkable example of that state of things, particularly the current relief of destitution as it arises in each parish. If the poor in each parish of the kingdom were relieved by the Treasury, the necessary consequence of that mode of relief would be, that each parish or union would vie with every other parish or union in obtaining the largest possible amount of relief; the operation of this principle was shown upon a large scale in Ireland during the potato famine. The effect of the relief-works, under the Temporary Relief Act, was that each locality made an effort to obtain as large an allowance of the grants as possible for its special benefit. There is no pecuniary interest in any locality to diminish the expenditure under such circumstances. Where the tax is a local one, and the expenditure is managed by the ratepayers, there is an obvious interest in keeping down the expenditure; but where the tax is a general one, the share which each locality contributes to that tax is so impalpable, that the interest of the locality is to obtain as large a sum as the Treasury will grant them in comparison with other localities. At all events, they say, 'If such a parish obtained such a sum, it is 'not fair that we should not obtain an equal sum.' All classes of the community concur in that interest. In the first place there is the pauper class, who naturally seek to obtain as much as they can, whether from the Treasury or from the local ratepayers. The middle classes would join in promoting any appropriation of money which would have the effect of paying the wages of their labourers out of the National Treasury; the shopkeepers would also concur in an application for a grant, which would increase the custom at their shops; and the higher classes of society, landlords and persons of that description, if they found that any grant was likely to be made which would facilitate the payment of rents or tithe, or any other payment due to them, would certainly not be backward in enforcing the application; therefore, there is an interest, in every locality, in obtaining as large a share of the national charity as possible. And wherever that experiment has been tried upon a large scale, its effects have been shown in so very decisive and in so very immediate a manner, that the experiment has not been of very long duration; and, therefore, we have not the experience of many years, in any case, to refer to. But it cannot be doubted, that such a system would lead to an enormous increase of the burden of maintaining the poor; and that it would ultimately impose upon all the local inhabitants a much larger sum in the shape of national taxation than they would otherwise pay in the shape of poor rates. Moreover, it would lead to a most extensive demoralization of the working classes; it would go very far to disorganise society, and to disturb all those relations between the working and the other classes of society upon which internal peace and good order rest.

(*Q.*) "What system do you allude to, which is to produce all those evil effects?

(*A.*) "The system which I allude to is the payment of the current relief to the poor out of the National Treasury.

(*Q.*) "Out of the Consolidated Fund?

(*A.*) "Yes. I allude to such a system as was pursued in Ireland under the Temporary Relief Act, and such a system as was pursued for a short time in Paris in the national workshops under the revolutionary government. That system, in my view, if made the habitual and legal mode of relieving the poor in this country would lead to such consequences as I have attempted to describe."

These arguments apparently induced the Committee in their Report, while stating "that the relief of the "poor is a national object towards which every de- "scription of property ought justly to be called upon "to contribute, and that the Act of 43 Eliz. c. 2. "contemplated such contribution according to the "'ability' of every 'inhabitant,'" at the same time to report "that although several items of union and "county expenditure are charged, and other items "may be conveniently made chargeable on the Con- "solidated Fund, it is not expedient that the general "maintenance of the poor should be provided for out "of that Fund."

The same considerations may be presumed to have weighed with the Select Committee of the House of Lords on the Poor Laws in 1817, when they reported as follows (pages 9 and 10 of their Report):—"Upon the subject of the general mode of "assessment for the relief of the poor, the Committee "are of opinion, upon the fullest consideration, that "nothing can tend to keep the present system of the "poor's rates within reasonable bounds, but that the "assessment should continue to be levied upon those "who are immediately interested in the disbursement, "and who from present knowledge of the character "and situation of the individuals, are best enabled to "judge of the justice of their claims and the extent of "their wants, in cases of application for relief."

APPENDIX XXXV.

RETURN of the LAND TAX originally charged to each County in England and Wales in 1798, and the Net Quota remaining chargeable in 1892–3.

APPENDIX XLI.

Appendix A. XLI.

(*Handed in by Mr. F. L. Robinson. See Questions* 45,696.)

INCOME TAX.

It is not possible to give a statement of the temporary abatement in respect of which income tax was remitted in the latest years upon agricultural land, but the following repayments of income tax have been made in the last five years under Schedules A. and B. under the heads indicated, viz.:—

Repayments in Year	Tithe Rent-charge.	Agricultural Depression.	Lands on Hand.	Total.	Repayments in Year	Tithe-Rent charge.	Agricultural Depression.	Lands on Hand.	Total.
England.	£	£	£	£	Scotland.	£	£	£	£

APPENDIX B.

CENTRAL CHAMBER OF AGRICULTURE.

AGRICULTURAL HOLDINGS ACT COMMITTEE, 1894.

1. The Council of the Central and Associated Chambers of Agriculture, at their meeting held on February 4th, 1894 resolved—

That in the opinion of this Council the time has come when the Agricultural Holdings Act requires amendment, and that a committee of not more than fifteen members be appointed to consider the various suggestions made by the Associated Chambers and Clubs, and to report what amendments in the Act are desirable.

The Committee was accordingly appointed as follows: Mr. Channing, M.P. (chairman of the Central Chamber), Mr. Jeffreys, M.P. (vice-chairman of the Central Chamber), The Right Hon. H. Chaplin, M.P., Mr. C. S. Read, Mr. Lipscomb, Mr. Bowen-Jones, Mr. W. Biddell, Mr. Rowlandson, Mr. Carrington Smith, Mr. Treadwell,

Appendix B.

Mr. St. John Ackers, Mr. Kay, Mr. Latham, Mr. F. E. Muntz, and Mr. Kidner.

2. The committee beg to report that at their first meeting on March 6th they elected Mr. Lipscomb as chairman. They have held altogether five meetings. They have carefully considered all the suggestions sent up by Associated Chambers and Clubs (including some which have reached them since their appointment), and present an analysis of the same as an appendix to this report. They have also gone carefully through the Agricultural Holdings Act, 1883, and considered what amendments are desirable. (whether suggestions respecting them had been sent up or not).

3. The Committee, before proceeding to state the results of their deliberations, think it desirable to draw attention to the action which has been previously taken by the Central and Associated Chambers in regard to the question of tenant right.

Previous action by the Chambers.

4. In 1870 the Council declared that the application of capital to agriculture was discouraged, among other causes, by "the uncertainty of tenure and absence of "compensation for unexhausted improvements, and by "unnecessary restrictions on cropping."

In 1872 a large number of resolutions were sent up by Associated Chambers, and the Central Council, after prolonged discussion at two meetings, resolved—

(1.) That this Council considers it necessary for the proper security of capital engaged in husbandry that when such security is not given by a lease or agreement, the outgoing tenant should be entitled by law to compensation for the unexhausted value of his improvements, while, at the same time, the landlord should be paid for dilapidations and deterioration caused by default of the tenant, provided that such compensation is subject to previous consent of the owner in the case of buildings, drainage, reclamation, and other works of a permanent character.

(2.) That this Council considers absolutely necessary a change in the law of tenancy so that in all yearly holdings, the letting and hiring of agricultural land, as well on entailed and ecclesiastical as on other estates, shall be subject to at least twelve months' notice to quit, cases of insolvency excepted.

5. In March, 1873, a committee comprising Sir Michael Hicks-Beach (then chairman of the Chamber), Mr. G. F. Muntz (then vice-chairman of the Chamber), Mr. E. Heneage, Mr. Clare Sewell Read, Mr. W. C. Little, Mr. W. Lipscomb, Mr. Russon, Mr. R. H. Masfen, and Mr. R. Fowler, was appointed to collect and prepare information on compensation for unexhausted improvements. Schedules of inquiry were distributed in all districts of England and Wales, many of the local chambers making also independent inquiries, and sending up their reports and recommendations.

6. In the meantime, during the session of 1873, a Landlord and Tenant Bill—the earliest measure dealing with the subject which was laid before Parliament—was introduced by Mr. James Howard and Mr. Clare Sewell Read. This was discussed in April, and the following resolution passed:—

That this Council, without pledging itself to the details of the Landlord and Tenant Bill, approves of its principle of compensation to tenants for the unexhausted value of their improvements, and to landlords for dilapidation or deterioration caused by default of tenants; and desires that security for this purpose, when not given by lease or agreement, should be provided by legislation, subject only to the written consent of the landlord in the case of permanent improvements.

A similar resolution was subsequently passed at a special general meeting of the central chamber. Objection was taken to the proposal to prevent the power to contract out, but the chamber decided in favour of a measure which should *not be permissive*, but effectually made binding wherever security was not given by custom, lease, or agreement. The Bill was withdrawn owing to the sudden illness of Mr. Howard on the day when it would have come forward.

7. In 1874 the subject was again considered, and previous resolutions re-affirmed. A report was presented by the committee showing the customs existing in most of the counties in England, and in June the council authorised the Parliamentary Committee to draft a Bill.

8. In February 1875 the final report of the committee on agricultural customs was presented. It stated that—

Looking at the results of the inquiry so far as it has at present proceeded, revealing a very partial prevalence of equitable tenant right customs, very conflicting practices as between one county and another, and even between different parts of the same county, and over a very large number of counties and districts the absence of any compensation whatever for unexhausted capital invested by the occupier (and this a quarter of a century after the labours of Mr. Pusey's committee and the attempted legislation of 1848), your committee cannot but conclude that the time has arrived for a settlement of the agricultural customs of the kingdom upon an equitable basis.

The draft of an Agricultural Tenancies Bill was brought forward and discussed very fully at two meetings in February and March. As then settled it was forwarded to the Prime Minister and the Lord President of the Council, and in May the Government introduced their Agricultural Holdings Bill. The Council cordially concurred in the main principle of this measure, but regarded with great doubt the principle of mainly testing the amount of compensation by the increase or diminution of letting value of the holding.

Attempts were made on behalf of the Chamber to modify the unconditionally permissive character of the Bill, but the amendments brought forward with this object were defeated. The principle laid down by the Council, and consistently adhered to, was "compensation certain—if not by agreement, then by law." The measure, however, was passed without the demands of the Chambers being met.

The Act of 1875.

9. It may be of interest to recapitulate the main provisions of the Agricultural Holdings Act of 1875, as it was repealed by the Act of 1883, and is now not easily accessible. It came into operation on February 14th, 1876, and every new tenancy created after that date was subject to its provisions, *unless an agreement that it should not apply was made in writing between landlord and tenant.* It applied to all tenancies from year to year or at will existing at the time of its commencement, *unless either landlord or tenant gave notice within two months that the existing contract of tenancy should be unaffected.* Twelve months' notice to quit was substituted for six months, in accordance with the suggestion in the draft Bill of the chambers.

The three groups of improvements (corresponding to the permanent, durable, and temporary improvements set forth in the Bill of the chambers) were described as first-class, second-class, and third-class improvements respectively, the maximum limit of exhaustion being taken as twenty years for the first class, seven years for the second-class, and two years for the third class.

Thirteen improvements were specified in the first-class, namely, drainage, erection or enlargement of buildings, laying down permanent pasture, the making of osier beds, water meadows, irrigation works, gardens, or fences, the making or improving of roads and bridges, of watercourses, ponds, wells, or reservoirs, or of works for the supply of water for agricultural or domestic purposes, as well as the planting of hops and orchards, and the reclaiming or warping of land. For these works the previous written consent of the owner was indispensable. It was provided by the 7th section of the Act that the tenant's compensation was to be "the sum laid out by the tenant on the improvement, with a deduction of a proportionate part thereof for each year while the tenancy endures after the year of tenancy in which the outlay is made and while the improvement continues unexhausted."

Second-class improvements were boning with undissolved bones, chalking, clay-burning, or the claying, liming, or marling of land. The period fixed for endurance was seven years, and notice was required to be given in each case to the landlord not more than 42 or less than 7 days before commencing.

Purely temporary improvements of the third class consisted of applications of purchased manures, and the consumption by cattle, sheep, or pigs on the holding of cake and other feeding stuff, not grown on the farm. No compensation was due if a corn, potato, hay seed, or other exhausting crop has been taken from the improved portion of the holding, nor was any recoverable under the Act in cases where the tenant

was, by custom or by agreement, allowed payment by the landlord or the incoming tenant for additional value produced by the consumption of feeding stuff in the manure left on the holding. The outlay must have been properly incurred, and the sum finally awarded was to represent the value of the improvement to an incoming tenant. Neither was any claim allowed by this statute whereby the tenant could be credited with a larger outlay in the last year of his tenancy than the average of the three preceding years, and an equivalent in manure was to be returned for all hay, straw, roots green crops sold off the holding before a claim for compensation was made.

The landlord could counterclaim for waste or breach of covenant committed within four years of the close of the tenancy.

The procedure was by arbitration, unless the parties themselves agreed. One referee might be jointly appointed, or landlord and tenant might each appoint one, such referees appointing an umpire. If they failed to do this the appointment might be made by the county court judge, or either the Inclosure Commissioners or the county court judge might be invited by either party to name the umpire without leaving it to the referees. The award was to set forth, "as far as reasonably may be," the details by which the compensation awarded was arrived at. On paying compensation the landlord might obtain, on the order of the county court, a charge on the holding, but no instalment or interest was to be made payable in the case of a landlord who was not an absolute owner for his own benefit after the time when the improvement paid for was assumed to be exhausted.

The Act of 1883.

10. It was not long before proposals were brought in for amending this Act. A general meeting of owners and occupiers of land was convened under the auspices of the Central Chamber and of the Farmers' Club, on the 2nd July 1879, to consider remedies for the depression in agriculture. This was very largely attended, and the permissive character of the Agricultural Holdings Act was generally condemned. A Royal Commission was unanimously demanded to inquire into the causes of depression. This demand was at once acceded to by the Government, and in August the Commissioners were appointed for the purpose.

In their Report, issued in 1882, the Commissioners "recommend that the principle of the Agricultural "Holdings Act relating to compensation should be "made compulsory in all cases where such compensa-"tion is not otherwise provided for."

11. In 1881 Mr. Chaplin and Sir Thomas Acland introduced their Bills, and the Council again approved the principle of both, expressing, however, a preference for the former, "as it established the principle "originally laid down by the Council in the draft "Bill suggested by them before the introduction of "the Agricultural Holdings Act, that every tenant on "quitting his holding should be compensated by law, "by custom, or agreement."

Two Bills were also introduced in the same Session dealing with the law of distress and the Council approved the principle of exempting agisted stock and hired machinery, and also the limitation of the power to distrain to a period of two years.

12. In 1882 the Council re-affirmed their resolutions of the previous year. Two Select Committees of the House of Commons were appointed to consider the Bills introduced to amend the laws relating to agricultural holdings and to distress.

13. Early in 1883 the Council again pressed their demand for legislation, and the Government late in the Session introduced their Bill. Two meetings were held by the Council to consider it, and it was approved generally with some criticism of details. The Select Committee on the Law of Distress having reported in favour of the limitation of the power to distrain to one year, the Council approved the inclusion of this recommendation in the Agricultural Holdings Act. The Act was passed on 25th August of this year.

14. It was at once felt by practical men that although "the value of the improvement to an incoming tenant" was theoretically sound, as a measure of compensation it left wide scope for dispute, which would tend to increase the costs of arbitration, with nothing more definite as a guide. On December 12th, 1883, the Council debated as to the expediency of adopting a basis of valuation, such as was proposed by the Lincolnshire and West Riding Chambers.

As a result a committee was appointed to draw up a standard of compensation under the Act. It consisted of Mr. Lipscomb (Chairman), the Right Hon. H. Chaplin, M.P., the Earl of Suffolk and Berkshire, the Hon. M. Finch-Hatton, M.P., Mr. Heneage, M.P., Mr. W. Biddell, M.P., Mr. Bowen-Jones, Mr. C. S. Read, Mr. Bell, Mr. Willson, Mr. Jabez Turner, Mr. W. T. Scarth, and Mr. Duckham.

The report of this Committee was presented in June 1884, and contained a proposed scale of allowances for the unexhausted nominal value of feeding stuffs, with a schedule giving the suggestions sent up by Associated Chambers from various districts. In December following the report was adopted unanimously.

15. In March 1889, and again in May 1890, the question of the position of a tenant on land subject to mortgage was considered, and on the latter occasion the following resolution was carried :—

That where compensation for improvement is due to the occupier under the Agricultural Holdings Act of 1883, such compensation shall, with the exception of any sum arising from the payment of tithes, be a first charge on holdings, any contract with the mortgagee under the provisions of the Conveyancing Act of 1881, or of the Settled Land Act of 1882, notwithstanding; and that it is expedient to introduce a Bill into Parliament to amend the existing law in such cases.

A Bill was immediately afterwards introduced by Col. Cotton-Jodrell to give effect to this resolution, and passed into law.

In May 1890 the Council resolved—

That home-grown corn, being now so very much consumed, should, under proper safeguards, be included in the third part of the schedule under which compensation is to be given.

That the counter-claims of landlords under the Agricultural Holdings Act should be scheduled.

In November of the same year the Council resolved—

That in the opinion of this Council it is desirable to amend the Agricultural Holdings Act by establishing the relation of landlord and tenant, for the purpose of compensation under the Act, as between a tenant for life occupying his own land and the remainderman.

Recommendations.

16. The Committee have to a considerable extent formulated their recommendations as specific amendments to the present Agricultural Holdings Act, but they have not thought it within their reference to attempt to draft a new Bill, or to completely set out all the amendments which may be consequential on their recommendations. They now proceed to state the alterations in the Act which they recommend to the Council.

17. *Basis of Compensation.* The Committee recommend that the words—

"Provided always, that in estimating the value of any improvement in the First Schedule hereto, there shall not be taken into account as part of the improvement made by the tenant what is justly due to the inherent capabilities of the soil,"

be struck out of Section 1.

18. *Compensation to tenant for unexhausted improvements.*—The Committee recommend that the First Schedule should be amended so as to stand as follows :—

Part I.

Improvements to which Consent of Landlord is required.

(1.) Erection or enlargement of buildings.
(2.) Formation of silos.
(3.) Making and planting of osier beds (exceeding one acre).
(4.) Making of water meadows or works of irrigation.
(5.) Making of gardens (exceeding one acre).
(6.) Planting of orchards or fruit bushes (exceeding one acre).
(7.) Making of roads or bridges.
(8.) Making of watercourses, ponds, wells, or reservoirs, or of works for the application of water power, or for supply of water for agricultural or domestic purposes.
(9.) Making of fences.
(10.) Removal of fences.

Appendix B.

(11.) Planting of hops.
(12.) Reclaiming of uninclosed waste land.
(13.) Warping of land.
(14.) Embankment and sluices against floods.

PART II.

Improvements in respect of which Notice to Landlord is required.

(15.) Drainage.
(16.) Improving of roads.
(17.) Improving of watercourses, wells, or reservoirs, or of works for the application of water power, or for supply of water for agricultural or domestic purposes.
(18.) Laying down of permanent pasture.
(19.) Making of gardens (not exceeding one acre).
(20.) Planting of orchards or fruit bushes (not exceeding one acre).
(21.) Making and planting of osier beds (not exceeding one acre).
(22.) Reclaiming of enclosed waste land.

PART III.

Improvements to which Consent of or Notice to Landlord is not required.

(23.) Boning of land with undissolved bones.
(24.) Chalking of land.
(25.) Clay burning.
(26.) Claying of land.
(27.) Liming of land.
(28.) Marling of land.
(29.) Application to land of purchased artificial or other purchased manure.
(30.) Consumption on the holding by horses exclusively engaged or kept on the holding, cattle, sheep, or pigs, of cake, or other feeding-stuff not produced on the holding.
(31.) Consumption on the holding by horses exclusively engaged or kept on the holding, cattle, sheep, or pigs, of corn produced on the holding, provided that satisfactory evidence be adduced of the same.
(32.) Two years' and older seeds, if a good plant, and the land clean and in good heart.
(33.) Increased fertility of the holding, due to continuous good farming.
(34.) Any other improvement increasing the value of the holding as an agricultural holding, and not specifically mentioned in this schedule, for which the tenant is not otherwise compensated.

19. *Record of Condition of Holding.*—The committee recommend that the Act be amended so as to provide:—

(1.) That on the face of every award in the case of a quitting tenant, there shall be a record in a scheduled form of the general condition of the holding.
(2.) That in case of no award a record shall be made either by the landlord and entering tenant themselves, or by a valuer or valuers; and that such record shall be in duplicate or accessible to both landlord and tenant, and signed by all parties making the record.

20. *Compensation to Landlord for Dilapidations.*—The committee recommend that the dilapidations for which a landlord may claim be scheduled, and that the following be inserted as the second schedule to the Act:—

(1.) Unduly mowing grass lands.
(2.) Over cropping.
(3.) Land neglected or rendered foul by default of the tenant.
(4.) Breaking up old grass land without written consent of landlord.
(5.) Neglect of gates and fences.
(6.) Neglect of roads.
(7.) Neglect of drains, outfalls, and watercourses, for which the tenant is liable.
(8.) Damage to plantations, coppices, and timber included in the holding.
(9.) Neglect of ordinary repairs of buildings, for which the tenant is liable by custom or agreement.
(10.) Loss of manure by hay, straw, roots, or green crops, removed off the farm without written consent of the landlord, or without previous security having been given that equivalent manurial value has been or will be forthwith brought on the holding, and, if required, vouchers for the same produced at the next rent audit; provided that no removal of hay, straw, roots, or green crops, being the last year's produce, shall take place, except with the written consent of the landlord.
(11.) Other dilapidations and deteriorations or decreased fertility of the holding, caused by act or neglect of the tenant which detract from the letting value of the holding.

The committee further recommend that the period in respect of which a landlord may claim for waste or breach (section 6) be reduced from four years to two years.

21. *Notice of Claims.*—The committee recommend that the tenant and landlord shall have an equal right to claim for improvements or dilapidations respectively, and that section 7 be amended accordingly so as to read as follows:—

A tenant claiming compensation under this Act shall, 28 days at least before the determination of the tenancy, give notice in writing to the landlord of his intention to make such claim.

A landlord shall, 28 days at least before the determination of the tenancy, give notice in writing to the tenant of his intention to make a claim in respect of any waste or any breach of covenant or other agreement, provided that the landlord shall have power, within 14 days after the determination of the tenancy, to amend his claim in respect to dilapidations to buildings occurring after the notice of claim has been delivered.

Every such notice shall state, as far as reasonably may be, the particulars and amount of intended claim.

22. *Appointment of Valuers and Umpires, and Procedure.*—The committee recommend:—

That the word "valuer" be substituted for "referee" throughout the Act.

That either the landlord or tenant may act as his own valuer.

That the county council for every county (other than the metropolis) shall from time to time nominate such number of fit persons as they shall think fit to be umpires, and shall forward the names of such persons to the Board of Agriculture, who shall appoint all umpires to be appointed by them under the Act from such list.

That all umpires appointed under the Act shall be selected from a list of valuers nominated by county councils, and sanctioned by the Board of Agriculture.

That in the event of valuers not appointing an umpire before they enter upon the reference (as provided by section 9, sub-section 7) they shall not be entitled to their charges.

That the authority to appoint an umpire in the event of the valuers failing to do so shall be the Board of Agriculture (section 9, sub-section 9).

That the costs of and attending a reference (section 20) shall be subject to review by the Board of Agriculture, who shall also draw up, and from time to time revise, a scale of maximum fees for umpires.

That on questions of fact and value there shall be no appeal from the award of the umpire, but that on any question of law there may be, at the request of either party, an appeal to the judge of the county court, whose decision shall be final.

That the day fixed by the award for the payment of money awarded shall be "not later than two months" (instead of "not sooner than one month") after the delivery of the award.

That if any umpire shall be proved to the satisfaction of the Board of Agriculture to be incompetent or guilty of any misconduct in the execution of his duty as an umpire, he shall be liable to have his appointment summarily cancelled by the said Board.

23. *Service of Notice.*—The committee recommend that section 28 be amended so that a notice sent by post shall be deemed to have been served at the time when the letter containing it was registered.

24. *Fixtures.*—The committee recommend that the right of the tenant to remove fixtures shall be limited to 10 days (instead of "a reasonable time," section 34) after the termination of the tenancy; and further, that a tenant who shall have acquired by purchase any

fixture, under section 34, shall be in the same position as though he himself had affixed or erected the same.

25. *Damage by Works on Land Resumed.*—The committee recommend that a tenant shall be entitled to fair and reasonable compensation for any damage which he may suffer by the construction or carrying out of any of the works mentioned in section 41.

26. *Distress.*—The committee recommend that the right of a landlord to distrain for rent be limited *absolutely* to rent for 12 months before the making of such distress; and that the period within which (under the Law of Distress Amendment Act, 1888) a tenant may replevy goods and chattels distrained be extended to 21 days.

27. *Loans to Landlords for Carrying out Improvements.*—The committee recommend that the Board of Agriculture be empowered to grant loans to landowners for carrying out improvements on their estates.

Signed on behalf of the Committee,

WM. LIPSCOMB,
Chairman.

Norfolk House, Norfolk Street, London, W.C.,
April 30th, 1894.

R. Henry Rew,
Secretary.

CENTRAL CHAMBER OF AGRICULTURE.

REPORT OF THE COMMITTEE ON THE AGRICULTURAL HOLDINGS ACT.

ADDENDUM.

The committee on the Agricultural Holdings Act (appointed February 4th, 1894) presented their report to the Council on June 5th, 1894.

On the motion of Mr. Lipscomb, seconded by Mr. T. Carrington Smith, the Council received the report and resolved to consider it clause by clause.

Clauses 1 to 15, down to "recommendations," were adopted.

Clauses 16 and 17, "recommendations" were adopted.

Clause 18 was amended by the insertion of the word "alteration" after "erection" in item 1, part I., of the first schedule.

Clause 19 was adopted.

Clause 20 was amended as regards the proposed schedule of dilapidations for which a landlord may claim in the following particulars:—

Item (2). The words "without adequate manuring" added.

Item (4). The word "old" struck out and "permanent" inserted. After grass land, the words "existing at the commencement of the tenancy, "towards which the landlord has contributed," inserted.

Item (6). The words "for which the tenant is liable" added.

Item (10). All after "without" in first line to "provided" in fourth line struck out, and the words "adequate manure being returned" inserted.

Clause 21 amended by striking out "fourteen" and inserting "twenty-eight" days as the period within which the landlord may amend his claim, and by the addition of the following words:—

"Provided that where the tenancy of the holding is determined at different periods with respect to the land and the buildings, the valuers or the umpires shall be empowered to make an interim award as to the matters affected."

Clause 23 adopted.

Clause 24 amended by striking out "ten" and inserting "twenty-eight" days for removal of fixtures.

Clauses 25 and 26 adopted.

Clause 27 amended by the addition of the words:—

"At a rate of interest not greater than 2¾ per cent. with a sinking fund upon the usual basis."

Resolution adopted unanimously by the Council on November 6th, 1894:—

"That in the opinion of this Council it is desirable to amend the Agricultural Holdings Act by establishing the relation of landlord and tenant, for the purposes of compensation under the Act, as between a tenant for life occupying his own land and the remainderman."

R. HENRY REW,
Secretary.

APPENDIX D.

AGRICULTURAL STATISTICS.

Corn Area in the several Agricultural Divisions and Sub-divisions and Counties in England at different Periods.

Memorandum presented by William C. Little, a member of the Commission, April 1895.

The following tables are in continuation of a series which I compiled and published in 1882 with the object of determining the relative position held by the different counties of England in respect of the area of corn crops generally, and that of wheat, barley, and oats particularly. For the purpose in view I took the average result during the 10 years 1872 to 1881 as a safer guide and standard of comparison than would have been afforded by the statistics of any single year.

Having ascertained the positive and relative importance of the corn crops in each county, I proceeded to suggest the grouping of counties in four geographical provinces or divisions of the county, and in accordance with the greater or lesser prominence of the corn crop area; No. I. division having the largest proportion of its farmed land, and No. IV. division the smallest proportion of such land devoted to corn growing. The grouping thus suggested was subsequently adopted for statistical purposes by the Board of Agriculture, with a further development of the principle by the division of each group of counties into two not very unequal sub-divisions.

The tables now presented carry on the comparison of the divisions, sub-divisions, and counties of England to the latest possible date, 1894. The intervening years since the first set of tables was compiled have been divided into three periods, viz.:—

(i.) Five years, 1882–1886.
(ii.) Five years, 1887–1891.
(iii.) Three years, 1892–1894.

It seemed to me that while a period of *ten* years was not too prolonged for my original purpose, viz., that of determining the comparative importance of the corn crop and of certain descriptions of corn in different parts of the country, the changes in the system of cultivation which have been so marked during recent years could be better appreciated by comparing the averages of somewhat shorter periods with those of the first period of 10 years.

I have not thought it necessary to make a thorough and exhaustive comparison of each period, though the tables supply the materials for such comparison. It seemed sufficient in dealing with the larger areas of divisions and sub-divisions to compare the average results during the three years, 1892, 1893, and 1894, with those of the 10 years, 1872–1881.

It should, however, be pointed out that while a 10 years' result may be relied upon for a comparison between county and county during the period covered it does not fully indicate the difference between one period and another, since it minimises the extent of the change wherever the tendency of such change is continuously in one direction though not absolutely visible in each year. For instance, in every county in England the corn area and the wheat area was less in 1880 and 1881 than in 1872 and 1873. The barley area increased in the 10 years, 1872–1881, in 24 counties, was practically stationary in 8, and decreased in 10 counties. Oats increased in area in 33 counties and declined in 3 counties during these 10 years. If, therefore, a period of three years ending in 1874 were compared with that of three years ending 1894 the decrease in the corn crops and wheat crops would be much greater than these tables represent, while the increase in both barley and oats would be considerably larger than these tables would appear to show.

The system upon which these tables have been arranged is as follows:—

Section A relates to corn crops of all kinds.
„ B „ wheat.
„ C „ barley.
„ D „ oats.

In each of these sections the 1st table (Nos. I., VII., XII., XVII.) deals with the larger areas of divisions and sub-divisions, giving the average area under each particular section in 1872–81 and in 1892–94, with the per-centage of the total cultivated area under the crops in question, and the rate of increase or decrease since the earlier period.

Tables II., VIII., XIII., XVIII. give similar particulars as to area and ratio of area to cultivated area during three periods.

Subsequent tables in each section show the counties of England arranged in respect of the positive and relative area under each of the crops dealt with, and the rate of increase or decrease in area which has taken place.

It may be worth while to point out some of the more striking facts which are exhibited by these tables.

It has been stated that the several divisions of the county were made in respect of the relative importance of the corn crops. Table I. shows that no change has taken place in the order of these divisions. The ratio of corn to cultivated area being approximately 40 per cent. in Division I., 24½ per cent. in No. II., 18½ per cent. in No. III., and 15 per cent. in No. IV. The proportion in all England being 24·33 per cent. The results as regards decrease in area are not so uniform. As will be seen when the details are examined in some counties and divisions the marked tendency has been a decrease in corn crops generally, in others it has been, to some extent, the substitution of one kind of corn crops for another. It will be remarked, however, that in Division I., which is pre-eminently the corn region, the decrease of area under corn has been much smaller than in any other division, it being only 10·7 per cent. On the other hand, it will be seen that the greatest decrease in corn area is in Division II., where it amounts to more than 23 per cent. A. Corn Crops.

Table II. shows that in almost every county the decline in the importance of corn crops has been continuous. In Lancashire, Westmoreland, and Worcester the proportionate area has been slightly larger, and in Herts and Cumberland it has been the same during the last three years as it was during the preceding period of five years. In three of these counties, however, the area under corn is small.

In Table III. the counties are arranged in order of positive and relative area of corn crops. It will be seen that in Cambs 47½ per cent. of the farmed land is still under corn, while in Westmoreland less than 7½ per cent. is thus cropped.

Table IV. shows what has been the increase or decease in the positive area of corn in each county, taking for comparison the average 1872–1881, and that during 1892–1894. It appears that in Lancashire only is an increase shown, in other counties the decrease ranges from 35 per cent. in Cheshire to 39·5 per cent. in Middlesex, the decrease in the latter county being slightly exaggerated by the abstraction of a portion of the former area which is now counted as in the county of London. (*See* note to Table II.)

Table V. shows how much of the corn crops was in wheat, barley, and oats respectively in each division and sub-division of England at two different periods. It appears that as regards wheat the order of the divisions is strictly the same as it is with regard to corn, Nos. 1 to 4 following in regular order, 35·2, 34·4, 32·0, and 17·4 per cent. being the several proportions. In barley the order of divisions is Nos. I., III., II., IV. In oats, as might be expected, the order is reversed, and Nos. IV., III., II., I. follow in order of diminishing importance of the crop.

In Table VI. the proportionate part of the whole area under corn crops, wheat, barley, and oats in each division and sub-division is shown. B. Wheat

Turning next to the tables relating to wheat, it is not a little remarkable that when the decrease of area is examined it will be found that the decrease proceeds regularly as we descend from the more conspicuous to the least conspicuous corn region, and that such

decrease, which is universal, is in inverse ratio to the relative importance of the crop. Thus in the several divisions and sub-divisions the relative area and the rate of decrease in area were as follows:—

	Relative Area, 1892–94.	Decrease, 1892–94 as compared with 1872–81.
I.—a	16·23	22·4
b	12·18	31·4
Total	**14·1**	**26·8**
II.—a	9·11	36·1
b	7·55	38·1
Total	**8·48**	**37·1**
III. a	6·90	43·0
b	4·82	44·9
Total	**5·89**	**43·8**
IV. a	3·12	52·6
b	2·15	54·0
Total	**2·63**	**53·2**
England	**7·67**	**36·5**

It is not necessary to discuss each table in detail, but reference may be made to Table XI., which shows the counties arranged in respect of wheat area relatively to cultivated area, and also arranged in respect of the least decrease in the area of wheat. In the left-hand column, if we take the first seven counties in the list, we have a group of Eastern and Midland counties where the per-centage of cultivated area under wheat ranges from 13·4 to 20·8 per cent. In the next column the same seven counties stand first, though not exactly in the same order. Similarly at the other end of the scale there is a striking coincidence in the names of counties with the least proportionate area of wheat and the greatest proportionate decrease in that area.

C. Barley. The tables relating to barley show some curious and by no means uniform results. In the sub-division containing Lincoln, Norfolk, and the East Riding of Yorkshire, there has been an increase in the acreage of barley; in every other sub-division a marked decrease has occurred. In the north-west sub-division this decrease has been more than 40 per cent. A reference to Table XVI. will show that the increase in Sub-division I. b. was most marked in the county of Lincoln, while as regards Sub-division IV. b., Cheshire, Westmoreland, and Cumberland exhibit a decrease ranging from 36·6 to 62·8 per cent. in the area of barley.

D. Oats. With regard to oats, there has been a remarkable increase in the area of the crop in Divisions I. and III. In Sub-division (a) of Division III. that increase was at the rate of 55 per cent.; in Sub-division (a) of Division II. the increase was only 7·9 per cent.

A glance at Table XVII. will show that in every county except Northumberland the increase of the area under oats has been continuous. Taking the four periods of comparison it will be seen from Table XX. that the area of oats in the county under consideration decreased by 2·3 per cent. during the 2nd period (1882–86), by 11·2 per cent. in the 3rd period (1887–91), and by 15 per cent. in the 4th period (1892–94). On the other hand, in some counties the increase in the area of oats has been remarkable, as in Worcester and Suffolk (*see* Table XXI. (*b.*)), and as has been already observed, if the last three years were compared with the earlier years of the first period, the result would be still more striking. In the following statement the aggregate area of oats in certain counties during the three years, 1872, 1873, and 1874, is contrasted with that of the three years, 1892, 1893, and 1894. The counties selected are those which appear at the head of the list in Table XXI. (*b*).

Counties.	Aggregate Area.		Per-centage of Increase.
	3 Years, 1872–74.	3 Years, 1892–94.	
Worcester	21,376	51,416	140·5
Suffolk	40,751	94,647	132·2
Gloucester	45,886	99,991	118·0
Hereford	32,330	68,471	111·8
Beds	27,440	53,378	94·5
Norfolk	83,882	153,392	83·0
Warwick	43,171	85,946	99·1

It may be convenient to indicate what are the counties included in each of the agricultural divisions and sub-divisions of England:—

Division I.

Sub-division (a.):

Beds, Cambs, Essex, Herts, Hants, Suffolk.

Sub-division (b.):

Lincoln, Norfolk, York, E.R.

Division II.

Sub-division (a.):

Berks, Hants, Kent, Surrey, Sussex.

Sub-division (b.):

Bucks, Leicester, Middlesex, Northampton, Notts Oxon, Rutland, Warwick.

Division III.

Sub-division (a.):

Gloucester, Hereford, Monmouth, Salop, Wilts, Worcester.

Sub-division (b.):

Cornwall, Devon, Dorset, Somerset.

Division IV.

Sub-divison (a.):

Durham, Northumberland, York, N.R. and W.R.

Sub-division (b.):

Chester, Cumberland, Derby, Lancaster, Stafford, Westmoreland.

Appendix D.

A. Corn Crops.

ENGLAND.

A.—CORN CROPS OF ALL KINDS.

Table I.—Showing the Average Area of Corn Crops in the several Agricultural Divisions and Subdivisions of England during the 10 years 1872 to 1881, and also in the three years 1892 to 1894, with the Per-centage of the Cultivated Area under such Crops, and the rate of decrease in Area in the latter period.

Divisions and Sub-divisions.	Average Area 10 Years, 1872–1881.		Average Area 3 Years, 1892–1894.		Decrease per cent. 1892–94 compared with 1872–81.
